The Office of Counsel to the President typically solicits complete financial records to anticipate problems before nominations are announced and explains reporting requirements to potential nominees. The Office of Counsel provides forms to potential nominees and gives the completed reports to designated agency ethics officials and to the Office of Government Ethics. Agency heads are responsible for compliance with the ethics program, and they appoint the agency's ethics official. The financial disclosure reports are also reviewed by the employing agency's representative, and the agency's evaluation is included in the Office of Government Ethics's opinion letter. The opinion letters are reviewed by the president before the nomination is sent forward. The members of the Senate involved in the confirmation process review the letters and generally include their own assessment of possible conflicts of interest.

Identification of possible conflicts may result in nominees being asked to disqualify or recuse themselves from participation in decisions regarding firms or industries in which they may have personal or financial interests, divest themselves of financial interests in particular firms or industries which may cause conflicts of interest, or put their financial holdings into "blind trusts" so that they will have no knowledge of their financial interests in particular firms or industries. A waiver may also be granted if it is determined that a nominee's interests in a particular firm or industry are so slight or peripheral as to assure that any conflict of interest will be very minor.

RESTRICTIONS ON FUTURE EMPLOYMENT

In 1989, President George Bush appointed a Commission on Federal Ethics Law Reform that recommended strengthening the provisions dealing with "influence peddling" as well as broadening the provisions dealing with conflicts of interest when officials may gain personally or financially. Subsequent amendment of the Ethics in Government Act

expanded its scope to include influence peddling by former officials. The act restricts what former government officials may do upon leaving office, principally in terms of a two-year prohibition against representing private interests before their former agencies. These provisions were designed to lessen conflicts of interest that may arise during an official's tenure with an agency, when he or she may be anticipating future employment outside government, and to help stop the "revolving door" pattern of employment in which individuals move from government agencies to the industries they were responsible for regulating and vice versa. The provisions also include a one-year prohibition on former officials representing private interests before their former government employer when the individual had no responsibilities relating to his or her current employer.

IMPACT OF THE ACT

Critics of the Ethics in Government Act have charged that it makes it difficult to recruit potential officials from the private sector. This criticism was expressed numerous times during the Reagan administration. At issue are whether the financial disclosure requirements themselves are impediments to recruitment because individuals do not want to make their finances public or whether other restrictions on employment discourage individuals from accepting nominations. In addition to financial disclosure and limitations on relationships with former and future employers, the act restricts the freedom of officials to manage their own financial affairs.

Supporters of the act argue that it focuses attention on the issue of ethics and, in particular, reinforces the principle that even the appearance of impropriety is to be avoided in public-sector employment. The Ethics in Government Act also reaffirms the principles that government officials should not use their positions for personal gain and that government business should be conducted "in the sunshine." Moreover, the act serves to protect appointing officials from inadvertently selecting someone who might be motivated to seek public employment for personal gain or who might later be charged with bias in making decisions.

The standards set in the Ethics in Government Act have had a broad impact in government. States and municipalities are increasingly requiring financial disclosure by political appointees and elected offi-

cial to lessen the potential for conflicts of interest. Conflicts that may arise because of dual employment, financial interests in businesses that deal with government agencies, and the use of public positions to benefit private interests are examined closely. Conflicts arising from the employment of law enforcement officers in private security during their off-duty hours are cases in point.

Ethics/morality distinction

DEFINITION: Distinction drawn by moral philosophers between the study of moral judgments and choices (ethics) and the systems of rules and values governing those choices (morality)

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Ethics is the study of morality, but almost every system of ethics also attempts to create, formulate, or advocate its own moral principles, thus blurring the distinction.

Ethics refers to the most important values and beliefs of an individual or a society. These beliefs help shape the character of the people in that society, teaching them what is good and bad. Ethics implies knowledge of these basic principles and the responsibility to make the appropriate choice when necessary. The

strong bond between ethics and a society's customs raises the issue of relativism. Moral philosophers argue that ethics implies values that are universal and are not tied to one society or time period.

The particular rules implementing ethical beliefs in a specific society may change, but not the fundamental principles. In a society composed of subcultures, the specific laws or customs of each may be expressed differently. The distinction between ethics and morality becomes important when the rules used by different groups are not understood or accepted. Unacceptable behavior may be assumed to mean unacceptable values. In that case, the ethos, or unifying characteristics, of a society is weakened and individuals within that society must justify their actions, because morality cannot be assumed.

Ethnic cleansing

DEFINITION: Forced expulsion of a specific population from a territory

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: Ethnic cleansing is predicated either upon a judgment that the presence of a specific ethnic group in an area is harmful, or upon a judgment that the cleansing group has a moral right or imperative to create a homogeneous culture for itself. Either judgment will activate ethical concerns about violence, warfare, prejudice, human rights, minority rights, and the rights to self-determination of both groups.

"Ethnic cleansing" is a euphemism for murder and land theft that is sanctioned by a state government. It usually refers to the expulsion of an "undesirable" population from a given territory for political, strategic, or ideological reasons, or because of religious or ethnic discrimination. Forced emigration and population exchange are elements of ethnic cleansing. Forced population removal or transfers have occurred repeatedly throughout history, most often to

create or secure an ethnically homogeneous homeland or state.

The Assyrian king Tiglath-Pileser III (745-727 B.C.E.) carried out one of the earlier recorded cases of ethnic cleansing. One-half of the population of any land that he conquered was forcefully removed and replaced by settlers from other regions who were loyal to him. Many centuries later, European settlers in North America slowly “cleansed” the land of most Native Americans with the tacit consent of the state. By expelling the entire East Indian community from Uganda during the early 1970’s, Idi Amin of Uganda “cleansed” that country of East Indians so that indigenous Africans could take over their land and businesses. During the 1990’s, Serbians in the former Yugoslavia tried to “cleanse” territory that they claimed for Serbian Christians by driving out Muslim citizens. They used murder, rape, starvation, and a variety of other deplorable techniques to achieve their goal.

There is no moral justification for ethnic cleansing. It is carried out by those who hope that if they occupy the land long enough, their right to it will not be challenged. Yet history has shown that time neither heals every wound nor justifies every action. Ethnic cleansing is and has always been criminal. It should not be sanctioned by any self-respecting government, because it is ethically unjust.

Ethnocentrism

DEFINITION: Attitude according to which one’s own race or society is the central criterion for evaluating other groups or cultures

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: Ethnocentrism promotes loyalty to the group, sacrifice for it, and hatred and contempt for those outside it.

Ethnocentrism is the emotional attitude that places a high value on one’s own customs and traditions and

belittles all others, rating as least valuable those who differ most. One’s own group is the center of everything, and all others are scaled with reference to it. Each group nourishes its own pride and vanity, believes itself to be superior, exalts its own divinities, and looks with contempt on outsiders.

Sociologists and anthropologists have found that people everywhere seem to believe that the groups to which they belong are the best and that their ways and morals are superior. Others outside their group are something else—perhaps not defined—but not real people: the Jews divided all mankind into themselves and the Gentiles, the Greeks and Romans called outsiders “barbarians,” the Arabs referred to others as “infidels,” and the whites in South Africa called the blacks “kaffirs.” Although ethnocentrism serves a useful purpose in that it performs the function of discipline and social control within the group, it can be very irritating and disruptive, and when it gets out of hand, it may be dangerous and even fatal.

Etiquette

DEFINITION: Code of manners governing social behavior and interactions

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Disagreement exists as to whether etiquette should be considered a branch of ethics. The answer depends on the extent to which politeness and manners are judged to be moral requirements.

Normative ethics and etiquette are alike in that each offers prescriptions concerning how people ought to behave. Ethics tells people to avoid certain forms of conduct because they are morally reprehensible and recommends that they engage in others because they are morally admirable. Etiquette, in contrast, prohibits certain forms of conduct because they are discourteous or vulgar and recommends others as polite or elegant. Ethics and etiquette are separate at least

to the extent that ethical violations can be committed without violating etiquette, and to violate at least some aspects of etiquette, it is not necessary to violate ethics.

Etiquette, unlike ethics, is much concerned with characterizing the social meanings of forms of behavior, determining what behavior expresses respect, contempt, gratitude, aggression, and so forth. Different societies have very different conventions about these matters. For example, in Turkey, the normal way in which men greet one another with respect is by kissing, while in English-speaking lands, kissing is deemed improper and a handshake is preferred. Since these conventions vary so widely, the prescriptions of etiquette are far more socially relative than are those of ethics. The maxim “When in Rome do as the Romans do” generally applies to etiquette, though it is less sound as a maxim of ethics.

The *Instructions of Ptah Hotep*, an Egyptian text dating from about 2500 B.C.E., provides the earliest known account of polite behavior. Later Western notions of etiquette are rooted in medieval chivalry, according to which the knight should be not only a powerful warrior but also honorable and well mannered. In particular, he is to display gentle, sincere devotion toward ladies, and they, in turn, are to be delicately refined and of absolute purity. The Renaissance writer Baldassare Castiglione expresses these ideals in *The Courtier* (1528). Later, the term “etiquette” entered English with the publication of Lord Chesterfield’s *Letters to His Son* (1774), in which the author expounded gentlemanly deportment.

ETIQUETTE AND CLASS

These codes of manners were aristocratic. Persons of lower-class birth did not understand or conform to them and therefore were marked off from the upper class. In the nineteenth and twentieth centuries, however, class divisions weakened and an expanding circle of people sought to advance themselves socially by cultivating good manners. Books on etiquette multiplied. In the United States, the writings of arbiters such as Emily Post, Amy Vanderbilt, and Miss Manners (Judith Martin) have enjoyed

Categories of Personal Etiquette

<i>Behavior</i>	<i>Examples of prescriptions</i>
Eating	Style and self-restraint in table manners, table settings, and service.
Dressing	Modesty and elegance according to sex, age, and occasion—formal or informal.
Communicating	Tact and skill in handling introductions, polite conversation, writing letters, telephoning, use of calling cards.
Socializing	Graciousness in giving and attending parties and other entertainments, having and being houseguests, making and receiving social visits.
Celebrating	Appropriate degrees of ostentatious formality in private celebrations of weddings, engagements, births, graduations, and anniversaries.
Rituals	Propriety in observing formalities of official diplomatic, religious, military, or governmental ceremonies.

wide circulation. These authors have sought to present etiquette not class-consciously but democratically, offering guidance in civility for everyone. They consider not only everyday personal etiquette but also special areas of etiquette; for example, in business, in the professions, in diplomacy, and so on.

Iconoclastic persons often view etiquette with contempt, because they condemn class-conscious snobbishness and artificial conventions and because they suppose that the ethical virtues of sincerity and truthfulness are all that are needed in life. They are right, of course, that arbiters of etiquette sometimes have defended frivolous rules and sometimes have done so for blameworthy reasons. They are wrong, however, to suppose that egalitarian society has no need of etiquette and that social interactions could successfully proceed were manners guided by sincerity and truthfulness alone. The point that they miss is that human beings in their everyday contacts readily generate antagonisms that can become destructive unless they are covered by the cloak of tact-

fulness and smoothed by the oil of polite formalities. A society that is polite, at least to a judicious degree, can function more efficiently and more happily than can a sincerely truthful but uncivil society.

ETIQUETTE VS. ETHICS

Do ethics and etiquette sometimes conflict? It might seem so, since ethics is thought to prescribe that people not engage in lying or deception, while etiquette encourages the use of white lies. ("I'm so sorry, but I'm busy that night," one is supposed to say, instead of the more truthful "I don't like you and don't want to come.") This supposed conflict between ethics and etiquette is not deep-seated, however, since the white lies of etiquette can be justified in terms of the ethical principle of nonmaleficence (avoiding hurting the feelings of others). Moreover, the saying of something not literally true is scarcely a lie when everyone knows that it is prescribed by social custom.

Etiquette enjoins people always to be polite. In rare cases, when there are strongly countervailing ethical considerations, one ought to abandon politeness in order to do what is morally right (for example, a firefighter, in order to extinguish a fire, may have to intrude violently on someone's privacy). Usually, however, etiquette conflicts very little with ethics, and violations of etiquette commonly are violations of ethics also, because they tend to injure others, at least mildly.

A controversial question that philosophers have not discussed extensively is whether politeness itself should be classified as a moral virtue, along with honesty, fidelity, modesty, and the like. If by "moral virtues" are meant those admirable human qualities that enhance a person's capacity for contributing to the well-being of society, then politeness can be a virtue in this sense. Notice, however, that being polite is not the same thing as being favorably disposed toward everyone else. Someone possessing the virtue of politeness knows ways of politely expressing negative reactions toward others, and especially toward those who are out of line.

Eugenics

DEFINITION: Attempt to alter human evolution through selection

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Even in its most benign form, eugenics raises serious ethical questions, since it almost unavoidably involves some people making reproductive choices for others, and making decisions about which genetic traits should be preserved, strengthened, and eliminated from the human race. The darker forms of the science entail much clearer and more heinous transgressions, up to and including involuntary sterilization and genocide.

Although the idea of selective breeding dates back to antiquity, the first detailed exposition of eugenics founded in genetic and evolutionary science was produced by Sir Francis Galton in *Hereditary Genius* (1869). Two main strategies of eugenics are possible: increasing the gene contributions of those who have desirable traits (positive eugenics) and decreasing the gene contributions of those who have undesired traits (negative eugenics). Genetic testing must first determine what traits people have and to what extent each trait is heritable. Supporters of eugenics claim that intelligence is genetically determined, but most data concerning this claim are suspect, and the true heritability of intelligence is still hotly debated.

Positive eugenics encourages people with desirable traits to produce more numerous offspring. Encouragement may take the form of monetary rewards, paying the educational expenses for children, and so forth. Sperm of desirable men could be collected and stored for the future artificial insemination of selected women, but this suggestion has rarely been followed because of the expense of the procedure.

Negative eugenics applications may mean that individuals carrying undesired traits might be killed or sterilized. Advocates of eugenics say that this cruelty is for the greater good of humanity, but opponents strongly object. Beyond this issue, other ethical questions arise: Which traits are desired? Who will make the decisions? Since many traits vary by race, negative eugenics raises questions of racism and brings humanity close to the dangers of genocide. (The only nationwide eugenics laws in history were used in Nazi Germany to exterminate Jews and other non-“Aryans.”) Geneticists have also determined that negative eugenics is very limited in its ability to change gene frequencies. Most genetic defects are rare, and selection against rare traits is very ineffective. Selection is especially ineffective if a trait is influenced by environment or education, as intelligence scores are. Also, if negative eugenics could succeed, it would reduce the genetic variability of the population, and variability may itself be desirable, especially if future environments change.

Euthanasia

DEFINITION: Active or passive encouragement of the death of a person to prevent further suffering

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Euthanasia continues to be an extremely controversial issue, since it engages one of the most fundamental moral questions: Under what circumstances, if any, is it ethical to cause the death of another person?

The term “euthanasia” is derived from the Greek phrase that means a pleasant or easy death. Relieving suffering was part of the Hippocratic oath, dating from the fourth century B.C.E., when Greek physicians were sworn to preserve life and never willingly to take it. This sanctity-of-life principle was not, however, honored always and in all places. The Greeks and Romans, for example, ruled that slaves and “barbarians” had no right to life. In Sparta, the law required the death of deformed infants. The philosophers Plato and Aristotle regarded infanticide and abortion as acceptable, and Plato himself was a victim of compulsory suicide.

Before and during World War II, Nazi Germany practiced euthanasia on those viewed as socially unproductive: Jews, older people, the deformed, the chronically ill. Memories of these compulsory deaths have caused many people to resist the idea and practice of euthanasia, even by what would be considered humane methods. In 1969, however, Great Britain's House of Lords passed a voluntary euthanasia law; earlier bills had been defeated in 1938 and 1950. The main purpose of the British law was to authorize physicians to give euthanasia to a patient thought to be suffering from an incurable physical condition and who has made a declaration requesting euthanasia. A clause provides that a declaration may be revoked at any time. Passive euthanasia had been generally accepted, but Parliament by this act legalized active euthanasia.

Euthanasia is divided into two types: active and passive. Active euthanasia is direct intervention to bring about the death of one suffering from a terminal illness, while passive euthanasia is letting nature take its course. The intent to bring about death requires ethical analysis to find a moral consensus, since the rights of an individual and those of society come into play.

CHRISTIANITY AND EUTHANASIA

Throughout the twentieth century, Western churches—the Roman Catholic Church in particular—took strong stands against both types of euthanasia. During the medieval era, Saint Augustine of Hippo and Saint Thomas Aquinas affirmed that only God is the arbiter of life and death. They taught that pain and suffering have purpose in God's sight. In 1940, the Catholic Church officially condemned the administration of euthanasia for any reason as contrary to natural and divine law. In late 1957, however, Pope Pius XII, speaking to an International Congress of Anaesthesiologists, stated that “morally one is held to use only ordinary means” to sustain life and that in cases of terminal illness, there is no obligation to continue lifesaving measures. Differences exist, however, regarding what constitutes ordinary versus extraordinary means and who should decide when death is preferable to treatment.

Ordinary means of treating a sick or dying person are means that are in common use, while extraordinary means involve nonstandard treatment, the new and the rare. Scientific and technological advances have transformed the extraordinary into the ordinary. This development complicates the issue, since such factors as scarce funds and facilities also come into play, introducing another ethical problem: the acceptability of utilitarianism.

The sanctity-of-life principle holds that it is absolutely prohibited either intentionally to kill a patient or intentionally to let a patient die and to base decisions for the prolongation or shortening of human life on considerations of the quality of that life. Under no circumstances is there a “right to die.” This is true irrespective of the competency or noncompetency of a person to decide for himself or herself whether to choose euthanasia.

Patients, doctors, and the patients' families are generally the decision makers in cases of possible euthanasia, whether active or passive. By 2004, virtually all states accepted living wills whereby competent adults give directions for the health care they want if they become terminally ill and cannot direct their own care. Those who believe in the sanctity of life fear that these living wills are a wedge that will allow nonvoluntary euthanasia to become acceptable.

While staunchly opposed to euthanasia, some churches and courts accept the “double-effect” prin-

ciple. This principle holds that an action whose primary effect is to relieve suffering may be ethically justified, although a secondary effect may be death. Physicians, they argue, have a duty to relieve pain as well as to preserve life—although doing so may shorten the person's life.

THE QUALITY-OF-LIFE ETHIC

Much debate centers on the quality-of-life ethic. Some argue that if there is little hope that a given treatment prolonging a person's life will allow that person to live a beneficial, satisfactory life, then euthanasia is justified. In such cases, the sanctity-of-life principle is set against the quality-of-life approach. How can a proper quality of life be guaranteed to all citizens and an equitable distribution of medical care be ensured? Using utilitarianism as a guideline, providing high-quality life for a majority takes priority over prolonging the lives of a few. Cost-effectiveness becomes a major factor in the decision to choose or not to choose euthanasia. This is unacceptable to many persons, since it places an economic value on people.

The counterargument is made that while every person is equal to all others, not every life is of equal value. The case of Karen Ann Quinlan is cited as an example of the quality-of-life and sanctity-of-life dilemma. The victim of an accident, Quinlan went into a coma in 1975 and was kept on a respirator for several years. After repeated requests from her guardian, a court decision allowed discontinuance of the respirator. Quinlan's life was not benefiting her and was burdening her parents unduly. The quality-of-life judgment prevailed in that case.

In 1990, the U.S. Supreme Court ruled that patients have a constitutional right to discontinue unwanted life-sustaining medical treatment. In 1992, the Netherlands's parliament approved liberal rules on euthanasia and doctor-assisted suicide. The guidelines require, however, that the patient must be mentally competent, be suffering unbearable pain, and request euthanasia repeatedly; and the doctor must consult a second physician before proceeding.

The right to die with dignity, free of terminal agony, is a concept that enjoys strong public support. Most of this support, however, is for passive euthanasia; support for active euthanasia is more moderate. The notion of a right to die is still very controversial, making moral standards of judgment ever more im-

perative. Whether supporting the sanctity-of-life doctrine or the quality-of-life argument, there is general agreement among those most engaged with this issue that not every patient's life ought to be prolonged. The moral debate is over how this life should be ended. Individuals, families, courts, and ethics committees struggle over euthanasia, striving for justice for both patient and society.

Evers, Medgar

IDENTIFICATION: Martyred American civil rights activist

BORN: July 2, 1925, Decatur, Mississippi

DIED: June 12, 1963, Jackson, Mississippi

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: The National Association for the Advancement of Colored People's (NAACP) first

Medgar Evers during a television interview in 1962. (Library of Congress)

field secretary in Mississippi, Evers was an important civil rights activist and organizer. His assassination received widespread news coverage and was a source of national outrage that helped to galvanize the Civil Rights movement.

After growing up and attending segregated high schools in Decatur and Newton, Mississippi, Evers served in the army, seeing action in the European theater of World War II. Afterward, he attended the all-black Alcorn Agricultural and Mechanical College, graduating in 1950. He became an insurance salesman but devoted much spare time to his work for the NAACP. Trying to organize local affiliates for the NAACP, he visited most areas of the state and began building a wide-ranging base of support. By 1954, he had moved to Jackson to become field secretary for the entire state.

In relocating to Jackson, Evers had moved to a city that had rigid segregation. To bring change, in 1963 Evers organized a massive nonviolent protest movement. Day in, day out, Evers challenged segregation and discrimination by personally leading the protests. The protests and Evers’s life were cut short when, on June 12, 1963, Evers was assassinated by Byron de La Beckwith. De La Beckwith was tried twice for the crime in 1964, but both trials resulted in hung juries. He was finally retried and convicted in 1994 and spent over six years in prison before dying of heart problems on January 21, 2001.

In the twelve weeks after Evers’s death, 758 racial demonstrations occurred in the United States. Such pressures convinced President John F. Kennedy to send a civil rights bill to Congress, a bill that eventually became the Civil Rights Act of 1964, a law that gave minorities more justice than they had ever had before.

“Everyone does it”

DEFINITION: Rationalization invoked to excuse, justify, or otherwise neutralize the moral bind of law, freeing one to commit acts deemed morally, legally, and socially undesirable

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Originally thought to explain delinquency among delinquent youth, the idea that “everyone does it” has been shown to explain why white-collar offenders commit crime and simultaneously maintain their sense of being upright citizens.

In his 1994 book *“Everybody Does It!”*, criminologist Thomas Gabor describes how people justify their involvement in dishonest, unethical, or immoral behavior, using phrases that “normalize” their actions to themselves and others. Phrases such as “everyone’s doing it” were first identified by sociologists

David Matza and Gresham Sykes during the late 1950’s as techniques of “neutralization” for questionable behavior.

Neutralizations are words and phrases that negate the moral and ethical binds of law. Those who use them draw on the explicit exceptions to law such as “I was not myself at the time” or “I was acting in self-defense.” Embezzlers commonly describe their stealing as “borrowing.” Dishonest employees typically blame their excessive expense-account claims, time thefts, or thefts of company property on their companies or unscrupulous supervisors, claiming that their companies have treated them badly, their bosses have cheated them out of vacation days, or their managers have prevented them from receiving deserved raises or promotions.

LANGUAGE OF NEUTRALIZATION

Similarly, corporations themselves use neutralizing words and phrases to explain that their fraudulent actions are necessary for them to remain competitive. Government agencies may explain their abuses of power as necessary to “protect the public.” The use of such phrases is self-serving, in that they reduce the sense of moral culpability of wrongdoers, while also freeing them to commit further offenses, especially if they sense that their excuses will be accepted by judging audiences.

Neutralizations may be excuses that people use to acknowledge committing misdeeds, while denying responsibility for them; an example is “I was ordered to do it.” Alternatively, neutralizations may be justifications offered to accept responsibility for misdeeds or to assert the rightfulness of the actions, such as “no one got hurt.”

Most people use such “claims to normality” in varying degrees to excuse or justify their deviant behavior; some to negate serious deviant, and even criminal, behavior. As a claim of normality, saying that “everyone does it” promotes the commonality of the action over any principle of ethics or law.

A crucial issue of neutralizations is their timing. When they occur after the acts, neutralizations are seen merely as rationalizations seeking to minimize the culpability or consequences for questionable behavior. When they occur prior to the acts, they can motivate misbehavior by freeing potential wrongdoers from the moral and ethical bind of law.

Criminologists argue that to counteract the effect

Examples of Neutralizing Accounts

Claim of normality	“Everyone cheats on their taxes.”
Denial of responsibility	“It’s not <i>my</i> fault.”
Denial of injury	“No one got hurt.”
Denial of victim	“They had it coming!”
Condemning the condemners	“The police are corrupt.” “Judges are biased.” “Our priests are immoral.”
Appeal to higher loyalties	“I did it for the good of my family.”
Metaphor of the ledger	“If you weigh all the good things I’ve done against all the bad things, I must come out on the good side.”

of neutralization that undermines morality and ethics, it is necessary continuously to point out the harm caused by the misdeeds—through the media, meetings, and interpersonal relations. It is also important to be clear that words and phrases used to neutralize are nothing less than self-deception, designed at best to minimize the consequences for the offenders, and at worst, to justify doing harm to others because of harm others have done in the past. An example of the latter would be to justify any action that undermines corporate power because of the damage corporations have done to the environment in the past.

Evil

DEFINITION: Morally reprehensible behavior or force

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The existence of evil poses a problem for any religious system that posits a benevolent, omnipotent deity or for any secular system that represents human history as fundamentally meaningful. Indeed, many such systems seem to have been created precisely in order to explain or to mitigate evil’s presence in the world.

The contradiction within the problem cited above can be solved logically only by denying any one of the three propositions. One must hold that God is not all powerful or that God is not all good. Alternately, theists such as Saint Augustine denied that evil exists; instead, there is only privation caused by

humankind’s distance from God. Modern Christian Scientists and Stoics generally follow the thought of Augustine. Some philosophers, however, such as William James, tried to solve the contradiction by denying the omnipotence of God, arguing instead that God had much, but limited, power.

All monotheistic religions that stress the omnipotence and goodness of God develop a system of ethics that defines what is right, what is wrong, what is good, and what is bad. The presence of evil in the world, however, threatened to destroy belief in God and thereby destroy absolute ethical values. In God’s defense, theodicy developed. Theodicy, in its classical form, is the philosophical and/or theological attempt to justify the righteousness of God.

The Greek philosopher Epicurus (341-270 B.C.E.) was apparently the first to articulate the dilemma that the “question of evil” raises. The ancient Hebrews also grappled with the problem, as did early Christian theorists such as Saint Irenaeus, Saint Augustine, and Saint Thomas Aquinas. In the modern era, scholars who have examined the problem include Immanuel Kant, David Hume, John Stuart Mill, and Albert Camus.

DEFINITIONS

Several kinds of evil exist. The first is moral “radical” evil that occurs when an intelligent person knowingly and willingly inflicts suffering upon and harms another being, human or animal. The second type is natural evil, which is self-explanatory and which includes all manner of natural calamities such as earthquakes, tornadoes, tidal waves, cancer, heart disease, and so forth. The third is metaphysical evil, an abstract concept that “wonders” why a perfect, all-powerful God did not create a perfect universe.

Within the definitions above, the magnitude of evil varies. Some evil is personal, as is the case when an individual beats, robs, or murders another person. Evil can be “transpersonal,” as is the case when one group (German Nazis, for example) tries to murder millions of other people. Evil can be “transgeneric”; that is, if imperfect beings exist on other planets, evil goes beyond humanity as we know it. Finally, evil can be cosmic, as is the case when nuclear powers threaten to blow up the world or when greed-driven corporations foul the world’s environment beyond repair.

Genocide, terrorism, threats of nuclear war, individual callousness, and cruelty—all are evil. In a Texas town during the early 1990’s, eight adults were charged with multiple counts of sexual assault on children who were related to the perpetrators—this is radical evil. In another state, four teenagers were found guilty of the murder of a twelve-year-old girl who was beaten, whipped, sodomized with a tire iron, raped, and—finally—doused with gasoline and burned alive; this is radical evil. Such evils, multiplied thousands of times are, according to nonbelievers, what the “silent” God must explain.

THE PROBLEM’S COMPLEXITY

Within the framework of monotheism, the existence of evil suggests that God does not exist. If God does exist amid flourishing evil, then He is either not all-powerful or is not all good. To paraphrase philosopher David Hume: Is God willing but not able to stop evil? Then he is impotent. Can he stop evil but is not willing to do so? Then he is not all good, and is probably malevolent. If he is willing and able, how does evil survive?

Looking at the problem another way, one might formulate the following set of ideas: Individuals are aware of the world around them; they see the world’s

evil, which causes death and suffering; they then have *prima facie* evidence that either there is no God or God is not all-benevolent; if God is not all-benevolent, if he allows innocents to suffer, he is capricious and cannot be trusted. Some critics say that it would be better to have no God than to have one who is capricious enough to allow evil.

Philosophically and theologically, the problem can be solved only through “belief” in the unknown, only with some rapid mental “footwork,” with a mental “leap” of logic. For example, various scholars, including Saint Augustine, the historic defender of the faith, advance the “free will” concept, which blames humankind for most evils, beginning with the original “sin” of Adam and Eve (either literally or symbolically). Critics reply, however, that a good God would have made the pair incapable of sin, would have given them such basic values that they would always choose not to do wrong.

One nineteenth century German critic, Friedrich Schleiermacher, argued that God, being perfectly good, could only have created a perfectly good Adam and Eve. They would have been free to sin, but they would never have to do so. To cite them as the authors of a willful evil crime is to assert a major contradiction—it is, in effect, to assert that evil has created itself *ex nihilo* (out of nothing).

OTHER ASPECTS OF THE DEBATE

Another rationalization hinges on the process of “soul-making,” which incorporates ideas that imperfect humans who created evil must, with God’s help, evolve into better beings and that evil and suffering are a part of the evolutionary process. Critics charge, again, that a perfect God could have created better beings in the first place. Furthermore, they point out that part of the “soul-making” has to do with developing virtues, but why should this be necessary if everything is perfect in Heaven?

Another aspect of the debate is the Augustinian and Calvinist doctrine of predestination. Indeed, predestination sets up another dilemma. If God wants to “save” all humans but cannot do so, he has limited power. If, on the other hand, he chooses to “save” some and eternally damn all others to eons of torture, then he is not perfectly good and, indeed, has a streak of sadism. Sadism is a form of evil. Therefore, is God himself evil?

The concept of “hell” also raises problems. Hell

as laypeople understand it is a place of torment to which “bad” people go to be punished forever through eternity. How could a good God create such a place or allow it to exist? Why would a good God create such a place or allow it to exist? Is God, then, not good? Is he again playing the role of a sadist who enjoys watching people suffer? Many fundamentalist televangelists would gleefully tell one so.

Associated with Hell is Satan, or the “Devil,” a supposed fallen angel that, many Christians, Jews, and Muslims believe, causes moral and natural evil. The concept of Satan probably had its origins in “extreme” religious dualism, one way that some people tried to rationalize about the existence of evil in a good world. One such dualistic religion was founded by Zarathustra (Zoroaster) about 1200 B.C.E. Zoroastrianism (or Mazdaism) taught that God—called Ohrmazd—was perfectly good but not all-powerful. Ohrmazd had a powerful antagonist, Ahriman, the personification of evil, destruction, and death.

Zoroastrianism also had its Adam and Eve, whose names were Mashye and Mashyane. Ahriman tempted them with lies, and they believed him—thus committing their first “sin.” Then they offered an ox as a sacrifice—their second “sin.” Zoroastrianism has various concepts in common with Christianity; for example, the fighting between God and the Devil (Ahriman) generally follows the Christian pattern.

Another example of dualism—a good being fighting a bad being, with the two having almost equal power—is found in Manichaeism, a movement that was contemporary with early Christianity; indeed, Manichaeism attracted Saint Augustine for a time.

Other philosophers turn to natural evils and explain them on the basis of the natural scientific laws of the universe. God, they argue, will never change those laws, because humankind needs their stability; without them, each new day would bring chaos to the natural world. Detractors again point out that an all-powerful God could intervene when necessary to modify natural laws (in the interest of saving human lives, for example).

ZOROASTRIANISM

As if they have taken a “lesson” from Zoroastrianism and Manichaeism, some lay Christians have “promoted” Satan to the post of junior god; they believe that this world is ruled by Satan and has been

since he was cast down from Heaven. True, demonology does not have the following that it did in the medieval era, but even so, many laypersons, especially fundamentalist Protestants, still believe that the Devil exists and has power over this world. Even if the Devil is directly responsible for evil, a philosophical problem still exists, because God is responsible for everything in the universe, including Satan. If Satan is responsible for evil, why does a perfectly good all-powerful God allow “him” to exist?

Just as some modern theists and believers deny that real radical evil exists, many also deny that Satan exists. Again, such a view is problematic; it contradicts what is found in the Bible. Specifically, belief in the Devil permeates the New Testament. The Gospels show that Jesus knew that Satan and demons really existed, because he was forever speaking of them and trying to cast them out of people. It appears that, dogma aside, Christianity has developed a type of dualism within monotheism. The dualism is represented by the struggle between the good God and the Devil; hence, evil results.

Some philosophers, such as Friedrich Nietzsche, did not grapple with the above questions, but instead rejected God on other grounds. Nietzsche argued that the very definitions of the words “good” and “evil” had become corrupted. Christian good led to meekness, humility, and cowardliness. Conversely, Christians labeled as evil such traits as creativity, passion, self-assertion, and the willingness to fight for ideals. Nietzsche then proclaimed that “God is dead” and said that people should go beyond “good and evil”; Nietzsche stressed moral pluralism rather than moral absolutism. Christianity had only mired people in guilt and made them escapists who would settle for rewards in Heaven because, surely, they would get no rewards in this world. Nietzsche argued that the strong, with a “will to power,” were the right people to lead a civilization; they could lead without guilt or regret.

Twentieth century horrors such as the death and destruction of two world wars—the last of which witnessed the killing of approximately six million Jews and at least that many Slavs—convinced many intellectuals that God did not exist, since he would have stopped such evil. The optimistic progressivism that characterized philosophical theism before 1914 gave way when mass destruction and death forced many thinkers to confront evil directly.

After living to see such evil, the existentialist Jean-Paul Sartre stressed the apparent powerlessness of God and went on to present a unique criticism. Sartre held that of the many people who try to believe in one God, a good number suffer overwhelming anxiety and puzzlement; they try to believe but are torn by doubt. After referring to the anxiety, the puzzlement, and the doubt, Sartre added simply that an all-powerful and all-good God would never allow his “children” to have such negative and perhaps destructive thoughts and feelings. Sartre’s contemporary and countryman Albert Camus developed the concept of the absurd—that is, the nonexistence of God, the meaningless of human life, and the existence of evil all around. Camus believed that the appropriate response was to face the meaninglessness, to create personal meaning by making a commitment to something larger than oneself, and to work to make life as meaningful as possible.

THEODICY

Other writers have attacked theodicy in more specific ways. For example, some scholars have studied the testimony given at the Nuremberg Trials after World War II. One particularly unsettling type of murder at Auschwitz was committed by Nazi guards who isolated children who were too young or too sick to work. Those children would then be thrown directly into crematorium furnaces or into blazing pits. Some witnesses noted that the children were thrown in while still alive and that their screams could be heard all over the camp. No witnesses knew just how many children were viciously murdered in this way.

After he had studied the appropriate trial transcripts and had learned of the burning children, Irving Greenberg attacked theists with a vengeance. In making their defense of theodicy, Greenberg demanded that they should propose no argument, theological or otherwise, that would not be credible in the presence of the burning children. Greenberg submitted that no attempted justification of God was possible, that anyone who attempted it—with the burning children in mind—was guilty of something even worse than blasphemy.

Elie Wiesel, a victim who managed to stay alive in a Nazi death camp, added his own testimony about the problem of evil. He saw babies burned alive, yet the death by hanging of a small fifteen-year-old boy seemed to trouble him the most—perhaps because

the boy was so slight that the hanging did not immediately kill him. Instead, hanging by the rope, the boy struggled in the air, and twisted and turned; he suffered for at least an hour before he died. Just then, someone asked Wiesel “Where is God now?” Wiesel pointed at the boy on the gallows and spit out the word: “There!”

Animal pain is another aspect of evil. In the animal “kingdom,” one species preys on and devours another. Still-conscious animals are literally eaten alive by their predators. Painful accidents and diseases are also common. Indeed, nature is “red in tooth and claw.” How can nature’s struggle of survival be reconciled with an omnipotent and perfectly good Creator? Scholarly attempts to answer such a question fall short of the mark. Some argue that animals live totally in the present and lack the human abilities of memory and anticipation that give rise to suffering; even though an animal’s life may be violently terminated, the animal’s life is most likely active and pleasurable up to the point of death. Such arguments about animal suffering are morally bankrupt, and such rationalizations may well be part of the evil world that no one can adequately explain.

Another answer to nature’s brutal ways was advanced by such philosophers as C. S. Lewis, who, in *The Problem of Pain*, argued that Satan’s pre-mundane fall has had cosmic consequences, one of which was the perversion of the entire evolutionary process to create a savage world. Again, however, such statements can be criticized because the all-powerful God allows Satan to exist.

Evolutionary theory

DEFINITION: Theory that living species change over time due to a process of natural selection of genetic traits by the environment

DATE: Articulated by Charles Darwin in 1859

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Darwin's theory of evolution challenged the authority of revealed religion, strengthened biologically deterministic arguments, and encouraged an ethical outlook based on processes at work in the natural world.

In his seminal work *On the Origin of Species* (1859), Charles Darwin advanced a convincing explanation for the changes that occurred in life-forms throughout geological time. His conclusions, based partly on insights gleaned from prevailing economic theory and new geological discoveries and largely on his own extensive investigations, contradicted the biblical view of creation. It also challenged the previously dominant eighteenth century Deistic view of a benign, carefully designed cosmos. In place of a master watchmaker harmonizing creation, Darwin posited a violent, indifferent natural order in which advances occurred as the more fit vanquished the less fit. In the

Darwinian universe, values were placed at the service of natural selection.

HISTORY

The idea of evolution gradually gained momentum throughout the eighteenth and nineteenth centuries. This was largely the result of significant advances in several specific areas: classification, which placed living beings in logical relationships with one another; comparative anatomy and embryology, which allowed comparisons between simpler and more complicated organisms; and paleontology,

which increasingly revealed a progressive fossil record. Pre-Darwinian evolutionary theories, however, were overspeculative, lacked sufficient evidence, and had weak theoretical underpinnings. Darwin's work profited from Sir George Lyell's geological analyses, which greatly extended the known age of the earth, and the economic writings of David Ricardo and Thomas Malthus, which introduced the allied concepts of population pressure on scarce resources and the struggle for existence. Darwin's theory of evolution through natural selection intertwined a massive volume of evidence with those leading ideas. The re-

Charles Darwin and the *Beagle*

In 1831, a twenty-two-year-old Charles Darwin, who had been studying for the ministry at Cambridge, by luck was offered a position as naturalist on the ship HMS *Beagle*, which was about to embark on a round-the-world voyage of exploration. His domineering father was against the trip at first, but he finally relented. The expedition would turn the young man into a scientist. Over the next five years, Darwin recorded hundreds of details about plants and animals and began to notice some consistent patterns. His work led him to develop new ideas about what causes variations in different plant and animal species:

[The] preservation of favourable individual differences and variations, and the destruction of those which are injurious, I have called Natural Selection, or the Survival of the Fittest. . . slight modifications, which in any way favoured the individuals of any species, by better adapting them to their altered conditions, would tend to be preserved. . .

—*On the Origin of Species by Means of Natural Selection*, 1859

Until Darwin and such colleagues as Alfred Russel Wallace, the “fixity” or unchangingness of species had been

accepted as fact, and the appearance over time of new species remained a mystery. Darwin's lucky trip laid the foundation for today's understanding of life and its diversity.

sult was a methodologically convincing tour de force; criticism of Darwinian evolutionism was generally based on its religious and ethical implications rather than on any pronounced scientific deficiencies.

ETHICAL IMPLICATIONS

The theory of evolution advanced the view of an amoral universe in which change occurred blindly and was perpetuated through impersonal mechanistic processes. Random mutations made a given organism more or less able to cope with its environment and more or less able to propagate itself. Its relative success in the struggle for existence defined its value. In the intense interspecies and intraspecies competition for scarce resources, the rule was survival of the fittest. Individuals and species were naturally selected; that is, harsh environmental factors determined survivability. Favorable changes accumulating through time produced more fit, and therefore more highly evolved, individuals and species. Darwin did not always present the selection process as a direct function of an unforgiving environment, since he discussed the possible impact of variables such as accidents and sexual selection.

In a later work, *The Descent of Man* (1871), Darwin also praised the value of cooperation, altruism, and self-sacrifice. Even then, however, perpetual strife remained the motor of evolutionary change. Sexual selection was competitive, accidents were chance outcomes issuing from a violent context, and the value of traits such as cooperation and altruism lay in their contribution to the survival of one group that was engaged in competition with others. Darwin's dour deterministic theory impartially challenged beliefs in a benign universe, a personal savior, the biblical view of special creation, and ethical systems derived from revealed religion.

SOCIAL DARWINISM

Darwin noted that humans were less subject to evolutionary pressure than lower organisms were because societies modified their environments. Social theorists such as Herbert Spencer, Benjamin Kidd, and Lewis H. Morgan, however, were less exacting; known as Social Darwinists, they applied Darwin's ideas to human behavior in a wholesale fashion. Adopting concepts such as variation and natural selection, they placed social and cultural differences in an evolutionary context and justified existing power

relationships as examples of survival of the fittest. During the late nineteenth century and early twentieth century, Social Darwinists promoted unrestricted competition, laissez-faire economics, and neocolonialism in the belief that survival of the fittest invariably produced advances in civilization. The movement declined as it became apparent that human societies could not easily be classified as more or less primitive, that evolutionary change did not automatically mean progress, and that the notion of survival of the fittest provided cover for the unequal treatment of individuals and groups.

NATURE VS. NURTURE

The theory of evolution perpetuated, in secularized form, traditional disputes regarding free will and predestination. That issue was exacerbated in the second half of the twentieth century by two important developments: breakthroughs in genetics that further underscored the characteristic biological determinism of Darwinism, and advances in the study of animal behavior (ethology), which had immediate sociological implications. The activities of ethologists such as Nikolaas Tinbergen, Konrad Lorenz, and E. O. Wilson were particularly significant because they related human behavior to the wider context of ethology. By rigorously examining evolutionary antecedents, parallels, and alternatives to human behavior, they reopened the nature/nurture controversy in the sharpest possible way. In one way or another, their investigations touched upon numerous ethical issues. Was aggression learned or biologically dictated? What was the evolutionary value of aggression? Were gender roles social constructs or did they reflect natural, necessary biological relationships? By placing such issues into an evolutionary context, they revisited an investigative path followed cautiously by Darwin and much less carefully by the Social Darwinists—that is, the attempt to align human behavior with the physical laws of nature.

Excellence

DEFINITION: Superiority at performing a given practice or function

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: While innate excellence is of no particular moral significance, excellence as an ideal toward which one strives is an important value for many ethical systems.

Although “excellence” is prominently associated with the ethical thought of Plato and Aristotle, the concept dates back at least as far as Homeric Greece (eighth century B.C.E.), when it designated not strictly the virtues of personal character but the uniquely Greek *aretê*, the skillful performance of any function, be it running, fighting, or even thinking. It applied also to certain masculine and feminine virtues necessary for the protection of countrymen and family.

The masculine and feminine excellences may be viewed as “competitive” and “cooperative” excellences, respectively, denoting the proper fulfillment by men and women of the obligations entailed by their social and cultural roles. The competitive excellences of men were indispensable to the defense of

countrymen, family, guests, and friends. To be virtuous, a man had to be well-armed, strong, swift on his feet, and skilled in the strategy and techniques of warfare, qualities that explain why courage was a centrally important virtue in Homeric Greece. He also had to possess wealth, which implied high social status. A man in whom all these conditions were met was the epitome of Homeric excellence. Women, who had no need for the competitive excellences and were not permitted to demonstrate them, were designated as excellent by virtue of the cooperative or “quiet” excellences—beauty, skillful weaving, house-keeping, chastity, and fidelity, the latter being the central feminine virtue. Hence, whereas men protected society and family by acquiring largely military virtues, women offered protection of a different sort to home and family by cultivating the domestic virtues.

Homeric excellence was modified by fifth-century Athenians to include additional virtues. *Sôphrosynê*, self-control, had greater importance as a virtue for both men and women, indicating that men were judged in the fifth century according to a “quiet” virtue that had once been considered a criterion of feminine excellence. In addition, social status was less a determinant of excellence than it had been during the Homeric period. This evolution of the understanding of “*aretê*” culminated in the sense that the term ultimately acquired in the moral theory of Plato and Aristotle, although it was Aristotle who, in his *Nicomachean Ethics*, conferred upon this concept its most prominent philosophical status.

CLASSICAL VIEWS

In the classical view epitomized by the thinkers of fifth and fourth century B.C.E. Athens, excellence was determined by one’s generic role as a human being in addition to one’s particular societal role. There were now as many excellences as there were functions for an individual to perform. One could be an excellent father, physician, and citizen, and therefore an excellent human being. The latter excellence, however, denoting the quality of intellect as well as character, both encompassed and eclipsed in importance the virtues derived from more specialized (and therefore secondary) roles. The cooperative virtues played a more prominent role in classical excellence. In addition to the competitive Homeric virtue of courage, there were the virtues of friendship, self-control, wis-

dom, and justice, all contributing to the civic virtue of citizenship, without which one could not be good. There was general agreement that these virtues were proper to humanity even while there was disagreement about their definition, as in Plato's *Republic*, in which the point of contention was the nature of justice.

The Republic was the culmination of Plato's earlier dialogues in which the nature of virtue was a common theme. Plato depicted virtue as highly personalized, attainable by the individual who controlled his passions and made constructive use of his ambition through the exercise of disciplined intelligence. Platonic excellence, therefore, consisted of the harmonious interaction of the virtues of self-control, courage, and wisdom, which together constituted the civic virtue of justice. It was achieved only by the most intellectually gifted—Plato's "philosopher-kings"—who, after an educational process marked by rigorous intellectual discipline, were endowed with intuitive insight into genuine moral goodness. In a larger context, the excellence of the state was an extension of this personal excellence, constituted by the wise, disciplined governance by the philosopher-kings of their fellow citizens, whose natural capabilities relegated them to the more mundane activities of society.

ARISTOTLE

Whereas for Plato true excellence was confined to the philosopher-kings, Aristotle believed that excellence was achievable in various degrees by anyone with sufficient experience and rational judgment. While Aristotelian excellence was to some extent compatible with the common wisdom of ordinary men, it was, however, refined and most prominently exemplified in the intellectually accomplished. This reflected Aristotle's division of excellence into intellectual and moral excellence, intellectual excellence being attained through education, and moral excellence through virtuous habits. Genuine human excellence, therefore, consisted of being intelligent enough to judge correctly how to do the right thing at the right time in the right place and in the right manner, and to do so consistently and deliberately, thus fulfilling the proper function of a human being.

Although for Aristotle excellence was essentially a "mean"—a point of equilibrium between extremes—it was, paradoxically, an extreme as well:

It was the mean, or perfect moderation, between two vices, while also the extreme, or highest degree of what is right and good, with respect to feeling and action. Successfully ascertaining the mean and avoiding extremes of feeling and action required the keenest exercise of the powers of rational judgment. For Aristotle, as for Plato, excellence was highly personalized but also inextricably linked to citizenship; the exercise of personal virtue could not be comprehended apart from the political context.

The idea of excellence as virtue is found in the ethical theory of modern thinkers. Alasdair MacIntyre, in *After Virtue: A Study in Moral Theory*, retains the understanding of excellence as virtue in essentially its original Aristotelian form. John Rawls, in *A Theory of Justice* (1971), regards the "excellences" as natural talents and assets such as wit and beauty, as well as personal virtues such as courage and self-control. For both thinkers, excellence as the rational exercise of the virtues acquires significance only within a social and political context.

Executive Order 10988

IDENTIFICATION: Federal executive order that gave federal employees the right to collective bargaining

DATE: Signed on January 17, 1962

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Executive Order 10988 made the labor policies of federal offices and agencies consistent throughout the country and influenced the labor policies of state and local agencies.

Before the 1960's, federal agencies dealt with organized labor unions individually; some agencies recognized unions, and some refused to negotiate with them. The administration of President John F. Kennedy took a more favorable attitude toward unions. On January 17, 1962, Kennedy signed Federal Executive Order (EO) 10988, giving federal employees the right to form unions and to bargain collectively through them. Under the terms of the order, employees had the right to form a union but could not be forced to join one. Federal agencies were required to bargain with properly elected unions. These unions were forbidden to strike.

Once the order was signed, there was a tremendous increase in the number of federal employees represented by unions, especially among white-collar workers. Some groups, including postal workers, are represented by unions for all of their contract negotiations. The rights of federal employees were amended several times during the late 1960's and the 1970's. In 1978, the Civil Service Reform Act became the first unified code of federal sector labor relations, formalizing the bargaining rights first endorsed by the executive order.

Existentialism

DEFINITION: School of philosophy that emphasizes individual subjectivity, freedom and responsibility, and the irrational as primary features of the human condition

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: On one hand, existentialism denies that the individual is beholden to or constrained by any traditional system of morality. On the other hand, it asserts that the individual is morally obligated not merely to create and abide by his or her own moral values, but to create and abide by a worldview which will make sense of an otherwise meaningless cosmos.

The history of systematic ethics started with the ancient Greek philosopher Socrates' question "Is the unexamined life worth living?" Socrates, like most Western philosophers since, believed that the intellect was the key to answering this question. Moreover, prior to existentialism, most ethicists had assumed that humankind's essential nature was rational. Consistent with these views, Western ethical tradition has generally assumed that the rational individual pursuing the rational life is the essence of "the good life."

In contrast, existentialism—a broad movement in philosophy and literature—boldly challenges these basic assumptions of the Western tradition. Existential ethics refuses to understand the good as a norm or a law. Existentialists contend that Western thought has been obsessed by the idea of regulating the life of the world by reason. Hence, unlike previous ethics, existentialism emphasizes the tragic and absurd facets of life rather than the empirical and rational facets.

THE TERM "EXISTENTIALISM"

It is impossible to discuss an existential theory of ethics without briefly considering the existential movement as such. The term "existentialism" may be properly used in at least two senses. The first is a narrow one referring to a movement in philosophy and literature that emerged in the nineteenth and twentieth centuries. The second and broader sense refers to a much earlier trend in Western thought dating back to the Old Testament book of Ecclesiastes (300 B.C.E.) and including such diverse works as *The Confessions* (c. 400) of Saint Augustine, the *Pensées*

(1670) of Blaise Pascal, and the works of William Shakespeare and Fyodor Dostoevski.

In the broader sense, the existential movement is seen in the tendency of some Western religious and literary writers to dwell upon the sense of paradox and tragedy in the human condition. Even within the narrow sense of the term, however, there is little substantive agreement among existentialists on specific ethical precepts; thus, easy generalizations about existential ethics cannot be drawn.

A partial list of existentialists will help readers appreciate the diversity of ideas and viewpoints that constitute this "school." Søren Kierkegaard, an early nineteenth century Danish existentialist, was a fanatical Christian. Friedrich Nietzsche, another nineteenth century existentialist, was a militant atheist. In twentieth century existentialism, there is an equal degree of heterogeneity. Martin Heidegger was a Nazi, Martin Buber a Jew, Albert Camus a humanist, Jean-Paul Sartre a communist, and Gabriel Marcel a Roman Catholic. The list could go on with further diversifications. It is sufficient to note, however, that there is no common denominator of substantive agreement within the existential movement. Existentialism does not predefine any substantive moral program. Many philosophers have described existentialism as more of a "mood" or "attitude" than a doctrine of thought.

SOME COMMON EXISTENTIAL THEMES

In spite of all this diversity, there do appear to be several elements upon which most existentialists agree. For example, existentialists generally regard freedom, responsibility, suffering, and commitment as the highest of human values. They tend to have a pessimistic or despairing view of the human condition. The religious existentialists, however, balance this with a great hope. Although existentialists generally reject such a thing as human nature, they agree that it is meaningful to speak of the human condition. The existential approach to ethics emphasizes the freedom and responsibility of the existing individual as the wellspring of all ethical considerations. Several other common themes appear to run through most, if not all, existentialist ethics: People are free to choose how they will live and no system can guide them, and the highest good is in the struggle to be one's authentic self. Existentialists endlessly contrast the "authentic" with the "inauthentic" and agree that any philosophy that is not actually lived is worth-

less. Any appeal to a transcendent rule or utilitarian principle would constitute "bad faith"—that is, self-deception.

By looking at the historical situation in which existentialism arose and the systems against which existential thought protested, one may see some of the common core of existential thought. Historically, existentialism arose as a reaction against idealism, materialism, and empirical science. The existentialists have staunchly protested any "ism" that would encapsulate humanity. A review of several historical examples may sift out several of the unique qualities that are associated with existential ethics.

SOME HISTORICAL EXAMPLES

Søren Kierkegaard's writings were an attack upon the work of Georg Wilhelm Friedrich Hegel, who was an idealist philosopher of the metaphysical system-building variety. Hegel proposed that the individual was a subordinate cell in the organic whole of the cosmos. Kierkegaard rebelled fiercely against what he believed was the excess rationalism and collectivism of Hegel. In this sense, Kierkegaard was antirational and opposed to any system that made society greater than any existing individual member.

In existential ethics, the question "What ought I do?" can never be answered by appeals to logic or society's norms. For Kierkegaard, the ethical act is unique and unrepeatable—in other words, existential. Only the existing individual in the crucible of his or her own inner life can answer the question. Here no elder, no rule book, no formula can apply. Consequently, authentic ethical behavior has no ultimate court of appeal except the individual. There is only the existing individual, with his or her freedom and responsibility. Sartre puts it unequivocally: "Man is the undisputed author of his own behavior."

Nietzsche, the militant atheistic existentialist, proclaimed that "God is dead!" The God who was the basis for all ethical and moral values underpinning the old rules for guiding conduct has become obsolete. Nietzsche notes that this strange and awful event of God's death, which at first seemed so terrible, is actually a great gift, for now humankind is truly free to create its own values. The only criterion for ethical conduct becomes the quality of life. Is the quality of life enhanced or ennobled by this action? Nietzsche does not refer to the maximum quantity of life; the quality of life that he hoped would guide people's ac-

tions has more to do with human nobility and the individual overcoming his or her all-too-human weaknesses.

ETHICAL KNOWLEDGE

Existential ethical knowledge attempts to give a concrete presentation of human life—its meaning, aims, and values. The basis of existential ethics is concrete moral experience. A dialectic that does not rest upon any moral experience is only an intellectual game. Ethics cannot be a merely theoretical discipline; it is also a moral and existential activity. Existential ethics attempts to turn to reality itself, to actual life, and to overcome the duality that undermines the value of academic or traditional philosophy.

According to Nikolay Berdyayev, a Russian Christian existentialist, the dilemma of ethical knowledge is that existence is irrational and individual, but people can know only the general and universal. Consequently, existential ethics moves from the epistemological subject of traditional philosophy to the concrete individual. Existential writers believe that what is essential about ethics is not that people should have ideas about what authenticity is, but that they should live authentically. Ethical knowledge is communion with truth and existence. Ethical objects cannot be described in a formal scientific way at all. They are revealed only to the person who performs creative acts of valuation and commitment.

Abstract a priori systems of ethics have minimal value. Sartre's often quoted existential dictum "Existence precedes essence" points to the irrelevance of any a priori system. One's identity and values emerge from one's choices, not from some essence of human nature that was given to one at birth. The individual, in struggle and anguish, must wrest his or her essence from existence by means of concrete moral choices. Humankind cannot rely on animal instinct, and people do not have some prepackaged morality that will serve to guide their choices. Nothing is authoritative. Thus, Sartre notes that people are "condemned to freedom." Moral life presupposes freedom in evil as well as good. Yet for Sartre it is unclear how it is possible to escape the no-win scenario of "bad faith" that he depicted. Sartre appeared to believe that it was impossible for humans to escape one form or another of "self-deception," no matter how hard or what they tried.

EXISTENTIALISM AND PLEASURE

Hedonistic ethics, whether it be heavenly or earthly, ultimately rests on fear. A hedonistic individual is bound to fear for his or her happiness and the happiness of others. Happiness is threatened with danger on all sides and bought at the cost of opportunism in actions and judgments. Berdyayev notes, "If I make happiness my aim I am doomed to fear all the time." Thus, the existentialists univocally renounce pleasure or happiness as a criterion of action. This renunciation takes resolve and courage. For Heidegger, the resolve of the authentic life alone liberates one from fear. For Paul Tillich, a Christian existentialist, the "courage to be" triumphs over fear.

Existentialists often recognize a dual nature of human beings and an ensuing inherent tension between these contradictory natures. Although humans are endowed with reason, they are irrational beings. The human being is a wounded creature. For the Christian existentialist, human beings aspire to the loftiest values and divine reality. Kierkegaard, discovering in human nature fathomless darkness, conflict, and pain, also recognized that the human being is a creator of values in the image and likeness of God. For Christian existentialists, human beings do not exist apart from the divine element in them. Thus, the authentic person is a bearer of the divine image. The soul is afraid of emptiness: Without *commitment*, it has no positive creative content and becomes filled with false illusions and fictions. At the same time, each person is a sick being, divided within and influenced by a dark subconscious. Sartre, taking a consistently atheistic position, defines each individual as a "useless passion."

The cognitive and optimistic psychology of either humanism or behaviorism, according to which people seek bliss and positive reinforcement, is erroneous. Humans are irrational beings who may long for suffering rather than happiness. "Happiness" is a meaningless and empty human word. Existential ethics, far from seeking happiness, may call people to the line of greatest resistance to the world, demanding heroic efforts.

SUFFERING AND AUTHENTICITY

Kierkegaard notes there are two kinds of suffering: the redeeming suffering that leads to life and the dark suffering that leads to death. Suffering may raise and purify people or crush and humiliate them. An

individual may go through life suffering serenely and graciously and be born into a new life as a result of it. All the suffering sent to humankind—the death of nearest and dearest, illness, poverty, humiliation, and disappointments—may serve to purify and regenerate an individual depending on the attitude that the individual takes toward them.

Victor Frankl, a twentieth century existential psychiatrist, points out that individuals can endure tremendous suffering if they see meaning in it. Attempts to avoid suffering only create more suffering; such an escape is one of the greatest delusions of life. Paradoxically, suffering is tied to alienation and despair, but it is also the way to light and renewal.

Existential ethics may be contrasted with Eastern thought. Unlike Hinduism, for example, existentialism stresses the individual's separateness from the world as a positive value. There is no *tat twam asi* (That art thou) in existentialism. The "other" is seen as truly "other," which serves to enrich the individual self through communion rather than merger. For the existentialist, the highest expression of selfhood does not entail the drop of water returning to the ocean; instead, it is an affirmation of the individual self and its higher destiny, which is, in some inescapable sense, separate from the world and from others.

THE PRIMACY OF THE INDIVIDUAL

The history of ethics is complicated by the opposing rights of the individual and those of society. As early as the time of Socrates, Greek thought tried to free itself from the power of law and society and penetrate to the individual authentic conscience. The moral conscience of Socrates came into conflict with the Athenian democracy. As a consequence, Socrates was martyred by the mob. Socrates proclaimed the principle that "God ought to be obeyed more than men." This means that God, conscience, truth, or the inner light ought to be obeyed more than society or any formal law. Radical reliance on truth alone provides authenticity. Thus, Socrates made a tremendous advance toward the liberation of personality and the discovery of the individual conscience. Existentialists go further than Socrates, saying, "You must always act individually, and everyone must act differently." Authentic existential behavior is truly original, not determined by social influences.

Existentialists have been outspoken in declaring the tyranny of the social unit. The power of society

over the individual has been found everywhere in history. Because of Western society's conditioning, the individual is not aware of living in a madness that is only superficially concealed. R. D. Laing, an existential psychiatrist, argues that the "fleet" is off course; hence, the individual "deviating" ship may represent the true course. Thus, society's norms are useless. The task of existential ethics is to distinguish between the authentic and the social in moral life and to reveal the pure conscience. In its essence, the authentic moral life is independent of social life. Christian existentialists urge people to remember the eternal principle in the human soul that is independent of historical changes, which in this sense is not social. Existential ethics places the individual above the law. A person *is* a value. A living human being is of higher value than any abstract idea—even the idea of the good.

In the work of Nietzsche, ethics cannot depend upon the herd morality, since it represents a slavish image of humankind, an image based upon resentment and cowardice. Nietzsche's noble individual, who is a yea-sayer to life, embodies the highest good and the supreme value. Everything that increases life is good, and everything that decreases life, leading to death and nonbeing, is evil. Such an ethic rejects any form of hedonism. A rich, full life is good and valuable even if it brings with it suffering rather than happiness. Thus, Nietzsche's championing of the noble life led to his being a bitter enemy of hedonism and utilitarianism. The supreme value and good is not life as such, but the authenticity with which it is lived.

DEATH, FREEDOM, AND EXISTENTIAL ETHICS

Existentialists, whether atheistic or religious, agree that one's attitude will be more authentic if one regards all people as though they were dying and determines one's relationships with them in the light of death—both their death and one's own. Berdyayev writes, "Every man is dying, I too am dying, I must never forget about death."

For Frankl, death is a message of hope, not doom. The imminence of death provides the impetus that is needed to live life authentically, above the petty cares that would otherwise fetter human fulfillment. The ever-present possibility of death, while terrifying, gives a sense of preciousness to the "now" that would otherwise be missing.

Ethics would be meaningless without freedom,

since “ought” implies “can.” Humans are free, creative beings who prefer freedom to happiness. Existential analysis details the insidious assaults upon human freedom. The mass media pose a number of false images of happiness as supreme values. These misrepresentations of “happiness” as the supreme good and final end have been instilled in people to keep them in slavery. Human freedom and dignity forbid the individual from regarding popular images of happiness and satisfaction as the primary goals of existence.

Any person—even a slave—can be inwardly free. Frankl’s experience in a Nazi concentration camp proved that acceptance of circumstances that have fallen to one’s lot can be interpreted as mastery over the external world. It is an existential victory. This does not mean that one must not try to improve one’s circumstances or strive for social reform. One must, however, remain spiritually free even in prison.

The point of fundamental importance for existential ethics is that one must strive first and foremost to free oneself from slavery. Because every state that is incompatible with existential freedom is evil, the inner conquest of slavery is the fundamental task of moral life. Every kind of slavery is meant here: slavery to the pull of the past and the future, slavery to the external world and one’s self, and slavery to one’s lower self. One’s existential task in life is to radiate creative energy that brings with it light, strength, and transfiguration.

FURTHER READING

Barnes, Hazel. *An Existentialist Ethics*. New York: Alfred A. Knopf, 1967. An exciting book dealing with an existential approach to liberating the individual that is based on the groundwork of Jean-Paul Sartre. Barnes, unlike Sartre, finds alternatives to bad faith. Especially useful for those interested in how existentialism relates to Eastern philosophy; seventy pages of the text explicitly compare the two. A good reference for those already familiar with the basics of existential ethics.

Barrett, William. *Irrational Man: A Study in Existential Philosophy*. Garden City, N.Y.: Doubleday, 1962. A superb introductory reference to existential philosophy. This work is widely recognized as the finest discussion of existentialism written by

an American. This book addresses the literary and religious approaches to existentialism as well as the rigorously philosophical approach. Strongly recommended.

Berdyaev, Nikolai. *The Destiny of Man*. Translated by Natalie Duddington. New York: Harper & Row, 1960. A somewhat advanced work in existential ethics written by a former Russian communist who converted to Christianity after the Russian Revolution. In “Concrete Problems of Ethics,” Berdyaev deals with sex, love, family, technical progress, and other topics from a rigorously existential viewpoint. An excellent reference for the serious student.

Frankl, Viktor. *Man’s Search for Meaning: An Introduction to Logotherapy*. 4th ed. Boston: Beacon Press, 1992. Millions of copies of this book have been sold to both laypersons and mental health professionals who wish to understand how existential ethics were lived in a Nazi concentration camp. The original title of this work was *From Death Camp to Existentialism*. An excellent reference for those interested in psychology, ethics, and existentialism.

Golomb, Jacob. *In Search of Authenticity: Existentialism from Kierkegaard to Camus*. New York: Routledge, 1995. An analysis of existentialist ethics in terms of the existentialist’s drive for authenticity. Golomb embraces authenticity as a way out of postmodern scepticism and detachment, and he reads classic existentialist texts for clues as to how to live today.

Kaufmann, Walter. *Existentialism from Dostoevsky to Sartre*. Rev. ed. New York: New American Library, 1975. An extremely rich anthology of readings from ten leading representatives of the existential movement. Kaufmann’s introduction tells the reader how to approach the specific texts. An excellent collection of primary sources in existentialism for the beginning student who would like to read what the existentialists actually said. Accessible and widely available.

Experimentation

DEFINITION: Conduct of practical scientific or medical research

TYPE OF ETHICS: Scientific ethics

SIGNIFICANCE: Experiments conducted on humans and animals are governed by formal and informal codes of ethics designed to protect the rights and welfare of the subjects, to ensure that the experiments serve a legitimate public interest, and to regulate the use of the information obtained as a result of the experiments.

What are the moral principles to be considered in evaluating the rightness or wrongness of using humans as research subjects? In *The Patient as Partner* (1987), Robert M. Veatch summarized the ethical principles and issues involved in research: The principle of beneficence, which has its roots in the ethics of medical treatment, states that research with humans is justified only when some good can come from it; this is the minimum justification for human research.

Research may do good (therefore meeting the criterion of beneficence) but may also cause harm. Research that causes harm is morally wrong; that is, it does not meet the principle of nonmaleficence. When research causes both good and harm, which principle, beneficence or nonmaleficence, takes priority? If avoiding harm takes priority, then a vast amount of research with human subjects with the potential for doing much good would be considered unethical. Therefore, the ratio of benefit to harm is a more reasonable criterion for justifying human experimentation.

If benefit/harm is adopted as the moral principle, a new problem emerges, because this principle would justify inhumane experimental procedures such as those employed by the Nazis as long as it could be shown that severe harm or death to a few human subjects was of benefit to large numbers of people.

Benefit/harm, a form of beneficence, is therefore a necessary but insufficient justification for research with human subjects. Additional principles are required.

The principle of autonomy recognizes that among the inalienable rights of persons is the right to liberty. The principle of autonomy implies a right to self-determination, including the right, when informed of

the benefits and harms, to consent to participate in research that may entail certain risks to the subject. Therefore, autonomy is the basis for the use of informed consent in research with human subjects; informed consent helps to mitigate some of the problems posed by sole reliance on beneficence as a moral criterion.

Still another principle involves considerations of justice (fairness) in the conduct of human research. According to one theory of justice, distributive justice, fairness involves attempting to equalize the benefits and harms among the members of society. This principle has implications for the selection of subjects for research in the sense that disadvantaged subjects—for example, members of minority groups—should not be chosen as subjects, since this would add another burden to an already unduly burdened group. This principle would not apply when minority status was a variable under study in the research.

The principles of beneficence, autonomy, and justice form the basis for some of the criteria set by the U.S. Department of Health and Human Services (DHHS) and used by institutional review boards (IRBs) for judging whether proposed research involving human subjects is ethically sound. These criteria are (1) risks to subjects are minimized, (2) risks are reasonable relative to anticipated benefits, (3) prior informed consent will be obtained from subjects or their legal representatives, (4) informed consent will be documented, and (5) selection of subjects will be equitable. Two additional criteria are that (6) subjects' privacy and confidentiality will be maintained and that (7) the research plan involves monitoring the data, when applicable, so as to ensure subject safety.

The application of ethical principles to particular instances of research with human subjects highlights the complexities involved in the use of these principles. One question that arises concerns the obligations of a scientist when the nature of the research precludes informed consent, as in psychological research that involves the use of deception. While many people believe that deception is permissible under certain limited conditions—for example, when there is little or no risk to subjects and there are no alternative ways of gathering the data—others feel that deception is intrinsically harmful to subjects and is never justified.

Another question has to do with the issue of in-

formed consent with subjects who may not be competent to give informed consent; for example, in cases involving children or individuals who were formerly competent but are no longer so (such as individuals who have some form of dementia). When risks are minimal, informed consent by parents of children and informed consent by guardians of the formerly competent have been employed as criteria.

In circumstances in which the subject is competent but informed consent may be obtained under potentially coercive conditions, as in the case of prisoners or clinic patients, complex ethical questions are raised.

The ethics of experimentation also extend into such other areas as issues of animal care and rights, and the ethical obligations of scientists with regard to the integrity of the research process.

Exploitation

DEFINITIONS: The indecent or illegitimate use of others for one's own advantage or profit

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Exploitation of individuals violates the post-Kantian ethical principle that people should be treated as ends in themselves, or subjects, and not as means to ends, or objects. The systematic exploitation of groups or classes by other groups or classes may be cause for the moral condemnation of an entire social structure or society.

Many ethicists find that the definition of what exploitation is and what can be effected by it are inextricably linked. By examining the categories of existence that are understood to be capable of being exploited, however, a clearer, broader view of the definition can be seen.

What is considered as decent or legitimate must be sorted out in the context of what is merely socially acceptable and what is ethical, correct conduct. According to Peter Singer, "Ethics takes a universal point of view. This does not mean that a particular ethical judgment must be universally applicable. . . . What it does mean is that in making ethical judgments we go beyond our own likes and dislikes."

EXPLOITATION OF HUMAN BEINGS

The area in which exploitation has been studied most is the ethical treatment of human beings. Even so, there are many unanswered questions, and new ones arise as technology advances. Yet human behavior has still not even caught up with ethical standards that are already well established in nearly every society. For example, slavery is no longer deemed acceptable in most cultures, but near-slavery conditions continue to exist in many of these cultures. To provide for the wealthy minority in the technologically developed industrialized world, millions of people

live in desperate poverty. These people earn lower than subsistence wages by performing hazardous and strenuous jobs, live in unsanitary and unsafe housing, eat a diet that does not provide adequate nutrition, receive insufficient medical care, and are unable to obtain enough education to be informed citizens. Surely these pitiable people are being exploited.

How can such an unethical situation exist? There are at least three possible explanations. First, perhaps not many people are aware of the situation. Second, perhaps there are not sufficient numbers of aware people with both enough political power and enough ethical strength to stop the situation. Third, perhaps humanity has ceased to care. As Elizabeth Pybus states, "If it is possible to turn a blind eye to suffering, it may also be possible to direct a steady seeing eye towards it."

The situation of near slavery, however, is an old problem. Other human problems that have arisen in more recent times have to do with dilemmas such as the mass marketing of untested medical devices, double-blind drug tests, the whole range of uses of the information obtained from the human genome study, the use of prison labor for commercial enterprises, and informed consent in medical testing and treatments.

EXPLOITATION OF ANIMALS

Exploitation does not always involve humans as its objects. Various people are working on the problems of animal rights and the humane treatment of animals. One of the first philosophers to formalize a system of proposals for the ethical treatment of animals was Jeremy Bentham. He believed that the basis for human behavior toward animals is in exploitation's definition of "other." He maintained that the point is not whether animals can reason or speak, but whether they can suffer. Their capacity to feel is called sentience. Peter Singer believes that what will determine ethical treatment of animals is for humans to give them "equal consideration" of their interests. Ethicists such as Singer believe that people will come to realize that the use of animals for food, to test cosmetics and drugs, or as pets constitutes animal exploitation and that understanding this concept will guide people to treat animals more humanely.

Most philosophers have maintained that only sentient, living creatures can be exploited, because those that are not in this category have no interests that

need to be considered. Yet the concept that even plant species can be exploited has crept into the human consciousness and vocabulary. Consider trees in an old-growth forest that are exploited for their timber or patches of tasty wild mushrooms that are harvested to extinction. Are these truly cases of exploitation? The answer lies in the definition of the concept. Are these human uses indecent or illegitimate? Yes, because people have planned poorly in using forest products and have wasted vast amounts of forest "resources." Yes, because the mushrooms are not essential for human sustenance.

In these examples concerning plants, two conditions in the definition of exploitation—indecent or illegitimate use for advantage or profit—have been met. The problem lies with the third condition: that in these situations, a nonsentient "other" has been so used. Singer asks that humans do not practice "speciesism" in their treatment of animals, yet even he maintains that only sentient creatures need be given this consideration. It is when ethicists push past animal rights into the area of ecoethics that equal consideration for plants comes into question.

Ecoethics has existed throughout the ages, manifesting itself in such systems as Jainism and Native American belief systems. Since the nineteenth century, there has been a growing formalized understanding of what ecoethics involves. The study has become much more intense since about 1950, with Aldo Leopold's discussions of a "land ethic," and the early 1960's, with Rachel Carson's revelations in *Silent Spring* about pesticides accumulating in the environment.

The concept of ecoethics allows that it is possible for humankind to exploit any of the environment's manifestations, capacities, or systems. Each of these elements has been recognized as one of the "others" from the definition of exploitation. Therefore, it is possible to exploit not only plants but also mineral deposits or other geologic formations. It is possible to exploit a water table or an oil deposit. Wetlands and whole forests are potential victims of exploitation. So are the oceans and the atmosphere.

Terms that have been used with increasing frequency in discussing the environment are the biosphere and the Gaia concept. Using this expanded vocabulary, humankind is beginning to understand its potential for damaging, through exploitation, all that sustains human life.

As human technology progresses, people are beginning to discuss whether it will be necessary to apply ethical standards to any potential “rights” of artificial intelligence systems and robots.

Since organized human behavior seems to lag far behind the establishment of ethical injunctions, it might seem unlikely that humankind will ever stop its practice of exploiting all that it encounters. Yet it is in an increasing awareness of these universal views and in self-examination that the possibility of the human practice of exploitation coming to an end exists.

F

Fact/value distinction

DEFINITION: Distinction between that which is either true or false and that which can be neither true nor false

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Because it is so difficult to justify placing normative judgment within the domain of fact, the fact/value distinction suggests that normative ethics is ultimately a subjective discipline that cannot be evaluated in terms of truth or falsity. Postmodern and some other late-twentieth-century ethics hold that it is morally wrong to treat values as facts, or to obscure the value-laden nature of purportedly factual statements and judgments.

The fact/value distinction is based upon the intuition that there is an important difference between sentences whose truth-value can and sentences whose truth-value cannot be determined empirically (with one or more of the five senses) or mathematically (by thinking about logical, numerical, or spatial relationships). Among the sentences whose truth-value cannot be determined empirically or mathematically are those of normative ethics: sentences about what is ethically obligatory, permissible, and forbidden, good and evil, right and wrong. Few would deny that there is such a difference and that it is important, but there is profound disagreement concerning the nature of the difference. In one camp are those who maintain that even though it is not possible to determine the truth-value of normative-ethical language by empirical observation or mathematical reflection, it is just as true, or just as false, as the language of physics and biology, geometry, and logic.

Just as there is a real, material world and a real world of mathematics, so there is moral reality. Normative ethical statements are true when they conform to that moral reality and false when they do not. In the opposing camp are those who say that since the truth-value of normative ethical sentences cannot be deter-

mined by empirical or mathematical means, they are neither true nor false. (This is an oversimplification, because there is disagreement within each camp, and some ethical theorists attempt to stake out intermediate positions, but seeing the disagreement between the extremes is the best way to understand the importance of determining whether the domains of fact and value are mutually exclusive.)

HISTORY OF THE CONCEPT

Like most concepts in ethical theory, the fact/value distinction has a long history. While its roots can be found in ancient ethical theory, its rapid growth began with the Enlightenment. In English-language ethical theory, “fact” was contrasted with “right” before being opposed to “value.” In *Leviathan* (1651), Thomas Hobbes distinguishes “matters of fact” and “matters of right,” and the third earl of Shaftesbury draws a distinction between a “mistake of fact” and a “mistake of right” in his *Inquiry Concerning Virtue, or Merit* (1711). The meaning of the English word “value,” as used in phrases such as “fact/value distinction” and “value judgment,” owes its origin in part to the influence of nineteenth century German writers, especially theologian Albrecht Ritschl and philosopher Friedrich Nietzsche.

Perhaps the clearest explicit distinction between statements of fact and judgments of value is found in British philosopher A. J. Ayer’s *Language, Truth, and Logic* (1936; 1946). Many philosophers observe a distinction between sentences and propositions, in order to account for both the fact that different sentences, in different languages or different contexts, for example, can have the same meaning, and the fact that a single sentence can have different meanings, for example, when written by or about different persons. Given this distinction, propositions are either true or false; it is possible, however, for a sentence to be neither true nor false, because not all sentences express propositions. With this distinction in mind, Ayer writes: “Since the expression of a value judgment is not a proposition, the question of truth or

falsehood does not here arise.” At another point he adds: “In saying that a certain type of action is right or wrong, I am not making any factual statement.”

Ayer did not claim that to say that a certain type of action is right or wrong is to do nothing. He argued that sentences of normative ethics express emotions rather than propositions and are sometimes calculated to change other persons’ behavior by arousing their emotions. Thus, the metaethical theory that normative ethical language does not express propositions is called “emotivism.”

While ethical subjectivism, relativism, and emotivism are clearly distinct from one another at the level of metaethical theorizing, they frequently have the same cash value for those whose life’s work is not the study of ethical theory. According to both subjectivism and emotivism, the meaning of normative ethical language is to be understood in terms of emotions. The difference is that according to subjectivism such language states propositions about the speaker’s emotions, while emotivism says that such language expresses the speaker’s emotions. According to both relativism and emotivism, there is no absolute truth in normative ethics. The difference is that according to relativism there is only relative truth in normative ethics, while emotivism says there is no truth at all. For someone wondering whether, for example, abortion is immoral, these distinctions have little relevance and often tend to blur.

Although the question of whether the domains of fact and value are mutually exclusive cannot be answered by empirical observation or mathematical reflection, simple logic does reveal the magnitude of the bullet one must bite in order to maintain that they are. If only one sentence about the immorality of child abuse, torture, rape, murder, cannibalism, or genocide both makes a value judgment and states a fact, then no line can be drawn between facts and values.

Fair Labor Standards Act

IDENTIFICATION: Labor legislation regulating wages, hours of labor, and the use of child labor

DATE: October 24, 1938

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The Fair Labor Standards Act arose out of a progressive ideal that holds government responsible for protecting the economic and social welfare of laboring people by regulating business.

The Supreme Court ruled unconstitutional attempts such as the National Industrial Recovery Act of 1933 by the Roosevelt administration to regulate prices, wages, hours, and other labor conditions. In 1938, however, Congress passed wages and hours legislation as an omnibus bill, and the Supreme Court upheld it in 1941. The Fair Labor Standards Act regulated minimum wages, overtime pay, child labor, and the production of goods for interstate commerce.

Beginning with the third year after its effective date, the act raised the minimum wage to forty cents per hour, made it subject thereafter to review by a congressional committee, and required overtime pay of one and one-half times the employees’ regular pay above forty hours work per week. The act eliminated child labor (by children under age sixteen) with certain exceptions. One of the most significant amend-

Unemployed men form a long breadline during the depression. New Deal legislation such as the Fair Labor Standards Act was designed to reduce the need for such services. (Library of Congress)

ments to the act, which came in 1963, required equal pay for equal work without regard to sex. Although more than forty exemptions to the act exist, including the regulation of professional employees and outside salespersons, the act is a milestone for labor, since in it Congress and the president recognized their responsibility to be the guardians of economic and social justice for labor.

Fairness

DEFINITION: Moral principle used to judge procedures for distributing benefits and burdens justly and equally among parties

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: As an ethical principle, fairness regulates an exceptionally wide range of activities, from the conduct of games and other frivolous pastimes, to hiring and employment practices, to equal protection of the law and other fundamental civil rights.

Fairness is one of several ethical concepts, along with justice and equity, that are concerned with the distribution of benefits and burdens among individuals

and groups. It is sometimes used in a broad sense, connoting attitudes and features characteristic of much wrongdoing, including putting one's own interests ahead of others and favoring oneself or one's own at the expense of others. In this broad sense, fairness is a central component of the moral point of view, in contrast to a purely egoistic or self-interested standpoint. The individual adopting the moral point of view is fair-minded, looking at claims in a balanced, impartial, and reasonable way.

The ancient Greek philosopher Aristotle, in his classic discussion of justice in book 5 of the *Nicomachean Ethics*, observed that justice is used in a narrow sense as well as a broad sense. Fairness, like justice, seems to have a narrower sense as well. In fact, it might be more accurate to say it has several narrower senses or uses. One of these senses is exemplified in cases of the differential treatment of individuals on arbitrary or irrelevant grounds. The awarding of a job on the basis of political favoritism or nepotism is usually condemned as unfair. Another related sense is that used in connection with procedures; for example, when people speak of a fair trial or a fair contest. In these cases, fairness is a matter of there being rules or guidelines that are closely followed. Additionally, the rules or guidelines shaping the procedure should not give an undue advantage to certain parties. Sometimes these notions are referred to as "procedural fairness" and "background fairness."

A third sense involves profiting at another's expense; if such advantage-taking is not allowed by the rules of some competition, it is deemed unfair. Oddly, however, allowing another to gain at one's own expense is not regarded as unfair. A fourth sense of fairness and unfairness is found in situations of blame and punishment: Punishing an innocent person ("scapegoating") and blaming or punishing an individual more than is deserved are seen as unfair. While several elements of unfairness are present in such cases, the main offense to fairness seems to be the singling out of the individual for disfavor, the sacrificing of that individual even if he or she is not totally innocent and even if some greater good will come of it.

"FAIRNESS" VS. "JUSTNESS"

While the concepts of justice and fairness are closely related and are used interchangeably in some contexts, they are not identical. The terms "just" and

"unjust" often carry a stronger tone of condemnation than do "fair" and "unfair." At times, there is a readiness to admit that something is unfair but to tolerate it nevertheless, perhaps with an observation that "life is not fair." By contrast, the idea of tolerable or justifiable injustices is not countenanced. John Stuart Mill, in his discussion of justice in *Utilitarianism* (1861), made note of the avoidance of the idea that there can be "laudable injustice" by accommodating language so that "we usually say, not that justice must give way to some other moral principle, but that what is just in the ordinary case is, by reason of that other principle, not just in the particular case." Furthermore, fairness seems more appropriately applied to procedures and processes, while justice is often used for outcomes. Familiar examples of this are references to fair trials and just verdicts.

In *A Theory of Justice* (1971), philosopher John Rawls develops a theory of social justice that he calls "justice as fairness." He makes use of this association of the idea of fairness with procedures to extract principles of a just society as ones that would be the outcome of a bargaining process among parties under conditions marked by background fairness. One notion of fairness discussed by Rawls is identified with pure procedural justice. Pure procedural justice is characterized by the existence of a correct or fair procedure without an independent criterion of a correct or right result. In such a situation, provided the procedure has been followed, the result is correct or fair, whatever it happens to be. The fairness of the procedure transfers to the result.

In *A Theory of Justice*, Rawls attempts to develop a theory of a just society by treating social justice as a type of fairness or pure procedural justice. Pure procedural justice is contrasted with perfect procedural justice, in which there is an independent criterion of a correct result and the possibility of devising a procedure to arrive at that result, and imperfect procedural justice, in which there is an independent criterion of a correct outcome but no possibility of devising a procedure to consistently achieve that outcome.

Rawls also provides an extensive discussion of the principle of fairness or fair play. This is a principle of duty or right action, which relates to the sense of fairness in not taking advantage of others. If people enjoy the benefits of cooperative activities, benefits made possible by the contributions of others, then they have a duty to contribute their share or to do their

part. Otherwise they are “free-riding.” The tax evader who benefits from tax-supported programs is an example of a person unfairly benefiting from the efforts of others.

Fairness and Accuracy in Reporting

IDENTIFICATION: Left-leaning watchdog group that encourages the news media to report the diverse concerns and opinions of the American public rather than privileging mainstream conservative voices.

DATE: Founded in 1986

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: FAIR works to correct what it perceives as a conservative bias in news reporting.

FAIR believes that the national and local news media are increasingly influenced by political and economic powers—that instead of independently chal-

lenging and criticizing government and big business, the news media tend to accept and pass along official versions of events. For example, FAIR examined news coverage of the 1991 Gulf War and found that most news stories and editorials echoed official government press releases and statements, and reflected little or no attempt to confirm or refine government versions of events. When some official statements turned out to be exaggerated or false, corrections were given minimal attention. FAIR also found that on talk shows and other analysis programs, only a small range of views was presented, and the views of those opposed to the war were seldom heard.

In 1989, FAIR published an important report showing that the guest analysts on two of the most widely watched television news programs were overwhelmingly white males from large institutions. Representatives of labor, social movements, minority groups, and local civic groups were very rarely featured on these programs. FAIR maintains contact with the public through a magazine that is published eight times a year and through a weekly radio program.

Faith healers

DEFINITION: People who use prayer, religious faith, the power of suggestion, and touch to promote healing.

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The cures ostensibly effected by faith healers have never been adequately or scientifically proven and may keep patients from pursuing more beneficial medical care and advice and may cause the patient serious financial loss or difficulty.

Faith healers see themselves as instruments empowered by God to heal. They attract clients or “patients,” who seek relief from often serious medical or personal problems for which they have not found help and who seek assistance in divine intervention through faith healing.

Faith healers are also sometimes known as “spiritual healers.” Spiritual healing, however, has a broader significance that encompasses cultural relationships and spiritual dimensions of the personality. Research has shown that spiritual perspectives and religious beliefs do influence personal values, attitudes and behaviors, and therefore biochemistry. For example, beliefs in healing powers of magical objects, people, and places have always been known. Faith healers, on the other hand, have generally been associated with evangelical and fundamentalist religions based on literal biblical interpretations and Christian healing traditions. A common theme in the various types of spiritual and faith healing is an appeal to God or gods to change for the better a person’s physical or mental condition.

Some faith healers, such as those in the Pentecostal Church who use divine healing as part of their denominational dogma, do not prohibit use of professional medical care. They see professional physicians as receiving their healing skills from God. Some religious groups, notably Christian Scientists, however, reject the use of professional medical care in treating illness. They use Christian Science practitioners to help encourage faith directed to healing through God, teaching that illness is an illusion.

Spiritual healing has ancient origins. However, James Randi, an investigator of paranormal claims, has shown that the modern day faith-healing movement, which is fueled by claims of nineteenth century European and American evangelists, may have originated in the 1940’s with the Reverend William Branham. A Jefferson, Indiana, resident, Branham conducted charismatic sermons and healings and acquired a huge following. Similar healers quickly multiplied, conducting sessions in the homes of clients and in their own churches, or traveling around the country holding healing tent “revivals.”

EFFICACY OF FAITH HEALING

Various investigators have tried to determine the validity of faith healing by attempting to follow up on cases of numerous well-known faith healers including Oral Roberts, Pat Robertson, Father DiOrio, and Kathryn Kuhlman. Similar outcomes were obtained in all cases, with no criteria offered for failure and no cooperation or success in obtaining provable results through thorough pre- and post-healing medical examinations. Where some follow-up was possible, the

healings were not substantiated. William Nolen, a Minnesota physician who attempted to approach investigation of healing miracles with an open mind, was unable to confirm a single case. He did find that many people who thought themselves healed had relapses of their medical conditions within one to two weeks. Although physicians point out that around 80 percent of human illnesses will heal themselves without medical or spiritual intervention, successful cures are often credited to faith healers. Nolen concluded that people with disorders having psychological components may have benefited on a psychological level but others, who were not “healed,” perceived themselves as unworthy or undeserving in God’s eyes and therefore suffered heavy burdens of guilt and despair.

There are other problems with proving the results of faith healing. Since healers claim that an absolute and unquestioning faith is required from the client in order to be healed, failure can be blamed on insufficient faith or on personal transgressions and shortcomings of the client. Randi and other investigators point out that many techniques used by faith healers are identical to, or adaptations of, techniques used by magicians and mentalists, including use of memory techniques in calling out names and afflictions based upon data collected by associates before the service. Psychological conditioning sets up behavioral expectations for hands-on healing when a strike on the forehead causes the recipient to fall backward into the hands of assistants. Speaking in tongues relates to a psychological phenomenon called glossolalia, which was described by Plato long before the Christian manifestation and was noted in pronouncements by Greek and Roman oracles. These techniques, even when understood and exposed, do not lessen the beliefs or faith of many followers.

ETHICAL ISSUES

Modern scandals involving popular television evangelists, in addition to unproven results of their healings, have added to the concern of highly questionable ethics on the part of practitioners. Divinity appears to reside in the interpretation of the healer. There are no codes of ethics or any unifying organization. In fact, there is often intense competition for the minds and dollars of the clientele. It also seems that healing applies only to those clients who have afflictions that can be exploited before an audience. A

lost leg or body part never reappears, there is no way to prove the removal of a tumor without medical tests, and visible skin diseases, disfigurements, or afflictions always require days or weeks for a cure after the healers and audience are long gone. Television and radio add to the illusion and can be manipulated as required.

Commercialism is most certainly an issue, since faith healing generates millions of dollars. Many cases investigated by James Randi would, by law, constitute fraud. On the other hand, complaints were not forthcoming, and cases are difficult or impossible to prove without cooperation. Individuals who can least afford it may be defrauded of their limited resources and savings.

Where issues of consent are concerned, adults may make their own decisions regarding beliefs and practices. However, the courts have generally held that freedom of religion does not include the right to withhold medical care from a child. Faith healers do use children in their healing services, and if a child has afflictions that are not medically addressed, as in cases of Christian Science, this would constitute child abuse.

Family

DEFINITION: Fundamental social group, often consisting of a man, a woman, and their offspring

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Families are the basic social units that make up larger societies. They also constitute one of the core institutions that educate and inculcate children with ethical values.

All known societies value the family. In American society, the family is customarily defined as a social group based on a heterosexual partnership of procreation that creates a community of parents and children.

FAMILY TYPES

The concepts of household and family should not be confused. A household is a group of people who live together and share cooking and toilet facilities. Households may include unrelated boarders who rent rooms from a family, as is the case with many college students. "Household" is a descriptive term, whereas the term "family" is prescriptive. A family consists of people who are related to one another by blood or marriage and who thus ought to care for one another and share life's joys and sorrows. Duty and obligation bind family members as much as rights and privileges do. Family and household often overlap but do not necessarily do so. Members of a family may live in scattered households.

There are many types of family, each of which has evolved in response to different circumstances. In the United States, the term "family" commonly refers to the "nuclear family": a husband, a wife, and their children, all of whom share a home, often cook and eat together, and offer one another support. The word "family" also encompasses a person's ancestors and other relatives, such as aunts, uncles, and cousins. Most families are based on kinship, which simply means that the family members are related to one another by blood, marriage, or recognized forms of adoption. "Foster families" are an exception, because the children are neither adopted nor related to their foster parents by blood or marriage. Despite this fact, the members of such families live together and treat one another as family members.

Anthropologists, sociologists, and psychologists believe that nuclear families were well adapted to the

demands of industrial America. Their small size made it easy for industrial workers to relocate when employment demanded that they move. From the 1840's until the 1940's, the nuclear family was considered the norm in the United States and in the industrialized sections of Europe.

In the postindustrial United States, many other types of families are emerging. Skyrocketing housing costs have forced many parents with children to move in with grandparents, forming three- or even four-generational "extended families" made up of two or more nuclear families. Like the nuclear family, such a family is a "conjugal family," because some of its members are related by blood and others are related by marriage. Because many husbands and wives work, grandparents often provide no-cost child care for young couples. An extended family might also include aunts, uncles, and cousins. Many immigrant families form "joint extended families" composed of several related families that live together, pool their earnings, and share most expenses. Many of these families are headed by an old patriarch and his wife. Usually, married sons and their wives and children, as well as unmarried children, attach themselves to a grandfather's household to form a joint family. Such families are more common among families that own property or businesses than they are among the working class. Family type represents adaptation to circumstances, not moral imperatives. Ethics develop to justify and reinforce family structures.

Extended families can accumulate capital rapidly, which encourages early entry into small businesses. Family members often work in these businesses without pay in return for total support for themselves and their children. Since family members feel obligated to work for relatives, even without pay, some sociologists are critical of these families. They believe that this arrangement amounts to little more than slavery and exploitation. Sometimes, children are forced to work and, as a result, miss school to help maintain the family business.

These families raise many moral issues. Do obligations to extended family members limit an individual's freedom and stifle personal growth? If so, is a person justified in ignoring these demands? What duty do people owe their grandparents and relatives who are not within their immediate families? If one inherits financial benefits from distant relatives, es-

pecially as a result of heinous institutions, such as slavery, does one also inherit a moral obligation to right those persons' wrongs? Should those who prosper under a system work to change that system if they know that it is morally wrong? History has often provided examples of families that chose practicality and personal gain over morality; for example, slave-owning families.

Chinese immigrants to the United States provide an example of a type of extended family that is known as the "stem family." Betty Lee Sung's book *Mountain of Gold: The Story of the Chinese in America* (1967) notes that filial piety and a display of absolute loyalty to and respect for parents obligate one married son to live with his aging parents and become their caretaker. Other sons and daughters are free to marry and leave the family unit without being condemned for abandoning or neglecting the parents. This social obligation would make it both unethical and unthinkable for first-generation Chinese Americans to place their aging parents in homes for older people or allow them to struggle to maintain a household alone. Although caring for aging parents is a burden and may create economic hardships, moral imperatives take precedence in this situation. This tradition often changes in the second and third generation.

DECLINE OF THE NUCLEAR FAMILY

Some social scientists argue that the American family is doomed because "single-parent families" are a growing phenomenon. Rising levels of education make it possible for many women to support children without help from a father. Welfare creates similar options for less-well-educated poor women.

The conservative view of female-headed households implies that they are not ethical. Bearing children out of wedlock is considered immoral. Also important to conservatives is the fact that children born out of wedlock cost the government billions of dollars annually. Conservatives often assert that women who develop what conservatives like to think of as irresponsible sex lives contribute to the growing feminization of poverty. People who think in this way believe that character flaws, bad values, and personal weakness on the part of such women create "matrifocal families." These are "consanguineal families" in which the members are related by blood ties only. This view ignores the possibility that the man

may have abandoned the woman or that a woman may be widowed or divorced. Conservatives also believe that matrifocal families unfairly condemn millions of children to live as welfare wards and dependents of the state, plagued by persistent poverty.

WELFARE

Most families on welfare are matrifocal. Some observers believe that welfare is debilitating because it undermines the work ethic, which values work rather than leisure. To many Americans, work is a moral duty and an obligation to the family, the community, and the state. As early as 1898, Jacob Riis's book *How the Other Half Lives* (1898) argued that poor families should be given jobs, not charity. Riis believed that work restored a moral environment, which was the key to reducing poverty, strengthening nuclear families, and restoring people's self-respect and dignity. Conservative supporters of welfare reform echo Riis's views. They want to tie welfare eligibility to moral norms. Workfare programs are built on this assumption, and some of them allow nuclear families to receive aid if parents assume responsibility for the family and seek work or self-improvement through education in preparation for future jobs.

When investigating how female-headed families form, a different picture emerges. In slum neighborhoods, many single mothers have that status thrust upon them by high levels of male unemployment. *The Truly Disadvantaged* (1990), by sociologist William Julius Wilson, notes that in 1950, 80 of every 100 ghetto men were gainfully employed; by 1980, however, the number had dropped to 17 of every 100. The result was that few ghetto men were able to support wives and children. Wilson believes that economics is largely responsible for this disaster. Fathers without families feel guilty because they accept society's dictate that they should care for their children. Such shame is dysfunctional, and many males seek to escape from it by means of alcohol, drug abuse, or crime. Consequently, 25 percent of African American males between the ages of 17 and 35 are caught up in the criminal justice system, and many others are in the armed forces. In either case, they are not in their communities.

The absence of these endangered men from slum communities creates a void. Many men contract AIDS while they are in prison because they engage in homosexual affairs or become intravenous drug users

and share dirty needles. Once the infected person is released from prison, the disease is transmitted to his female lovers. For this reason, epidemics and drug abuse threaten to destroy urban low-income families.

As medical science increases longevity, society strives to offer all its members that benefit, but often only wealthy families benefit. This problem is most evident in figures calculating life expectancy in terms of race. Whites can expect to live ten years longer than African Americans may expect to live, because many whites can afford better nutrition and medical care for their families. This fact creates an ethical dilemma. Are rich families entitled to live longer than poor families? Is access to adequate health care a privilege or a right?

INFANT MORTALITY

Another cause of matrifocal families is the falling infant mortality rate, which is reflected in the increased number of adolescent girls who give birth. In *When Children Want Children* (1989), Leon Dash points out that although the overall rate of adolescent births has declined since 1970, the number of infants born to unwed mothers has increased threefold, from 91,700 in 1960 to 270,076 in 1983. Add to this the fact that 23 percent of these mothers said that they intentionally became pregnant and the moral crisis becomes clear. Early unmarried parenthood is closely tied to reduced education, marginal income-earning capacity, and welfare dependence. Teenage mothers also tend to have larger-than-average families, and married teenage couples have the highest divorce rate in the United States.

Children of teenage mothers have poorer-than-average health, lower-than-average IQ scores, low cognitive scores, and a better-than-average chance of living in a disruptive home during their high school years, and these children are more likely to become sexually active before marriage and repeat this tragic cycle than are other teenagers. The ethical crisis is clear, but the remedy is far from clear, despite the fact that Peter Laslett's book *Family Life and Illicit Love in Past Times* argues that this dilemma has faced Americans since the frontier era. In the past, high infant mortality rates and forced marriages covered up moral lapses. Decreasing infant death rates and greater freedom in mate selection are bringing old dilemmas into sharp focus, according to Laslett. Is

technology revealing a conflict between family ideals and reality?

POWER RELATIONSHIPS WITHIN FAMILIES

Practical matters dictate that there are vast differences in power within families. Traditionally, American men were expected to be monarchs within the family and to wield great power. The father's word was final. It has become clear that, in an alarming number of cases, the intimacy of the family conceals abuses of this power involving incest and beatings of wives, children, and older relatives. Family members may engage in denial and hide such abuse even from themselves. The rights of women, children, and older people within families need to be made clear and public in order to protect these people. The abuse of power becomes institutionalized when fathers are also the sole judges of injustice and their victims are delegated roles as custodians of patience, forgiveness, and forbearance. Lord Acton noted that power corrupts and that absolute power corrupts absolutely. This seems to be true within families; relations should be democratized by distributing power within the family to minimize abuses of all kinds.

Plato charged that families were bad because they made people acquisitive and thus subverted devotion to the good of the community. In his ideal republic, the guardian class would live and reproduce in communal groups, thus creating one huge extended family based on group marriage. This would reduce psychological and material divisions. The practice was tried in Israel and Russia, with little success. Thomas Jefferson wanted to allow private households and nuclear families but limit inheritance as a method of reducing the advantages that family wealth would give one American over another. Inheritance is an element of the issues of family favoritism and nepotism, which are banned for those who hold public office because they give family members unfair opportunities to secure jobs, political office, income, and other benefits.

DIVORCE

In 1930, American schoolchildren would have been shocked if any of their peers admitted to having divorced parents. By the early twenty-first century, such information was commonplace. Although this fact gives rise to fear that the family is breaking down, such fear is unrealistic. The highest divorce

rate of the twentieth century occurred in 1945, following World War II. This occurred because many couples married hurriedly, without knowing each other. The men went off to war, and the stress of separation caused both men and women to develop other relationships, leading to divorce after the war. The divorce rate dropped sharply after 1945 but began to rise steadily again between 1950 and 1980. Although the current rate is high, it is not nearly as high as the 1945 rate.

Divorce alone is not responsible for the increase in single-parent families, as some people have suggested. Drastic reductions in death rates mean that fewer parents are widowed and fewer children are orphans than was the case earlier in the century. These statistics offset the increase in single-parent households caused by divorce. Moreover, record numbers of parents remarry shortly after a divorce and form "blended families." Although stepparents assume responsibility for the children of their new spouses, remarriage raises questions. What are the best interests of the children? Who should have custody?

Children who have been given up for adoption can now use their rights to divorce their biological parents if there is an attempt to reunite them. Children who have done so have argued that they do not know their biological parents and are happy with their adopted social parents. Adopted parents choose these children out of love. In such cases, the genitor, or social parent, supersedes the biological parent. The courts have upheld the right of children to remain with adopted parents despite the wishes of the biological parents who put them up for adoption earlier in life. Is it ethical for the state to uphold individual rights at the expense of group rights?

CONCLUSIONS

Although some people have predicted the demise of the American family, the evidence suggests that this is not a likely scenario. The family is undoubtedly changing in response to new social environments and new challenges, but it remains basically healthy. In fact, families may be stronger than ever. Lesbian and gay couples, for example, do not wish to destroy the family; instead, they view it as an institution that is so desirable that they want its definition expanded to include same-sex couples who wish to make lifelong commitments. In the years ahead, society will be challenged to redefine the family, its

mission, and the ethics of relationships within it as it becomes possible to reproduce asexually through cloning and as other developments take place. Future families are likely to be more democratic and to avoid abusive sexism. Families may even drift away from privatism and favoritism toward close relatives, but changes in this area should be expected to occur slowly. Since families play pivotal roles in shaping the morality of the nation, business is likely to become more involved in family issues in order to ensure a steady supply of trustworthy and reliable workers. The declining roles of churches and schools as shapers of values may force business to play such a role. Finally, as families become more democratic, children will acquire more power within them, and those children must be taught how to use that power appropriately. The future of the family holds many problems and many ethical challenges.

Family therapy

DEFINITION: Type of group psychotherapy that seeks to address the needs of families or individuals within families by analyzing and modifying relationships and dynamics within the family

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: Family therapy raises all the ethical issues raised by individual psychotherapy, but it also raises special ethical concerns involving the need for evenhandedness in the relationship of the therapist to each member of the family group, the need for patients to balance honest work in therapy with the feelings of the other family members, and the confidentiality of information revealed between family members in therapy sessions.

Family therapy is guided by systems theory, which believes that psychological problems of the individual must be approached as a dysfunction of life within the family. Rather than attempting to promote behavioral and cognitive changes in the dysfunctional individual alone, the family therapist views the family unit as the agent or system for achieving change. It is through the family that understanding of individual behavior is achieved. Actions by any single family member have an effect on all other family members. Family therapists may work with individuals, couples, parents and children, siblings, the nuclear family, the family of origin, and social networks in order to understand their clients' problems and to formulate strategies for change.

ETHICAL STANDARDS IN FAMILY THERAPY

Gayla Margolin observed that the ethical questions facing the family therapist are even more different, numerous, and complicated than those faced by therapists who do individual therapy. In an attempt to provide guidance on how to deal with these ethical issues, the American Association of Marriage and Family Therapists published a code of ethics in 1991. The code addresses eight areas: (1) responsibility to

clients; (2) confidentiality; (3) professional competence and integrity; (4) responsibility to students, employees, and supervisees; (5) responsibility to research participants; (6) responsibility to the profession; (7) fees; and (8) advertising.

Most of these areas (areas 3 through 8) are essentially the same for individual and family therapists because they focus on only the therapist: his or her qualifications and training, behavior, and income. It is in the first two areas of responsibility to clients and confidentiality that unique ethical issues confront the family therapist. These unique ethical concerns have been summarized by Gerald Corey, Marianne Schneider Corey, and Patrick Callanan (1993) in four general areas:

1. *Treating the entire family.* Most family therapists believe that it is crucial for all members of the family to participate. Ethical questions arise when a family member or members refuse to participate. Coercing militant members to participate is unethical. Some therapists may withhold therapy until all members participate, but this strategy is controversial. Besides resembling coercion, it can be argued that this tactic denies therapy to the willing participants.

Conversely, Rachel T. Hare-Mustin contends that involving the whole family may not always be in the best interests of a particular member. Giving priority to the good of the entire family may jeopardize the legitimate goals or desires of that member. Ethical considerations require the therapist to minimize risks for any family member.

2. *Value system of the therapist.* The therapist's value system crucially influences the course of family therapy in two ways: first, when the therapist has values that are different from those of a member or members of the family, problems can arise; second, value systems influence the formulation and definition of the problems that are presented, the goals and plans for therapy, and the course the therapy takes. For example, Irene Goldenberg and Herbert Goldenberg contend that family therapists generally believe in maintaining the family way of life. Such a belief could, however, be harmful or inappropriate under some circumstances.

Ethical considerations demand that the therapist make known his or her attitudes and commitments to each family member. Gerald Corey et al. further state that it is not the function of the therapist to make decisions for clients or dictate how they should change.

The therapist's role is to provide insight into family dynamics and to help and encourage the family to make necessary changes. The therapist must be aware of how his or her values can influence the course of therapy.

3. *The ethics of consulting.* This issue arises if one of the family members terminates joint sessions and begins therapy with another therapist. To complicate the situation further, Corey et al. pose a situation in which a person might persuade other family members to also consult with his or her therapist while still seeing their original therapist. Is this new therapist ethically obligated to consult with the original therapist? Are the two therapists ethically obligated to receive permission of their clients before talking with each other? Would it be ethical for the two therapists to ignore each other? These are difficult questions to answer.

4. *The issue of confidentiality.* In the course of family therapy, the therapist will see the family as a group and also individually. During individual sessions, of course, the client may divulge information that is not known to other family members. What is the ethically correct approach regarding the confidentiality of information revealed during these one-to-one sessions? Some therapists will not reveal such information. Other therapists believe that it is appropriate to reveal such information under appropriate circumstances that would benefit the rest of the family. Again, this is a difficult issue to resolve.

The implications of revealing confidences can be serious. Revealing confidences may, however, facilitate resolution of the family's problems. Corey et al. suggest a middle position. The therapist is ethically obligated to inform the family that information revealed during private sessions may be divulged, if in the therapist's opinion that shared information would benefit the family. This position allows the therapist maximum flexibility and options to act in the family's best interests.

In conclusion, the increasing popularity and usefulness of family therapy require sensitivity to and understanding of the unique ethical issues it can present to the family therapist.

Family values

DEFINITION: Qualities of life that are necessary for the preservation of, or arise out of the practice of, the family as a social institution

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The family is one of the most important and powerful institutions for the creation, perpetuation, and inculcation of values. The precise meaning of the phrase "family values," however, is a source of controversy. The phrase has been used, beginning during the 1980's, to refer only to those values preserved within morally and politically conservative families. More recently, leftist political and moral leaders have attempted to reclaim the phrase to refer to their own value systems.

"Family values" is a complex concept, and such terms as "family," "family life," and "moral development" appear as frequently as does the term "family values." No one word or idea adequately expresses all that is involved; however, the two words in the

phrase suggest two vital elements: a family unit and values that hold the family unit together so that both social and personal needs are met.

"Family values" means, first of all, the existence of a family. In biblical thought (Gen. 1-2), the idea of family was integral to the creative activity of God. The beginning of humankind was cast in the form of family; namely, Adam and Eve and their children. Thus, values associated with the family are religious values or have religious connotations.

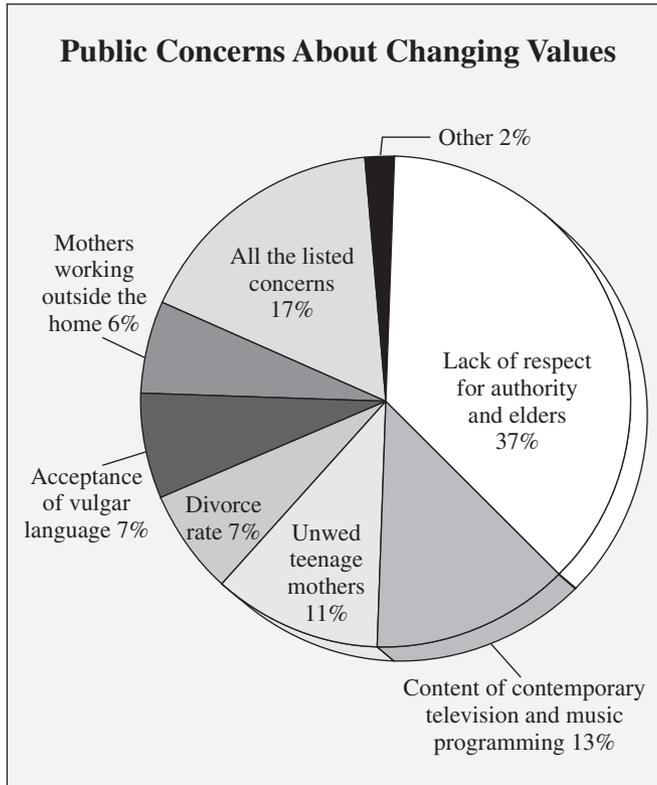

This religious idea of family carries through to the New Testament. When presenting a family code of behavior (Eph. 5-6), the apostle Paul specifically drew on Old Testament concepts. Ephesians 5.31 refers to Genesis 2.24, and Ephesians 6.2-3 refers to the Ten Commandments. Paul gave the family code as an example of walking (living) the Christian life (Eph. 4.1, 17; 5.1, 8, 15). Then he placed the code within the context of mutual submission of family members to one another (Eph. 5.21). The code itself (5.22-6.9) further emphasized these mutually beneficial relationships with a literary framework that may have roots in Aristotle (*Politics*, book 1, chapters 3, 12, 13). Thus, Paul Christianized the code and raised the status of every family member by emphasizing genuine care and concern of the members for one another—care based on Christian principles. Finally, the passage on walking the Christian life concluded with a call for Christians to overcome evil, not only in the home but everywhere, by means of all the defensive and offensive armor provided by God (Eph. 6.10-20).

With this as its background, the Christian concept of family takes on an aura of religious commitment. A man leaves his father and mother and cleaves to his wife. A woman leaves her father and mother and cleaves to her husband.

LOVE

This commitment and the mutual care and concern of the members provide enough glue to hold the family together for its own sake and against all assaults from outside. Without the glue, the unit dissolves. Whatever the reasons for joining together in the first place, there is a sense of mutual responsibility and commitment. At the heart of the idea of "values" in "family values" is love.

For this reason, child abuse, for example, is regarded as a heinous crime, not only because an indi-

Source: NBC News/Wall Street Journal Poll, June 16-19, 1999. Figures based on poll of 2,011 adult Americans.

vidual is hurt but also because the whole concept of a caring family unit is endangered. Similarly, divorce is also regarded as the antithesis of family because it dissolves the unit. Because of these views, many religious groups reach out to embrace and care for these splintered families. The individuals are valued for themselves, and this caring also helps to preserve the picture of the ideal family by showing that splintering is not the ideal.

IDEAL FAMILY

In “family values,” the ideal family is one with at least two essential poles: mother and father. Children are usually included in the ideal. This traditional concept is generally consistent with both philosophical commentary on the family and Christian views. In Christian thought, however, the ideal family is considered to be an instrument of God and the best means of fulfilling human needs and development.

Alternative family concepts challenge this ideal. Some of these alternatives result from necessity. Oth-

ers exist because of choices people have made. For example, there are single-parent families with female or male parents, couples without children, and families with divorced or separated parents. The list can go on and on. According to traditional ideals of family values, however, these alternatives are not the ideal and are therefore deficient to some degree.

“Family values” are about the family, not about business or religion or politics, even though “family values” intersect other sets of values. For example, one set of “family values” may include belief in God as integral to the family itself. Obviously, this value intersects specifically religious values. Beliefs that prohibit family members from lying and stealing and cheating also affect other values. Economic, educational, and other social values interact with “family values.” A family does not live in an ivory tower. Nevertheless, “family values” are usually given preference.

RESPONSIBILITY

For there to be a family and “family values,” someone must take responsibility for choosing and enforcing values. Someone must say, “We do this. We do not do that.” Enforcing values usually has two aspects. On one hand, someone must exercise discipline to enforce the values. On the other hand, someone must say, “I love you” and hold out a comforting embrace when the values are not met. Choosing and enforcing values in autonomous families is traditionally the task of parents, not that of state or social agencies.

Famine

DEFINITION: Extreme and protracted food shortages, causing widespread and persistent hunger and malnutrition, with associated health problems and substantial increases in death rates

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Throughout history governments have used famine to oppress citizens who oppose their policies or coerce them into participating in programs of the state.

Famines have occurred in many parts of the world throughout history. The earliest written reference to a

Time Line of Major World Droughts and Famines

<i>Date</i>	<i>Place</i>	<i>Event and estimated casualties</i>
3500 B.C.E.	Egypt	Earliest recorded famine.
1700 B.C.E.	India	Indus Valley civilization collapses because of drought.
436 B.C.E.	Rome	Thousands are said to drown themselves in the Tiber River to avoid starvation.
450 C.E.	Italy (Dufresnoy)	Parents said to eat their own children to survive.
1300	Southwestern U.S.A.	Cliff Dwellers vanish after drought.
1769-1770	India	Drought kills 3-10 million.
1790-1792	India	Doji Bara, or skull famine—so named because skulls of the dead were too numerous to count.
1846-1851	Ireland	Potato famine kills more than 1 million and spurs emigration of 1 million people to America.
1876-1878	India	5 million die.
1876-1879	China	9-13 million die.
1921-1922	Soviet Union	5 million die.
1932-1934	Soviet Union	5 million die in failed collectivization scheme.
1943-1944	India	More than 1.5 million die.
1960-1980	Sahel (West Africa)	More than 1 million die.
1967-1970	Biafra (Nigeria)	More than 1.5 million starve to death during civil war.
1975-1979	Cambodia	More than 1 million die during civil war.
1984-1994	Ethiopia and Somalia	Wars and droughts lead to starvation of more than 1 million.
1990's-	North Korea	More than 1 million have died
2000-	Ethiopia	Unknown

famine was in Egypt in 3500 B.C.E. Famines develop in situations in which there are too many people and insufficient food to feed them. The many causes of famines usually can be broken down into natural and human categories. Natural causes spring from unfavorable weather conditions, such as drought, heavy rains and flooding, plant diseases, and insect and vermin infestations. Human causes are primarily political and cultural in nature and are indicative of underlying problems in food production, distribution, earning capacity, medical care, and levels of development.

Some social scientists see famines as products of power relations, of the use of violence by states that leads to mass starvation. Famines occurred in early Roman times because of Rome's inability or unwillingness to transport food to regions experiencing shortages. It was a common practice for the Roman emperors to hoard grain in the center of the empire, while famines gripped other regions of the empire. The violence of warfare by both attacking and defending forces has caused famines not only by deliberately destroying crops and food supplies but also by disrupting distribution by sieges and blockades. Scorched-earth policies used by retreating troops to deprive their attackers of food have also starved local peoples who are dependent on their land.

In famine-stricken areas, populations generally turn to their governments for relief but do not always receive the help they seek. Government authorities may not admit the severity of famine conditions for fear that they will be held responsible for them. Rulers may ignore or conceal famine conditions in order to maintain their international prestige. The greatest mortality from famine in the twentieth century resulted from communist regimes withholding food supplies in order to coerce unwilling citizens into collectivization. During the 1930's, peasants in the Ukraine who resisted the Soviet government's proscription against private ownership of property burned their own grain and slaughtered their livestock rather than turn them over to the government.

Communist authorities confiscated what remained and prevented other food from entering the area. The result was Joseph Stalin's greatest atrocity, the Great Famine of 1932-1933, in which six million people died. In a similar way, Chairman Mao Zedong's Great Leap Forward program in the People's Republic

of China in the late 1950's resulted in twenty million to thirty million fatalities through malnutrition and famine. In both the Soviet Union and China, the communist parties exported grain while the famines raged.

The prevalence of widespread famines has continued in parts of Africa, Southeast Asia, and Latin America, but the ability of countries to import food and the efforts of international relief organizations have lessened the effects of modern famines. Developed nations face the difficult ethical choice of either helping oppressive regimes develop their countries' agricultural productivity in order to avoid famines or waiting until famine conditions require the shipment of food aid.

al-Fārābī

IDENTIFICATION: Muslim philosopher

BORN: 870, Farab, north of Tashkent, Turkistan (now in Kazakhstan)

DIED: 950, Damascus, Syria

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Influential in Islamic ethics and in medieval European thought, al-Fārābī's *The Agreement of Plato and Aristotle* (tenth century) attempted a reconciliation of Plato, Aristotle, and Neoplatonic philosophy.

Al-Fārābī's ethical thought is intimately intertwined with his Neoplatonic emanation scheme, in which the One generates a hierarchy of concentric spheres. The intellect of the lunar sphere (the active intellect) emanates pure intelligibles to the human realm. In *The Opinions of the Inhabitants of the Virtuous City* (tenth century), al-Fārābī argued that the immortality of the soul was dependent on its actualization in apprehension of that Intellect. The virtuous city is well-ordered, so that its citizens are reminded of a life beyond this one. Its citizens achieve moral virtue, which allows reason to govern appetites and passions, and they turn their attention to the gifts of the Active Intellect. Such souls find bliss in the afterlife. Less-actualized souls simply cease to exist (if they were ignorant of the Active Intellect) or, if they were excessively attached to bodily pleasures, endure a limited series of transmigrations or torment caused by separation from the body after death.

Al-Fārābī had an important place in the philosophy of Avicenna, Albertus Magnus, and, through them, Saint Thomas Aquinas.

Farrakhan, Louis

IDENTIFICATION: African American religious leader and minister of the Nation of Islam

BORN: May 11, 1933, New York, New York

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Louis Farrakhan filled an important leadership void in the Nation of Islam left by the death of Elijah Muhammad but became a controversial public figure.

Born with the name of Louis Eugene Walcott, Farrakhan changed his name to Louis X after joining the Nation of Islam. He later changed it again to Louis Farrakhan. Farrakhan was at one time the right-hand man of Malcolm X. Malcolm often referred to Farrakhan as his "little brother" when the latter was head minister of the Boston mosque and

Malcolm was the head minister of the Harlem, New York, mosque during the early 1960's.

After Malcolm was expelled from the Nation of Islam in 1964 for making disrespectful statements about the assassination of President John F. Kennedy, Farrakhan grew critical of Malcolm's attacks on the ethical behavior and sexual immorality of Elijah Muhammad. Farrakhan said that Malcolm deserved to die and that Malcolm would not get away because of his criticisms of the Nation of Islam and Elijah Muhammad. Although Farrakhan has never denied making such statements, he has steadfastly denied having anything to do with Malcolm X's assassination in 1965. Similarly, when Jesse Jackson ran in the democratic presidential primaries in 1984, Farrakhan threatened that harm would come to anyone who attempted bodily harm to Jackson.

In 1975, Farrakhan succeeded Elijah Muhammad as the head of the Nation of Islam after Muhammad's death. Questions related to Farrakhan's ethical conduct were raised in connection with his relationships with both Malcolm X and Jesse Jackson. In the first case, Farrakhan had implied (but later denied) that he would be associated with the death of Malcolm X. In the second case, he tacitly asserted that injury would come to anyone who harmed Jackson. Both cases raise the issue of ethical or unethical behavior related to threats outside the normal boundaries of morality in the political system.

Fascism

DEFINITION: Governmental system of, or political belief advocating, autocratic rule by a charismatic leader and subordination of the individual to the nation or race

DATE: Term coined in 1919

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Fascism severely restricts or eliminates personal liberty; punishes opponents by imprisonment, torture, or death; and regards all peoples not of the officially decreed nationality as inferior.

Like communism, fascism is a type of totalitarian system that attempts to control every aspect of life (political, economic, and personal), usually through a secret police force. Unlike communism, however, fascism allows private ownership of industry as long

as the government or its authorities are served. Fascism also promotes extreme patriotism (“state over self”), militarism, and the organized persecution of minorities. A fascist government controls newspapers, radio, and other means of communication in order to issue propaganda supporting its policies and to silence all opposing views.

Some historians trace the origins of modern fascism to the dictatorship of Napoleon Bonaparte of France, who controlled his country through some fascist means. Later dictators adopted many of his methods, as well as harsher ones. Benito Mussolini, who first used the term “fascism,” controlled Italy from 1922 to 1943.

In Germany (where fascism reached its zenith) Adolf Hitler and his fascist Nazi Party began in 1933 to wipe out all opposition and systematically destroy the Jewish race, Slavs, Gypsies, the mentally ill, and other “inferior” groups. During the 1930’s, fascist

Image not available

parties gained much support in Hungary, Japan, Romania, and Spain. Fascists usually come to power after some national disaster by promising to revive the economy and to restore national pride.

Fatalism

DEFINITION: Belief that all events are predetermined by forces beyond human control, and hence that one's destiny cannot be altered

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Fatalism is a species of determinism that connotes resignation to one's destined end and a lack of resistance to the forces governing that end. It holds submission to one's fate to be the ultimate ethical wisdom.

Fatalism is a concept as ancient as civilization and as widespread as the human race. The English word "fate" is from the Latin root *fatum*, meaning "oracle" or "prophecy." Both the Greeks and the Romans were persuaded that three goddesses, the Fates—Atropos, Clotho, and Lachesis—determined one's destiny.

Similar beliefs, however, were evidenced in Celtic, Germanic, and other mythologies, in which "norms" or "powers" overruled human desires and initiative. Fatalism is apparent in the Hindu concept of karma (the factor that binds one to cycles of rebirth), the Muslim teaching of *kismet* ("one's allotted role"), and certain types of Christian predestinationism. Modern philosophies and psychologies have offered "fatalism" in "secular garb," viewing history or personality as being controlled by impersonal and amoral forces.

Fāṭima

IDENTIFICATION: Daughter of Muḥammad

BORN: c. 606, Mecca, Arabia (now Saudi Arabia)

DIED: 632, Medina, Arabia (now Saudi Arabia)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Revered throughout the Islamic world as the matriarch of the house of ʿAlī, Fāṭima stands as an exemplar of piety, spiritual purity, and spiritual power.

The daughter of Khadija and the Prophet Muḥammad, Fāṭima was married (in August, 623, or June, 624) to the Prophet's cousin, ʿAlī ibn Abī Ṭālib, and was the mother of Ḥusayn and Ḥasan. She and Khadija were the women most beloved by the Prophet, and the tragedies that befell her husband and sons contribute to the pathos of her story. Reverence for Fāṭima, whose father is the Prophet, is so deep that she is often referred to as *umm abīhā* ("her father's mother"). The Qur'an refers to God's wish "to remove uncleanness far from" the "Folk of the Household" of the Prophet (*sūra* 33:33).

Fāṭima is often included in that Household, which has contributed to her popular image as a model of purity (much as Mary the mother of Jesus is also revered in Islam). Such spiritual purity brings with it spiritual power (*barakat*), and Fāṭima is often asked to intercede on behalf of the faithful. Fāṭima, ʿAlī, and their descendants are still specially honored as *sādāt* (singular, *sayyid*) or *ashrāf* (singular, *sharīf*), and widely believed to participate still in the residual *barakat* of Muḥammad.

Fear in the workplace

DEFINITION: Emotion experienced in the face of job-related threats

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Fear can be both a cause and a result of unethical behavior.

Fear is fuel for unethical behavior, and unethical actions are fuel for fear. Fear is therefore both a cause of and a result of unethical behavior. When people man-

age ethically, they do not operate in an environment of fear. Fear is an emotion experienced in the face of threats or danger that one feels unable to control. It has two components: the presence or perception of a danger or threat and a lack of control over the danger or threat. Kathleen Ryan and Daniel Oestreich, in their book *Driving Fear Out of the Workplace* (1991), observe, "We see fear as a background phenomenon that undermines the commitment, motivation, and confidence of people at work. It is most easily observed as a reluctance to speak up about needed changes, improvements, or other important work issues."

EFFECTS OF FEAR

Managers often do not see the impact of fear because it is hidden in the process of how the work gets done. The cost of having fear in the workplace can be figured out by examining the influence of negative emotions on people's work. Ryan and Oestreich's research indicates that the two greatest impacts fear has on an organization are negative feelings about the organization and decreased quality and productivity. Fear translates into a loss of trust and pride, and employees often react to fear by increasing self-protective behavior. Negative feelings about the organization also result in sabotage (theft, fraud, and the destruction of company property). Fear translates into a lasting resentment, the making and hiding of mistakes, or failure to meet deadlines and budgets. W. Edwards Deming has said that quality is impossible to achieve when people are afraid to tell the truth. They fear being ethical. Scrap and breakage are hidden, numbers and schedules are misrepresented, and bad products are shipped to customers because someone is afraid to stop the production line.

Fear shows up in "falsifying" reports and overpromising customers. Employees may not ask for personal time off for fear that their supervisors will not understand and their requests will be denied, so they lie and call in sick. Falsifying reports, overpromising customers, and calling in sick when one is not soon become the norm. Employees become used to behaving unethically. There is an old saying, "It is easy to tell a lie, but difficult to tell only one." Negative feelings about the organization make unethical behavior easier to live with.

Fear is often at the center of "whistle-blowing." The employee fears the results of the improper activ-

ity (harm to employees, customers, or the community) and also management's reaction. He or she feels pushed to go outside to have the injustice resolved. The employee does not trust management to handle the problem.

WHAT CREATES FEAR

The employee's relationship with his or her immediate supervisor has the most impact on creating fear. Ambiguous or abusive behavior destroys trust. Other behaviors contributing to fear are blaming, insulting, and ignoring. A manager who is not fair, who plays favorites, or who takes credit for an employee's idea invites mistrust from subordinates and executives. Unethical actions such as asking employees to mislead and lie to customers send a signal that perhaps the employees are being misled and lied to as well. Ethical management is at the center of efforts to create an atmosphere in which fear cannot survive. A good relationship with one's manager is a start.

The systems, procedures, and culture of the organization also contribute to fear. Will the company support the employee or not? The employee asks, "My manager is okay, but if I complain to the human resources department about a sexual harassment incident, will I be labeled a troublemaker and laid off in the next round of cutbacks? Is top management really concerned about people, customers, and employees? Is the leadership honest and does it convey a sense of integrity? Is management honestly communicating to employees about the health of the company?" The prevalence of rumors signals a culture of fear.

In an atmosphere of fear, managers and employees do not trust one another. Managers believe that employees are manipulative and operate only on the basis of self-interest. Employees worry that their managers will put their own self-interest ahead of the needs of employees and customers. Each group fears the other and reacts out of fear. It becomes a self-propagating behavior. If I fear that you will act first in your self-interest, I will interpret all your actions in the light of that fear, and react accordingly with self-preserving behavior and retaliation. It is not difficult to imagine the unethical actions that permeate such an environment.

FEAR AND UNETHICAL BEHAVIOR

Laura Nash says, in *Good Intentions Aside* (1990), "I cannot think of a single ethical problem in busi-

ness that does not rest on a . . . betrayal of trust.” Which comes first, lack of trust and fear or unethical behavior? Fear is not the only cause of unethical behavior. Another cause is the lack of awareness of the ethical implications of decision making. Unethical behavior is not fear’s only result. Good employees often leave a company in which there is an environment of fear. Fear is both a cause of and a result of unethical behavior. It is a red flag, a signal that the health of the organization needs attention. If company employees and managers look for the effects of fear and take action to develop an atmosphere of trust, the ethical pulse of the organization will improve accordingly.

Howard Putnam, in *The Winds of Turbulence* (1991), summarizes fear’s effect: “Fear is the most imposing barrier to transformation. Fear flows from the feelings of instability caused by dealing with the unknown, and it can strangle creative thinking.”

The Feminine Mystique

IDENTIFICATION: Book by Betty Friedan (1921-)

DATE: Published in 1963

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: *The Feminine Mystique* challenged the then-prevalent view that women should be completely (and only) fulfilled by their roles as wives, mothers, and homemakers.

Friedan defined the feminine mystique as the myth of female fulfillment based on domestic labor and proposed that the myth is based on a vision of woman not as a whole person but only in terms of her sexual role. This limiting view of woman, which further suggested that a woman’s value could be expressed only through her potential as wife and mother, discouraged women from pursuing educations or professions, thus effectively trapping them within the myth.

According to Friedan, post-World War II economic and social factors combined to force American women to confine their interests and energies solely to serving their husbands and children through their roles as housewives, a situation that led women to devalue themselves and their contributions to soci-

Betty Friedan, author of *The Feminine Mystique*.

ety. She based this assessment in part on extensive interviews with women, many of whom were highly educated and were plagued with feelings of frustration, guilt, and inadequacy because they were not completely satisfied by the rewards of homemaking. These women felt isolated from one another and alienated from society by their failure to conform to the myth. Friedan asserted that women must look outside the narrow role assigned to them by the feminine mystique in order to discover identity and fulfillment.

Feminist ethics

DEFINITION: Ethics that are grounded in a feminist perspective and that are characterized by a feminist commitment that calls into question traditional ethical assumptions and seeks to construct ethics that are more inclusive of women's lived experiences

DATE: Emerged during the 1960's

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Emerging as a reaction against the traditional, male-dominated modes of doing ethics, feminist ethics both critiques traditional ethics and seeks to redefine the field and its methods.

Feminist ethics developed out of the feminist movement of the mid-twentieth century. Feminist ethical theories reflect the diversity of feminist theories. Liberal, socialist, radical, social constructionist, and post-modern feminism have all influenced feminist ethics. It is neither simply defined nor monolithic in perspective. However, feminist ethics can be defined as ethics with gender issues as its main organizing principle, characterized by a commitment to the general feminist goal of gender equality, the critique of Western traditional ethics, and the reconstruction of traditional ethics to include women's lives and experiences.

CRITIQUING TRADITIONAL ETHICS

Feminist ethics criticizes the notion of the moral agent as dispassionate and disengaged for its failure

to recognize the social foundation of self. Following on Carol Gilligan's critique of Lawrence Kohlberg's work on moral dilemmas and moral decision making, feminists reject what they see as an androcentric, or male-dominated, notion of the moral agent who stands outside a social context. The construction of an idealized human moral agent has been shown to actually mean "man" in its particular sense and not the so-called inclusive sense that male ethicists, theologians and philosophers maintain is what they "really mean." The detached moral agent ignores, hides, and makes invisible the inequality between men and women. The emphasis on justice as an abstract principle unrelated to social life made women's lives and their concerns invisible in most traditional ethical theories.

CONSTRUCTING A FEMINIST ETHICS

Early feminist attempts at moral theorizing claimed not only that women's issues were being ignored but also that women and men define and interpret moral problems differently. Carol Gilligan characterized women's morality as an "ethic of responsibility." Nel Noddings calls women's morality an "ethic of caring." Sara Ruddick ties ethics more specifically to women's lives by using the term "maternal thinking" for understanding women's ethical and moral behavior. However, as other feminists and critics point out, this kind of feminist ethical theorizing tends to valorize "feminine" traits or characteristics in ways that make it seem as if women "naturally" think in these ways.

Later feminist ethicists have tried to avoid such essentialist notions by reconstructing ethics based on women's lived experiences. They understand women's moral thinking and choices as contextualized in a particular community: family, neighborhood, or workplace. These choices are the result of living in particular social circumstances rather than tied to biological characteristics. Therefore, feminist ethics are seen to be constructed out of the diversity of women's experiences. Ignoring social context and relations within a family, community, or workplace limits women's moral agency.

Alison Jagger and others have brought together the traditional ethical concern for justice with these so-called feminine concerns. A feminist approach to ethics must offer a guide to action that will tend to subvert rather than reinforce the systematic subordination of women. Jagger also sees feminist ethics as

an extension of politics handling moral issues in both the so-called public and private domains, providing guidance on issues of intimate relations, such as affection and sexuality, which, until quite recently, were largely ignored by modern moral theory. Feminist ethicists are developing ways of dealing with actual problems through consideration of both justice and care.

FEMINIST ETHICS, DIVERSITY, AND CHOICE

Analyses of women's experiences bring to light a crucial component of how feminist ethics are socially constructed. Women's lives are different—not only from men's lives but also from one another. If feminist ethics are to be based on the experiences of all women and avoid the problem of false universalization, then such differences in women's experiences must be acknowledged and incorporated into feminist theory. This inclusive relationality takes into account the economic as well as the social and cultural dimension in moral decision making and understanding how it often constrains women's choices. The economic dependency of women in the family, the inequality of pay and promotion in the labor force tied to women's role as child-bearer and child-rearer, the possibility of sexual harassment or physical abuse from a stranger or an intimate, and further, in psychological terms, the tendency toward lack of ego differentiation in women's personality formation are all factors impinging upon women's sense of a self that can be autonomous in confronting or defining ethical situations.

A framework for feminist ethics starts with reflection upon concrete situations. Challenging abstract models of ethical theorizing, Carol Robb has argued that morality and ethics cannot be tested via prefabricated dilemmas based on an androcentric viewpoint. "Doing ethics" means that ethicists must gather data about the historical situation and context: They must analyze the roots of oppression, uncover loyalties and community ties as well as political ones, and eventually clarify a theory of values rooted in women's lived experiences. Feminist ethics, then, are transdisciplinary, using perspectives from philosophy, sociology, psychology, education, medicine, theology, business, and the natural sciences.

Feminist ethicists have expanded traditional ethical theorizing by exploring the moral dimension of all aspects of women's and men's lives, breaking

down distinctions between the public and the private. From procreative choice, abortion, and new reproductive technologies to gendered work and the economy, issues of peace and war, and the environment, social analysis is inherent in almost all feminist ethics. How do social institutions work? How do they shape the ways in which people structure their lives, their moral development, and their ethics? Feminist ethics are socially constructed within the context of culture and society, history, and geography. Rather than a complete theory and method, feminist ethics are a process based on the ongoing experiences of women's and men's lives.

First Amendment

IDENTIFICATION: Amendment to the U.S. Constitution providing that government may not establish a religion, interfere with an individual’s religious liberty, or abridge freedom of speech, press, or assembly or the right to petition the government for a redress of grievances

DATE: Adopted on December 15, 1791

TYPE OF ETHICS: Civil liberties

SIGNIFICANCE: The First Amendment guarantees various aspects of the freedom of conscience: It ensures that citizens of the United States may hold any beliefs, may express those beliefs, may worship in accordance with those beliefs, and may gather to discuss those beliefs, without government interference. It also protects the rights of the people to watch over, and respond to transgres-

First Amendment Controversies

<i>Issue</i>	<i>Reasons to Limit</i>	<i>Reasons Not to Limit</i>
Does the First Amendment protect the right of members of the Native American Church to use peyote as part of their religious rituals?	Peyote is a controlled substance. To permit its use might endanger the lives of the user and others.	The free exercise of religion by the Native American Church requires the use of peyote. Freedom of religion should not be infringed.
Does the First Amendment protect the right of art galleries to display publicly artworks that may be considered obscene or offensive?	The First Amendment does not protect pornography or obscenity. If a work is considered offensive by people in the community, it should not be displayed.	Freedom of speech and freedom of the press imply free expression. Art is in the eye of the beholder.
Does the First Amendment protect those who burn the American flag in violation of state laws?	The flag is the country’s most important symbol. State governments ought to be allowed to protect it.	Burning the flag is as legitimate an act of protest as speaking out against a government policy. Preventing flag-burning would be banning a form of political expression.
Should schools and public libraries ban books that contain racially offensive terms?	Use of some racial terms is offensive and may lower the self-esteem of minority students.	Censorship restricts the flow of ideas. Students would be prevented from reading literature that was written in a time when such terms were considered more acceptable.
Should the press be allowed to print any government documents?	The press’s freedom should be restricted to ensure national security.	Government decisions should be exposed to the will of the people.
Should newspapers and the media be allowed access to participants in a trial before a verdict has been delivered?	Unlimited discussion of trial-related matters in a public forum may infringe upon Fifth Amendment rights to due process.	All matters of public concern should be open for discussion.

sions by, the government, whether through the press, through public acts of political dissent, or through direct governmental petitions.

For the framers of the U.S. Bill of Rights, the freedoms of religion and speech were the most important substantive liberties. Years of struggle, often violent, between Protestants and Catholics in England persuaded Americans that the government should have no role in promoting religion or in controlling religious observances. Three additional themes provide the most common justifications for considering these the “first” liberties: The first stresses the value of liberty of conscience in promoting individual self-realization and self-expression, the second emphasizes the importance of free communication and discussion for informing the citizenry in a representative democracy, and the last emphasizes the value of free discussion in establishing truth in the “marketplace of ideas.”

First Amendment questions often arise in the United States, and many Supreme Court cases have been devoted to settling such issues as subversive advocacy, obscenity, school prayer, and flag burning.

Five precepts of Buddhism

DEFINITION: Buddhist vows to abstain from taking life, stealing, sexual misconduct, lying, and using intoxicants

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The five precepts, which are incumbent upon all Buddhists, both laity and priests, are the basic ethical tenets of Buddhism.

Traditionally associated with the Buddha (Siddhārtha Gautama, c. 563-c. 483 B.C.E.) but generally taught in older Hinduism as well, the five precepts are roughly equivalent to the ethical rules in the Ten Commandments.

The first, the precept to abstain from taking life, includes any intention to use either direct or indirect

means to cause death. It refers not only to human but also to other animal life. As a consequence, most Buddhists are vegetarians.

The second precept requires abstinence from taking what is not given and includes trickery and gambling as well as outright stealing. The blameworthiness of an offense depends partly on the value of whatever is stolen and partly on the worth of its owner.

The third precept, to abstain from sexual misconduct, precludes homosexual sexual relations as well as heterosexual relations with family members, married persons, concubines, slaves, and others. For monks, the precept requires celibacy.

The fourth precept, to abstain from false speech, refers to words and actions that are intended to deceive others. It also prohibits deliberately concealing the truth.

The final precept, to abstain from intoxicants, prohibits both alcohol and other drugs that dull the mind. These precepts are supplemented by as many as five more for monks or serious lay practitioners.

Forgiveness

DEFINITION: Act of giving up one’s resentment toward a person who has morally wronged or seriously disappointed one

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Forgiveness is a defining characteristic of God in portions of the Judeo-Christian tradition and a central human virtue in Christian ethics, but it is a questionable virtue in modern secular ethics.

The concept of forgiveness occurred first as a revealed characteristic of God: God announced to Moses that God forgives creatures’ sin (Exodus 34:6-7). Early Judaism (c. 250 B.C.E. to 200 C.E.) taught that forgiveness was a personal virtue for humans. The New Testament commands people always to forgive one another, because they all have enjoyed

God's forgiveness (Matthew 5:7, 6:12, 14-15, 18:21-35; Ephesians 4:32; Colossians 3:13; and the book of Philemon).

Outside this Judeo-Christian context, a forgiving spirit has been called a vice rather than a virtue. Moral philosophers since the 1970's have examined in the context of secular ethics both the definition of forgiveness and the ethics of forgiveness (Is a readiness to forgive always a virtue for humans? Is forgiveness a duty?). Here are some highlights of this rich debate.

DEFINING FORGIVENESS

What is forgiveness? The occasion for forgiveness entails one (or someone one identifies with—as a parent identifies with her child, for example) being mistreated by someone. This offense may be moral wrongdoing, but it is also possible to forgive close friends when they do nothing morally wrong but deeply disappoint one. Forgiveness is not an emotion itself, but it involves letting go of negative emotions such as hatred, contempt, or deep disappointment toward the offender.

Forgiveness may be a decision, but often it is a difficult process of construing in a new way the mistreatment and the offender, and this process is only partially under one's control. Either way, forgiveness must be deliberate and directed toward mistreatment. Simply forgetting about it, coming to see it as not mistreatment after all, and engaging a therapist to focus one's attention away from it are ways of curbing negative emotions caused by the injury, but they do not count as forgiving the offender. Also, the reason for forgiving must be concern for the offender's welfare or some other concern for others. Letting go of negative emotions only because one is tired of dealing with them might be advisable sometimes, but it is not forgiveness, because it is self-absorbed.

A forgiving spirit has seemed to many to be a virtue because forgiveness appears to be a morally acceptable, healthy way of dealing with negative emotions. Hatred or disappointment, when harbored, begin to distort one's moral sensitivity and sense of fairness toward others. Releasing these emotions helps one to see and to act morally. In the context of a personal relationship, forgiveness enables us to reestablish the intimacy and caring we enjoyed.

Is forgiveness always morally acceptable? Consider a tough case. Suppose a person motivated by

cruelty hurts one in a serious way. Self-respect and respect for the moral law (which includes condemnation of all malicious wrongdoing) causes one to be angry at this cruel offense. Why should one ever give up one's righteous indignation and forgive the offender? If one forgives, will one not either ignore wrongdoing or cease to condemn it? Either way (by willful ignorance of or lack of concern for moral offense) one will endorse cruel treatment of others and fail to respect oneself as a person valued by the moral community. In this case, is not forgiveness morally wrong?

Granted, if one's ultimate loyalty is to an abstract moral order, forgiveness in this and other such cases would be unacceptable. The order must be preserved, and one must do one's part to preserve it by harboring righteous hatred for serious moral offenders. We cannot afford to "hate the sin but love the sinner." In the context of a secular ethic, a generous, forgiving spirit would be a vice.

However, in the Judeo-Christian worldview from which the concept of personal forgiveness originated, one's ultimate loyalty is to a generous God who desires the moral growth and flourishing of each created person. The moral order is important in this perspective, but human loyalty to it is part of one's fundamental commitment to God. When one is cruelly treated, one naturally responds with anger first. Yet one prays to see the situation from God's point of view. As one deeply enters God's perspective, one continues to see the offense honestly, in all of its cruelty, and the offender as malicious. One also sees the offender in a more complex way, however, as a person with problems, hurting others, and yet a person deeply loved by a God who can reform and correct the offender. A Christian must leave to God the role of judge and executioner, and accept a role as a coworker with God in caring for the offender. This perspective enables one to love the offender, while maintaining self-respect and respect for the moral order.

Modern debates on forgiveness highlight key differences between secular and Judeo-Christian ethics. These differing moral evaluations of forgiveness remind one that ethical theories cannot be fully understood or evaluated apart from the worldviews that they presuppose.

Foucault, Michel

IDENTIFICATION: French philosopher

BORN: October 15, 1926, Poitiers, France

DIED: June 25, 1984, Paris, France

TYPE OF ETHICS: Modern history

SIGNIFICANCE: A philosopher and activist whose *Discipline and Punish: The Birth of the Prison* (*Surveiller et punir: Naissance de la prison*, 1975) helped bring about significant prison reforms in France, Foucault believed that societal norms and morality are revealed in studies of those individuals who are excluded from society. His other works include *Madness and Civilization: A History of Insanity in the Age of Reason* (*Folie et déraison: Histoire de la folie à l'âge classique*, 1961), *The Order of Things: An Archaeology of the Human Sciences* (*Les Mots et les choses: Une Archéologie des sciences humaines*, 1966), and *The History of Sexuality* (*Histoire de la sexualité*, 1976-1984).

Foucault and Genealogy

In many ways Michel Foucault is the philosophical descendant of German philosopher Friedrich Nietzsche, author of the 1887 work *On the Genealogy of Morals*. Foucault's lifelong project is best understood as an extended "genealogy of morals," in which he examines the history of fundamental moral categories such as guilt and innocence. The purpose of genealogy, for both Foucault and Nietzsche, is to demonstrate that these categories *have* a history. They are not immutable, eternal, self-evident aspects of human nature but are rather constructed in different ways by different societies at different historical moments.

The entity at the center of both Nietzsche and Foucault's genealogical projects is what they refer to as the "modern soul." Foucault understands this soul to be the creation of specific nineteenth century disciplinary institutions such as the asylum, the prison, and the school. These institutions teach their inmates to discipline themselves by placing their inner identities under ethical scrutiny. In so doing, they create a new object of study and repression (the soul), as well as new techniques and sciences for understanding and manipulating people (such as psychology, behaviorism, statistics, and criminology). For this reason, Foucault proclaims, "the soul is the prison of the body."

Michel Foucault was a twentieth century French philosopher who studied the concept of "principles of exclusion." His career at the University of Paris-Vincennes and the College de France expressed two broad themes. The first, which was represented in Foucault's 1961 book *Madness and Civilization*, focused on mental illness and society's response through the institution of the insane asylum.

Later, Foucault began to expand the concept of exclusion to include the penal system and prisons, and in 1975 he published *Discipline and Punish: The Birth of the Prison*. In this book, Foucault described the societal changes that led to the move from castigating the body by means of torture to imprisoning both the body and the spirit. Capitalist society, said Foucault, is a carceral society of control and domina-

tion. Later in his life, Foucault focused on the evolution of human self-mastery. In *The Order of Things: An Archaeology of the Human Sciences*, he surveyed the history of ideas and categories of thought in order to understand societies' self-definitions. His *History of Sexuality* was an attempt to determine the relationships of individual and social attitudes with human sexuality.

Perhaps Foucault's most lasting contribution to philosophy and social theory was the concept of "power/knowledge." Foucault believed that all social practices, all knowledge, and indeed all things in the world are created through, express, and perpetuate relationships of power. This notion has several profound ethical consequences. First, it means that every action, every thought, and every belief of every person either supports or resists the current configuration of power, so that people have a moral responsibility to understand their relationship to power and to act only in ways which will increase human freedom and reduce dominance. Second, however, Foucault is often read to believe that attempts to increase freedom or resist dominance are inherently doomed, since power is in operation at all times and in all places. Finally, the doctrine of power/knowledge constitutes as assertion that the fact/value distinction is a myth, since all facts are actually the product of power, and there can be no disinterested or objective truth.

Foundations of the Metaphysics of Morals

IDENTIFICATION: Book by Immanuel Kant (1724-1804)

DATE: *Grundlegung zur Metaphysik der Sitten*, 1785 (*Fundamental Principles of the Metaphysics of Ethics*, 1895; better known as *Foundations of the Metaphysics of Morals*, 1950)

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: *Foundations of the Metaphysics of Morals* is the clearest and most concise statement by Kant of his basic approach to ethics, an approach that is now regarded as the model of rationalist, deontological ethics.

Foundations of the Metaphysics of Morals is a preliminary sketch of the fundamental metaphysical laws governing moral experience. These laws are metaphysical in that they can be discerned a priori—that is, by the exercise of pure reason and without reference to psychology. Kant's goal is to set forth the supreme principle of morality. The attempt is organized into three sections. In the first section, he argues that only a will may be good in any unqualified sense. For Kant, a good will is one that acts not only in accordance with duty but also from a sense of duty. The standard of a morally good action, then, is that it is performed simply because it is right. This conception of duty (as the condition of a will that is good in itself) leads Kant to formulate the principle that governs the good will. He calls this principle the categorical imperative: Act only according to that maxim that you can at the same time will that it should become a universal law. In section 2, Kant offers a closer analysis of the nature of the categorical imperative and of derivative (and thus, he thinks, equivalent) formulations of it. Finally, he defends the autonomy or freedom of the will in section 3.

Four noble truths

DEFINITION: Buddhist doctrine asserting that existence is marked by suffering, that suffering is caused by desire, that desire can be overcome, and that there is a specific way to overcome desire

DATE: Formulated in the sixth century B.C.E.

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The doctrine of the four noble truths, which is perhaps the most basic tenet of Buddhism, provides the foundation of Buddhist ethics.

The Four Noble Truths

1. All existence is characterized by suffering.
2. Suffering is caused by desire.
3. Desire, and therefore suffering, can be overcome.
4. The way to overcome desire and suffering is to follow the eightfold noble path.

The first of the four noble truths states that life entails suffering. There is no way to escape this facet of existence. The fact that existence is characterized by suffering should not, however, be taken to mean that suffering is all that is experienced in life. It is also possible to feel happiness, joy, comfort, and many other positive and neutral emotions and sensations. The problem is that no sensation lasts. When an individual experiences joy, it is inevitable that that joy will end. It is also true that negative emotions and sensations do not last, but that is not where the problem lies. It is the transitory nature of happiness and satisfaction that causes problems for people.

The second noble truth states that the cause of suffering is desire. People typically seek experiences that they believe will make them happy and shun experiences that they think will make them unhappy. This process is, however, extremely problematical. Often, the process of striving for happiness does not give rise to happiness. People's positive expectations about their lives may remain unrealized. Unexpected problems may arise or things simply may not happen in the way that was intended. In such cases, it is all too easy for people to attempt to block out negative experiences and continue to strive for happiness. This attempt is easy to understand, but it can lead to an unwillingness to accept the unpleasant experiences that are an inescapable part of human existence, and when people attempt to reject the unpleasant parts of their lives, they can begin to live in a world of fantasy, divorcing themselves from their own experiences and creating further suffering for themselves by refusing to see things as they are. When people do not face up to the truth of their situations, they are hampered in their attempts to put things right.

The third noble truth states that there is a solution to the problem of suffering. It is not necessary to live in a world of wishes that will never be fulfilled. There is a definite method by which the problems of suffering can be overcome. This does not mean, however, that following this path will mean that one experiences no more suffering in life. What it does mean is that it is possible to accept all situations as they are, without magnifying or minimizing them. The real problem is not so much one's experiences as it is the way in which one reacts to one's experiences.

The fourth noble truth states that the solution to the problem of suffering is to follow the comprehensive method set forth in the eightfold noble path. The eight aspects of the path are (1) *samyag-dṛṣṭi*, right understanding; (2) *samyak-saṃkalpa*, right aspiration; (3) *samyag-vācā*, right speech; (4) *samyak-karmanta*, right action; (5) *samyag-ājīva*, right livelihood; (6) *samyag-vyāyāma*, right effort; (7) *samyak-smṛti*, right mindfulness; and (8) *samyak-samādhi*, right concentration.

APPLYING THE FOUR NOBLE TRUTHS

Right understanding involves, first, knowing and understanding the basic concepts of Buddhism. After one understands them rationally, one must work to test those concepts and, if one finds that they are sound, one comes to understand them on an experiential level.

Right aspiration means not only aspiring to understand and to practice Buddhism but also aspiring

The Eightfold Noble Path

<i>English</i>	<i>Sanskrit</i>
1. Right understanding	<i>samyag-dṛṣṭi</i>
2. Right aspiration	<i>samyak-saṃkalpa</i>
3. Right speech	<i>samyag-vācā</i>
4. Right action	<i>samyak-karmanta</i>
5. Right livelihood	<i>samyag-ājīva</i>
6. Right effort	<i>samyag-vyāyāma</i>
7. Right mindfulness	<i>samyak-smṛti</i>
8. Right concentration	<i>samyak-samādhi</i>

to do so for the right reasons. Basically, this means that one should not be practicing to benefit oneself. Right aspiration means working toward living in a more selfless way.

In order to practice right speech, one must refrain from lying or deceiving in any way. In addition, one should not indulge in harsh language toward others or engage in slander or backbiting. Instead, one's speech should serve to promote harmony among people.

Right action involves refraining from killing sentient beings, from stealing (or taking what is not given in any way), and from engaging in unlawful sexual intercourse, such as adultery or incest.

Right livelihood means not earning one's living by means of deception or trickery, not trading in arms, not trading in living beings of any kind, not selling flesh of any kind, not selling intoxicants or poisons, and not engaging in any kind of livelihood that involves killing beings, such as being a soldier, a hunter, or a fisherman.

Right effort means preventing evil thoughts, suppressing those evil thoughts that have arisen, cultivating good thoughts, and maintaining good thoughts after they have arisen.

Right mindfulness and right concentration refer to the practice of meditation, which can take many forms. It particularly involves the cultivation of awareness and the direct perception of reality as it is, including particularly the truth that all things that apparently exist are in fact empty. There is no self, although people cling to the idea that the individual self exists.

By exerting oneself in these eight areas, according to Buddhist doctrine, it is possible to rid oneself of the desire that causes suffering, thereby solving the primary problem of existence by cutting it off at the root.

Fraud

DEFINITION: Deliberate deception intended to give one an advantage in a transaction

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Fraud is one of the fundamental kinds of unethical acts.

The long history of ethical condemnation of deception helps to show fraud's significance to ethics; in the Judeo-Christian tradition, for example, one of the Ten Commandments is "Thou shalt not bear false witness." This commandment is broad enough to cover fraud.

The famous English Statute of Frauds, which was passed in 1677 and has now been adopted in one form or another in almost every part of the United States, requires that one must "get it in writing" before one can sue to recover more than a specific monetary amount (for example, \$500) or to enforce a contract that extends beyond a certain period of time (for example, one year). The statute's point was to reduce the number of claims regarding purported fraud. Leaving important matters to memories of oral statements resulted too often in cases that pitted one person's word against another's.

Good faith precludes fraud even when honest mistakes are made. The classic slogan defining good faith is “white heart and empty head,” which refers to having good intentions but being stupid. Stupid mistakes are not fraud.

Deceptive advertising is a matter of degree, but at some point, exaggeration becomes fraud. This is especially true of intentionally false quantitative claims. Qualitative claims are difficult to classify as fraud, since quality is characteristically a matter of opinion rather than fact. Therefore, U.S. law recognizes “puffing” as nonfraudulent falsehood. Puffing is, essentially, an overstatement of the quality of something that is being sold. An example of puffing is a cologne maker’s claim that Cologne X makes one as “mysterious as the wind.” Furthermore, if the falsehood is so obvious that no reasonable person would be deceived by it, then stating that falsehood does not constitute fraud. (For example, one brand of toothpaste was sold with the claim that it would straighten teeth!)

Fraud can be committed by either commission or omission. A fraud of commission involves lying or making some other type of material misrepresentation. A fraud of omission involves the failure to disclose some significant fact that the law requires to be disclosed. Libertarianism, an ethical principle that has been politically influential, endorses the idea of *caveat emptor* (“Let the buyer beware”) rather than the idea that some bureaucracy should interfere with the free market by legally requiring disclosures. Libertarianism supports *laissez-faire* capitalism with only minimal government and opposes the welfare state that began with President Franklin Delano Roosevelt’s New Deal. Libertarianism condemns fraud but defines it narrowly, requiring that a lie be committed for fraud to exist.

Egalitarianism, by contrast, is an ethical principle that allows the mere withholding of information to be considered fraud. Egalitarians condemn exploitation, which involves taking advantage of an innocent person’s predicament. Therefore, egalitarians support laws defining fraud so as to include the failure to disclose key facts. Libertarians do not recognize the applicability of the concept of exploitation in its ethi-

cally pejorative sense. They view charging whatever the market will bear, for example, not as exploitation but as entrepreneurship, which they see as a virtue. The two approaches of libertarianism and egalitarianism correspond at least roughly to actual fraud and constructive fraud, respectively. Actual fraud involves some active deception or lie. Constructive fraud includes any act of commission or omission that is contrary to law or fair play.

Free enterprise

DEFINITION: Economic practice based on the principle that businesses should be allowed to organize themselves and compete in the marketplace free from excessive government regulation

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Free enterprise is the economic embodiment of the general principle that government should interfere in the affairs of its citizens as little as possible, and that self-regulation and mutual regulation are preferable to legal controls and standards.

Free enterprise is an economic system characterized by private property and private investment decisions, the profit motive, supply and demand as the regulator of prices, and limited government involvement. The economic systems of most Western European nations, the United States, Canada, Australia, and Japan are to varying degrees free enterprise systems.

Advocates of free enterprise fall into two categories. Members of the first category hold that free enterprise is morally neutral and that it is justified on practical grounds as the most efficient system known for producing wealth. Members of the second category agree that free enterprise is practical, but they argue that it is justified primarily on moral grounds.

MORAL JUSTIFICATION

Free enterprise is advocated as the only system that is, in principle, compatible with the requirements of human survival. To survive, individuals need values such as food and shelter. These values must be created by individual initiative and effort. (Cooperative ventures depend for their success on individual initiative and effort.) Therefore, human survival depends on individual initiative and effort.

In a social context, however, individuals run the risk of coercion by other individuals. Coercion is a danger to human life because it undermines individual initiative and effort: Coercion can end an individual's life (murder) or remove to some degree an individual's control over his or her life (slavery, assault, or theft). Coercion, accordingly, is wrong in principle, and all social arrangements should be based on the principle that only voluntary interactions are moral.

The rejection of coercion is spelled out in terms of rights. If murder, slavery, and theft are, broadly speaking, the fundamental social wrongs, then life, liberty, and property are the fundamental social rights.

ROLE OF GOVERNMENT

Since some individuals will resort to coercion in order to benefit from the productive efforts of other individuals, and since the primary social need of individuals is freedom from such coercion, it follows that there is a need for an institution with the power to protect individuals' rights: government.

The moral task of government is to ensure that individuals are at liberty to use their property as they see fit to sustain and enhance their lives. Governments thus are given the power to use coercion in defense of individuals' rights.

A government can use coercion against individuals, however, so individuals also need protection from their government. In a free enterprise system, this protection is provided by a constitution that limits the coercive power of government to defensive purposes. Since the political power of government is a coercive power and free enterprise requires that all economic transactions be voluntary, the constitution of a free enterprise system will require a separation of economics and politics. Governments will not be able to use political power to subsidize one business at the expense of another or, more generally, to redistribute wealth from one individual or group of individuals to another.

PRACTICALITY

If individuals thus have a reasonable guarantee of freedom from both other individuals and the government, they will invest, produce, and reap as much profit as their skills, dedication, and ingenuity allow them. They will be free to reinvest or consume their profits. They will be free to form voluntary associations (such as partnerships, corporations, and stock markets) to enhance their production and hence their profits. They will be free to pursue specializations, since specialization generally yields higher production, and to exchange their products in a market in which rates of exchange (prices) are governed by the forces of supply and demand.

The practicality of free enterprise is a consequence of individual effort. The freedom to pursue

profit releases enormous amounts of human productive energy, and this explains the historical success of free enterprise systems.

CRITICISMS

Free enterprise is sometimes criticized for being harsh, since it provides no guarantee of success for all individuals. Since some individuals will fail, the critics continue, the government should use its coercive power to redistribute some wealth from the successful to the needy. Advocates of free enterprise respond that using coercive means to redistribute wealth is not only impractical—since coercion undermines the conditions of wealth production in the first place—but also immoral, since it involves coercively using individuals as a means to the ends of others. There is nothing to prevent the establishment of voluntary charitable associations to assist those in need, and in a free enterprise system the only moral way to solve problems is through voluntary associations.

Free enterprise is also criticized for encouraging the profit motive. Advocates of free enterprise respond that the profit motive is moral. It is moral that individuals take charge of their lives, and profit is necessary for life. To stay alive, an individual must consume at least as much energy as he or she expended in producing the value to be consumed, and to grow, an individual must consume more energy than he or she expended in producing the value. In economic terms, this means he or she must achieve a net return on the investment—that is, profit.

Finally, free enterprise is sometimes criticized for leading to inequalities in wealth. Advocates of free enterprise respond that the only relevant sense of equality in this context is equality before the law. As long as the government ensures that everyone plays by the same rules, the fact that individuals of differing natural endowments, acquired skills, and moral characters will acquire different amounts of wealth is perfectly just.

Free-riding

DEFINITION: Enjoying a benefit produced by the efforts of others without contributing a fair share oneself

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Free-riding is generally considered unfair behavior that threatens the success of cooperative endeavors among people.

Free-riding, as the expression suggests, involves gaining a benefit, such as a ride, at no cost to the one enjoying the benefit. Free-riding activity is seen as unfair, at least where the provision of the benefit involves costs borne by some and there is an expectation that those enjoying the benefit share in the cost.

One of the more common uses of the idea in ordinary contexts is in connection with union membership. Typically, in labor relations in the United States, one union or agent is authorized to serve as the exclusive representative of workers in a bargaining unit. Under such exclusivity, the union can speak for all the employees, but all the employees in turn have a

right to be fairly represented by the union as their agent. Each employee is thought to have a duty to pay a fair or proportionate share of the cost of such representation; those not paying their share are accused of free-riding.

Samuel Gompers, an early leader in the American labor movement, stated the point as follows: “Non-unionists who reap the rewards of union efforts, without contributing a dollar or risking the loss of a day, are parasites. They are reaping the benefits from the union spirit, while they themselves are debasing genuine manhood.”

Two points are illustrated in the labor example. The first is the moral condemnation of free-riding as unfair. The other is the more general issue about the provision of certain types of benefits or goods from cooperative activities: Benefits made possible by the cooperative efforts of some are available to all. Some goods or benefits are not easily divisible; therefore, it is not feasible to exclude noncontributors from enjoying them. In the case of such goods, it may seem rational in a sense to free-ride, since one can obtain the benefits at no cost to oneself. Cooperative ventures producing goods available to all need to provide some way of discouraging such free-riding. In the organized labor arena, unions have sought closed-shop or union-shop arrangements to prevent free-riding of the sort decried by Gompers. Under these arrangements, employers either must hire only union members or may hire anyone, with the proviso that all employees hired and retained must join and remain in the union.

HOBBS'S LEVIATHAN

Thomas Hobbes's classic work *Leviathan* (1651) is seen as the earliest treatment of the free-rider issue, posing it in the context of self-interested individuals in a state of nature using reason to find a way out of the miserable condition of life stemming from the absence of a sovereign power “to keep men in awe.” While mutual restraint is the reasonable way out, it is not a sound choice for an individual who has no assurance that others will restrain themselves. The famous Hobbesian solution is the creation of an enforcement mechanism, the sovereign or “great Leviathan,” who will lay down rules of conduct to secure peace and order and will enforce the rules against any lawbreakers or free-riders.

One of the points about free-riding behavior that is

illustrated in Hobbes's discussion is the problematic connection with rational choice. From the narrow view of the individual intent on maximizing personal satisfaction, free-riding seems like the reasonable course of action, so long as enough others are willing to cooperate and contribute to a sufficient extent to make the cooperative venture a success. From a more general standpoint, however, when cooperation with others offers substantial mutual benefits, then it seems reasonable for each individual to cooperate and thus not free-ride. The free-rider seems to threaten the establishment of a cooperative endeavor or the stability of an endeavor that is already underway.

Many cooperative ventures can get started and remain going concerns even when there are some free-riders, since the benefits of cooperation are great enough that many persons are willing to contribute regardless of free-riding. In welfare economics and public finance, the often-used example of a public or collective good susceptible to free-riding is that of the lighthouse. Some shipowners may find it worth their while to build and maintain a lighthouse for use by their vessels, even though other ships will be able to use the lighthouse for navigation. The owners of these other ships will be free-riding—that is, benefiting without paying any share of the cost—if they make no contribution to the building or maintenance of the lighthouse. The free-riding owners are not, however, adding to the costs of those supporting the lighthouse. Despite the free-riders, building the lighthouse may be a rational choice for the contributing shipowners because the benefits of the lighthouse outweigh the cost of construction and maintenance.

In ethics, the unfairness of much free-riding poses a difficulty for utilitarian theories that seek to equate wrongdoing with doing harm, since free-riding often does not harm contributors to a cooperative scheme. It does not always harm them in the sense of adding to their costs, although it may engender feelings of resentment toward the free-riders and lessen the morale of contributors, who believe that they are being made “suckers.” Other ethical theories emphasizing the role of consent and contract also find it difficult to account for the wrongness of free-riding, since free-riders are typically not breaking any contract. The unfairness of such conduct, the act of taking advantage of others, seems to provide the most plausible and direct explanation for its wrongness.

Freedom and liberty

DEFINITION: Psychologically, the capacity to choose; socially, the ability to act without interference from others

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The nature of freedom is a central question in moral, social, and political philosophy. Some philosophers define freedom only negatively as a lack of constraint, while others think of it as the positive ability to live an ethical and fulfilling life. Moreover, while some thinkers hold freedom to be a characteristic of individuals, others assert that only an entire society can be judged to be free or not free.

Freedom of the will, sometimes referred to as "free will" or "volition," makes ethics possible and necessary. Free will is the capacity to control the direction one's thoughts and actions take, and even whether one thinks or acts at all. Because humans do not think or act automatically, their thinking and acting can go in a variety of directions, some of which are benefi-

cial and some of which are not. Since whether a beneficial or a harmful direction is taken is within one's control, one is responsible for the direction taken. Accordingly, moral praise is warranted for using one's volitional capacity to select beneficial thoughts and actions, while moral blame is warranted either for not exercising one's volitional capacity or for using it to select harmful thoughts and actions.

"Freedom" and "liberty," then, designate fundamentally a capacity of human nature. Freedom of the will is the capacity to choose between alternatives; by extension, social freedom is the ability to act upon one's choices without interference from others. In parallel, the term "libertarianism" is sometimes used to name the position that holds that freedom of the will exists, as well as the social philosophy that holds that respect for individual freedom is the fundamental social principle.

FREEDOM THROUGH HISTORY

Freedom is a fragile thing. Throughout most of human history, it has existed only in brief, isolated instances. The city-states of classical Greece experimented successfully with democratic social institutions, and classical Rome derived much of its strength from its republican social institutions. Yet Rome's decline marked the West's return for a thousand years to the historical norm of human social arrangements: tribal and feudal versions of authoritarian social arrangements. Not until the end of the Middle Ages did freedom begin to become an increasingly normal part of some humans' existence.

During the Renaissance and the Enlightenment, a number of major, related institutional changes brought about a gradual decentralization of intellectual, economic, and political power, and a corresponding increase in the powers and freedoms enjoyed by individuals. Intellectually, the rapid growth of science contributed to the increasing secularization of society and gave rise to a greater diversity of opinions; and in northern Europe, the impact of the Reformation and Protestantism's emphasis upon each individual's being able to read and interpret the Bible was partly responsible for the rapid increase in the number of literate individuals. Politically, the decline of the European monarchies gave rise to a variety of democratic and republican forms of government. Economically, the rapid increase in wealth made possible by increasing international trade and

new forms of finance and production, culminating in the Industrial Revolution, gave increasing numbers of individuals unprecedented economic control over their lives.

The rise of liberal social arrangements in economics, politics, and the quest for knowledge often occurred prior to an explicit, theoretical understanding of their political, economic, and intellectual value. While the practical value of liberty became obvious to many, it was also obvious that liberty conflicted with many traditional theories of morality. Accordingly, an explicit theoretical understanding of freedom's moral standing became crucial. Indeed, most opposition to individual economic and political freedom stems fundamentally from moral disagreements with freedom's individualist ethical foundations.

THE MORALITY OF FREEDOM

The morality of freedom is based on its being a requirement of human survival. To survive, individuals need values such as food and shelter. These values must be produced by individual initiative and effort. Production, however, depends upon the individual's having acquired the requisite knowledge, and the acquisition of knowledge in turn depends upon the individual's exercise of free will to control his or her mind's operations. Human survival, therefore, depends ultimately upon freely directed individual initiative and effort. Individuals need to choose to think, in order to acquire knowledge, in order to put their knowledge into practice, and in order to produce the values they need to consume in order to survive and flourish. At each step of the process—thinking, production, and consumption—the individual's freely chosen initiatives determine the degree of his or her self-determination.

Humans live in social groups. Although social arrangements can yield great benefits to individuals, social living also raises the risk of the use of coercion by some individuals against other individuals. Coercion, which can take many forms—killing, slavery, kidnapping, assault, theft—is a danger to human life because it removes to some degree an individual's control over his or her life. Coercion, accordingly, is wrong in principle, and all social arrangements should be based on the principle that only freely chosen interactions are moral; that is, respect for individual freedom is the fundamental social principle.

The rejection of coercion and the protection of

freedom are often spelled out in terms of rights. Rights specify spheres of autonomy that leave individuals free to think and act as they deem necessary to sustain their lives. An individual's right to control his or her own life is the fundamental social principle in terms of which all other rights are defined. Since the process of life involves three subprocesses—thinking, producing, and consuming—the right to life is specified in greater detail to make explicit the protection individuals need in each subprocess. Individuals need to think independently in order to acquire knowledge; therefore, people recognize the right to freedom of conscience. Individuals need to act upon their beliefs, so people recognize the right to liberty; and since the actions that individuals believe are necessary often involve communicating and acting cooperatively with other individuals, people recognize the rights to freedom of speech and freedom of association. Since individuals need to consume the values they have produced, they need to be able to control the fruits of their production; therefore, people recognize the right to property. Overriding an individual's rights in any area means undermining that individual's freedom, which in turn means undermining that person's self-control.

THE ROLE OF GOVERNMENT

Since some individuals will resort to coercion in order to benefit from the productive efforts of other individuals, and since the primary social need of individuals is freedom from such coercion, government is established as the institution charged with protecting individuals' rights. The moral task of government, then, is to ensure that individuals are at liberty to use their property as they see fit to sustain and enhance their lives. A government thus is given the power to use coercion defensively, in protecting individuals' rights.

Since a government too can use coercion against individuals, however, individuals also need protection from government. In liberal social systems, this protection is usually provided by a constitution that explicitly limits the coercive power of a government to defensive purposes in the service of individuals' rights. As a further safeguard, the power given to a government to do its job is broken up and spread among the various branches of government so that each branch can serve as a check upon possible abuses by the others.

Such liberal political arrangements have economic consequences. If individuals have a reasonable political guarantee of freedom from both other individuals and government, they will invest, produce, and reap as much profit as their skills, dedication, and ingenuity allow them. They will be free to reinvest or consume their profits. They will be free to form voluntary associations (such as partnerships, corporations, and stock markets) to enhance their production and hence their profits. They will be free to specialize, since specialization generally yields higher production, and to exchange their products in a market in which rates of exchange (prices) are governed by the forces of supply and demand.

The practicality of free enterprise is a consequence: The freedom to pursue profit releases enormous amounts of human productive energy, and this explains the historical success of liberal social systems.

CRITICISMS OF LIBERTY

Neither such moral justifications of individual liberty nor the historical success of liberal social institutions has won over the advocates of the many doctrines that are opposed to freedom. Opposition to and attacks upon individual freedom generally stem from opposing fundamental premises about morality. In most such attacks, the common theme is that the individual's life and freedoms have less moral significance than does the individual's duty to sacrifice himself or herself for the benefit of some higher being. Opponents of freedom disagree among themselves about what or who that higher being is, although religion, monarchism, and collectivism have been the three historically dominant sources of candidates for beings for whom individuals should be willing to sacrifice their lives and liberties.

RELIGION AND LIBERTY

The history of the relationship between religion and liberty has been long and varied. Some religious theorists conclude that secular liberty and independence are compatible with religious obedience and subservience to a higher being—God—by arguing, first, that God created humankind to be his stewards of the natural world and charging them with the task of using the world's resources efficiently and fruitfully, and second, that politically and economically free social systems are more efficient and fruitful

than are authoritarian systems. The central thrust of most religions, however, has been to exalt God's power and, correspondingly, to diminish humans' power. Instead of individuals volitionally selecting their lives' goals and the methods to achieve them, the ends and means of human life are held to be established by God.

The range of valid options open to individuals is thus limited severely by God's decrees, and moral virtue, it follows, consists not in liberty in thought and action, but rather in strict obedience to God's commands. Although many religions grant that one has the volitional capacity to think independently and freely, such self-indulgence is held to be immoral; to be moral, one must choose to recognize one's dependence and be obedient. To the extent that religion is translated into political doctrine, theocracy is the result: God's agents on Earth are charged with the authority to enforce God's commands, so they should have the political power to enforce obedience on the part of the rest of society.

MONARCHY AND SECULAR AUTHORITARIANISM

Structurally, monarchy is a secular form of theocracy. Individuals are held to exist to serve and glorify a higher being—in this case, the king or queen, rather than God. The ends and means of individuals' lives are established by the monarch, and the monarch's decrees serve to limit the range of options open to individuals. Moral virtue again does not consist fundamentally in independence in thought and liberty in action, but rather in obedience to the monarch's commands. Individual liberties exist only by default; that is, to the extent that the monarch fails to prescribe the course of his or her subjects' lives or is politically unable to enforce his or her decrees.

Historically, some advocates of secular monarchies have used religious appeals to justify the concentration of political power in the hands of a monarch who is not also a duly constituted religious authority. According to the doctrine of the divine right of kings, the monarch's possession of great power is justified not merely by the fact that he or she has succeeded in acquiring it or by the fact that he or she is the biological descendant of the previous monarch, or by the claim that the concentration of political power in the monarch's hands is the most efficient means of realizing political aims in the best interests of the subjects, but rather by his or her se-

lection by God to carry out part of God's plan on Earth.

Another general form of secular authoritarianism is based on collectivist ethical principles. According to collectivism, individual human beings are of less moral value than is some larger group to which they belong; therefore, individuals are expected to devote their lives to serving the larger group. Different versions of collectivism define the larger group differently; some hold that the appropriate group is the nation, while others hold that it is the race, the culture, one's economic class, or, more vaguely, society as a whole. Collectivists argue that individuals are not morally free to pursue their own ends, but rather that they have a duty to sacrifice and to serve the ends of the collective, as determined by the collective's leaders.

The twentieth century saw the rise of several versions of collectivism, with a corresponding diminution of individual freedoms to the extent that collectivist doctrines were practiced.

Marxism, for example, holds that the dictatorship of the proletariat (the working class) is a necessary step in the transition between capitalism and international socialism. During the dictatorship of the proletariat, the leaders of the Communist Party will hold absolute power and will determine what is necessary, while individuals will sacrifice themselves, voluntarily or not, to bring about a new collective entity—the international socialist state.

Fascism, to take another prominent example, holds that dictatorship is a necessary step toward realizing a national or racial version of socialism. Again, the leaders of the party will hold absolute power and will determine what is necessary, while individuals will sacrifice themselves, voluntarily or not, to bring about a new collective entity—the national socialist state.

Some versions of radical environmentalism, to take a final example, hold that the ecosystem is the collective entity that is the unit of value, and that humans exist to serve the ecosystem as a whole. While humans have a duty to serve the ecosystem, however, most of them seem shortsighted and have abused their freedoms (by causing pollution and overpopulation). Accordingly, the freedoms of individuals to produce and reproduce should be overridden by enlightened leaders who have the best interests of the ecosystem as a whole at heart.

PESSIMISM VS. FREEDOM

In addition to religious, monarchic, and collectivist attacks on individual freedom, certain positions on the status of human nature have also led directly to attacks on freedom. To the extent that a pessimistic evaluation of human nature is accepted, there is a tendency to reject political and economic freedom in favor of some version of paternalism. Paternalists typically hold that humans are too evil or too incompetent to be left free to determine their own affairs. Accordingly, rather than conceiving of the state as a servant whose job it is to protect individuals' freedoms while they pursue their lives, paternalists urge the state to take control of individuals' lives, either as a strong and stern authority suppressing the natural tendencies of humans to do evil, or as a wise and benevolent leader organizing individuals' lives so as to protect them from their own incompetencies.

THE SCOPE OF FREEDOM

Individual freedom is at stake in scores of major practical moral controversies. People continue to debate, for example, abortion, censorship, free trade, taxation, the use of alcohol and drugs, the military draft, and homosexuality. Each practical issue focuses on whether individuals should be free to act as they judge best or should be forced to act as some other individual or group judges best. In each debate, the acceptance or denial of the legitimacy of individual freedom is a conclusion derived from more fundamental premises about metaphysics, human nature, and ethics. If, for example, God has all the power, then humans have none; therefore, freedom is not an issue. If humans are not intellectually competent enough to run their own lives, then intellectual control should be given to someone who is, so censorship is a practical option. If humans are basically evil, then freedom is folly, and so is allowing humans access to alcohol and drugs. If individual humans are merely servants of a larger collective, then freedom is unnecessary; therefore, a draft is justifiable. A full defense of freedom and liberal social institutions, then, depends on a full philosophical system of premises demonstrating that human beings are by nature none of the above—that, instead, they are competent individuals who are morally ends in themselves.

Freedom of expression

DEFINITION: Right to speak and otherwise communicate without interference or fear of government reprisal.

TYPE OF ETHICS: Civil liberties

SIGNIFICANCE: Free expression is considered one of the most fundamental rights in democratic societies. It is founded upon two ethical ideas: first, that freedom of conscience (the right to one's own beliefs) is meaningless unless one is also free to express those beliefs to others; and second, that society as a whole benefits from a free "marketplace of ideas" in which all points of view may be heard and considered.

The modern belief in freedom of speech is assumed to include all other forms of free expression. These forms include the right to speak freely in political assemblies, the right to petition those assemblies, the right to relate and publish debates of the assemblies, and freedoms of correspondence, of teaching, of worship, of publishing newspapers and books, and of expression in the arts. Freedom of expression is all-inclusive, but it is epitomized in freedom of speech. It is from freedom of speech that all other individual expressions take their distinctive forms. Understood to accompany the freedom of expression are freedom of thought (spiritual freedom) and the right to criticize—to inquire or to research old dogmas.

ANCIENT GREECE

The language, theory, and practice of freedom of expression in the modern, Westernized world are linked to Greek and Latin ideas and institutions. Freedom of expression was born in Athens in the archaic period (c. 800-600 B.C.E.), when the aristocratic rulers allowed certain classes to voice their opinions without fear of reprisal. This freedom was increased

under the reforms of Solon (c. 594 B.C.E.), and it reached a high point in the golden age of Pericles (c. 507 B.C.E.) and Cleisthenes (c. 443-429 B.C.E.). The citizens of Athens were granted freedom of expression in the political arena, including the council, the assembly, the courts, and in society at large, and also in the areas of philosophy and the arts. Freedom of speech is excellently illustrated by the dramatist Aristophanes' criticism of Cleonymus, an Athenian politician of considerable power, as a "glutton," a "perjurer," and one who throws away his shield in battle (a coward).

Despite the broad latitude permitted in Athens for freedom of expression, such freedom was by no means absolute. Restrictions were placed upon the speakers, the content of the speech, and the time and place of utterance. The leaders of the assembly restricted freedom of speech to the citizen class; those individuals who were considered "unworthy" or "dishonorable" were punished by having their right to speak taken away.

ANCIENT ROME

In Republican Rome, freedom of expression differed markedly from the variety found in Athens. The representative democracy of Rome was established on the basis of the idea that all political authority came from the people. The notions of liberty (*libertas*) and of the political process (*civitas*) were considered inseparable. Therefore, there was no basic clash between the individual and the state, for the free and responsible citizen had certain rights that the state could legitimately support so long as they furthered *civitas*.

Roman law did not support legal guarantees for freedom of expression, but a tradition of tolerance evolved in Rome that permitted and encouraged freedom of expression. Both orators and writers freely criticized public and private figures by name. Some controls were exercised regarding who could speak and what could be said. The government also established theaters and exercised censorship over them.

The right to speak and speech content in the assembly were controlled by procedures. The republican constitution provided that the assembly serve as the principal legislature and as the supreme court. The ordinary citizen who participated in the assembly did not have a right to speak but did have a right to listen to debates by magistrates, senators, and

juriconsults (lawyers). They also had the right to vote. The right to speak was controlled by the governing class.

The Twelve Tablets, Rome's first written law, which was codified in 451 B.C.E., provided for the punishment of seditious libel or defamation. Nevertheless, orators often engaged in defamation and invective. Cicero attacked his opponent Piso, calling him a "beast," "funeral pyre of the state," "mud," "donkey," "hog," and a "piece of rotten flesh." Libelous expression was constrained, although the record is not clear about the existence or enforcement of specific laws governing sedition or defamation in the assembly and the senate. Defamation, however, was actionable if it occurred on the stage or in the courts.

In the Roman Empire, government control mutated from democratic institutions to one-man rule. Free expression was commonly tolerated on an ad hoc basis, depending on the emperor. Augustus was moderately tolerant of dissent, Tiberius allowed a considerable degree of freedom of expression, and Caligula started with a policy of leniency but soon turned toward brutal repression that included having one writer burned alive in the amphitheater. Claudius suspended the law of treason, but his successor, Nero, reinstated it; Vespasian and Domitian applied the law of high treason vigorously, including having the historian Hermogenes Tarsus put to death and his secretaries crucified.

THE WESTERN TRADITION

The late classical world's pattern of constraints on freedom of expression formed the basis for the emergent practices in the West for more than seventeen centuries. During this lengthy period, no Western nation extended to its citizens a legal guarantee of freedom of expression. The Christian Church fervently persecuted those whom it thought unorthodox or heretical. Inquisitions of various kinds were carried out by the Church from the thirteenth century through the eighteenth century.

During this dark period for human liberty, England moved quietly but unquestionably toward establishing a tradition of civil liberty. In June, 1215, King John, a tyrant, was forced to sign the Magna Carta, which is now recognized as the foundation of constitutional liberty for both England and the United States. This charter did not mention freedom of expression, but it did claim that no free man could

be deprived of life or property except by peer judgment and by the law of the land. The word “liberty” appears several times in the document.

The regal Magna Carta gave support, through its transformation, to political liberty, including freedom of expression. While there is no direct line of descent from antiquity to Western Europe and England of freedom of expression, the West had to learn the principles and practice of freedom of expression reflexively and by intentional emulation. Once the idea of freedom of expression took hold, its growth was assured by an increasingly mobile and rational society that was beginning to debate and test everything.

The Renaissance, the Scientific Revolution, the Reformation, the Enlightenment, and the two great revolutions of the eighteenth century imbued views of freedom of expression with much of their modern implications and tone. The debate and testing of worldviews blossomed in the United States in 1791 with the ratification of the Bill of Rights. In the meantime, following King John’s signing of the Magna Carta, church and state in England continued for centuries to restrain the development of liberty of speech by controlling the content of speech and the medium of speech—the printing press.

THE EARLY MODERN ERA

John Milton was the first to decry prior restraint of the press. Milton published his argument in *Areopagitica* (1644). Milton’s essay states in cautious prose four arguments against prior restraint or press censorship by Parliament. First, prior restraint was conceived and used by the Roman Catholic Church to suppress the Protestant Reformation. Second, prior restraint, according to Milton, weakens character, since individuals do not have the chance to determine the truth for themselves. Third, prior restraint does not work; the censored ideas will inevitably become known. Fourth, prior censorship discourages learning and the search for truth (it replaces the pursuit of truth with unquestioned authority), which injures society. Milton had many reservations about extending freedom of expression to everyone (for example, Milton did not believe that freedom of expression should be extended to Catholics). Nevertheless, his work was a milestone in the development of civil liberties in the West and Westernized societies.

John Stuart Mill, an English philosopher and economist, went much further than Milton in his ar-

gument in support of freedom of expression. In his work *On Liberty*, Mill asserts three basic reasons for government to permit freedom of expression. First, the “hated ideas” may be true and the orthodox ideas may be false. Second, truth is powerful enough to triumph over falsehood without the artificial protection of government, and the continual challenging of truth prevents it from becoming dead dogma. Third, there is probably some degree of truth in all ideas or opinions; therefore, to suppress any idea is to endanger possible truth. Mill’s argument for freedom of expression is that it is socially useful. Freedom of expression must have purpose beyond itself. Mill maintains that “absolute certainty” is not available to human beings, and therefore the suppression of any idea “is an assumption of infallibility”; such an assumption is unwarranted. Mill’s espousal of freedom of expression is best exemplified in one of his quotations: “If all mankind minus one, were of one opinion, and only one person were of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind.”

THE AMERICAN SYNTHESIS

The next leap forward in the progression of human rights occurred in America. It took its most complete development in the First Amendment to the U.S. Constitution. The framers of the Constitution placed freedom of conscience first, and then freedom of speech and the press. James Madison, Thomas Jefferson, and the others who inspired the First Amendment were inheritors of the Enlightenment and its antecedents. They believed in the power of reason, in the search for truth, in progress, and in the inevitable perfectibility of humankind. Freedom of expression was considered essential to the discovery and advancement of truth, for only by constant testing in a public forum could falsehood be uncovered.

The twentieth century, especially its last third, was a high point for freedom of expression. Alexander Meiklejohn, a foremost constitutional scholar, maintained that a teacher’s freedom to pursue knowledge (academic freedom) may be curtailed in certain circumstances; political speech, however, enjoys “an absolute, preferred position” in the Constitution. James Madison, author of the First Amendment, said, “If we *examine* the nature of Republican Government, we shall find the censorial power is in the

people over the Government, and not in the Government over the people.” It is only by freedom of expression that the people can voice their grievances and aspire to redress them. It is principally by exercising free speech that people can build without molestation political power that can counter recurrence of excesses by government.

THE JUDICIARY

The Supreme Court, as the final decipherer of the Constitution, has acted as the guardian of freedom of expression. In *Garrison v. Louisiana* (1964), Justice Joseph Brennan declared: “Speech concerning public affairs is more than self-expression; it is the essence of self-government.”

The primacy of freedom of expression has never been absolute in the United States, and it has been even more circumscribed in Western Europe. In times of war or similar crisis, for example, some publications that may threaten national security are prohibited. Other forms of expression are restrained on certain occasions by the courts, since they may unfairly assail the communal interest in public morality. Picketing, parades, and even words, if permitted at a particular time and place, may threaten public safety or order despite the constitutionality of the information or ideas.

The Court employed the bad-tendency test, or the “nip it in the bud” approach, to judging expression. This approach stops or punishes speech that the Court believes has a tendency to create a serious danger at some point in the future if it is allowed to continue. The principal statement of this position was in *Gitlow v. United States* (1925), in which the Supreme Court upheld the sedition conviction of Benjamin Gitlow: “A single revolutionary spark may kindle a fire that, smoldering for a time may burst into a sweeping and destructive conflagration”; therefore, it is reasonable and expected for the state to seek to extinguish the spark to protect the public peace and safety.

The Supreme Court began to inquire into the limits of freedom of expression only in 1919. The first landmark case decided by the Court was *Schenck v. United States* (1919). In more than seven decades, the Court assembled a body of constitutional law, but it did not formulate a theoretical basis for interpreting the First Amendment. The Court has consistently held that freedom of expression, especially of speech

and of the press, ensures the survival of the American political system. The chief purpose of the First Amendment, in the eyes of the Court, is to serve the political needs of an open and democratic society. Such political needs also include the right of the people to alter by lawful means the political process itself. Justice Felix Frankfurter’s famed pronouncement reflects the Court’s consistent opinion that freedom of expression is a means to better the political system: “Winds of doctrine should freely blow for the promotion of good and the correction of evil.” Justices Hugo Black and William O. Douglas reiterated the contention that freedom of expression exists to preserve American democracy: “It is the purpose of the First Amendment to preserve an uninhibited marketplace of ideas in which truth will ultimately win.”

TWENTIETH AND TWENTY-FIRST CENTURIES

Before the mid-twentieth century, the Court and political philosophers argued for freedom of expression in general terms. Zechariah Chafee, Jr., writing during the 1940’s, discussed problems of preserving the peace, defamation, and obscenity. His emphasis was on political expression and seditious libel. Chafee’s theory recognizes two types of expression: that which serves an individual interest and that which serves a more broad social interest. Chafee tries to balance freedom of expression in searching for truth against public safety. Every effort, Chafee says, should be made to maintain both interests unimpaired. Free expression should be sacrificed only when the interest in public safety is really imperiled, not when it is narrowly affected. Chafee espoused the doctrine of a clear and present danger test. Profanity and defamation, to Chafee, were socially “worthless” activities that were unprotected by the First Amendment.

Thomas Emerson, another constitutional scholar, wrote during the 1960’s. Emerson argued that freedom of expression includes the right to form and hold beliefs on any subject and to communicate those beliefs to others by whatever medium one chooses—whether through speech or by other means, including art or music. Freedom of expression, according to Emerson, includes the right to hear the opinions of others, the right to inquire, reasonable access to information, and the rights of assembly and association. Freedom of expression, Emerson declares, op-

erates in four ways: first, individual self-fulfillment; second, discovering truth; third, democratic decision making, and fourth, finding a balance between healthy strife and necessary consensus. Emerson tried to fashion a theory that would determine where the line should be drawn between expression and action in the many cases involving freedom of expression. Speech, ideally, should not be punishable at all; however, in certain situations, actions, if they are pernicious and unlawful, can and must be punishable.

Franklyn Haiman wrote during the 1980's and argued for a free marketplace of ideas. The law is an inappropriate tool for dealing with "hated" speech. The remedy for such speech is more speech, never (or nearly never) the repression of speech. Even in cases of defamation, the remedy is a right of reply, except when the alleged defamer refuses to provide for such a reply or when time is inadequate to permit a reply. Haiman is even tolerant of speech that incites unlawful actions. Haiman insists that those who allegedly incite others to illegal conduct should not be held accountable themselves for the actions of their listeners, unless the audience is deceived, is coerced, or is mentally impaired. Haiman also argues for a wide dissemination of all ideas. The law should be used to enrich and expand communications and to ensure that the marketplace of ideas remains free. Even the views of nonconformists should be distributed, Haiman concludes. Also, the scheduling of the time and place of speech should be done in a content-neutral way. Owners and managers of quasi-public private property (such as shopping centers and airports) should make provisions for nondisruptive communications with the public by any individual. Haiman further emphasizes that government in a free society is the servant and should not inhibit, distort, or dominate public discourse.

Most constitutional scholars agree that the freedom of American citizens to participate in governing themselves is best protected by the First Amendment. Free people, who govern themselves, must not be shielded from any idea that is considered unwise, or unfair, or dangerous; it is they, the American people, who must judge any idea. Freedom of expression is not a law of nature or a principle of abstract reason, but a basic American agreement that public issues shall be decided by the people. A general theory may be stated in the following way: The people's suffrage in a democracy must always be couched broadly in

terms of freedom of expression in the political process; however, government interference in personal conduct must be permitted rarely or not permitted at all.

Freedom of Information Act

IDENTIFICATION: U.S. law mandating that records possessed by federal agencies must be made available to the public upon request

DATES: Effective July 4, 1967; amended in 1974, 1976, and 1986

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: The Freedom of Information Act strengthened the American public's right to know, reaffirming the view that an informed citizenry is vital to the functioning of a democratic society.

Before the enactment of the U.S. Freedom of Information Act (FOIA) in pre-Watergate 1967, the public's "right to know" was merely a slogan coined by journalists, not a legal right. The press led the fight for "open government" and cited numerous instances of random and unexplained denials of access to information about crucial governmental decisions. Claims of executive privilege without any requirement of justification shielded the nondisclosure of materials to Congress for legislation and supervision. Government records were required to be revealed only to persons properly and directly concerned with them. Any records could be kept secret if such policy was in the public interest or if the records related solely to the internal management of an agency.

THE ACT

The rights conferred on the people by the FOIA are not specifically protected in the Constitution. Its goals, however—the elimination of secrecy and preservation of government accountability—were familiar even to the nation's founding fathers (James Madison, Alexander Hamilton, and Thomas Jefferson), who viewed excesses of power in the seat of big government with alarm.

Under the FOIA, all individuals have an equal right of access to information. The act provides that "any person" (citizen or noncitizen, partnership, corporation, association, foreign or domestic government) may file a request for an agency record for any reason. The requester does not have to be a party in an agency proceeding, and no showing of relevancy or involvement in litigation is required. The purpose for which the request is made has no bearing on its merits. The FOIA specifies only that requests must reasonably describe the documents sought and must comply with agencies' published procedural regulations. The agency must provide the document unless it falls within one of the nine exemptions contained in the act. If the agency refuses to produce the record, the requester may go to court, where the agency must prove that the documents in question are exempt under the law and that its refusal to produce them is justified. Courts determine the propriety of agency action without deference to agency opinion and expertise, unlike the course of action followed in other matters.

The FOIA establishes two categories of information that must be disclosed. The first requires publication in the Federal Register of basic information regarding the transaction of agency business; descriptions of the organization, including its functions, procedures, and rules; and policy statements of the agency. The second requires the availability for inspection and copying of so-called "reading room" materials: final adjudicatory opinions, specific policy statements, and administrative staff manuals. These materials must be indexed to facilitate public access, to help any citizen involved in a controversy with an agency, and to guard against the development of internal agency secrets. Records covered by the foregoing are subject to disclosure upon an agency's receipt of a request by any person.

The FOIA applies only to "records" maintained by "agencies" within the federal government. Not in-

cluded are records maintained by state and municipal governments, courts, Congress, or private citizens. Many states have counterparts to the FOIA. The Supreme Court has developed a basic two-pronged test for determining what constitutes an "agency record" under the FOIA: documents that must be either created or obtained by an agency and be under agency control at the time of the request.

EXEMPTIONS

Release of information contained in nine categories of exemptions is not required. These include national security and foreign policy matters, internal personnel rules and practices, exemptions specified by other federal statutes, privileged or confidential trade secrets and commercial or financial information, interagency or intraagency memoranda, personnel and medical files constituting an unwarranted invasion of privacy, investigatory records compiled for law enforcement purposes (including protecting the identity of confidential sources and information furnished to authorities), financial institution reports, and geological and geophysical information and data. It should be noted, however, that the exemptions are discretionary rather than mandatory. When challenged, therefore, their application to particular records and situations must be determined on a case-by-case basis and may be subject to varying interpretations by the courts.

SIGNIFICANT AMENDMENTS

As a reaction to the abuses of Watergate and widespread concern over excessive government secrecy, the FOIA was substantially amended in 1974. The overall scope of the act's law enforcement and national security exemptions was narrowed and its procedural aspects broadened. The 1974 amendments included a provision whereby a court could conduct an *in camera* (behind closed doors) inspection of withheld information in order to determine the propriety of nondisclosure and classification and whether certain portions of otherwise withheld records could be segregated and released. A time limit of ten working days for agency response to a request was also established, as was a provision for the disciplining of persons responsible for arbitrary and capricious withholding of information, and the awarding of court costs and attorney's fees to a plaintiff who prevails in an FOIA case.

As part of the Anti-Drug Abuse Act of 1986, the FOIA was amended to provide broader exemption protection for law enforcement information, special law enforcement record exclusions, and new fee and fee waiver provisions. The 1990's brought discussions about the need to implement refinements to the FOIA to accommodate technological advances such as electronic record-keeping. Numerous treatises and legal journal articles contain references to the Freedom of Information Act.

Freud, Sigmund

- IDENTIFICATION: Austrian pioneer in psychoanalytic theory
- BORN: May 6, 1856, Freiburg, Moravia, Austrian Empire (now Příbor, Czech Republic)
- DIED: September 23, 1939, London, England
- TYPE OF ETHICS: Psychological ethics
- SIGNIFICANCE: Freud founded the theoretical and clinical discipline of psychoanalysis, providing the twentieth century with one of its most power-

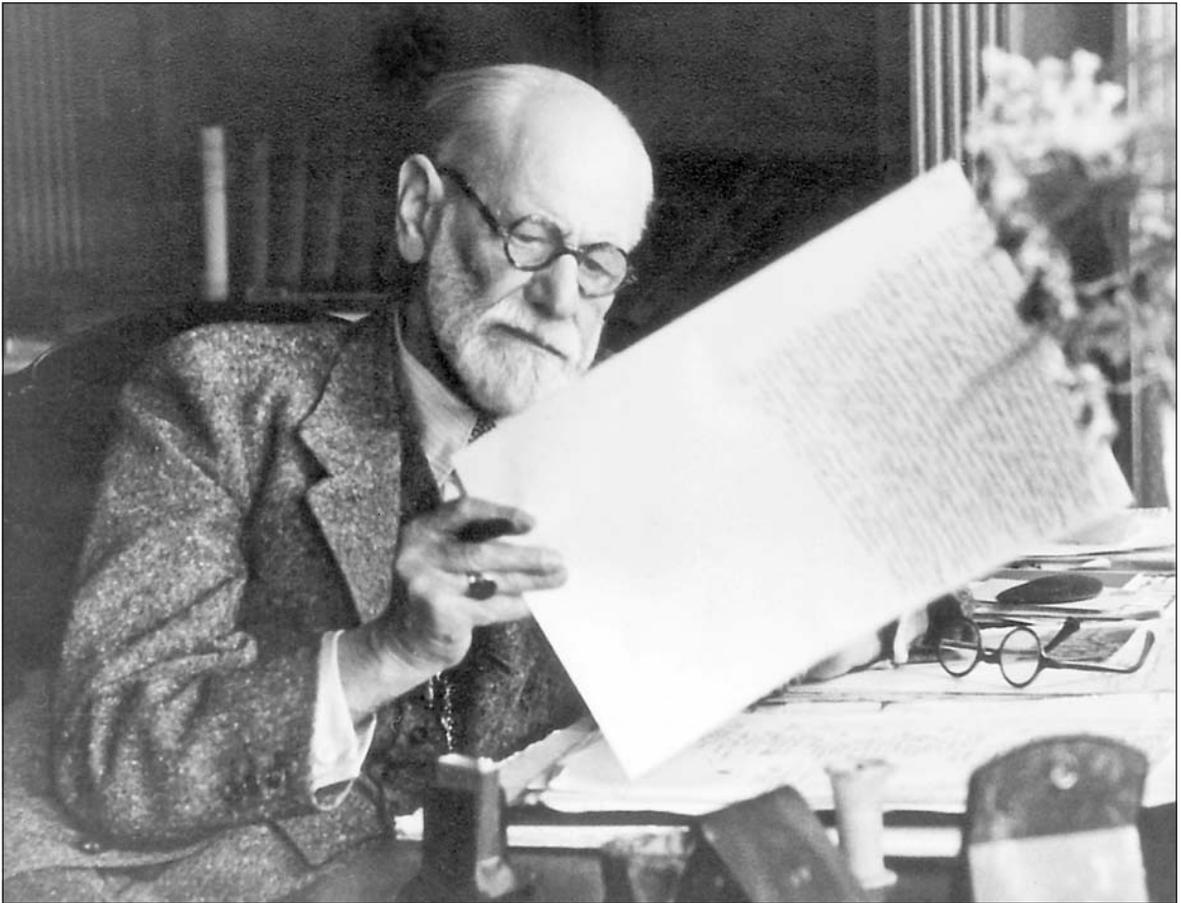

ful and influential models of psychological development, the formation of one's moral character, and the relationship between desire and culture. His many works include *The Interpretation of Dreams* (*Die Traumdeutung*, 1900) and *Civilization and Its Discontents* (*Das Unbehagen in der Kultur*, 1930).

Although Sigmund Freud has had a powerful impact on the field of ethics, he did not initially set out to study moral questions. Freud's original interest was medical research, and he was trained in Vienna as a physician. Financial constraints, however, forced him to abandon his chief interest in pure research, and he began to practice during the 1880's as a neurologist. In 1884, Freud was introduced to Josef Breuer, a Viennese physician, who had developed a "cathartic" method for the treatment of hysterical

symptoms. This method involved encouraging patients to talk in a completely free and unencumbered manner about the development of their symptoms. The talking alone seemed to produce a surprising improvement in patients' conditions. This discovery was the starting point of what later became the field of psychoanalysis. Freud and Breuer collaborated on *Studies in Hysteria* (1895), in which they described their groundbreaking work in this area.

RISE OF PSYCHOANALYSIS

Freud continued this work alone, publishing such seminal volumes as *The Interpretation of Dreams* (1900), *Three Essays on the Theory of Sexuality* (1905), and *The Origin and Development of Psychoanalysis* (1910). In all these works, Freud developed a new way of examining the structure, nature, and diseases of the human mind. Freud's original focus

Sigmund Freud. (Library of Congress)

was on the understanding and treatment of emotional disorders, but as the field of psychoanalysis rapidly progressed, Freud's ideas gradually took a broader perspective. Freud eventually left his followers with a theory of the human psyche, a therapy for the relief of its ills, and a method for the interpretation of culture and society. It was in his later works, such as *Totem and Taboo* (1913), *The Future of an Illusion* (1927), and *Civilization and Its Discontents* (1930), that Freud spoke most directly to ethical and social issues.

ETHICAL IMPLICATIONS

In many ways, Freud rejected the conventional ethics of his era. His focus on the egoistic, narcissistic, and aggressive roots of human behavior led some readers to conclude that Freudian psychoanalysis was an amoral discipline that left no room for either a philosophical or a practical theory of morality. It is true that Freud rejected many traditional religious values. He believed that a number of central religious beliefs were merely a misguided human effort to overcome infantile feelings of helplessness and dependence. In *The Future of an Illusion*, Freud argued that the belief in God is a mythic attempt to overcome the human sense of powerlessness. Like an idealized parent, the concept of God is, for Freud, the projection of childish wishes for an omnipotent protector. In *Civilization and Its Discontents*, Freud again argued that religious phenomena were merely the reflection of unresolved psychological needs from the early years of life. In the opening chapter of the book, Freud described the oceanic feeling, or sense of indissoluble oneness with the universe, which mystics have often celebrated as the most fundamental of all religious experiences. Freud believed that the origin of this feeling was the desire to re-create the undifferentiated infant's profound sense of fusion with its mother. By attempting to debunk such central aspects of religious belief, Freud called into question many religious notions of moral right and wrong.

In addition to his rejection of religious morality, Freud also disagreed with Immanuel Kant's position that reason and duty should be the central grounds for morality. While Freud believed that reason must play a part in the development of ethical guidelines, he also saw a place in ethics for the promotion of human happiness and welfare. Freud advocated a practical form of ethics that was designed to promote the gen-

eral welfare of society while simultaneously allowing individuals a sufficient degree of instinctual gratification.

FREUD'S VIEW OF HUMAN NATURE

For Freud, this position grew logically from his rather mixed view of human nature. Freud believed that most individuals possessed powerful aggressive and egoistic tendencies, along with a capacity for self-observation and altruistic behavior. Freud consistently maintained that theorists who saw human nature as inherently good were seriously deluded. For this reason, Freud believed that the golden rule—to love one's neighbor as oneself—was a destructive and unrealistic goal. Freud also suggested that utopian schemes such as communism were destined to failure, because they called for humans to give more than they were capable of giving.

According to Freud, the best course for humanity was to establish civilizations in which the more destructive elements of instinctual drives were prohibited, in order to promote the common social good. People will be able to tolerate the rules of such social organizations if nondestructive outlets for aggressive and narcissistic wishes can be developed. This will not be an easy task, and Freud believed that individual and group needs will generally be in conflict. Freud's hope was that society would adopt a realistic view of human nature and gradually learn more effective ways to manage the individual's need for instinctual gratification.

Friendship

DEFINITION: Attachment to another person, characterized by mutual affection, esteem, and goodwill

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Friendship is seen by some as a moral good in itself, and the ability to be a good friend is often a morally admirable quality. Friendship may also create new moral obligations for friends, especially obligations to be loyal to one another.

Friendship became a topic of Western philosophical discussion in Plato's early dialogue *Lysis* (early fourth century B.C.E.). Because this work belongs to a type of inquiry called aporetic, meaning that the author was interested in raising difficult questions about the topic, it is irritatingly inconclusive, but the questions Plato raises are ones that later Greek and Roman philosophers energetically set about discussing. He also touches upon friendship in many of his later works; in the *Laws* (middle fourth century B.C.E.), for example, he describes love as a "vehement" form of friendship, and love, one of Plato's favorite topics, is the subject of his celebrated *Symposium* (early fourth century B.C.E.).

Not surprisingly, Aristotle, who defined man as a "political animal" (the adjective carries the wider meaning of "social"), devotes the eighth and ninth books of his *Nicomachean Ethics* (c. 330 B.C.E.) to

friendship. He allows that friendship may be based on the relatively selfish motives of utility and pleasure but finds that the highest and most permanent form of friendship derives from a perception of goodness. All friends wish one another well, but a good person will value a friend not for a mere advantage but also for the friend's sake, and for the sake of the goodness in that friend.

Aristotle is one of many thinkers who point out that friendship does not, on the surface, appear to be necessary. It is neither a preliminary to the creation of new life, like erotic love, nor a condition of civil order. People cannot exist without water or food or shelter from the elements, and they normally crave human companionship, but they can and do exist without friends. To the question of why the happy person, presumably in possession of the good and essential things, would need friends, Aristotle applies another of his basic ideas, that of happiness as virtuous *activity*. The virtuous actions of one's own friend will be a delight, even a need, in one's own pursuit of happiness.

CICERO'S PRACTICAL ETHIC OF FRIENDSHIP

Of all the treatises on friendship from the ancient world, Marcus Tullius Cicero's *Laelius on Friendship* (44 B.C.E.) has had the most pervasive influence. From its composition through the Middle Ages and into the Renaissance, Cicero's was by far the discussion most often cited and reiterated. His philosophy is eclectic and unsystematic, drawing upon Platonic, Aristotelian, Stoic, and Epicurean thought. An accessible authority as well as a practical one, Cicero offered the medieval and Renaissance eras guidance on such questions as How far should the love of a friend extend? Cicero's answer: As far as is honorable. Accepting the common Greek idea that virtue induces friendship, he argues that virtue cannot be forsaken for the sake of friendship. For Cicero, the obligations of friendship include the avoidance of hypocrisy and suspicion, but he acknowledges that even good friends can go wrong. Therefore, it is one's duty not only to advise but also to rebuke one's friend if necessary.

CHRISTIANITY AND FRIENDSHIP

If friendship is a type or degree of love, as several of these ancient philosophers have claimed, Christianity has tended to see friendship as one of the man-

ifestations of charity—or love for the sake of God. Thus argued Saint Thomas Aquinas, the greatest of the medieval Scholastics, who also incorporated much Aristotelian thought into his *Summa Theologica* (1266-1272). It is difficult to reconcile the disinterestedness of charity with the exclusiveness of friendship (for the Greco-Roman philosophers had pointed out that one's circle of true friends cannot be large), but Christianity has generally held that all true love is divine at its core.

MODERN VIEWS OF FRIENDSHIP

Modern philosophers have concerned themselves little with friendship, and Freudian psychology, which argues that expressed motives are often not the real underlying ones, has complicated later discussions of friendship. One modern advocate of classical and Christian thought, C. S. Lewis, in his *The Four Loves* (1960), deplors the modern habit of equating friendship with the nonethical concept of companionship. Lewis also vigorously rejects the tendency to regard friendships between those of the same sex as homoerotic. He recognizes that friendships can, and frequently do, turn into erotic love; his strong disapproval of homosexual love, however, detracts somewhat from his noteworthy attempt to reaffirm traditional moral dimensions of friendship.

It remains unclear whether friendship should be regarded as distinct in kind or only different in degree from erotic love. While exclusive, it does not nearly so often foment the jealousies that afflict the latter. A friendship of two can grow into a circle. For Cicero, the fact that *amicitia* derives from *amor* proves that friendship is a version of love, but in many other languages, English among them, the characteristic terms for the two concepts are etymologically distinct.

It is also not clear to what extent friendship is a human need. Although it is obviously a need for some people, it now seems presumptuous to argue, as does Aristotle, that those who feel the greatest need for it are the *best* people; that is, the people most desirous of cultivating goodness. The great moral philosophers agree, however, that the motivation for friendship cannot be *merely* satisfaction of a need. If friendship were primarily a need, Cicero remarks, then the weakest and most deficient people would make the best friends.

Future generations

DEFINITION: Descendants of the people currently making environmental and other ethical decisions, and of the decision makers' constituents

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: The happiness and well-being of future generations is one of the central ethical concerns raised whenever nonrenewable resources are allocated, expended, used, or destroyed.

Since the time of the Stoics, most mainstream Western philosophers have agreed that people have some ethical obligations toward human beings in general, simply because they are human. Thus, Immanuel Kant wrote that the moral law commands one to "treat humanity, whether in one's own person or that

of another, always as an end, and never as a means only"; and John Stuart Mill prescribed that one ought to maximize the happiness of all who will be affected by what one does.

These traditional philosophers did not specify, however, whether unborn future generations are to be included in this mandate. It did not occur to them to confront this issue, because the ethical problems with which they were preoccupied concerned transactions among contemporaries only.

The environmental movement has alerted people to the possibility that the profligate treatment of nature may leave to future generations a despoiled planet much less suited to human life. In the economic sphere, lavish public spending may saddle future generations with a crushing burden of debt. Here, the theoretical question of whether individuals have ethical obligations to those who do not yet exist becomes linked with large practical questions of public policy relating to intergenerational equity.

CENTRAL THEORETICAL QUESTION

There are three ways of answering the central theoretical question. The narrowest answer holds that people can have obligations only toward persons who are now in existence. Those advocating this answer seek to justify it by arguing that analysis of locutions of the form "x has an obligation toward y" shows that these cannot be true unless y exists at the time of utterance. Such reasoning is sophistical, however, and the conclusion drawn is morally repugnant in its selfishness.

The broadest answer is that people ought to give equal consideration to all human beings who may be affected by their actions, regardless of when they exist. This answer is troublingly radical, because it goes so far in imposing obligations to promote the well-being of merely potential persons who are very remote in time.

An in-between answer would say that the interests of those as yet unborn ought not to be disregarded, yet that what consideration they are given should be less, other things being equal, the greater their distance in time from the present. Those favoring this answer presumably see temporal distance as generating a type of moral distance that diminishes obligations. They might mention that one's obligations toward contemporary persons vary, depending on how close one's genetic and social links with these

persons are (for example, one has stronger obligations toward close relatives than toward strangers). The idea would be that separation in time tends to generate moral distance; hence, the amount of ethical consideration one owes to future persons will tend to be less, the more remote in time they are from one.

In modern times, birth rates have been declining sharply in most advanced nations and family lines have been dying out at an increasing rate. As a result, individuals of each successive generation have had less and less reason to suppose that distant generations will include direct descendants of theirs. Many people regard direct biological descent as a particularly important tie creating ethical obligations. If they are right, the dwindling of that tie will tend to diminish ethical obligations. It would seem to follow that in modern times the ethical obligations of people of a given generation toward unborn future generations have been decreasing.

When one tries to decide which of the three theoretical answers concerning obligations to future generations to accept, one's reflection tends to be severely obstructed by the uncertainty of predictions about the future. No one knows with certainty what the needs and abilities of future people will be, how well they will be able to adapt to a changing environment, how much need they will have of natural resources that the present population contemplates exhausting, or even whether human life will endure into future centuries. Moreover, one not only cannot be sure that any human successors will be one's biological descendants but also cannot be sure that any such descendants will be persons whom one would wish to benefit.

People usually believe, for example, that ingratitude on the part of others lessens their obligations toward them; and if it should be that the persons of the future are not going to feel gratitude for any consideration that the present population shows them, then the present population perhaps owes them considerably less than would otherwise be the case. Thus, in trying to assess specific obligations to future generations, it is easy to become lost in a fog of speculations. Uncertainty concerning the theoretical issue about how much, in principle, the living owe to the unborn tends to be smothered by myriad other uncertainties concerning what sort of future lies ahead, and decisive answers become difficult to reach.

Future-oriented ethics

DEFINITION: Discipline devoted to understanding the ethical import of the effects of current actions on future conditions and future generations

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Future-oriented ethics asserts that current generations have a positive moral responsibility to improve the lives of those not yet born, or at the very least, to refrain from worsening their lives.

Future-oriented ethics concerns the influence of current decisions on the future. Some decisions affect

people who are not yet living and who therefore have no voice in the decisions. Some choices, in fact, will influence which people will be alive in the future.

In some senses, future-oriented ethics began when humans first acquired the ability to reason and choose. Many religions discuss the possibility of an afterlife, with behavior during this life determining an individual's fate in the afterworld. Development of future-oriented ethics as a guide to political and social policy in addition to individual action developed slowly. During the eighteenth century, philosophers such as Adam Smith and Thomas Robert Malthus began to explore formally the implications of various types of social, political, and economic behavior. Malthus is famous for his theories of population, which state that human populations are destined to experience cycles of prosperity and famine because population will grow more rapidly than will food supplies until there is insufficient food and people starve.

POPULATION CONTROL

Malthus's theories, based on agricultural economies, in general have proved to be overly pessimistic. The Industrial Revolution allowed production to increase more rapidly than did population, allowing rising standards of living.

Many less-industrialized countries, however, face Malthusian cycles of poverty. In these countries, agricultural production serves as a check on population: If there is not enough food produced, possibly because the population has grown too rapidly, people do starve to death. Nature thus controls population if people do not do so consciously.

Ethical issues of population control concern whether policy planners are willing to let nature take its course. Many of the wealthier countries step in, providing food and other supplies, when famine or other disasters threaten populations. Some population theorists argue that this type of aid perpetuates the problem, allowing populations to survive and grow even though the natural environment cannot support them.

Wealthier nations face similar, though less desperate, questions. Welfare programs of various sorts provide a better standard of living, or perhaps even survival itself, for those less able to support themselves. These programs may create a cycle of poverty in which parents who are unable to support them-

selves have children who in turn are unable to support themselves.

MEDICINE

Population also can be controlled through various medical means. Birth control is one example. Some countries—China is a prominent example—actively promote birth control as a means of keeping their populations at sustainable levels. Many religions, however, prohibit artificial means of birth control, ruling out that option of poverty alleviation for some countries.

As life extension through medical technology becomes possible, societies must decide the value of a human life. The fact that it is possible to prolong or save a life does not mean that it is beneficial or ethical to do so. Medical care costs money that could be spent on something or someone else. Saving one life could mean failing to save (or improve) others. Furthermore, money spent on research to delay or even prevent future deaths could be spent on care for current populations.

Medicine also has increasing power to determine and control life chances of infants and even fetuses. The theory of eugenics proposes that people should be bred so as to improve the genetic pool, creating “better” children. Medical technology can determine some characteristics of fetuses and can abort those fetuses found to be “undesirable.” Ethical questions surround the choices of which characteristics should be promoted and the circumstances under which such abortions should be performed. Medical technology literally has the ability to determine the characteristics of future generations. That ability will increase as scientists learn better how to manipulate genes.

EDUCATION AND INVESTMENT

Education provides a nonmedical means of ending the cycle of poverty. Through education, people can learn how better to provide for themselves. Education, however, has real costs. The starkest cases again are in poorer nations. A day spent in school can mean a day not spent out in the fields producing food. Even in wealthier countries, money spent on education, which will benefit people in the future, must be taken away from programs that benefit people today.

A basic problem of future-oriented ethics is the trade-off, illustrated by education, of present versus

future. People can improve their abilities to produce and earn a living through investment in education; similarly, a society can increase its ability to produce through investment in various types of infrastructure and through research and development. A power supply system, a railroad network, or a factory, for example, can significantly increase future productive capacity. Building or purchasing these things, however, takes money. Poorer nations may be unable to pay the cost without endangering current populations.

The development of financial markets offered one solution to this dilemma. Nations (or individuals) can borrow to pay for the means to improve their productivity; these loans can be repaid through higher earnings now possible in the future. Such borrowing is rational for loans that will be repaid within an individual’s lifetime by his or her own earnings; ethical questions come up, however, concerning loans of longer duration. Policymakers today must decide whether to borrow money to invest in projects that will have benefits for generations to come.

The debt incurred may have to be repaid by future generations. The question is whether it is ethical to force generations of the future to pay the debts incurred in the present. The issue is less troublesome if the debt is incurred for the benefit of those who will repay it; for example, in the case of research that benefits future generations. It is more troublesome if the debt is incurred to increase standards of living for those currently alive. Borrowing is a way of forcing one’s children to finance one’s own well-being.

TECHNOLOGY AND THE ENVIRONMENT

Investment in technology poses other questions. The type of investment made will determine the types of jobs available in the future. Increasing sophistication of technology creates the possibility of a small number of skilled, high-paying jobs existing alongside a large number of unskilled, low-paying jobs. Technological advance thus presents the possibility of creating a technological elite at the expense of the majority of workers.

Many methods of producing goods involve the exhaustion of nonrenewable resources such as oil and metals. Any of these resources used today simply will not be available for the people of the future. In addition, production processes often involve pollution of the environment. There is a clear trade-off be-

tween producing more today (possibly by producing through processes that are cheaper in dollar terms but use more resources or pollute more) and being able to produce more tomorrow.

G

Gaia hypothesis

DEFINITION: Theory holding that the earth is a living entity whose biosphere is self-regulating and is able to maintain planetary health by controlling its chemical and physical environment

DATE: Developed between 1969 and 1979

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: The Gaia hypothesis creates a model of earthly existence that is fundamentally biocentric rather than anthropocentric. Such a model might be seen ethically to require the maintenance of balanced relationships between humans and other forms of life. It might also be seen, however, as an indication that humans are no more responsible for their environmental effects than are any other organisms, since the system as a whole actively maintains itself independently of its individual living components.

While working on a project that would send a space probe to determine whether life exists on Mars, British geochemist and inventor James Lovelock theorized that one could answer the question by observing the activity in the planet's lower atmosphere. Lovelock developed his idea and came to recognize its implications through discussions with U.S. biologist Lynn Margulis. His thinking culminated in the book *Gaia: A New Look at Life on Earth* (1979), which presented his hypothesis that life and its natural environment have coevolved and that the lower atmosphere provides the raw materials for life to exist on the planet. The original title of the theory was the Biocybernetic Universal System Tendency (BUST), but novelist William Golding suggested that the theory be named for Gaia, the Greek Earth goddess who is also called Ge (from which root the words "geography" and "geology" are derived).

Although the Gaia hypothesis did not generate much scientific activity until the late 1980's, it was supported by both industrialists (who believed that it

supplied a justification for pollution, since the earth could theoretically counteract any harmful effects) and some environmentalists. Other environmentalists, however, believe that the theory argues against any attempt by humans to try to correct environmental degradation.

Gandhi, Mohandas K.

IDENTIFICATION: Indian nationalist and spiritual leader

BORN: October 2, 1869, Porbandar, India

DIED: January 30, 1948, New Delhi, India

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Gandhi led the ultimately successful resistance to British colonial rule in India. His nonviolent methods and unwavering commitment, in accordance with the ethics of the *Bhagavadgītā*, inspired millions of people around the world, including Martin Luther King, Jr., and many other practitioners of nonviolence.

Gandhi incorporated the teachings of the *Bhagavadgītā*, a Hindu scripture, and the Sermon on the Mount of the Christian New Testament into a philosophy of nonviolence that he used as an ethical standard. Gandhi's message to the world was that nonviolence is truth and love in action. The ethics of the *Bhagavadgītā*, which Gandhi followed and which he urged others to follow, held that one has a duty to fight against evil or injustice by persuading one's opponents to do good. One should not hate a person who does evil, because human beings are basically good. One should hate the action that the person performs and, through noncooperation, resist that ac-

tion. If one is ready to experience suffering, eventually the evildoer will realize the injustice and make an attempt to change it. One must hold on to truth no matter what. Gandhi's way of life is a discipline that must be practiced. Gandhi used the term *satyagraha*, or truth-force, which is sometimes translated as passive resistance, for this method of nonviolence.

Gangs

DEFINITION: Structured subcultures of individuals organized primarily by socioeconomic and ethnic status and promoting actions that deviate from the laws and morality of the culture

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Gangs openly advocate and commit moral transgressions up to and including rape and murder. These acts, however, often take place within the context of a positive moral code that

values traits such as loyalty, commitment, responsibility, and self-sacrifice for the good of the group.

In the eyes of many, the violence and drug-related activities of many late-twentieth century gangs appear to be anything but ethical; however, as Plato pointed out in *Republic*, even the individuals in a gang of thieves must cooperate and be just among themselves if they are to achieve their ends. Many researchers on twentieth century gangs have made this same point. For example, Frederic Thrasher, in his landmark study *The Gang: A Study of 1,313 Gangs in Chicago* (1927), claims that the members of gangs are highly committed to protecting each other, and James Vigil, in his article "Group Processes and Street Identity: Adolescent Chicano Gang

Members" (1988), argues that gang members' sense of self is motivated and affirmed by their commitment to the gang.

The nature of this commitment and the way in which it is motivated have received much attention, but there are two primary interpretations. Some scholars argue that people join gangs on the basis of rational self-interest. They join in order to achieve goals that they believe they would not otherwise be able to accomplish, such as acquiring money, sex, friends, and a sense of power and security. Others argue that individuals join gangs primarily as a means of securing a sense of self, or as a way of expressing who they are. Despite these differences, most scholars agree that gangs develop and emerge on the margins of traditional mainstream culture and that they often mimic and mock that culture. The reason for this, as Thrasher has argued, is that gangs generally appear in what he calls a "zone in transition." That is, gangs usually surface in communities that are removed from the stability of both urban central business districts and working-class neighborhoods.

More recent research, however, has shown that gangs do thrive in some neighborhoods or places that are stable; as Vigil argues, however, it is true that individuals are more likely to join gangs when they

come from an environment that suffers what he calls “multiple marginality.” Vigil claims that family, school, work, the ethnic majority of the culture, and other mainstream institutions and values are each elements with which an individual gang member, like a geographical “zone in transition” that is only marginally assimilated by stable urban centers and suburban neighborhoods, may be only marginally associated. The more an individual is marginally related to one or more of these elements, the more “multiple” is that person’s marginality and the more “stressors” that person will experience. It is as a response to these stressors that the values and ethics of a gang, and the marginal and deviant nature of these values and ethics, are to be understood.

As a response to the stressors of “multiple marginality,” individuals who join a gang attempt to compensate for these marginal attachments. The result is that these individuals tend to overcompensate. For example, adolescents who join gangs often have had little or no caretaking from their parents, the father in particular, and these juveniles overcompensate for this lack by adopting stereotyped and oversimplified masculine values that honor being tough and violent. In addition, individuals who join gangs also attempt to compensate for the ambiguous and weak sense of self that results from being marginally attached to those institutions that can give them a sense of who they are. By joining gangs, they overcompensate for this weak sense of self by identifying solely with the gang. Sigmund Freud discussed this phenomenon in *Group Psychology and the Analysis of the Ego* (1921), arguing that a result of this phenomenon is that other groups appear as threats not only to gang members’ territory but also to their very sense of self. This explains why gang members often say that “you’re either with the group or against it”; this, in turn, explains why real or imagined enemies are such an extremely important focal point for gangs.

GANGS AND SELF-IDENTITY

Since a gang member’s self-identity is defined in terms of the group and other groups are seen as a threat to this identity, it is not surprising that most of what is valued and honored by gang members concerns the ability to defend, violently if necessary, the

gang and its territory. Being and acting tough, Vigil argues, is the “focal value” of most gangs of the late twentieth century. One must be able to protect and defend the gang and its members. In return, one will also be protected, but only, as many researchers have noted, if one proves that one is dependable and loyal to the gang.

The morality of the gang, therefore, although in many respects deviating greatly from mainstream society, is nevertheless a morality—a morality that can be most clearly understood if placed in the context of the group. To this extent, the morality of gangs could be given a relativistic interpretation: That is, as Ruth Benedict argued in “Anthropology and the Abnormal” (1934) and Gilbert Harman later argued in “Moral Relativism Defended” (1975), moral claims are about the practices of the sociocultural group (for example, a gang) and nothing else. The moral claims of gangs, likewise, such as those that value violence, commitment, dependability, and the development of a “tough” character, are themselves expressive of the group dynamics and processes of the gang and its members’ “marginal” relationship to traditional culture and morality.

Gault, In re

THE EVENT: U.S. Supreme Court decision holding that juvenile defendants have a right in criminal proceedings to due process of law

DATE: Ruling made on May 15, 1967

TYPE OF ETHICS: Children's rights

SIGNIFICANCE: The majority opinion in *Gault* supports the proposition that juveniles are as entitled as adults to a fair hearing guaranteed by basic procedural guarantees and evidentiary rules.

In re Gault was the result of the arrest of Gerald Gault in 1965 for making a lewd telephone call to a neighbor. Gault, who was then fifteen years old, was on probation for an earlier minor offense. On the basis of police rumor about Gault as well as statements elicited from him in the absence of his parents or his lawyer, and without evidence or hearing, the juvenile judge found Gault to be delinquent. He was committed to a state industrial school until his eighteenth birthday. Gault's appeal to the Arizona Supreme Court was unsuccessful, and he brought the case to the U.S. Supreme Court. The Court decided by a 7-2 vote that juveniles are entitled to notice of charges, right to counsel, right to confrontation and cross-examination of witnesses, privilege against self-incrimination, a transcript of the proceedings, and appellate review. The majority argued that these minimal guarantees assure fairness without unduly interfering with any of the benefits of less formal procedures for juveniles.

Gay rights

DEFINITION: Rights of homosexuals to enjoy the same constitutional protections as other members of society

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: As American society has become more tolerant of diversity, members of the gay minority have gradually received legal redress to the various forms of discrimination that they have long endured.

Throughout American history, and indeed throughout most of world history, homophobia, the fear and hatred of homosexuals, forced gay people to suppress their natural feelings and engage in deceptions to mask their homosexuality. Attempts by gays to become heterosexuals generally proved futile. The American Psychiatric Association has established that people do not choose their sexual orientation.

Societal pressures that gay people "straighten up" have forced many homosexuals to suppress their natural sexual orientation to the point of attempting to use heterosexual marriage as a smoke screen for their own sexuality. This practice raises significant ethical questions because it often brings suffering to both the marriage partners of gay people and their children. Smoke screen marriages frequently encounter insuperable problems that lead to their collapse, raising ethical questions about the damage done to all concerned.

THE CIVIL RIGHTS ACT OF 1964

The U.S. Congress passed the Civil Rights Act of 1964 largely to ensure that members of racial minorities would receive equal treatment under the law. At the same time, however, it also prohibited discrimination in employment, housing, and public accommodations against all American citizens based on their gender, ethnic background, or religious affiliation. Since the law's passage, many conservatives and their legislators have attempted to exclude sexual orientation from the protections of the Civil Rights Act. Commenting on the scope of the Civil Rights Act, ethicist Richard Mohr has demolished most of the arguments against extending to gay people the same equal protections that members of other minorities have received under the Civil Rights Act. Such exclusion, he argues, is ethically unconscionable on two grounds. First, if homosexuality is something one cannot control because its base is genetic or psychological, being homosexual is comparable to being a member of a disadvantaged racial, gender, or ethnic minority. On the other hand, if, as others have contended, being homosexual is a matter of choice, then being homosexual is analogous to choosing to belong to a certain religion—which is also constitutionally protected.

Legal decisions affecting the civil rights of homosexual Americans have gradually concluded that the constitutional protections accorded to all Ameri-

cans must, on logical and ethical grounds, be accorded to gays. If gay Americans are, as a class, denied their constitutional rights, then similar rights granted to other Americans are seriously compromised. Laws—federal, state, or local—that abridge these guarantees undermine the equal protection clause of the U.S. Constitution.

STONEWALL INN RIOTS

A turning point in the movement for gay rights occurred in New York City on June 27, 1969. On that date, New York City police officers raided the Stonewall Inn, a gay bar in Greenwich Village. At that time, gay bars were routinely raided but only small numbers of people were arrested. Most arrestees were quickly released on bond and had the morals charges made against them dismissed. However, the police kept records of these charges, and those records were sources of serious concern to the people who were arrested. Both the arrests and the police records seemed to be unethical violations of the right of all citizens to enjoy freedom of association without having to fear being arrested and face the possibility of embarrassing and possibly damaging future public exposure.

When the police arrived at the Stonewall Inn on that 1969 date, gay people at the bar resisted arrest and brawls broke out. The ensuing riots focused national attention on the right of homosexuals to enjoy equal treatment under the law and became an enduring symbol of the struggle for equal rights.

EMPLOYMENT ISSUES

Before passage of the Civil Rights Act of 1964 and subsequent federal rights laws, the status of homosexuals in the workplace was tenuous. Employees suspected of being gay were often fired without cause. Many people were denied employment merely because they appeared to be gay. The federal government did not hire known homosexuals on the rationale that gay employees might be subjected to blackmail that could compromise national security. Gays passing as straight had limited job security.

Gays were also barred from serving in the armed forces of the United States until 1994, when a policy nicknamed “Don’t ask, don’t tell” was instituted in the military as a compromise measure intended to afford gays equal protection while placating irate conservative groups similar to those who had protested

loudly in the late 1940’s and early 1950’s when the armed forces were racially desegregated.

The argument that gay employees might be subjected to blackmail is circular and illogical. If it is unnecessary for people to hide their natural sexual orientations, the danger of their being blackmailed would be eliminated. Arguments that morale in the armed forces would decline if openly gay people were to serve in the military were as unconvincing as the anti-integration arguments advanced four decades earlier, during the Civil Rights movement. Like all employees, gays are expected to behave ethically and circumspectly in the workplace. The removal of employment barriers to gays has not led to moral disintegration within the workplace, so there is no reason to suppose that allowing openly gay people in the military would lead to moral disintegration there.

LANDMARK COURT DECISIONS

In 1986, the case of *Bowers v. Hardwick* reached the U.S. Supreme Court. The case stemmed from the arrest in Atlanta of a man named Michael Hardwick by a police officer who went to his home to serve a warrant. When the officer arrived, he found Hardwick engaged in oral sex with another man in the privacy of his own bedroom. The officer arrested both men under an 1816 law prohibiting oral sex between two people regardless of gender. In a 5-4 decision, the Supreme Court ruled that Georgia had the right to prohibit private sexual acts that were construed as contrary to community standards of morality. Ten years earlier, the Court had ruled that the state of Virginia had the right to make sodomy between consenting adults a felony.

The Court had historically supported even ethically questionable state laws depriving groups of citizens of their right to equal treatment under the law. However, seventeen years after *Bowers v. Hardwick*, the Court heard the similar case of *Lawrence v. Texas*, which arose from the arrest of two men in Texas under an antisodomy law. When this case reached the Supreme Court in 2003, the Court voted six to three to uphold the right of consenting adults to have sex in private, thereby overriding the Texas law. This decision marked a victory for gay rights.

GAY MARRIAGE

In his dissenting opinion in *Lawrence v. Texas*, Justice Antonin Scalia warned that the decision might

lead to gay marriage. Court actions in several states indicated that such a movement was already underway. In 1993, Hawaii's supreme court had reversed a lower court ban on gay marriage; however, in 1999, the state's legislature passed a law banning same-sex marriage. Vermont began recognizing same-sex unions in 2000 but stopped short of calling such unions "marriages." In 2003, the Massachusetts supreme court, by a narrow vote, declared the state's refusal to grant marriage licenses to gay couples a violation of its constitution. The court ordered marriage licenses to be granted to gay couples applying for them at the expiration of a 180-day waiting period, during which the state assembly would have an opportunity to enact legislation regarding gay marriage.

The issue of gay marriage is highly controversial. Gay advocates contend that gay people should have the legal and ethical right to choose the partners with whom they wish to make lifelong commitments. Indeed, gay marriage might bring to gay relationships a desirable stability. The legal ramifications of legaliz-

ing gay marriage are important. Legally sanctioned marriages would enable gay partners to have access to and make decisions for seriously ill partners, adopt children, and enjoy other legal benefits that heterosexual married couples enjoy. The ethical issue involved in this controversy is whether governments can contravene the rights of adults to select their own marriage partners.

The public outcry against gay marriage has been strong. For example, Senate majority leader Bill Frist vowed to support a constitutional amendment that would define marriage as a union only between a man and a woman. Concurring with Frist's statement, in 2003, President George W. Bush announced that his administration was exploring legal means to block gay marriage.

Almost simultaneous with Bush's statement was a Vatican edict declaring gay marriage unacceptable to Roman Catholics on scriptural grounds. The edict also called the adoption of children by gays a form of child abuse. In a nation such as the United States in

Arguments for and Against Same-Sex Marriage

Arguments for

Banning same-sex marriage discriminates against gays and lesbians.

Same-sex marriages would benefit societies and individuals in the same ways that heterosexual marriages do.

Legalizing same-sex marriage does not hurt heterosexuals.

Allowing same-sex marriages may benefit the institution of marriage.

Banning same-sex marriage restricts freedom of choice and labels homosexuals as second-class citizens.

Same-sex marriage would benefit the children involved.

Banning same-sex marriage mixes church and state in an illegitimate way.

Arguments against

Homosexual acts are immoral, and same-sex relationships are open to greater health risks.

Marriage is a fundamental and unchangeable institution that is traditionally between persons of opposite sex.

Allowing same-sex marriages will damage the institution of traditional heterosexual marriage.

Same-sex relationships are less stable and less faithful than opposite-sex relationships.

Society has an interest in promoting marriage for procreation and child-rearing, and same-sex couples cannot have children.

Same-sex parenting is not as good for children as traditional family parenting and may influence children to adopt homosexual lifestyles.

Marriage is defined by scripture and tradition as involving one man and one woman and is a religious sacrament

which church and state are separate, religious arguments against gay marriage, although widespread, are considered irrelevant by many people who interpret the law more liberally than religious conservatives do.

THE CONTINUING STRUGGLE

With every advance made to ensure equal rights for gays, a backlash develops that questions the wisdom and ethics of enacting and enforcing legislation to protect a minority that has traditionally been reviled by large numbers of mainstream Americans. A major ethical issue is one of minority rights, which have generally been protected by law.

Homophobic attitudes have, however, begun to moderate. Meanwhile, society is being forced to address the basic question of whether legally and ethically any segment of American society can be accorded unequal treatment under the law simply on the basis of who or what its members happen to be.

Gender bias

DEFINITION: Discrimination in thought or action based on cultural demarcation of gender or sex

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Discrimination based on sex or gender is an expression of ethical values. Many actions that may appear value-neutral with regard to gender may actually be found to contain implicit biases that are based on assumptions of gender inequality within philosophical foundations.

"Gender bias" may describe discrimination against either men or women. In practice, however, it is mostly a prejudice against women, typically because of implicit philosophical assumptions. Gender bias is also not merely a "battle of the sexes," that is, men discriminating against women, although such discrimination does occur. Rather it is a structural phenomenon of a patriarchal hegemony that empowers men and the masculine in which both men and women participate and help to perpetuate.

ORIGINS OF GENDER BIAS

Gender bias has its roots in sexual differences. Distinctions between "sex" and "gender" originate within feminist thought as a way to indicate that cultural values are overlaid upon sex, which is often seen as natural. In this way, some feminist thought argues that patriarchy is based upon prejudicial views of women, rather than upon any essential nature of the female sex. Taking this argument a step further, Judith Butler famously argued, in *Gender Trouble* (1990), that the many ways in which people can conceptualize sex—such as anatomy, hormones, chemi-

cals, or genes—speak to the cultural determination of even the very concept of sex. As a cultural determination, there is an essential valuing attached to differences, conceived of in terms of sex and/or gender, such that sexual difference is never without an ethical determination, though this determination is often hidden by the implicit ethico-political valuing within metaphysical foundations.

Sexual difference has been depicted throughout Western philosophy in an oppositional manner, beginning with the Pythagorean table of opposites. Along with the setting out of difference, which in itself is not necessarily biased, the Pythagorean table aligned male with “good” and female with “bad,” thereby affixing ethical values upon sexual differences. Throughout the course of Western thought this correlation has been taken up in various extensions of this dichotomy, including the alignment of maleness with form, reason, subject, mind, rationality, culture, public, freedom, justice, and the universal. Conversely, femaleness has been associated with matter, emotion, object, body, intuition, nature, private, subjection, love, and the particular. The alignment here is not a description of the behavior of men and women, but rather a description of the essences of femaleness, that is, what it means to be a woman. In its description, then, the pronouncement becomes a prescription, or how one ought to act in accordance with one’s essence.

Reviewing the metaphysical categories reveals the cultural bias against women, as the values associated with femaleness are subordinate in importance and even denigrated. These ethically weighted dichotomies are present in the philosophy of nearly every thinker of the traditional Western philosophical canon, including Aristotle, Saint Augustine, Thomas Aquinas, René Descartes, David Hume, Jean-Jacques Rousseau, and Immanuel Kant. These philosophers have integrated this bias into the ethical and political systems that act to structure both past and present societies such that the patriarchal hegemony that marks contemporary life has its roots so firmly entrenched that the bias appears “natural.” For example, the idea that women’s place and work is in the home is an expression of the metaphysical alignment of femaleness with a lack of reason, with which to engage in the public affairs of the civic world. This is one instance of gender bias that manifests in the inequity of women in the public workforce, including the far

lesser number of women in public office than of men.

Similarly, contemporary sexual objectification of women finds its origin in the alignment of femaleness with bodies and objects, despite the fact that men too have bodies. However, set in opposition to the mind—the source of knowledge and judgment—the body takes on a denigrated status, an object to be captured by the mind; that is, by men. One consequence of this type of thinking can be found in the modern global sex industry that enslaves more women and girls than were enslaved throughout the earlier history of world slavery, including slavery in the United States. The lack of political action taken to remedy this situation is at least in part another indication of gender bias; the status of women and girls is given little import. These examples help to demonstrate that the ethical phenomena of gender bias rest in the value-laden appointment of metaphysical categories.

VIOLENCE

The concrete ethical ramifications of gender bias are both deeply imbedded and ubiquitous. Worldwide, women and girls are subject to disproportionately greater incidents of violence, including rape, physical and sexual abuse, female genital mutilation, female infanticide, and dowry murder. Violence is also enacted against lesbians, the transgendered, and those who fail to exhibit traditional gender roles.

Violence perpetrated against men because of their homosexuality or their failure to act according to traditional masculine roles is a form of gender bias that discriminates against men. However, it also acts to maintain gender bias against women: Men are punished for exhibiting womanly—thus demeaning—qualities, while women are punished not only for exhibiting masculine qualities but also because this is an indication of a failure to serve the needs of men in some way. Globally, women lack power over their sexuality, as seen in forced marriages and forced sexual servitude in the sex industry, absence of resources, and access to fertility options and to health and medical aid. Economic inequity is manifest in women’s lower wages, unpaid work, hostile work environments stemming from sexual harassment, and lower literacy rates. Politically, women’s particular needs are not represented to a full degree of legality, nor are women represented in political institutions in proportion to the female populace.

While these facts of gender bias are known, the subject is rarely discussed as a philosophical and ethical concern. Rather, the problem often is taken either as belonging to the private realm—thus re-inscribing the very metaphysical origin of gender bias—or as a problem of cultural difference when analyzing global discrimination of women. In both cases, the ethical import of gender bias is not addressed at the structural level; thus, discrimination against women solely because of the very fact that they are women continues. Ethical systems are designed to address the treatment of humanity on both the individual and societal levels, making gender bias an indispensable component to any ethical discussion.

Generosity

DEFINITION: Magnanimity; freedom in giving

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Generosity is thought of as a virtue, but one that can be self-destructive if taken to extremes.

A virtue can be briefly defined as a form of moral excellence, goodness, or righteousness. Generosity

clearly fits into this definition. The term "generosity" is often used interchangeably with benevolence, altruism, charity, or kindness, and it is linked to the concepts of sympathy and forgiveness. All these virtues are associated with giving, but each is distinct.

There are four prerequisite conditions that distinguish generosity from the other virtues that are associated with giving. Generosity must arise from an awareness of circumstances, it must be based on a desire to benefit the recipient and be free of any other underlying motive, what is given must be of value to the giver, and what is given must be more than would be considered necessary under the circumstances.

In addressing the issue of awareness, Elizabeth Pybus states, "Being aware of the world around us is necessary for us to exercise our agency well and helpfully towards other people." In other words, those people (agents) who lack awareness of the needs of others cannot be generous.

Lack of awareness takes different forms. There is simple want of information, which, once it is provided, promotes generous behavior. Charitable organizations base their appeals on educating the public about the needs of others in order to stimulate contributions. There may be a lack of awareness because of a high degree of self-interest. Very young children exhibit such a lack of awareness. So do people with sociopathic personalities. Regardless of the cause, the result is the same. Without awareness of the circumstances of others, the agent cannot express generosity. This, then, lends a certain weight of moral obligation to awareness.

It is true that one cannot know everything. Individuals and societies are morally obligated, however, to try to be informed about the circumstances that others are experiencing. It can be very difficult to obtain information about some topics, especially when there is an organized effort to suppress truth or to spread disinformation. In these cases, it is even more important than usual to be aggressive in searching out the facts. Lack of awareness allows Holocausts to happen. While most situations that people face are not that extreme, the premise is the same: People are morally obligated to be as aware as possible.

Generosity is an other-oriented behavior. It flows freely from goodwill without the weight of other obligations. It must not be linked with motives such as reciprocity or duty. The only motive that can be involved is the desire to benefit the recipient. This does

not mean, however, that all self-interest must be disregarded. To value the other above the self in a benevolent act is not generosity but altruism.

Generosity requires that there be no motive of personal gain. That is, one who gives must not expect anything in return. Generosity precludes even a minimal degree of the attitude, "You scratch my back, and I'll scratch yours." Likewise, there must not be any expectation on the part of the agent of gratitude or recognition from the recipient for generous acts. While the agent may derive pleasure from giving, the anticipation of that pleasure cannot be the motive for the act, or it will not be generosity.

To give because one feels obligated is not generosity but charity. Generosity involves free choice, and the decision can be based on rationality or emotion. The campaign presented by a charitable organization is factual, but its appeal is emotional. Some people respond out of duty, because it is morally correct to give to those in need, and they will feel guilty if they do not give. Others give out of generosity because they decide that they want to, because they are persuaded by the facts or are moved by sympathy.

What a person gives is an important factor in generosity. It does not necessarily have to be anything material. It must, however, be something of value to the giver. Time is quite valuable to most people, and those who are given the gift of someone's time have often been given a treasure. There are those, however, who feel that they have much spare time, and therefore to give it may not mean very much. They may choose to use that time to share their particular talents. This, then, could be an act of generosity, if they did it purely for the benefit of the recipient and not just to fill up their hours with activity. Although it is usually so, what is given does not necessarily have to be valuable to the recipient. Its value in terms of generosity is in the intent of the giver.

In order for an act to be considered generosity, what is given should exceed what might be considered reasonable under the circumstances. This factor can be viewed from the context of either the giver or the situation. If two people—one wealthy and one earning minimum wage—each decided to donate a day's wages to some cause, the one with low income might be considered to be giving more than was required by his financial circumstances, and that contribution would be considered truly generous. In another situation, if a person's shoes were worn out and

someone gave him three new pairs, that also would be an act of generosity.

James Wallace states that a virtue such as generosity tends "to foster good feelings based on mutual good will." In some cases, however, the recipient may not appreciate a generous act in his behalf and may even be harmed rather than benefited. These results may not be possible to anticipate. If the agent is acting in the recipient's best interest and with compassionate awareness, however, the generosity that is offered is authentic.

Genetic counseling

DEFINITION: Identification, explanation, and discussion of deleterious genes in potential parents

DATE: Practiced began around 1960; formally defined in 1975

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Genetic counseling raises serious ethical questions in clinical practice, since reproductive decisions are central to conventional morality and the identification of inherited defects carries the possibility of discrimination.

Although it has roots in the eugenics movements of the early twentieth century, which have been justly criticized as being hampered by imperfect understanding of inheritance and tainted by racial and class prejudice, genetic counseling relies on landmark genetic discoveries of the 1950's—the elucidation of the structure of DNA and of the specific biochemical bases for a number of inherited disorders, including Tay-Sachs syndrome, sickle-cell anemia, and hemophilia. Beginning in 1960, specialists in medical centers began advising couples who had already had a child with such a disorder or had close relatives who were affected. In 1975, the American Society of Human Genetics published a formal definition and guidelines on genetic counseling. The availability of these services and the number of conditions amenable to testing have risen steadily, although access is not universal even in the developed world. Most severe genetic diseases are recessive; carriers with one defective gene may or may not be identifiable. Gross chromosomal abnormalities and some metabolic disorders can be diagnosed *in utero* through amniocentesis.

U.S. government guidelines for genetic testing and counseling caution against using the process for perceived societal good and stress that the impetus for testing and reproductive decisions must come from the affected individuals, without outside compulsion. Nevertheless, many people perceive that a genetically abnormal individual places a burden on society and believe that it is immoral to bear a defective child; this attitude is seen by others as providing a justification for abandoning the handicapped. Voluntarily abstaining from conceiving children is morally acceptable to most people in Western society, but objections to abortion are widespread. Some heritable abnormalities are commonest among small, inbred ethnic minorities, in which case refraining from having children and marrying outside the group, the most prudent courses of action from a medical standpoint, have genocidal overtones. Not all genetic disorders are equally debilitating, and it is uncertain whether genetic counseling is appropriate for less-severe conditions. Finally, there are many disorders (alcoholism, for example) that may be at least partially heritable, whose genetic basis is unknown, and for which the scientific basis for genetic counseling is tenuous.

Tests exist for some genetically transmitted con-

ditions (for example, certain cancers) that manifest themselves late in life, and more are continually being developed. Although knowing of their existence is helpful to medical professionals, there is real concern that this information could be used to deny employment or insurance coverage to those who are affected. Maintaining confidentiality and respecting the rights of individuals are paramount in genetic counseling.

Genetic engineering

DEFINITION: Branch of genetics that manipulates genetic material in living organisms, animal or vegetable

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: As genetic engineering rushes toward eliminating genetic ills, it has produced such substances as industrial enzymes, the human growth hormone, and insulin and made possible the cloning of vertebrates and other sophisticated but ethically controversial procedures.

Long practiced by animal breeders and botanists, genetic engineering entered a new phase in the late 1950's when Francis Crick, James Watson, and Maurice Wilkins unraveled the mystery of the double-helix structure of deoxyribonucleic acid, commonly called DNA, paving the way for research that seems almost a product of science fiction. The adult human genome contains approximately three billion chemical bases and some one hundred thousand genes, each with its function yet each containing the same DNA. The DNA from a single cell found in a person's saliva on the lip of a glass can identify with almost absolute certainty the person to whom it belongs. Every cell in a person's body possesses identical DNA. Every living organism has unique DNA except for identical organisms—in humans, identical twins. As the mysteries of DNA have continued to unfold, they have generated myriad ethical questions about the uses of genetic engineering.

Source: Moms Online.

FUNDAMENTAL CONCERNS

Many religious organizations and their members actively resist supporting research in genetics and have expressed alarm that genetic engineering tampers with nature in indefensible ways. Contradictions underlie many such arguments. For example, if farmers turn rocky woodlands into cultivated fields in which crops can grow, are they not meddling with nature? Few would contest farmers' rights to cultivate land on a basis analogous to arguments objecting to genetic engineering.

Nevertheless, considerable controversy surrounds such matters as the use of stem cells in genetic re-

search. Stem cells are harvested from human embryos, most of which have the potential of developing into humans but that exist unused in the freezers of fertility clinics. When a woman wishing to become pregnant receives fertility treatments, several of her egg cells are fertilized. The fertilized eggs that are not used to impregnate her are frozen and eventually discarded.

Stem cells are essential for research purposes because, as undifferentiated cells—that is, cells that have not yet assumed the specialized functions that distinguish more developed cells—they can adopt the characteristics of cellular material introduced into them and can reproduce rapidly. Animal experiments have revealed that neural or nerve stem cells not only replicate themselves but also, when placed in bone marrow, can produce several types of blood cells. These experiments provide hope that paraplegics may eventually have their spinal injuries repaired to the point of regaining the use of their paralyzed limbs and that genetic diseases may be contained or even cured.

Stem cell research offers hope that Parkinson's and Alzheimer's disease, diabetes, and heart trouble, as well as some cancers, will ultimately be controlled or wholly eliminated through the genetic engineering that such research makes possible. However, the question looms of whether it is ethically acceptable to use

human embryos as sources of stem cells, inasmuch as the embryos that produce such cells have the potential to become human beings.

The stem cell controversy has become heated and fraught with political, religious, and moral implications. In 2001, President George W. Bush signed a bill permitting federal funds to be spent on stem cell research only on a limited basis. The bill restricts such research to the small number of stem cells currently available in a limited number of laboratories, but forbids any continuation of government-supported research once this supply has been exhausted.

Ironically, one of Bush's predecessors, President Ronald Reagan, opposed stem cell research during his administration, and such research might have provided a means of controlling the Alzheimer's disease that severely disabled him through the last years of his life after he left office. Very much aware of this fact, his wife, Nancy Reagan, publicly called for continuation of stem cell research in early 2004. Meanwhile, despite a lack of federal support, privately financed research organizations like the Howard Hughes Medical Institute continued crucial stem cell research.

THE HUMAN GENOME PROJECT

The systematic study of genetics, initiated in the mid-nineteenth century by Gregor Johann Mendel, an Augustinian monk, advanced greatly when, around 1869, a Swiss physician, Friedrich Miescher, discovered deoxyribonucleic acid, commonly called DNA, in pus from the wounds of German soldiers he was attending. Interest in the study of inherited traits increased steadily in the late nineteenth and early twentieth centuries.

A major breakthrough occurred in 1953 when Francis Crick and James Watson published a landmark article on the double-helix configuration of DNA in *Nature*, a well-respected scientific journal. Their work and that of Maurice Wilkins led to further DNA research for which this trio shared the Nobel Prize in Physiology or Medicine in 1962. In 1975, the first decoding of a gene from the DNA of a virus was accomplished. In 1977, the human gene that manufactures a blood protein was isolated.

In 1990, the Human Genome Project was launched with the expectation that it would, within fifteen years, map completely the human genome, the so-called blueprint of life. The project advanced with remarkable speed. By mid-2000, about 95 percent of the human genome had been sequenced using accelerated sequencing methods developed in the preceding decade and considered 99 percent accurate.

This research enabled scientists to uncover genetic problems in the cells of organisms and either correct them immediately or work toward discovering ways to culture antidotes or messenger cells that would, once introduced into the organism, eliminate defective cells. The implications of such work are enormous for the control and treatment of all sorts of genetic diseases as well as for such conditions as paraplegia resulting from accidents.

PRENATAL GENETIC MANIPULATION

Some of the ethical implications of advanced genetic research are daunting. Through assessment of the condition of cells in pregnant women, various genetic predispositions can be identified. Potential parents presently can learn of genetic abnormalities that are correctable in the unborn fetus. Prenatal microscopic surgery has already corrected serious genetic defects in fetuses.

Before the twenty-first century ends, it should be technologically possible for parents to select characteristics they consider desirable in their offspring. They may be able to choose sex, hair and eye color, height, and body structure as well as such characteristics as intelligence, disposition, athletic ability, and manual deftness. Although to do so would require expensive procedures not covered by health insurance, it would enable parents willing to bear the expenses to tailor to their own tastes the children they want.

One must inevitably address the ethical considerations this sort of genetic manipulation presents. For example, the creation of made-to-order children would be affordable only by the affluent. Class distinctions would surely arise from it. A genetically manufactured ruling class with which the rest of society would be unable to compete could result from such genetic meddling, spawning serious ethical dilemmas.

CLONING

Significant reservations accompany cloning, which genetic engineering has brought far beyond the simple cloning done by farmers taking slips of plants and rooting them to create genetically identical plants. Complex vertebrates, notably sheep and cows, have been cloned, and the technology exists to clone humans, although most industrialized countries prohibit human cloning.

Through genetic engineering, it should soon be possible to clone individual body parts—kidneys, livers, hearts, and other vital organs—that will be created from the donors' own DNA and, when sufficiently developed, be transplanted into donors without fear of rejection. Although few people have ethical reservations about this use of cloning, many view with alarm the possibility that some people might have identical whole selves cloned to provide spare parts when the organs of the original donors fail.

Selling DNA on eBay

In May, 2004, an unlikely story made world headlines when the giant online auction site eBay shut down an auction for violating its rule against selling human body parts. The “body part” in question was the DNA of California governor Arnold Schwarzenegger. What the seller was actually offering was a partly consumed cough drop that had been retrieved from the trash can into which the governor—according to the anonymous seller—had discarded it. The auction invited bids with the come-on, “Own a piece of DNA from the man himself.” After the auction was closed, the seller relisted the item as “Arnold Schwarzenegger’s ‘Infamous’ cough-drop, ‘The Gov’ mint,’” dropping all references to DNA. The new auction quickly drew bids exceeding ten thousand dollars.

Among the interesting ethical questions that auctioning the cough drop raised was what anyone buying the drop would do with it. The buyer would have no way of knowing whether the cough drop actually contained Schwarzenegger’s DNA without having a known sample against which to compare it; however, anyone possessing such a sample should have no need for the cough drop.

The U.S. Supreme Court ruled that a cloned human cannot be patented, although in 1980, in its *Diamond v. Chakrabarty* ruling, it affirmed the right of an inventor to patent a genetically altered life-form. The Court has forbidden patenting cloned humans because such patents would, in the Court’s judgment, enable one person to own another person, constituting slavery.

GENETIC PRIVACY

Genetic engineering can reveal potential physical and mental problems. Such revelations can result in finding ways to control and possibly overcome these problems, but a threat accompanies the use of information gained from this sort of genetic investigation. If genetic information is not considered sacrosanct and strenuously protected, it could conceivably be made available to insurance companies, courts of law, potential employers, and others who might pe-

nalize people for their genetic predispositions even though there is no guarantee that such predispositions would eventuate in illness or disability.

Although uncovering genetic information can be extremely valuable in meeting potential problems, the irresponsible dissemination of such information might destroy people’s lives. What is sacrosanct today may not be considered sacrosanct tomorrow. A case in point concerns a disease such as Huntington’s disease, a disabling and potentially fatal condition that is likely to afflict about half the offspring of parents suffering from it. At present, genetic testing can determine whether the children of people with Huntington’s will develop the disease, whose onset typically occurs in middle age.

Many children of Huntington’s disease victims decline to be tested. They resist knowing that they might eventually develop the disease. They are faced with an array of ethical dilemmas. Should they marry? Should they have children? Should they inform prospective mates or employers of their predisposition? How should they plan for their futures? How should they answer probing questions about their medical histories on insurance and employment applications?

INCREASED LIFE EXPECTANCY

Life expectancy in the United States increased dramatically during the twentieth century. In 1900, the average man could anticipate living 44.3 years, the average woman 48.3 years. By 1950, those figures had grown to 65.6 years for men and 71.1 years for women. The figures for 1997 increased to 73.6 and 79.2 respectively.

Reliable sources indicate that genetic engineering and other technological advances may, by the year 2100, extend the life expectancy in the United States and Canada to as much as two hundred years. The thought that people may reach or surpass such an age poses thorny ethical questions, chief among them the question of how the elderly will survive economically. Will they be forced to work well into their second centuries? At present, the average American works from the age of about twenty to seventy. Given a theoretical life expectancy of eighty, they thus work for about two-thirds of their lives. If such a proportion is applied to a life span of two hundred years, people beginning to work at twenty would have to work until they are at least 160 years old. Even then,

their least productive period, some of it probably involving costly disability and illness, would extend to forty years, whereas for most people currently it is between fifteen and twenty years.

It might be expected that social upheavals would be loosed by such increases in life expectancy as younger members of society question the ethics of saddling them with the socioeconomic responsibilities that are bound to ensue from such an extended life spans. The national economy in the early twenty-first century is already under severe pressure from a Social Security Administration faced with overwhelming economic problems and a health care system threatened by insolvency within two decades. Caring for the aged is costly.

In the brave new world that genetic engineering and other technological advances make possible, a major concern is a population explosion that exceeds the ability of society to support it. Questions of right and wrong arise as people ponder whether it is ethical to burden upcoming generations with decades of supporting, directly or indirectly, the elderly while, with increasing life expectancy, the economic security of their own futures remain in doubt.

Genetic testing

DEFINITION: Laboratory analyses of genetic materials designed to determine if subjects are carrying certain diseases, are likely to contract the diseases, or have other genetic disorders

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Genetic testing is a potentially powerful tool for the prevention, early detection, and improved treatment of diseases that have known genetic characteristics. However, such testing carries with it serious concerns about the ethical, social, legal, and psychological implications of how the information collected is used.

With the completion of the mapping work of the Human Genome Project, genetic information is rapidly moving into mainstream clinical medicine. Genetic testing is a powerful method of establishing diagnoses, and in some areas of medicine it is becoming a routine part of diagnostic testing.

GENETIC TESTING VS. GENETIC SCREENING

Genetic testing that is used to predict risks of disease and influence individual clinical care should be distinguished from population-based genetic screening. An example of genetic screening is state-mandated newborn screening programs that are aimed at detecting genetic diseases for which early diagnosis and treatment are available. Population-based genetic screening is ethically justifiable when the benefits of screening outweigh the potential harms. Any such screening tests should provide clear diagnoses, and accurate information on risks and effective treatments for the conditions should be available. Screening is justifiable when the prevalence of the disease is high in the population screened, and when screening is acceptable to the population screened.

Population-based genetic screening is becoming increasingly common for adult-onset disorders for which known and accepted treatments are available. Population-based genetic screening to reduce the incidence of a disease, however, may sacrifice

the values of individuals for the sake of social goals. Individuals may feel pressure to undergo genetic screening tests they would not otherwise have chosen.

THE PRIVACY OF GENETIC INFORMATION

Maintaining the privacy of medical information is a concern that is not limited to genetic information. Privacy has instrumental value through the control that it affords individuals in providing protection from harm. For example, giving individuals absolute control over their own genetic information helps protect them from insurance or employment discrimination. Laws that guarantee the privacy of genetic information are instrumental in allowing every individual to control who has access to potentially damaging genetic information.

As the number of genetic tests clinically available has increased there has been greater public concern about genetic privacy. One of the ironies of advances in human genetic research is that the very people who stand to gain most from this information may not seek genetic testing out of fear of discrimination. In a national telephone survey, 63 percent of participants said they probably would not or definitely would not take genetic tests for diseases if health insurers or employers were to have access to the test results. Such concerns about the potential for insurance and employment discrimination are at the heart of a national effort to accord genetic information special privacy protections.

By mid-2003, forty-two states had enacted legis-

lation designed to protect against genetic discrimination in health insurance, and thirty-two states had legislated protection against genetic discrimination in employment. However, the specific provisions of these laws varied greatly from state to state.

On the federal level, President Bill Clinton signed an executive order prohibiting discrimination in federal employment based on genetic information. In addition, a new set of federal privacy regulations, issued pursuant to the Health Insurance Portability and Accountability Act of 1996 (HIPAA), created a minimum set of general privacy protections that preempt state law. Although multiple bills have been introduced into Congress, no federal legislation has been passed specifically relating to genetic discrimination in individual insurance coverage or to genetic discrimination in the workplace.

Efforts to enact legislation to ensure the privacy of genetic information stem from concerns that health insurers might use such information to deny, limit, or cancel insurance policies. There are also reasons for concern that employers might use genetic information to discriminate against their workers or to screen applicants for jobs. The use of genetic testing in the workplace presents employers with challenging decisions related to promoting health in the workplace while avoiding the potential misuse of genetic information. However, concerns about genetic discrimination may actually be out of proportion to the actual incidence of documented instances of information misuse.

Types of Genetic Testing and Screening

<i>Category</i>	<i>Subjects</i>	<i>Purpose</i>
Carrier identification	Prospective parents	Identification of recessive gene disorders that may give future offspring such diseases as cystic fibrosis, Tay-Sachs disease, or sickle-cell anemia
Prenatal diagnosis	Fetuses	Determination of possibility of babies being born with such disorders as Down syndrome
Newborn screening	Newborn babies	Determination of whether newborns carry such treatable conditions as phenylketonuria and congenital hypothyroidism
Late-onset disorders	Adults	Determination of whether subjects have such adult diseases as cancer, heart disease, and Huntington's disease

DISCLOSURE OF FAMILIAL GENETIC INFORMATION

Genetic test results of individuals have implications for other blood relatives. This feature of genetic information raises difficult ethical questions about the obligation of family members to share their genetic information with relatives, who may share the same genetic disorders, and the obligations of physicians to disclose information about disease risks with the relatives of patients who refuse to share the information themselves.

Studies of patients' attitudes toward disclosure of genetic information to at-risk family have documented varied attitudes toward disclosure of genetic information within families. Genetic information carries the potential for economic, psychological, and relational harm. For example, individuals who carry genetic alterations may see themselves as defective and feel guilty about the possibility of their transmitting genetic alterations to their offspring. There is an underlying fear that society will view those with genetic alterations as defective. Some perceive the identification of individuals with altered genes as the first step toward eugenics, or attempts to limit procreative freedom based on genotype.

Genetic testing should always be accompanied by the subjects' written informed consent to prevent misunderstanding and to minimize anxiety. The ethical, legal, social, and psychological implications of genetic testing are so complex that genetic counselors should be involved before, during, and after patients agree to undergo testing. Genetic counseling is a process of evaluating family histories to identify and interpret the risks of inherited disorders.

The mere fact that genetic tests are available does not mean that they should necessarily be ordered. Decisions to conduct tests should consider not only the possible benefits but also the potential social and psychological risks. Genetic counselors can be invaluable in helping individuals decide which tests are appropriate, deciphering complex test results, and helping individuals understand and reach decisions about what to do with the results of their tests.

PRE-IMPLANTATION AND PREDISPOSITION GENETIC TESTING

Pre-implantation genetic diagnosis (PGD) has raised many ethical concerns. It is an alternative to prenatal diagnosis for individuals undergoing in vitro

fertilization. PGD allows scientists to screen embryos for chromosome abnormalities and select unaffected embryos for implantation with the goal of reducing the transmission of genetic diseases. The process has been used for sex-linked disease and human leukocyte antigen matching. The ethical boundaries of employing this procedure are unresolved. It raises a variety of questions. For example, should parents be allowed to use the process to select the sexes of their offspring when no evidence of genetic diseases is present? Who should decide how this technology should be used?

Many of the earliest forms of genetic tests were designed to detect or confirm rare genetic diseases. Information obtained from single-gene disorders with high penetrance was relatively easy to interpret. However, later advances in genetics led to the discovery of gene alterations that contribute to common, complex diseases that develop later in life. These so-called predisposition tests determine the probabilities of healthy individuals developing the diseases. When unaffected family members are found to have genetic alterations that increase their risks of developing diseases, they may take measures to reduce their risk of developing the diseases. Such situations may also affect reproductive decisions and result in targeted medical diagnostics and therapeutics.

Appropriate uses of predisposition testing have been challenged. Predisposition genetic tests can identify alterations within genes, but they cannot always predict how severely the altered genes will affect the people who carry them. For example, finding an alteration on chromosome number 7 does not necessarily predict whether a child will have serious lung problems or milder respiratory symptoms.

Many ethical questions arise from predisposition testing. For example, should children undergo genetic testing for adult-onset disorders? Should predisposition testing be allowed prior to adoption decisions? Generally speaking the best interests of the children should guide decisions about genetic testing. When no immediate benefit to a child is evident, inessential testing should be avoided.

Genetic testing carries the promise of disease prevention, risk modification, and directed therapy. These benefits, however, are accompanied by the potential for discrimination and stigmatization. Informed consent and genetic counseling are essential to ensuring that genetic testing is appropriate and that

the risks to individuals and social groups are minimized. The greatest benefits of the Human Genome Project are yet to be realized, and as new genetic tests emerge new questions will certainly arise.

Genetically modified foods

DEFINITION: Foods artificially created by manipulating living organisms using methods involving the transfer of genetic information (DNA) from one source to another

DATE: Began in the late twentieth century

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: The emergence of genetically modified foods at the end of the twentieth century led to wide public debate regarding food safety and quality, consumer rights, environmental impact,

the value of small-scale farming, and the potential need to regulate certain technological applications.

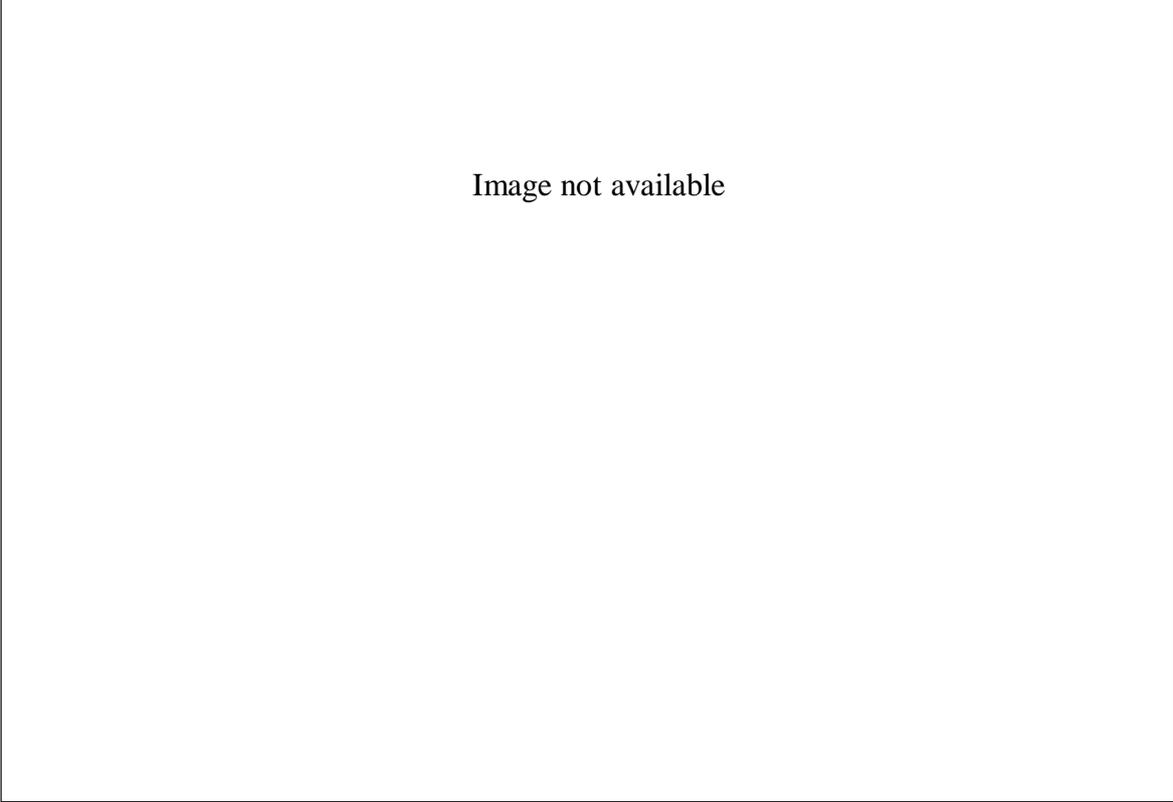

Human beings have been manipulating living organisms for food for thousands of years. Early examples were wine and bread production and the domestication of the ancestor to the modern corn plant. As scientists learned more about plant and animal biology, selective breeding practices became more efficient. Later, methods developed to alter DNA led to new traits important for commercial growing practices or that enhanced the quality of the food. With the development of genetic engineering, new ways to modify plant and animal food sources became possible. In 1990, the U.S. federal Food and Drug Administration gave approval for the first food ingredient produced through recombinant DNA technology: chymosin or rennet, which is used in the production of cheese and other dairy products. Shortly afterward, Calgene, Inc. introduced the Flavr Savr tomato—the first genetically modified whole food approved for market.

By the early years of the twenty-first century, genetically modified (GM) foods had been altered for a variety of reasons including improving plant resistance to pests, disease, and such environmental stresses such as drought and frost. Other goals of genetically modifying foods have been to improve taste, quality, or nutritional value; to improve ability to transport or store the product; and to use plants to produce novel products for industry, medicine, and consumer use.

Animals used as food sources have also been modified—most commonly by treating them with hormones produced through genetic engineering to increase their milk production or their muscle mass. Hormone-treated dairy cows and the appearance of herbicide-resistant crops were particularly important in leading to public outcry against genetically modified foods. As a result, a new field of food and agriculture ethics emerged in which ethical principles related to general welfare, justice, and people's rights are applied. Environmental ethics and questions regarding what is considered "natural" enter into the assessment of this technology.

A UTILITARIAN APPROACH

One way to assess any new technology is to consider its potential benefits and harms. This approach,

A large rectangular box with a thin black border, containing the text "Image not available" centered in the middle.

Symbolic of a growing world backlash against the uncertain hazards of genetic engineering, Greenpeace activists staged a protest against genetically altered foods in the capital of Brazil in January, 2004. Their Portuguese-language banner reads, “Seven of ten Brazilians do not want genetically modified foods.” (AP/Wide World Photos)

however, can lead to major dilemmas when considering genetically modified foods. Food is essential for survival of all animals, and thus has value. The Food and Agricultural Organization (FAO) of the United Nations has pointed out that access to safe, sufficient, and nutritious food is a universal right that impacts other values of enhanced well-being and human health. Proponents of genetically modified foods argue that they can contribute to sustainable agricultural systems and food of high nutritional quality—both of which are critical to support the expanding world population.

Opponents of genetically modified foods argue that genetic manipulation damages food quality by decreasing its nutritional value and increasing risk for the presence of dangerous chemicals in food that might cause allergic reactions or even cancer. Although regulatory agencies and scientists have

deemed these foods safe, insufficient scientific data exist to conclusively address public concerns.

Genetically modified foods indirectly impact other aspects of human well-being including quality of life (the aesthetic value of rural settings and the natural environment) and satisfactory income and working conditions. Concerns about genetically modified food technology range from fears and uncertainties about the environmental and ecological impact of genetically engineered crops to the demise of small-scale farmers or possible disrespect for local customs and traditions. Given the ever-decreasing space available to grow food and the long history of environmental disturbances resulting from other agricultural practices, ethical analyses should compare the relative benefits and risks of both genetic modification technology and traditional practices.

ISSUES OF JUSTICE AND FAIRNESS

The world human population doubled between 1960 and 2000 and is expected to increase by an additional 50 percent by 2050. This increase, coupled with the growing gap between wealthy and less developed nations, forces consideration of new technologies and policies for food production and distribution. The value of enhanced well-being for all is intimately linked to the need for practical rural infrastructure and sustainable agriculture on a global basis.

Proponents of genetically modified foods argue that the technology may be the only way to address growing global food shortages and malnutrition. Opponents argue that other sound practices should be considered, that potentially unsafe food is being touted as a solution to world hunger, and that wealthy nations are forcing developing countries into abiding by patent rules and trade agreements to get the food supplies they need.

Certain business practices associated with genetically modified food production have been controversial. Widely differing public views on genetically modified foods in Europe versus the United States have led to international debates on fair trade laws and practices. Other concerns arise from patenting issues, the costs of genetically modified seed, and industry-imposed limitations on how farmers can use these products.

Interestingly, patent and intellectual property legal complications might actually lead to the underdevelopment and underutilization of genetically modified foods that could be applied for the greater public good. An example of this is “golden rice,” a form of rice that was genetically modified to contain extra vitamin A in order to address nutritional deficiencies among Asian societies. The public views the intentions of businesses associated with genetically modified foods with skepticism, since many believe that corporate profit is valued more than either the condition of humankind or the long-term health and sustainability of the global environment.

Environmental ethicists question what is fair to the natural world. Will the technology that produces genetically modified organisms, including those used as food, negatively impact biodiversity—perhaps through the production of genetic pollution, “superweeds,” or new pathogens—or will the technology actually enable scientists to help preserve biological diversity or perhaps even restore populations of en-

dangered or extinct species? During the first years of the twenty-first century, genetically modified food technology was still too new to know whether there were unforeseen risks or to assess its impact on ecosystem balance and natural selection.

OTHER ISSUES

Another controversial issue surrounding genetically modified foods is whether the products should be labeled as such. Regulatory agencies in the United States have ruled that because such foods are essentially the same as natural and traditionally grown foods, they do not require special labeling. Companies producing genetically modified foods argue that given misperceptions and a lack of public understanding of the technology, such labeling would unfairly skew market competition. Consumer rights advocates argue the importance of the public’s right to know and the need for freedom of informed choice in a democratic society.

As with the broader issue of genetically modified organisms, genetically modified food technology leads to concerns that science may have gone too far in intervening with nature. An underlying fear is that if humans continue to reduce living organisms to the status of manufactured goods, the standards set for genetically manipulating any organism, including humans, will also be relaxed. Traditional ethical principles and commonly used risk-benefit analyses do not readily apply to situations in which genetically modified crops begin to impact biodiversity, irreversibly change the concept of natural selection, or alter human activities involving basic needs and long-valued human interactions with the land.

Geneva conventions

THE EVENTS: Series of international meetings that codified the rules of warfare

DATES: 1863-1977

TYPE OF ETHICS: Modern history

SIGNIFICANCE: The Geneva conventions encourage the humanitarian treatment of civilians and enemy combatants. They arise in part from the idealist moral belief that human worth and dignity transcend nationalist concerns even in wartime, and in part from each nation's practical desire to protect its own citizens by joining a collective agreement which will protect all people.

The background for the Geneva conventions can be found in European diplomatic and military development since the sixteenth century. The breakup of the medieval Christian outlook during the Reformation era and the devastating religious and dynastic wars that resulted led to the growth of international law. During the eighteenth century Enlightenment, several philosophers applied these rules with some success to the conduct of war.

The French Revolution and the wars of national liberation that resulted broke the comparative calm of the Age of Reason and introduced a new note of savagery into armed conflict. Writing in the wake of the revolutionary age, Carl von Clausewitz advocated the concept of total war—that is, the necessity to push conflict to the utmost bounds of violence in order to crush the enemy. These teachings were widely accepted in the Western world, and the nineteenth century Industrial Revolution made it possible to produce the various weapon systems that could carry out Clausewitz's dictum.

The new attitude of “efficiency” and ferocity in warfare led to a strong humanitarian reaction. During the Crimean War, Florence Nightingale and her colleagues worked with the wounded and drew public attention to the scandalously inadequate arrangements made for them by the armies. A few years later a Genevan businessman, Jean Henri Dunant, was traveling in north Italy and happened upon the battlefield at Solferino (1859). Encouraged by the example of hospital work in the Crimea and moved by the tragic plight of the wounded and dying, he organized groups to help the unfortunate soldiers. For Dunant, this was such a traumatic experience that he dedicated his life to helping soldiers, a category of poor who seemed to be neglected by their employers. In 1862, he published a moving account of his reminiscences of the Italian experience which, along with his personal contacts, aroused the sympathy of the rulers of Europe and led to the Geneva Conference of 1863.

ACCOMPLISHMENTS

The meeting had two results; a decision to create Red Cross societies and a decision to provide a set of rules for the humane treatment of those who were incapacitated. The second of these decisions led to the Geneva Convention of 1864. Attended by representatives from sixteen states, it did not give official recognition to the Red Cross societies as such but did lay down a series of rules that were to be followed in time of war. These rules provided for the care of sick and wounded soldiers, the neutrality of the medical corps, the humane treatment of prisoners, and the display of a distinctive emblem, such as the Red Cross, by persons and places involved in medical work. The conventions were signed by twelve states and were open to acceptance by others whenever they wished. By the early twentieth century, they were ratified by forty-eight nations, including even the non-Western powers of China, Japan, Siam, and the Ottoman Empire.

The International Red Cross movement flourished more or less under the direction of the entirely Swiss leadership of an international committee yet was made up of a series of nationally controlled societies. The articles of 1864 were extended in a series of meetings held at The Hague in 1899 and 1907 and at Geneva in 1906, 1929, 1949, and 1977.

The Hague meeting of 1899, called at the suggestion of Czar Nicholas II of Russia, was attended by

Geneva and Hague Conventions

Summary of the treaties concluded in Geneva, Switzerland, and at The Hague, Netherlands, for the purpose of ameliorating the effects of war on soldiers and civilians

<i>Year</i>	<i>Convention</i>	<i>Significant provisions</i>
1864	Convention for the Amelioration of the Wounded in Time of War	Initiated by Henri Dunant. Provided for (1) immunity from capture and destruction of all establishments for treating wounded and sick soldiers and their personnel; (2) impartial reception and treatment of all combatants; (3) protection of civilians rendering aid to the wounded; (4) recognition of the Red Cross symbol to identify persons and equipment covered by the agreement.
1899	First Hague Conference	Convened at the invitation of Count Mikhail Nikolayevich Muravyov, minister of foreign affairs of Czar Nicholas II of Russia. Twenty-six nations were represented. The conference defined the conditions of a state of belligerency and other customs relating to war on land and sea. Declarations prohibited: (1) the use of asphyxiating gases; (2) the use of expanding bullets (dumdums); (3) discharging of projectiles or explosives from balloons. Also adopted the Convention for the Pacific Settlement of International Disputes, which created the Permanent Court of Arbitration.
1906	Second Geneva Convention	Amended and extended the provisions of the first convention.
1907	Second Hague Conference	Proposed by U.S. president Theodore Roosevelt, convened by Czar Nicholas II. Forty-four nations attended. Conventions adopted re-employment of force for recovery of contract debts; rights and duties of neutral powers and persons in war on land and sea; laying of automatic submarine contact mines; status of enemy merchant ships; bombardment by naval forces in wartime; establishment of an international prize court. Renewed declaration prohibiting discharge of projectiles from balloons. Did not reaffirm declarations prohibiting asphyxiating gas and expanding bullets.
1929	Third Geneva Convention	Amended and extended the provisions of the first two conventions. Introduced the convention relating to the treatment of prisoners of war. Provisions included: Belligerents must (1) treat prisoners humanely; (2) supply information about them; (3) permit visits to prison camps by representatives of neutral states.
1949	Fourth Geneva Convention	More than 150 nations party to this agreement. Following the horrors of World War II, this was the most complete of the treaties and included these provisions: (1) provision for care of the wounded and sick in land warfare; (2) rules for the care of those injured or shipwrecked at sea; (3) laws guaranteeing the just treatment of prisoners of war; (4) provisions protecting citizens of occupied territories by condemning such practices as deportation, hostage taking, torture, collective reprisals, wanton destruction of property, and discrimination based on race, religion or nationality.
1977	Fifth Geneva Convention	Only slightly more than half of the nations who signed the Fourth Convention signed the 1977 protocols. Supplemented the provisions of the previous conventions with two additional protocols that extended international law protections to wars of liberation and civil wars.

delegates from twenty-six nations. The Geneva rules commanded such respect that there was a strong desire among the major powers to extend them to naval conflict and to limit the use of new, more horrible weapons. At The Hague conference, conditions regulating a state of war were defined and the use of asphyxiating gases, expanding bullets (dumdums), and aerial bombardment (dropping projectiles from balloons) was forbidden. The conference also established a permanent court of arbitration to encourage the peaceful settlement of disputes between nations.

The second Geneva Conference (1906) revised the decisions of the first meeting, based upon the war experiences of the intervening years. It provided for the policing of battlefields, the identification of the dead, the protection of the name and sign of the Red Cross, and the dissemination and enforcement of the Convention's decisions through military penal codes.

A second meeting (1907) was suggested by President Theodore Roosevelt and called by the czar. Attended by delegates from forty-four nations, it passed a series of acts that provided for the enforcement of contracts, the recognition of rights of neutrality, the prohibition of submarine contact mines, the limitation of bombardment by naval forces, and restriction on aerial warfare. Ominously, when one looks back on the meeting after the experience of World War I, it did not renew the 1899 prohibitions against the use of gas or dumdum bullets. The third Geneva Convention's (1929) most original contributions concerned prisoners of war. They were to be dealt with in a humane manner, information about them was to be supplied to their governments, and their treatment was to be monitored by neutral observers.

Probably the most important of the Geneva meetings was held in 1949 in response to the horror of World War II. It drew up the most complete of the Geneva Conventions, including provision for care of the wounded and sick in land warfare; rules for the care of those who were injured or shipwrecked at sea; laws guaranteeing the just treatment of prisoners of war; and provisions that protected citizens of occupied territories by condemning such practices as deportation, the taking of hostages, torture, collective reprisals, wanton destruction of property, and discrimination based on race, religion, or nationality.

In 1977, another conference supplemented these

provisions with two additional protocols that extended the protection of international law to wars of liberation and civil wars. More than 150 nations have signed the 1949 conventions, but far fewer have agreed to the 1977 protocols.

Genocide, cultural

DEFINITION: Deliberate and systematic destruction of a particular culture

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: Cultural genocide is a violation of egalitarian moral principles such as inalienable human rights and the right to self-determination. It has been justified by recourse to other moral principles, such as the responsibility of a sovereign nation to watch over or educate members of ethnic subcultures or colonial subjects.

Cultural genocide is the deliberate and systematic destruction of a culture. Absent harm, it is not ethical to destroy the culture of another group of human beings or change it without their consent. Each culture should be judged by its own standards of excellence and morality, unless its cultural practices threaten to harm others physically or mentally.

A dramatic example of cultural genocide is the Canadian government's attempts to outlaw many indigenous customs of the Kwakiutl Indians of the Northwest Coast of Canada in an effort to convert them into imitations of Europeans. The Kwakiutl were renowned for a unique custom that they called the potlatch. Kwakiutl chiefs competed with one another for status and power through this custom. It involved accumulating vast wealth in the form of artistic items known as "coppers," blankets, and food. After accumulating a fortune, a chief would invite his rival and the rival's followers to a feast. During this feast, the host would wine and dine all of his guests lavishly. Dancers would entertain them. At a prearranged time, the host would conspicuously destroy the valuable coppers and other treasures to demonstrate that he could afford to do so. He would challenge his guest to top this feat or accept inferior status. Upon leaving the feast, guests were given many blankets and foodstuffs to take home with them. The Canadian government viewed this practice as a wanton and savage destruction of valuable property and a waste of labor, so they outlawed the potlatch.

Anthropologists have argued that, in addition to serving the overt function of leveling individuals, the potlatch served a covert or hidden function by redistributing wealth from areas that had accumulated a surplus to areas that had experienced shortages during bad years. The destruction of this and other pivotal institutions caused the Kwakiutl culture to collapse, leaving in its wake a vacuum that was soon filled by alcoholism, dysfunctional families, and other social problems.

Another example of cultural genocide comes from Africa. In 1884, at the Berlin Conference, European powers unilaterally carved up the African continent into territories that they claimed for themselves. Africans were not invited to this meeting. These European powers pledged to support the "civilizing" of Africans by Christian missionaries, which was "calculated to educate the natives and to teach them to understand and appreciate the benefits of civilization."

The missionaries immediately declared traditional religions "devil worship." They collected all indigenous statues, relics, and artifacts and destroyed them. They fought to outlaw clitoridectomy, polygyny, and other native customs that they found "repugnant." These acts led to a clash of cultures and to an identity crisis for many Africans.

The classic example of cultural genocide in North America grew out of slavery. Plantation owners feared that allowing African slaves to speak their own languages, use African names to identify themselves, or practice African culture would encourage slave revolts. Consequently, every effort was made to stamp out African culture in the United States. The people survived, but much of their culture was destroyed. Today, African Americans are culturally more like other Americans than they are like Africans, despite strong physical similarities and a common ancestry.

The assumption that one's own culture is better for others than theirs is constitutes the ultimate cultural arrogance. It assumes that one's own culture is superior and that one has the right to impose one's values on others. This imposition is unfair and unethical. Cultures, like individuals, have a right to life unless their customs threaten the lives of others, as in the case of head-hunting and cannibalism.

Genocide, frustration-aggression theory of

DEFINITION: Theory of Neal Miller and John Dollard that genocidal behavior is the result of hostility and frustration caused by the blockage or interruption of goal-directed behavior

DATE: Formulated during the late 1930's

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The frustration-aggression theory of genocide attempts to adduce a mechanistic psychological cause which would explain the most horrific forms of collective behavior.

John Dollard and Neal Miller's frustration-aggression theory asserts that the blockage or interruption of goal-directed behavior can cause frustration and hostile feelings. Often, these cannot be directed at the source of the frustration, which may be either unknown or too powerful to confront. Consequently, a person may displace this hostility onto an unrelated scapegoat.

After World War I, the Allied nations imposed harsh economic conditions upon Germany for "causing" the war. As a result, Germans experienced severe hardships. Defeated and too weak to lash out at the Allied powers, Germany turned against its Jewish population. According to the frustration-aggression theory, between 1920 and 1945 Germans scapegoated the Jewish population and persecuted them instead of hitting back at Britain and France, who were causing their suffering. The Jews were too weak to fight back. When a German bought a loaf of bread, he paid a Jewish merchant, not a French capitalist, so the Jewish merchant became the target for his anger.

Adolf Hitler took advantage of this popular anti-Jewish resentment, which was widespread in Poland, Russia, France, and England as well as in Germany and Austria, to help him rise to power. Hitler accused the German Jews of subversion and of making deliberate attempts to sabotage the German people in order to further selfish Jewish economic interests. Nazi propaganda films compared Jews to rats and suggested that the only true means of ridding Germany of either pest was extermination.

The Nazi Party wanted to deport all German Jews to Madagascar, but this plan proved to be impractical because Allied submarines were sinking many German ships, and the Vichy regime in France, which controlled Madagascar, did not relish the idea. Therefore, soon after the German conquest of Poland in 1939, the Nazis ordered the extermination of all known Jews. More than six million Jews were exterminated between 1939 and 1945. This horrific act did not, however, relieve the German sense of frustration. Instead, it created a false consciousness, because Britain, France, and a weak economy—not the Jews—were the real sources of Germany's problems.

The Jews had been treated as scapegoats for centuries throughout Europe and elsewhere before Hitler and the Nazi Party attempted to exterminate them. They were herded into segregated ghettos and became the target of frequent pogroms in Russia and

elsewhere. Because the frustration-aggression theory of genocide fails to account for this long history of abuse prior to the rise of Hitler and the Nazi Party, the theory has limited explanatory value.

SCAPEGOATING

Despite the fact that scapegoating is based on misconceptions, aggression aimed at a scapegoat has been alleged to have a cathartic effect because it temporarily relieves frustrations. Regrettably, this temporary effect only reinforces negative behavior. In theory, the release of such tension onto a third party should promote mental health. Thus, games such as football have been thought to be cathartic and actually to help to reduce the probability of war. In fact, however, such games may increase the likelihood of aggression by reinforcing antisocial violent behavior. Once set in motion, a vicious self-perpetuating cycle can be created. A wiser course of action is to teach people to control negative thoughts and behavior rather than vent them.

The frustration-aggression model and the accompanying scapegoating and oppression of another group produce behavior that is ethically deplorable. Members of the persecuted group receive prejudicial treatment and may become targets of genocide. Flawed and rigid thinking encourages people to adopt this model of behavior. Insecurity feeds it. Once such attitudes are formed, they are difficult to change unless society can force prolonged contact with members of the other group on a frequent basis, under conditions in which neither group is superior to the other and competition is minimal. Under such conditions, people find that it is easier to abandon prejudices and to adopt healthier attitudes that view others as equals deserving of whatever rewards their talents earn them. Ethically, society has a social and moral obligation to create the sustained contact and minimal competition that will be required to reduce or stamp out the prejudice, bigotry, stereotyping, racism, and discrimination that breed the human tragedy of genocide.

ETHICS

Revised Edition

This page intentionally left blank

Genocide and democide

DEFINITION: Intentional destruction of human groups based upon identifying characteristics that members of the groups are assumed to have

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Modern political, social, and religious leaders agree that genocide and democide violate the most basic principles of international human rights.

Raphael Lemkin, a Polish jurist and scholar of international law, coined the term “genocide” during the early 1940’s. The term later became a basis of international law, making it possible to try crimes of genocide before the International Criminal Court. In its narrowest sense, genocide is an intentional and systematic attempt to destroy an entire human group, based upon the nationality, ethnicity, race, or religion of the group’s members. Since Lemkin’s time, the meaning of the term has been expanded to encompass other defining human characteristics, such as sexual orientation or political affiliation. However, not all scholars accept these broader definitions, and legally such expansion is not permitted. To overcome these limitations, Rudolph Rummel coined the term “democide” during the 1990’s to serve as a more inclusive label for governmental efforts to perpetrate mass murder. Estimates of the numbers of persons who were victims of genocide and democide during the twentieth century range from 170 to 210 million. These numbers are at least four times greater than the numbers of people killed while fighting wars during the last century.

DEFINITIONS

Although legalistic definitions of genocide are limited to definable groups, the concept includes the destruction of human groups through mass murder as well as the process of limiting procreation. Thus, genocide can be committed through efforts to sterilize a population to prevent the birth of future generations. Early eugenics movements had at their core, in the early twentieth century, the elimination of those whose genes were deemed inferior. The Nazis used such policies to begin massive sterilizations of the mentally and physically disabled as well as Jews and Roma/Sinti (Gypsies). The pattern of mass rape as practiced during the atrocities against Bosnians dur-

ing the 1990’s was officially codified as a form of genocide by the International Criminal Tribunal for the former Yugoslavia. Definitions of genocide are not based solely on nation-states or governments as perpetrators. Individuals and nongovernmental groups whose actions include the destruction of another group may also be found guilty of genocide.

Mass murders that clearly fit the criteria for genocide include the killing of Armenians by the Young Turks of the Ottoman Empire during World War I, the killing of Gypsies by Nazis during World War II, and the killing of Tutsis by Hutus in Rwanda in 1994.

While the term democide is broader in terms of target groups, the term is applied only to murders undertaken by governments or quasi-governmental bodies. Thus, a hate group that targets specific individuals for murder would technically not be guilty of democide. However, a government engaged in the same kind of crime would be guilty of democide. On the other hand, the term democide is not applied to the killing of soldiers during wars and the execution of persons lawfully convicted of capital crimes.

The list of mass murders that fit the definition of democide is extensive and includes the mass killing of political dissidents by Joseph Stalin in the Soviet Union and the mass murders committed under the rule of Mao Zedong in China. Many cases of democide are more often described as a genocide. For example, the Cambodian genocide of the mid-1970’s fits the definition of democide but is usually referred to as a genocide. The targeted groups in the killing fields of Cambodia consisted largely of groups such as city dwellers and the educated. As that episode had Cambodians killing Cambodians on the basis of characteristics not identified within the narrow definition of genocide, it theoretically should not be identified as genocide but rather as democide. However, the killing of the Vietnamese by Cambodia’s Khmer Rouge communists would be considered an instance of genocide.

REVERSAL OF MORALITY

The ethical issues involved in genocide and democide appear transparent at first glance. Both actions violate the principles underlying the major world religions and are also considered to be violations of international law. Individuals, groups, and nations involved in genocide and democide are considered guilty of violating the United Nations Convention on

the Prevention and Punishment of the Crime of Genocide (1948) and the Universal Declaration of Human Rights (1948). Although no ethical or moral defense for the atrocities of mass murder, genocide, and democide exists, perpetrators of genocide often view their actions as moral and for the greater good. Moreover, few perpetrators of genocide and democide have been held accountable under international law and have thus acted with impunity. This apparent reversal of morality with its accompanying moral relativity raises questions as to how individuals and nations can move from general acceptance of ethical codes against killing to a moral position that justifies atrocity.

Doctors working for Germany's Nazi regime believed that they were engaged in a higher good by sterilizing and later "euthanizing" or killing patients who were regarded as incurable. These included epileptics, schizophrenics, alcoholics, people with mental disabilities, and a host of others labeled "useless eaters" and killed by starvation, lethal injection, gunshot, or poisonous gas. The regime justified its actions by arguing not only that patients would appreciate being spared future suffering but also that their extermination removed dangerous genetic infections that threatened the well-being of the people of Germany. The Nazi genocide of Jews, Gypsies, and other peoples was regarded as the removal of a tumor from the body of Germany, a Final Solution in dealing with Germany's "problem" groups. Thus, the Nazis and their supporters perceived their genocide as a valiant, courageous, and morally good action.

During World War II, the United States dropped atom bombs on the Japanese cities of Nagasaki and Hiroshima, killing more than 120,000 men, women, and children. The government rationale for these actions was that such destruction was horrible but necessary to save the lives of the Allied soldiers who would otherwise be needed to invade Japan. While the validity of this rationale has been debated, it represents a case in which the morality of democide may be unclear. If purely military targets in Japan had been selected for destruction, the resulting loss of life would not fit the criteria identified for democide. However, as Hiroshima and Nagasaki were civilian targets, the loss of life represents a case of democide. If similar bombs had been dropped on major population centers in England or the United States during the war, it most likely would not have been viewed as morally acceptable.

Centuries of genocide against indigenous populations have been justified through self-interest, primarily need for land and resources. The indigenous populations in North and South America, Australia, and Africa all experienced varying levels of physical as well as cultural genocide. Little is written about these groups, however, as the colonizers and conquerors have written most of the histories of their conquests.

AUTHORITARIAN LEADERS

Nations that commit genocide and democide are generally led by authoritarian rulers in totalitarian governments. Such governments and leaders may also have destructive ideologies and are thus more likely to commit atrocities than are governments of democracies. The rulers responsible for the most destructive genocides and democides are Joseph Stalin, Mao Zedong, and Adolf Hitler, who were all totalitarian leaders. Moreover, the members of societies ruled by such governments also tend to exhibit high degrees of conformity as well as obedience to authority. Such people may be willing to kill other people simply because obedience and conformity are considered to be their only appropriate ethical choices. During the Nuremberg Trials of Nazi war criminals held after Germany's defeat in World War II, many former Nazi officers tried to justify their crimes by claiming to have merely followed orders. Judges on the Nuremberg tribunal did not accept such defenses, but individual soldiers whose participation in the Holocaust may have been less pivotal were not tried in part because of this justification.

PATHS TO GENOCIDE AND DEMOCIDE

The practice of genocide and democide often begins slowly within a culture. Pre-genocidal cultures typically have histories of believing that members of certain groups or classes within their cultures are superior to members of other groups. During times of relative stability and prosperity such cultural populations may engage in limited prejudice, stereotyping, and discrimination. However, during times of economic or political crisis, latent hatreds can be revived and used by authoritarian leaders as a means to build solidarity and support within the dominant groups. What begins as prejudice and discrimination over time may evolve into a pattern of deliberate denial of civil rights. Thus, members of a targeted group may

find they are denied such rights as employment, citizenship, or the ability to own property. If few objections are publicly voiced, the next step may be a move toward greater loss of fundamental human rights and finally loss of existence. Little outrage was expressed when Jews began losing their rights in Nazi Germany during the 1930's. That fact made it easier for the government to progress from laws prohibiting certain forms of work to loss of citizenship, then ghettoization, and finally deportation and death.

For human beings to move down such a path toward greater violence, a process of moral disengagement and exclusion must occur. It is difficult simply to kill a person whom one has known as an associate or neighbor. Propaganda helps a society advance step by step toward a policy of genocide. Such propaganda includes a vilifying of members of the target group as well as a dehumanization of the group. For example, during Germany's Holocaust, government propaganda denounced Jews as parasites who threatened Germany's well-being and equated Jews with rats and vermin. When human beings begin morally disengaging and finally excluding their neighbors from what is perceived as their moral realm, the process becomes complete. Human beings have less trouble killing people whom they perceive as not fitting within what they regard as traditional human boundaries, particularly if they regard those people as a threat. In Rwanda, for example, Hutus who killed their Tutsi neighbors during the mid-1990's regarded them not as fellow Rwandans but as dangerous aliens, whom they characterized as *inyenzi* (cockroaches). Euphemistic language also assists with this process of moral disengagement and exclusion. Germany's Nazi government did not tell German citizens that it was sending Jews and other people to their deaths in concentration camps; it simply told them that their Jewish neighbors were being "sent east."

BYSTANDERS

Bystanders—whether they be individuals, groups, or nations—can prevent genocide from developing if they raise protests early as a government moves down the path to genocide and democide. This raises serious questions about the ethics of those who stand by passively as a disenfranchised group becomes increasingly targeted for violence and genocide. As violence began in Rwanda, both outside nations and the United Nations distanced themselves from the devel-

oping genocide and proclaimed it to be an internal matter that was solely Rwanda's responsibility. For outside nations to label the events in Rwanda as genocide would have necessitated action. This inaction by a passive world that watched the horror unfold helped fuel the deaths of approximately 800,000 Tutsis over the course of one hundred days. By the time the United Nations finally sent international peacekeepers into Rwanda, the mass killings had ceased.

The longer bystanders wait to act as a genocide develops, the more difficult intervention becomes. When intervention occurs late, both the outside governments and their citizens must accept moral responsibility for their earlier inaction. Moreover, as time passes, bystanders tend to rationalize that the victims of a genocide deserve their fates in order to maintain their belief in a just and moral world.

DENIAL

The last step on the path of genocide and democide is denial that the mass killing ever occurred. Thus, the final assault on the victims is that their very memory is excised from history. Denial can take many forms. For example, the government of Turkey has consistently denied that it staged a genocide against its Armenian citizens during World War I. Instead, the government portrays the events of that period as an unfortunate effect of deportations of an internally dangerous population. Most modern Turkish citizens who deny the Armenian genocide are basing their denial not on a history of prejudice but rather on a history shaped by the Turkish victors. Thus, they are simply repeating what they and their parents have learned of the events during World War I in revisionist history.

Other instances of genocide such as the man-made famine in the Ukraine during the 1930's have been simply written off as unintended and accidental occurrences resulting from distant governmental policies. The deaths of large numbers of Native American groups in what is now the United States have often been dismissed simply as unintentional deaths resulting from disease and failure to adapt to life on reservations. Famine, disease, exposure, and other "natural causes" of death manufactured by governmental policies enable the distancing of responsibility and the denial of genocide. Other forms of denial clearly have at their base an agenda of hate. Holo-

caust denial is not a new phenomenon and is propagated by many white supremacist groups within the United States and around the world. Such forms of hate-based denial have at their core genocidal intent. Whatever the intent of those who deny specific instances of genocide or democide, whether out of ignorance or hate, such efforts at denial are ethically unjustifiable.

Gewirth, Alan

IDENTIFICATION: American philosopher and educator

BORN: November 28, 1912, Union City, New

Jersey

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Gewirth proposed the principle of generic consistency—the principle of equal and universal human rights—and justified freedom and the ethical obligation to respect human rights.

The author of *Reason and Morality* (1978), *Human Rights: Essays on Justification and Applications* (1982), *The Community of Rights* (1996), and *Self-Fulfillment* (1998), Alan Gewirth is recognized as one of the most prominent ethicists of the late twentieth century. He has published over one hundred articles on moral, ethical, social, and political philosophy, the epistemology of René Descartes, and many other topics. He is well known for his work on the philosophical foundations and ethical implications of human rights. In the late 1970's, he proposed the idea that freedom and well-being are fundamental, universal human rights, a concept known as the principle of generic consistency (PGC), Gewirth's supreme principle of morality.

Gewirth claims that freedom and well-being are the foundation attributes necessary for all human action. They establish the common (generic) conditions for the successful exercise of free agency for the members of all cultures. Gewirth argues that all other rights can be derived from these two. He assumes that people in general act for purposes that they regard as being good—not necessarily morally good, but valuable. Thus people must be entitled to freedom and well-being. For consistency, people are bound by duty to not restrain others from obtaining freedom and well-being. In other words, it is an ethical requirement that every individual must allow the same human rights to every other individual. Some philosophers have used the PGC to analyze complex ethical

questions, such as the attempt to determine human traits prior to birth.

One inference drawn from Gewirth's PGC is that people who violate the principle must either be using incorrect reasoning or be unethical persons. The principle also makes the transition of transforming fundamental, prudential rights into moral rights. However, many philosophers criticize and disregard the PGC because of these implications.

Gewirth is a strong advocate that self-fulfillment is a fundamental goal of human endeavor. Although many deem it to be an egotistical effort, Gewirth developed an ethical theory showing that self-fulfillment is based on the dignity of human beings and that human rights are essential to self-fulfillment, completing its interrelationship with the PGC. Self-fulfillment enhances the ethical and moral growth of not only an individual, but also of the society in which the individual resides.

al-Ghazālī

IDENTIFICATION: Persian philosopher

BORN: 1058, Ṭūs, Khurasan, Iran

DIED: December 18, 1111, Ṭūs, Khurasan, Iran

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Al-Ghazālī is author of several widely read works on ethics, including *The Revival of Religious Sciences* (late eleventh century), *The Niche for Lights* (early twelfth century), and *The Incoherence of the Philosophers*

(late eleventh century), as well as an influential spiritual autobiography, *The Deliverer from Error* (early twelfth century). His mysticism also made Sufism more acceptable to conservatives.

Abū Hāmid al-Ghazālī (not to be confused with his younger brother, Ahmad Ghazālī) is best known for his writings on ethics, the proper foundations for ethics, and mysticism (which is, for al-Ghazālī, continuous with ethics). His work enjoys widespread respect, earning him the honorific title "the scholar among the inhabitants of the world." Unlike many other philosophers, who were happy to begin their reflections with reason or sense experience, al-Ghazālī placed great emphasis on the importance of the Qur'ān and the *Ḥadīth* (traditions) of the life of Muḥammad.

Al-Ghazālī was a successful and respected professor of theology at the most important college in the Seljuk empire, the Nizāmiyya, in Baghdad. In 1095, however, he suffered a severe personal crisis, left the Nizāmiyya, traveled throughout the Middle East, and eventually resettled in his ancestral home, Ṭūs. There, he wrote the many treatises that secured his enduring, central place in Islamic thought.

The crisis of 1095 was focal to al-Ghazālī's later thought. A superb logician, al-Ghazālī was not only able to construct impressive systematic theology but also was aware that intellectual argumentation about that which transcends the abilities of argumentation is built on a foundation of sand. Furthermore, the scholarly endeavors of orthodox legalists and theologians came to seem arid, even spiritually sterile, to al-Ghazālī, who appears to have felt an increasing sense of loss of the presence of God in these scholarly religious investigations. After carefully studying the works of numerous Sufis and understanding their principles intellectually, he appears to have had an epiphany in which those principles became experiential.

THE INCOHERENCE OF THE PHILOSOPHERS

The Incoherence of the Philosophers and the reply by Averroës (*The Incoherence of the Incoherence*) constitute one of the most famous philosophical exchanges in the Islamic world and were also very widely discussed in medieval and Renaissance Europe. Al-Ghazālī attacked Avicenna, al-Fārābī, and Aristotle for logical inconsistencies in their work

and for basing their systems of thought on rational argument alone, denying a central role for revelation and for the direct experience of God. Al-Ghazālī did not reject wholesale the conclusions of these philosophers, and he did not deny an important role for Aristotelian logic. Some of his conclusions about practical ethics, for example, do not differ from those of Aristotle. Further, although he did reject Neoplatonic emanation schemes entirely, he did so by perspicuously demonstrating their logical impossibility. Nevertheless, al-Ghazālī argued that the work of these philosophers was not built on a sound foundation; would lead the faithful astray in many matters; and, hence, ought to be abandoned in favor of an ethical system based on the Qurʾān, *Ḥadīth*, and experiential knowledge of God—a system that he provided in the *Revival*.

THE REVIVAL OF RELIGIOUS SCIENCES

Written in forty (the number symbolic of patient effort) chapters, the first section of the *Revival* concerns 'ibādāt, or worship. The second section, on customs, might seem mundane to Western readers. It offers very practical guidance in such areas as diet, ways to serve food, child rearing, and so forth. (Much of al-Ghazālī's advice on child rearing strikes the modern reader as far ahead of its time.) In Islam, however, all aspects of life, even the most mundane, should be infused with reminders of divine will, and therefore these practical matters are part of religious sciences. The central chapter celebrates the Prophet and emphasizes the importance of the traditions of Muḥammad's life as the "good example" (Qurʾān, *sūra* 33:21) for ethical conduct. The third section examines vices and their sources, and the final section examines those things that lead to salvation (including virtues and their sources, as well as mystical love and longing).

Although Western modernity might see the topics of the *Revival* as diverse, al-Ghazālī clearly saw them as continuous, as necessary training in one's gradual development toward the highest possible perfection. The ultimate goal is experiential knowledge of God, which "can be reached only when the barriers in the heart precluding such achievement are removed." This essentially mystical goal requires practical ethical training so that the passions and excessive attachment to bodily pleasures can be curbed, and so that wisdom can be developed.

THE NICHE FOR LIGHTS

The relationship of this text to al-Ghazālī's other works has been highly controversial. The *Niche for Lights* is a commentary on the "Sūra of Light" (Qurʾān, 24:35), in which Allah is indicated as the purest Light, which inspired al-Ghazālī to develop a metaphysics of light that has remarkably strong affinities with Illuminationist Sufi doctrines. One refers to Light properly only when one indicates God, al-Ghazālī argued, and one uses "light" only analogically in all other instances. Only the Divine Light exists, and all in this phenomenal world is but a shadow cast by that light (comparison with Plato's allegory of the cave would not be farfetched). The ultimate good in human life is attainment of direct apprehension of Light and complete immersion in Light.

Gideon v. Wainwright

THE EVENT: U.S. Supreme Court decision holding that felony defendants are entitled to legal representation regardless of the crime with which they are charged, and that if such a defendant cannot afford an attorney, the court must appoint one

DATE: Ruling made on March 18, 1963

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: The Supreme Court ruled that forcing criminal defendants to represent themselves is a violation of the due process clause of the Fifth Amendment, as well as the right to counsel guaranteed in the Sixth Amendment.

Because of a 1942 Supreme Court decision, *Betts v. Brady*, the state was not required to appoint an attorney for Clarence Earl Gideon at the time of his first trial for robbery in Panama City, Florida, in 1961. Following the dictates of *Betts*, Florida provided counsel only to defendants accused of capital offenses, and Gideon, an impoverished individual of limited education, was forced to act as his own attorney. He was found guilty and sent to prison. While there, he penciled a petition to the Supreme Court to hear his claim that his constitutional rights had been violated. The Court agreed that, because he had been forced to appear without benefit of counsel, Gideon had been denied a fair trial. The Court ordered that

Gideon be allowed a new trial and a court-appointed attorney. At his second trial, Gideon was acquitted of all charges. He had demonstrated the power of a single individual to change the entire legal establishment.

Global warming

DEFINITION: Gradual increase of the earth's surface temperatures

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Global warming is a source of long-term but increasing danger to human beings and to all ecosystems on Earth that raises questions

Image not available

Scientists take water samples from the sea, gathering data used to study global warming. (AP/Wide World Photos)

about the point at which future problems become present ethical concerns.

During the twentieth century, the earth's average surface temperature increased about 0.5 degree Celsius, arguably as a result of concurrent human generation of "greenhouse" gases. Furthermore, some environmental modeling indicates another 0.7 to 2 degrees Celsius of warming after the oceans reach equilibrium, plus a further 2 to 5 degrees by the year 2020 if no action is taken.

Even greater changes, however, occurred many times in the more remote past when no human activities could have caused them. Repeated glaciation and deglaciation in the last million years repeatedly exceeded the hypothesized changes without human influence, and the causes of glaciation are not thoroughly understood. The major environmental effects of global warming include the poleward shift of climatic belts, the sea level's rising as much as 6 meters by 2020, and drastically changed atmospheric and oceanic circulation. All these occurrences will disrupt present human activity. Thus, regulation or abolition of activities that may be responsible for warming, such as the burning of fossil fuels, is an ethical issue that has provoked proposals for action at both national and international levels. The prohibition of combustible fuels, for example, entails massive social and economic changes, which should not be undertaken lightly in view of substantial lack of consensus regarding the causes and future course of currently observed global warming.

Globalization

DEFINITION: Process of increasing interconnections and linkages within societies and across international boundaries through improved communications and expanded world trade

TYPE OF ETHICS: International relations

SIGNIFICANCE: Because of the economic and social disparities that exist among between countries

and continents, the ethics of globalization are often debated in the international arena, and this debate focuses on who benefits from globalization and who loses.

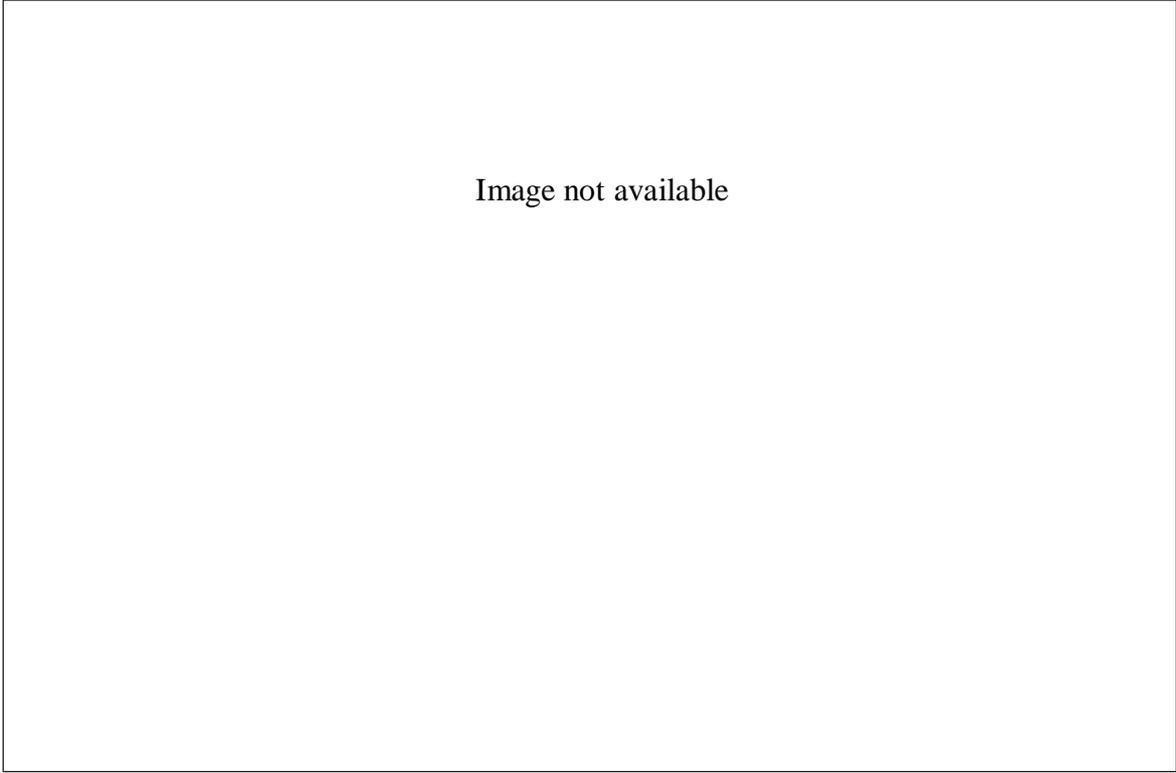

The term "globalization" began gaining prominence during the mid-1980's as a description of the expansion of interrelated economic, social, and cultural activity beyond national borders to societies across national and international geographical boundaries. The interconnections and linkages that occur with globalization have removed barriers to free trade, which has resulted in an increased standard of living for many around the world along with increased life expectancies. At the same time, however, that phenomenon challenged traditional social, political, and economic structures.

Globalization has been brought about by reductions in transportation and communication costs, as well as dissolutions of artificial barriers to movements of trade, services, capital, and knowledge across borders. Specific trade agreements that most often draw attention in discussions of globalization are the General Agreement on Tariffs and Trade (GATT) and the North American Free Trade Agreement (NAFTA).

PROCESS OF GLOBALIZATION

The process of globalization has been brought about by the creation of new international organizations such as the World Bank, the International Monetary Fund (IMF), and the World Trade Organization (WTO). The World Bank and the IMF were established at Bretton Woods, New Hampshire, in 1944. Known as the Bretton Woods Institutions, the two organizations seem similar but have clear differences. The IMF was established to create stability in international trade and provide temporary financial assistance to countries in financial crises. The World Bank was created to eliminate poverty through reconstruction and development. The three organizations, taken together, attempt to regulate and provide stability to the global economic and trade environment, in the hope of furthering globalization and creating opportunities for globalization for all countries in the world.

The benefits of globalization include open markets, positive competition, increased use of technology, and the potential to enrich many people, espe-

Thousands of Filipinos march in Manila on September 13, 2003, as part of coordinated protests throughout the developing world against the developed world's globalization policies. The worldwide "Global Day of Action" coincided with a ministerial meeting of the World Trade Organization in Cancun, Mexico. (AP/Wide World Photos)

cially the poor. Globalization has reduced the sense of isolation felt by many in the developing world. The expansion and increased use of technology have provided access to knowledge and information that before was limited to only the wealthiest countries.

Globalization has also increased the types and frequency of interactions among peoples of varied cultures. People from all over the world meet together to a much greater extent than they had in the past, and they consequently begin to influence each other as well as begin to understand each other. This global culture has led to the creation of new identities and new forms of literature, music, and art.

While globalization has clear benefits, it has not succeeded in reducing poverty as was promised; in fact, the gap between the haves and the have nots in developing countries is widening. Globalization has also not provided for stability in developing nations. Latin American and Asia are two good examples

of how financial crises can affect the entire global economy. In addition, globalization has had negative effects on the environment, with many poor countries using precious environmental resources in the name of development. The "sustainable development" movement is an attempt to preserve the environment while at the same time providing for development opportunities.

ETHICS ISSUES

The ethics of globalization ultimately centers around two questions: Who benefits from globalization? Who loses from globalization? Political leaders are continually having to consider their economic and social priorities between serving their own people and working to benefit the welfare of citizens in countries other than their own. For those whose interests lie in the health and environmental movements, ethical principles such as autonomy, beneficence,

nonmalfeasance, justice, utility, and stewardship are important to the discussion of the ethics of globalization. For others, global ethics must support social equity and cultural diversity, as well as developing common global goals.

Global ethics cannot be discussed without some reference to the role of morality. However, this further complicates the discussion, since one has to ask "whose morality"? Many people are looking to the religious communities of the world to provide some answer to this question. In a publication entitled *Our Creative Diversity*, published in 1995 by the World Commission on Culture and Development, the United Nations, and UNESCO, the commission lists several elements of a global civic culture that could provide the framework for a global ethical code, including human rights and responsibilities, the peaceful resolution of conflicts, democracy and civic governance, the protection of minorities, fairness of negotiation, and intergenerational equity.

Nongovernmental organizations (NGOs) are calling for global ethics that emerge from a process of discussion and debate from global grassroots movements. These organizations proved to be quite powerful when they worked together to protest the WTO meetings in Seattle, Washington, and in the campaign against the World Bank and the IMF. Their ability to join together across continents allowed for an understanding of shared values and objectives. The production of common statements of protest and organized actions begins to set the stage for a discussion on global ethics. The question now is who will facilitate this process and take responsibility for the ensuing debate.

Gluttony

DEFINITION: Overindulgence in food and drink

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Traditionally one of the seven deadly sins, gluttony is a self-destructive form of behavior, morally objectionable on the grounds both of social propriety and of the imperative to self-preservation. In modern society, gluttony is quickly becoming an endemic social problem as irresponsible eating and exercise habits become one of the major causes of death in the United States.

Since classical antiquity, gluttony has been regarded as a reprehensible individual choice; however, both the motivation and the degree of social censure have varied. In ancient Rome, the vomitoria were viewed as the ultimate symbol of decadence (the *Satyricon* of Petronius), but in general, overindulgence for sheer hedonistic pleasure inspired more envy than disdain.

During the Middle Ages, gluttony came under heavy censure, partly because the overindulging individual was incapacitated, but primarily because of the awareness that excessive consumption by a few denied food to those in need. Gluttony was counted

Gluttony as a Competitive Sport

In the early twenty-first century—a period when health care professionals are warning of an epidemic of obesity in the United States and are campaigning for more sensible eating habits—competitive eating has reached new levels of popularity. Since Nathan’s hot dog stand at Coney Island, New York, began an annual eating contest in 1916, Americans have associated eating competitions with modest numbers of frankfurters, pies, and watermelon slices. Today, however, eating contests have reached unprecedented levels of volume, vulgarity, and publicity, and some people are seriously arguing that competitive eating should be regarded as a “sport.” Meanwhile, competitors such as these have captured the public imagination:

- A young 145-pound Japanese man whose records include eating more than 20 pounds of food in a single sitting
- A 380-pound American who has eaten—on different occasions—15 burritos in 8 minutes, 9.5 pounds of peas in 12 minutes; 49 doughnuts in 8 minutes, and 12 pounds of cheesecake (containing 37,000 calories) in 6 minutes
- A slender 36-year-old American woman who has eaten 432 oysters in 10 minutes, 7.75 pounds of stuffed duck and turkey in 10 minutes, and 23 pulled-pork sandwiches in 10 minutes

Apart from the obvious health hazards that such eating stunts pose, the growing popularity of the contests raises questions about both the ethics and the aesthetics of conspicuous consumption. In an e-mail message to the *Los Angeles Times*, Michael Strober, the director of the Eating Disorders Program at UCLA’s Neuropsychiatric Institute, suggested that competitive eating might represent, at least for some participants, a means of channeling clinical disturbances of eating behavior, such as binge eating, into socially acceptable behavior.

among the seven deadly sins on the strength of Paul’s censure of “those whose god is their belly” (Phil. 3:19).

From the Renaissance onward, the religious and social censure of gluttony gradually became muted; gluttony even received an ironic apology from François Rabelais in the course of his overall attack on the

vestiges of medieval philosophy and ethics (*Gargantua*, 1552). In the eighteenth and nineteenth centuries, gluttony became increasingly regarded as a purely medical problem, and by the late twentieth century, the term “gluttony” was generally replaced by “eating disorder,” “compulsive eating,” “compulsive drinking,” and “alcoholism,” reflecting a sense that over-indulgence in food and drink (including alcohol) is involuntary and is thus outside the sphere of moral or ethical choice.

God

DEFINITION: Supreme supernatural being

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: If God exists, and if human conceptions of God are at all accurate, God’s existence would necessarily entail the existence of a universal objective moral law. However, in the absence of conclusively accepted evidence supporting either of those two conditions, religious belief and practice are largely, if not wholly, matters of faith, and morality is a matter of personal conviction.

All persons of sound mind have in some way answered, though few may have asked, the question “Why be moral?” The typically philosophical question is “What is the good?” The answers to both questions have attempted to lay the cornerstone for a moral life. One common answer centers on humanity within the context of the world. “The good,” or “being moral,” is defined in terms of the natural world. Here, natural sciences and anthropocentric disciplines are used to discover the moral life.

A second response to the seldom-asked question “Why be moral?” is God—solely God. God is good. God’s acts are moral acts. God’s acts define morality. From this perspective, theology and philosophy are the primary disciplines that provide insight into the moral life.

A third customary response maintains that there is no fundamental contradiction between God and God's creation. Many believers in God, therefore, combine the first two answers to one of life's most fundamental questions. God is good. God has created a good world. God has created humanity as part of the world in such a way that humans are to live in the manner that God has required of them. Consequently, the natural sciences, social sciences, philosophy, and theology can all contribute to the moral life. Although this more unified approach to morality is most inclusive, avoiding both the abstractions of an intellectually isolated theology and a narrow thoroughgoing naturalism, the remainder of this article focuses on the concept of God and the moral life.

GOD AND HUMAN MORALITY

There are at least three ways in which God's actions can be relevant for human morality. These three relationships constitute the main theological theories of ethical objectivism. First, God's actions and commandments define what is right. Whatever God commands is moral simply because God commands it. The weakness of this view is that whatever a person understands God to do or to command would be considered moral, including, for example, war, infanticide, and human sacrifice. This would magnify God's power, but at great cost to God's morality. Another way in which God and ethics might be related is for morality to be determined independently of God. All of God's actions and commandments would still be morally correct, but their morality would be determined externally to God. The problem with this view is that morality is determined prior to and separately from God. Thus, God is rendered dependent and limited. Moreover, the identity and nature of this unrivaled moral power is unknown.

The third view holds that God's actions correspond to the good. It is not that any arbitrary act of God defines moral actions or that the good is externally delimited, but that every act of God reveals God's character as the good God who created the good world and continues to act without self-contradiction. God has revealed God's own nature in creating and sustaining a moral world. The difficulty with this view is that one must explain how persons who believe that there is no God, and how persons with radically divergent ideas about God, can nevertheless lead highly moral lives. This complaint appears answer-

able, however, by the third response to the initial question: Humans should be moral because God has created them in the cosmos in such a way that they are to live in the manner for which they have been created. Thus, the sciences, philosophy, and theology can all contribute to the moral life that builds upon God as the source and foundation of morality.

VARYING NOTIONS OF GOD

Different notions of God lead to different moral decisions. According to the priestly theology of the Pentateuch, Moses justifies many of ancient Israel's civil laws by citing the acts of Yahweh, the God of Israel. At Yahweh's direction Moses taught, "You shall be holy, for I the LORD your God am holy. . . . When you reap the harvest of your land, you shall not reap to the very edges of your field, or . . . strip your vineyard bare; . . . you shall leave them for the poor and the alien: *I am the LORD your God. . . . You shall not cheat in measuring length, weight, or quantity. You shall have honest balances and honest weights: I am the LORD your God, who brought you out of the land of Egypt. You shall keep all my statutes: . . . I am the LORD*" (Lev. 19). Although it is the case that many of Israel's laws are related to other religions and nations, its ethical justifications are not cultural, political, or philosophical but historical and, preeminently, theological.

Although not identified as God, Plato's "form of the good" functions in his ethics as God. At the pinnacle of his philosophical hierarchy rests "the good" in relation to which all other objects exist (both ideals and sensible objects) and must properly live. The good is the source of all moral principles. This functional apotheosis of the good, conjoined with the primacy of his ideals or forms (they are nonphysical, nonspatial, nontemporal, and beyond the sensible world), leads Plato to distrust the material world even to the point of rejecting most physical pleasures and advocating a philosopher king rather than a popularly chosen ruler.

In another example, according to the Gospel of Luke, Jesus of Nazareth understands God as generous and forgiving toward all persons. Jesus consciously roots his moral teachings in his concept of God. "Bless those who curse you, pray for those who abuse you. . . . If you love those who love you, what credit is that to you? For even sinners love those who love them. . . . But love your enemies, do good, and lend, expecting nothing in return. Your reward

will be great, and you will be children of the Most High; for he is kind to the ungrateful and the wicked. Be merciful, just as your Father is merciful” (Luke 6:27-36).

By definition, beliefs about God influence the ethics of those who believe that God exists. Nevertheless, a system of ethics and human behavior are not identical. Research has shown that behavior is less predicated upon theological beliefs than upon perceived threats and authority, and upon the central object of one’s trust and loyalty.

Godparents

DEFINITION: Persons who take on special responsibilities when they sponsor candidates for baptism or initiation into Christian life

TYPE OF ETHICS: Family issues

SIGNIFICANCE: Godparents fulfill a historical custom

in the ethical and religious education of the newly initiated that expands family and spiritual ties.

In the Christian tradition, godparents take responsibility for the religious and ethical educations of the newly baptized or newly initiated whom they are sponsoring. The history of godparenting is thus coextensive with the history of Christian baptism, originating in the early practices of the Church. Serving as godparents is considered an honor, a significant responsibility, and a spiritual bond with the godchildren—who may be infants, children, or adult—and their families.

Although specific practices vary by denomination, godparents traditionally assume several responsibilities for their godchildren. They sponsor the children for baptism, the rite of initiation into the Christian religion (for this reason, godparents are also known as sponsors), and represent the witness of the faith community. Second, they help instruct the children in the religious and ethical doctrines of the faiths into which they are baptized. Finally, they help form and educate their godchildren throughout their spiritual lives.

To fulfill these responsibilities, it is usually required that godparents be active, adult church members who are able to exemplify the faith to their godchildren in both words and practice. Godparents assume the duty of assisting the parents in the religious education of the godchildren, and they assume full responsibility for that duty if the parents cannot fulfill it. For these reasons, preferred godparents are those who can form close, lifelong relationships with their godchildren and be available to them at all the important stages of life.

Godparents also often give their godchildren religious gifts at baptism, send cards on religious anniversaries, teach prayers and customs, and suggest names for infant godchildren. Their chief gift, however, is perhaps to pray for their godchildren. It is commonly thought to be ideal if the same godparent can sponsor a godchild for both baptism and confirmation.

Golden mean

DEFINITION: Ethical principle that virtue consists of following a course of moderation between extremes

DATE: Articulated between 335 and 323 B.C.E.

TYPE OF ETHICS: Classical history

SIGNIFICANCE: The golden mean is based on a model of human experience in which extremity of any kind is to be avoided and stability and comfort in the world are positive ethical goods.

The ethical doctrines of Aristotle are expounded in three major works: the *Nicomachean Ethics*, the *Eudemian Ethics*, and the *Great Ethics*, or *Magna Moralia*. The *Nicomachean Ethics* is considered to be Aristotle's most mature work on the subject of ethics. In the *Nicomachean Ethics*, a work divided into ten "books" of roughly similar length (approximately 20 pages), Aristotle addresses the issue of human conduct and raises and attempts to answer the question: "What is the good life?" In book 6 of the *Nicomachean Ethics*, Aristotle gives one of the most typically Greek answers to this question of ethics and in so doing makes use of the compromise position that he took in philosophy generally.

The golden mean, which has also been called the "doctrine of the mean" and the "Aristotelian mean," is the ideal that Greeks customarily sought as a guide to their daily lives, both public and private. It followed naturally that Aristotle associated ethics with the state—not with religion, as Christianity subsequently taught. Thus, the *Nicomachean Ethics* has been viewed as a fundamentally political work.

Aristotle argues from the premise that human beings occupy an intermediate position in the hierarchy of living forms: Human lives are not as good as those of gods, but they are (or at least can be) better than the lives of other animals and plants. He seeks a theory of the human good that not only accords with this assumption but also explains it: Humans want to know what it is that makes their lives occupy this intermediate position. The best good for a human being, according to Aristotle, must be something that no other animal or plant can achieve.

VIRTUES OF CHARACTER

To fully understand Aristotle's defense of the virtues of character—the skills that enable humans to

listen to reason—it is necessary to see how they are connected to the preeminent virtue: practical wisdom. In book 2 of the *Nicomachean Ethics*, Aristotle states that he undertakes his present project for a practical purpose: for humans not to contemplate truths about what virtue is, but to become good people. In this spirit, Aristotle then introduces the notion of a mean: Such bodily virtues as strength and health are destroyed by deficiency and excess (too much or too little exercise, too much or too little eating), and the same holds of such virtues of the soul as temperance and courage. For example, to be courageous means not to fear everything and avoid every danger, nor must humans be without fear and accept every risk; to be temperate one must not pursue every pleasure, and one must not go to the opposite extreme of pursuing none. Aristotle points out that the mean for one person in one situation will differ from the mean for someone else in a different situation. The idea is that there is not some one correct amount of anger, for example. Instead, when one aims at the mean, one must aim at something that is for him or her neither too great nor too little: It must be the appropriate amount of anger, fear, or appetite at this time, in relation to this person, and so on.

To be virtuous, people must aim their actions and feelings at a mean between deficiency and excess. In the same way that a good craftsman attempts to produce something from which nothing should be taken away and to which nothing need be added, so humans should strive for something equally appropriate to the situations in which they find themselves. Finding this intermediate path is difficult, according to Aristotle, because there are so many different ways to under- or overshoot one's target. Striking the mean in one's actions and feelings is a task that requires practical reason. Thus, when Aristotle defines ethical virtue, he describes it as a state concerned with choice, since a mean is relative to the individual as determined by reason, the reason by which the practically wise person would determine it.

Echoes of this formulation run throughout Aristotle's discussion of the virtues—to exercise the virtues is to follow reason; his doctrine of the mean is the guiding principle behind his classification of virtues and vices. To possess an ethical virtue is to know how to strike the mean. Consequently, there are two kinds of character defects: One may regularly do and feel either too much or too little. Every such virtue is

therefore to be understood by comparing it with its corresponding vice.

Whether or not Aristotle's claims are true, it has been argued that they do provide a workable standard for decision making. Nearly the whole of book 6 of the *Nicomachean Ethics* is devoted to the study of two kinds of virtues: practical wisdom and theoretical wisdom. Aristotle is saying that either of these should be the target toward which the reasonable person aims. Thus, the "right" amount in actions and feelings will be whatever amount best contributes to the fullest expression of these two rational skills. Aristotle's entire discussion may be viewed as contributing in one way or another to an understanding of what he maintains are the two highest human virtues.

Golden rule

DEFINITION: Ethical principle that advises that one should treat others as one wants to be treated

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The golden rule includes both an ide-

alist and a practical component. It asserts that there is a fundamental human nature which entitles all people to the same level of dignity and respect, and it also assumes that the life of each individual will be made better if everyone agrees to abide by a law founded on this assumption, whether the assumption itself is true or not.

The injunction that one should treat others as one wants to be treated is known as the "golden" rule because it is often said to be of unparalleled value as a fundamental ethical principle. Testimony to the value that human beings have accorded this principle is found in its long and rich history, a history that includes, but is not limited to, its appearance in Confucianism (sixth century B.C.E.), Buddhism (fifth century B.C.E.), Jainism (fifth century B.C.E.), Zoroastrianism (fifth century B.C.E.), Hinduism (third century B.C.E.), Judaism (first century B.C.E.), Christianity (first century C.E.), and Sikhism (sixteenth century C.E.).

The golden rule has been formulated both negatively (do *not* do to others what you would not want done to yourself) and positively (do unto others what you would have them do unto you). The negative formulation seems to be the older of the two, being the version endorsed in Confucianism, Buddhism, Jainism, and Zoroastrianism; nevertheless, it has been argued that the positive formulation is superior to the negative formulation because the former includes a call to beneficence that is lacking in the latter. This criticism of the negative version does not withstand scrutiny, however, for neglect is certainly one of the things that an individual might want to avoid and thus—in keeping with the negative formulation—would be something an individual should not do to others.

A more serious problem said to afflict both versions of the golden rule is that neither provides a basis for distinguishing between virtuous and non-virtuous wants. Thus, an individual who wants to be debased or subjugated is enjoined by the golden rule to debase and subjugate others. For this reason, it has been thought that the golden rule cannot serve as a fundamental principle of morality, since its just application is possible only if one already has some independent means for distinguishing between morally good and morally corrupt behavior.

LOVE THY NEIGHBOR

Because of this concern, it has sometimes been suggested that a close cousin of the golden rule—Love thy neighbor as thyself—is a superior fundamental moral principle. The superiority of the call to love one's neighbor as oneself is thought to reside in the concept of love, a concept that specifies that one's wants should be directed toward the welfare of oneself and others. By virtue of its focus upon the welfare of the beloved, the call to extend the same love to oneself and others prohibits acting upon wants that are unjustifiably damaging. In fairness to the golden rule, however, it should be pointed out that applicability of loving one's neighbor as oneself presupposes both that people do love themselves and that this self-love can be used as a model for attitudes toward others. While these presuppositions might seem reasonable, it is worth noting that the possibility of nonvirtuous self-directed wants that drives the objection against the golden rule poses similar problems for the aforementioned presuppositions of the call to love thy neighbor as thyself.

It was also concern over the problem of corrupt wants that led Immanuel Kant to distinguish his own first moral principle, the categorical imperative, from the golden rule. One version of Kant's categorical imperative states that one should act only according to that maxim (rule of action) that one can, at the same time, will to be a universal law. The difference between the golden rule and the categorical imperative is found, according to Kant, in the fact that one can always treat others as if they shared one's wants, corrupt or otherwise; however, it is not possible consistently to will the universalization of corrupt behavior. To illustrate the difference between the two principles, Kant points out that many individuals would gladly agree to receive no assistance from others and thereby—in accordance with the golden rule—be relieved of the duty to assist others. Willing that such mutual neglect be universal would be irrational, however, because it would involve willing that no human being ever render assistance to others, a policy that would undermine the very existence of the human race. In this way, says Kant, the categorical imperative excludes corrupt wants that the golden rule allows to stand.

Even if the problem of nonvirtuous wants and related problems do show that the golden rule cannot generate an ethical system by itself, however, the rule

is still deserving of its rich history insofar as it can serve as a ready test of the impartiality of some proposed plan of action.

The Good

DEFINITION: That which one ought to do

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The good is the total of all positive morality: actions one is required to take, qualities which are considered virtuous, and constructive, full, or otherwise admirable ways to live one's life. It names a presence of moral right rather than a mere absence of moral wrong.

Plato spoke of a kind of trinity of forms: the good, the true, and the beautiful. Each of these corresponded to the perfection of a faculty in humanity. The beautiful was the perfect object of the faculty of judgment. The true was the perfect object of the faculty of the intellect, and the good was the perfect object of the faculty of the will. In Platonic metaphysics, moreover, these three forms enjoy a kind of consubstantiality. In later natural-law thinking, goodness, truth, and beauty were coextensive with being itself.

In the theodicy of Saint Augustine, furthermore, this becomes crucial, since that father of the Church overcame the metaphysical implications of the existence of evil by denying real being to evil: Evil does not enjoy substantial existence but subsists in a kind of parasitic relation to the good. Evil is the absence of a good where a good should be. In the will, this situation amounts to a choice of a lesser good over a greater good.

In these ways, metaphysical notions of goodness interact with ethical conceptions of the good. Classical philosophers as well as patristic and Scholastic theologians held that the human will must always will a good; in reality, there are only goods to be willed.

Aristotle analyzed the nature of goods by distinguishing between intrinsic and nonintrinsic goods (often called instrumental goods). Intrinsic goods are valuable for their own sake, while nonintrinsic goods are sought for the sake of some intrinsic good. Aristotle further noted that among intrinsic goods, one good will be a *summum bonum*, or ultimate good. The *summum bonum* for Aristotle (and for Saint Thomas Aquinas) was happiness—*eudaimonia*—and the activity/state most associated with the achievement of this end was philosophical contemplation for Aristotle and beatitude (with the attendant beatific vision) for Saint Thomas. On account of this divergence, Aristotelian ethics are designated as natural eudaimonism and Thomistic ethics as supernatural, or theological, eudaimonism.

For both Aristotle and Thomas Aquinas, the *summum bonum* served as an architectonic principle that was capable of ordering all other lesser goods in relationship to it. This Aristotelian-Thomistic approach combines eudaimonism with a natural-law approach that conceives of a fixed and universally shared human essence. Each subordinate faculty of humanity

has its own teleology—its specific purpose or end (that is, its own good)—but the ends of these are ordered to the final end of humanity.

NATURAL LAW AND THE GOOD

This natural-law approach to morality upholds a strict objectivity in ethics, for while a man might pervert his nature by ignoring the promptings of his conscience and his reason, that would in no way alter the nature of his true good. Ethical pluralists deny that there is a *summum bonum* for humankind; there are only individual choices of goods in accordance with hierarchies of value created by individual tastes and commitments.

The distinction between ethical objectivists and ethical subjectivists in regard to goodness is vital. Subjectivists maintain that there is no activity of persons or state of being that is inherently good unless it produces an appropriate subjective response in the individual. An objectivist, however, claims that some human activities or states of being are inherently good, apart from any subjective response that they may produce in the subject.

Classical hedonism of both the rational school, associated with Epicurus, and the so-called irrationalist school (or Cyrenaic school), associated with Aristippus of Cyrene, claimed pleasure as the inherent good for humanity. In the more sophisticated versions of hedonism, the concept of pleasure is so expanded as to come close to the multifaceted concept of *eudaimonia*.

In modern times, in both the act utilitarianism of Jeremy Bentham and the rule utilitarianism of John Stuart Mill, pleasure is the good for humanity, which position has caused many scholars to treat utilitarianism as a special form of hedonism. Classical hedonism developed its social aspects by building up its theory from the individual's interests, needs, and desires, while utilitarianism, with its central criterion of "the greatest good for the greatest number," begins with an inherently social perspective.

Both Mill and Bentham defined the good as pleasure, but they differed so radically in their definitions of pleasure that it has been standard practice among philosophers to refer to Bentham's quantitative theory of pleasure as hedonistic utilitarianism and to Mill's qualitative theory of pleasure as eudaimonistic utilitarianism.

THE NATURALISTIC FALLACY

There was, perhaps, no more significant development in the modern search for the good than G. E. Moore's demonstration of the so-called naturalistic fallacy. Having demonstrated that no natural property can be designated as the good, Moore went on to claim that goodness must be a nonnatural property inhering in good acts.

Analytical philosophers of the Anglo-American tradition accepted Moore's proof that the good could not be a simple natural property, but they rejected his notion that it constituted a nonnatural property, electing instead to assume that the term was used differently in different contexts, indicating quite different natural properties or combinations of natural properties.

Pragmatists such as John Dewey agreed with the analytical philosophers concerning the nature of the good, but they were led to their conclusions by ontological rather than linguistic considerations. Given his commitment to situational ethics and to the ultimate plasticity of human nature, Dewey envisioned the good as varying with historical circumstances and cultural contexts.

Noncognitivist ethicists have interpreted the good in terms of their special linguistic approaches. Emotivists have held the term "good"—like all positive ethical language—to express a positive emotional response to ethical actions in the world: "Charity is good" is translated as an emotional approval of charity. Imperativists hold that ethical statements are overt or covert commands, and "Charity is good," for them, means "Perform charitable deeds." Finally, emoto-imperativists see a term such as "good" as combining a command function with emotional responses.

David Hume's explication of the is/ought problem also must be seen as vital for an understanding of the difficulties that modern ethical philosophers have had with the concept of the good. With the discovery that prescriptive ("ought") conclusions cannot be derived from descriptive ("is") premises, the conception of the good was put under an inordinate strain. Always implicit in the concept of the good had been the notion of "that which one ought to do." With the is/ought dichotomy, this aspect of the concept of the good was forever divorced from the more substantive contents of its various alternative definitions.

Sir Karl Popper noted that the definition of the

good as "that which one ought to do" cannot be expanded to accommodate any substantive content beyond that meaning.

In contrast to the consequentialistic tradition in ethics, the great countertradition of formalism arose, defining the good not in view of the consequences of particular acts, but in respect to the form of the ethical judgments that choose those acts. Cicero may be seen as the originator of formalism, with his unique ethical theory that derived from the academics of the late Platonic school, the peripatetics of the late Aristotelian school, and the stoics. In Ciceronian moral philosophy, the *summum bonum* was equated generally with virtue and specifically with the virtue of *honestum*, or right doing.

IMMANUEL KANT

Immanuel Kant, whose ethical thought seems to have been influenced by Cicero and the stoics, is the very epitome of a formalist ethicist. Although Kant believed that a properly virtuous person would ultimately enjoy acting morally and would achieve happiness thereby, these considerations were unnecessary for the essential goodness of his or her actions. The goodness of an action rests in its meeting the formal criterion of the categorical imperative: An action whose implicit maxim can become a universalizable law for all moral agents is a good action. Any action not in accord with that standard is a morally impermissible action.

For Kant, furthermore, it is not meritorious to do the correct action because one desires some benefit from that action. A merchant who keeps honest weights and measures because such a practice is good for his business is not acting in a morally good manner. To be morally virtuous, Kant would maintain, an action must be done for the sake of the moral law. That is why Kant could term his ethical system a "deontology"—a science of duty.

In contrast to the absolutist moral claims of Kantian formalism, the various forms of ethical relativism have descriptive definitions of the good. In individual ethical relativism, nothing is held to be right or wrong for the individual person except that which he or she truly believes to be right or wrong. Cultural ethical relativism holds that good actions are those approved by one's culture and that evil actions are those condemned by one's culture. Finally, the relativism of situational ethics defines the good in terms

of the judgments of one's historical era and so forth.

Divine command morality, one of the less fashionable byways of ethical theory, must be acknowledged as having a formalistic account of the good, for the goodness of acts consists in their being done in response to divine command alone.

The history of ethical philosophy may well be said to be the history of the changing notions of goodness, and that history is a tormented one indeed. In the earliest days of ethical theory, Aristotle found it necessary to abandon Plato's form of the good because, attractive as that concept was, it seemed to bear no real relationship to human ethics. Aside from possible mystical experience, humans do not seem to have access to the form of the good; thus, it could have no real bearing upon ethical theory.

Aristotle's abandonment of the form of the good led to great alterations in agathokakological theory—the philosophy of good and evil. While Plato ascribed evil to ignorance—Socrates stated repeatedly that to know the good is to do the good—Aristotle added *akrasia* (weakness of the will) to the causes of evil. Aristotle did not deny the role that the Socratic/Platonic concept of evil arose from ignorance, but he held that notion to be inadequate to encompass all evil. Some men know the good, Aristotle believed, but lack the force of will and character to pursue it.

In late Judaism and early Christianity, the concept of the free will (*liberum arbitrium*) and its role in the selection or rejection of the greater good came to play a predominant part. The notion that one may know the good, have the strength of will to do it, and yet deliberately reject it entered theological ethics. Freely chosen evil—the “Mystery of Iniquity”—came not merely to supplement the concepts of ignorance and *akrasia* as wellsprings of evil but to dominate them. Evil done from ignorance or *akrasia* in this view would be true moral evil only if the ignorance or *akrasia* were itself culpable, and that culpability requires that, at the end of the chain of moral causation, a free choice must have been the basis of all else that followed.

In part, concerns of theodicy—the theological/philosophical investigation of divine justice—fueled the Judeo-Christian development of the concept of freely chosen evil. How is it just that God punishes sin if an individual could not act otherwise? Freely chosen evil was the answer that was proposed. In addition, Judeo-Christian demonology, with the figure

of Satan/Lucifer, contributed to the need for a new explanation for the rejection of the good, for by traditional doctrine, Lucifer was the highest of all created minds and, as an angel, lacked a lower nature—thus, ignorance and *akrasia* are excluded as explanations for his evil.

For Kant also, the question of freely chosen evil became a fundamental problem in his ethical theory. In the *Foundations of the Metaphysics of Morals* (1795) and the *Critique of Practical Reason* (1787), Kant seemed to speak as if deliberately chosen evil were possible. Already, however, there were problems, for true freedom—the autonomous will—was possible only when the will made a law for itself, and that law could only be the categorical imperative.

Finally, in *Religion Within the Bounds of Reason Alone* (1793), Kant repudiated the notion of freely chosen evil, maintaining that there could be no “devilish minds.” Despite Kant's conclusion, however, it is unclear that the notion of human free will—the *liberum arbitrium*, the free choice between good and evil—can be maintained without the concept of freely chosen evil. Furthermore, as hard and soft determinists contest with one another, it is uncertain that moral responsibility can be maintained in the absence of the *liberum arbitrium*. In this way, the very question of the ability freely and knowingly to reject the good ties into the most basic issues in ethics, such as free will and the existence of moral responsibility.

There is, perhaps, no concept so central to every aspect of ethical philosophy as the concept of goodness. What distinguishes ethical philosophies from one another most often are their differing visions of the good. They are further distinguished by their handling of the brute fact of human rejection of the good. What is the good? Why do people find it attractive? How are some able to reject the good? These are among the three most crucial questions in the ethical sphere.

Good samaritan laws

DEFINITION: Taking their name from the New Testament story of the Good Samaritan, laws specifying that, under normal circumstances, health care professionals and other people attempting to provide help during an emergency cannot be sued for damages inadvertently caused by their efforts

DATE: First enacted during the 1980’s

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Good samaritan laws afford a measure of legal protection for emergency medical professionals and for passersby who decide to get involved in emergency situations. They are founded in the beliefs that it would be unjust to punish someone for making a good faith effort to help people in need, and that such efforts should be encouraged as a matter of public policy.

Some people refuse to stop and help injured accident victims because they fear being sued for improper action. Much of the fear is generated by misunderstanding and by misinterpretation of the laws. Good samaritan laws have helped to alleviate some of these fears. Essentially, good samaritan laws protect from lawsuit emergency medical services personnel (and, in some cases, private citizens), as long as they act in good faith and to the best of their abilities. Mistreatment, gross negligence, and abandonment are not included in this protection.

Thus, these good samaritan laws attempt to ensure that anyone who voluntarily helps an injured or ill person at a scene is not legally liable for error or omissions in rendering good faith emergency care. The provision of the Massachusetts General Law c111C, section 14, which is typical of that of many other states, reads: “No emergency medical technician who in the performance of his duties and in good faith renders emergency first aid or transportation to an injured or incapacitated person shall be personally in any way liable as a result of rendering such aid or as a result of transporting such person to a hospital or other safe place.”

Goss v. Lopez

THE EVENT: U.S. Supreme Court decision holding that states must provide some elements of due process of law in school disciplinary proceedings that can result in suspension

DATE: Ruling made on January 22, 1975

TYPE OF ETHICS: Civil liberties

SIGNIFICANCE: *Goss* established that, since disciplinary proceedings in public schools have the power to deprive students of a state-provided right to education, they must be conducted in accordance with the basic principles of due process.

During a period of unrest in the Columbus, Ohio, school system, Dwight Lopez was a student at Central High School. He was suspended from school for ten days for allegedly participating in a demonstration in the school cafeteria. There was some physical damage to the lunch room. Lopez received no hearing prior to his suspension. He later testified that he himself had not participated in the disturbance.

In a 5-4 decision written by Justice Byron R. White, the Supreme Court held that Lopez and the other nine suspended appellants were entitled to a hearing prior to suspension so that the charges against them could be assessed. The state of Ohio's argument that it was constitutionally entitled not to offer public education at all and could thus manage the system as it pleased was rejected by the Court; having established the system and given the public rights in it, Ohio could not deprive people of due process by later depriving them of that right. The dissenting justices in this case argued that the penalty was too insignificant to warrant a hearing.

Gossip

DEFINITION: Rumors or talk of a personal, sensational, or intimate nature regarding other persons who are not present

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Although gossip is generally re-

garded as an unethical behavior, it can serve positive social functions.

The word "gossip" comes from Old English *godsibb*, meaning a person related to one in God, or a godparent. Before the nineteenth century, the word "gossip" signified friendship. Because the amounts of gossip usually increase as the amounts of firm information on other people decrease, the information provided during gossip is founded primarily on speculation. It is in part because of this speculation that gossip is typically considered an unethical behavior and prohibited by most religious teachings and secular rules. Jewish law, for instance, generally forbids gossip and contends that gossip is a means by which personal honor is stolen. Passages in the Old Testament books of Leviticus, Exodus, Psalms, and Proverbs condemn the spreading of information, whether true or false, against someone in private.

Although by modern standards gossip is considered undesirable, it serves several positive social functions. For example, it is a means by which social rules and norms and limits on personal behavior can be communicated to new members without direct confrontations. It also allows members of groups to make comparisons with other members to put their own problems in perspective and gain moral compasses on their own behavior. Finally, gossip allows people to share intimacies that promote social bonding, which in turn helps to build sustainable communities.

The question of whether gossip may be considered ethical may be answered by asking questions such as these: Are the remarks that people say or hear about others the kinds of things that they would not want said about themselves? Are people saying things with the intent of harming other people's reputations? Are the remarks being made for personal gain? Are the remarks betraying personal confidences or spreading sensitive information? If the answers to any of these are yes, then the gossip is probably unethical.

Gratitude

DEFINITION: Appreciation or thankfulness

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The appropriate expression of gratitude may be considered a virtue, while ingratitude may be considered a vice.

Humankind is constantly preoccupied with equitable exchange. Gratitude is the heart's internal indicator when the tally of gifts outweighs exchanges. Gratitude is a moral value that helps regulate the "give and take" of human encounters. Gratitude is a universally recognized virtue. The Roman poet Cicero called it the "mother of all virtue." Seneca, an ancient Stoic, stated, "There was never any man so wicked as not to approve of gratitude and detest ingratitude." When the ancient Chinese sage Confucius was asked to summarize his ethics in one word, he replied, "Reciprocity." "Reciprocity" implies a sense of gratitude that arises when goods received go beyond what was deserved. The consensus of sages and philosophers is that people have a moral duty to keep fresh the memory of good things done for them.

As is often the case, moral injunctions serve to counter a trend in human nature that would otherwise remain unchecked. Prophets and moralists have found it necessary to counter the selfish and ungrateful tendency in human nature. Social critic Christopher Lasch, in his *Culture of Narcissism* (1978), has called attention to the dangers of a society that fails to maintain an "attitude of gratitude" as a core value. When the individual's "expectation of entitlement" becomes the group norm, gratitude is destroyed and the fabric of society is weakened. Gratitude is imperative for group survival and cohesion.

Many Christian theologians have argued that gratitude is the obligatory response of the believing person to the grace and goodness of God's creation and redemption. Saint Paul writes, "In everything give thanks." One's metaphysical and political commitments may, however, shape one's perceptions of life in such a way that "gratitude," rather than being a virtue, may be judged to be a form of self-deception or even a subtle coalition with one's oppressors. For example, Jean-Paul Sartre argues that life is essentially absurd and inchoate, prompting one who is "authentic" to have a fundamental attitude of "nausea" toward life. Karl Marx, an economic determin-

ist, implied that the individual has a moral obligation to feel ingratitude toward society when that society fails to fairly meet the needs of all.

ASIAN SYSTEMS OF BELIEF

In many forms of Asian thought, the status of gratitude is ambiguous, since gratitude requires a certain dualism between "benefactor" and "recipient" that may not apply in Asian systems. In much of Asian thought, the goal of life is to transcend the smallness of the finite self. As the devotee comes to identify with the impersonal absolute, the concept of "giving and receiving" becomes vacuous. The enlightened Hindu devotee may say, "One to me is loss or gain, One to me is fame or shame, One to me is pleasure, pain." Thus, gratitude may assume a different meaning in Asian thought.

Buddhists, who hold steadfastly to the doctrine of "no-self," staunchly express gratitude to the noble Buddha who taught the path of "no-self." In the Daoist perspective, good and evil lose their absolute character to such a degree that the concept of gratitude may become irrelevant. If both faces of fortune are greeted with equal countenance, the concept of gratitude becomes equivocal.

The book *Twelve Steps and Twelve Traditions* by Bill Wilson, a cofounder of Alcoholics Anonymous, states, "Action expresses more gratitude than words." Retroactively, gratitude is expressed through thankful remembrances, verbal expressions, and thank-you notes. Proactively, gratitude is expressed through charitable deeds that are performed without thought of reward. Alcoholics Anonymous (AA) meetings often focus on the topic of "gratitude" since the inculcation of this attitude is believed to be not only morally desirable but also necessary for peace of mind and high-quality sobriety. AA teaches that gratitude is the key to happiness and recovery, thus implying a moral imperative to be grateful.

Friedrich Nietzsche believed that gratitude was usually a disguise for covert interests. To have a person's gratitude is to have that person's loyalty. Sacrifice to the gods was never purely to express gratitude but to appease or ward off other evils. The "slave" who serves the "master" above the call of duty secretly expects a boon, not merely the master's gratitude. If gratitude is expressed with the motive of eliciting more gifts from God or any other superior agent, it becomes a form of mercantilism or spiritual materialism.

Nietzsche did, however, recognize a higher gratitude that makes possible a noble expression based on strength and true generosity of spirit. Similarly, Fyodor Dostoevski saw a dynamic connection between gratitude and human freedom. In the “Legend of the Grand Inquisitor,” in *The Brothers Karamazov* (1912), he allegorized that when God calls to humanity he must do so in an ambiguous form in order to maintain humanity’s nobility. If God were to appear to humans with all of his power, glory, and gifts, humans would be awed with gratitude and would have no choice but to obey. God, however, wanted human obedience and gratitude to be freely given. Hence the ambiguous nature of God’s gifts and communications. This ambiguity dampens humanity’s gratitude while preserving its freedom.

Joseph Amato, in his *Guilt and Gratitude* (1982), argues that the concept of gratitude is based on an older worldview that assumes a “limited good and the age-old struggle against scarcity.” This older worldview taught that humankind was dependent on material things. In a world of “scarcity,” gifts are deeply appreciated. To give generously was noble. Amato argues that the concept of gratitude requires a worldview based on scarcity of goods. There is a new “worldview” emerging, however, which says that the good is unlimited and that happiness can be achieved on Earth. A new ethics of gratitude is implied in this view. This challenges the old understanding of gratitude as based on sacrifice and limitation. Gratitude no doubt will continue to be a socially desirable attitude but will have high moral value only when intentions to posture, control, or placate the benefactor are absent. Correlatively, the only gift that can evoke the highest form of gratitude is one that is truly given without expectation that the recipient be obliged or perhaps even capable of repaying the gift.

Gray Panthers

IDENTIFICATION: Public advocacy group that combats discrimination based on age

DATE: Founded in 1970

TYPE OF ETHICS: Civil rights

SIGNIFICANCE: Gray Panthers was the first national organization to bring old and young people together to address discrimination based on age.

In 1970, a woman named Maggie Kuhn joined several friends to address two concerns. They wanted to change the laws that permitted forced retirement at age sixty-five, because they knew many people older than that who had much to contribute, and they wanted to join younger people in actively opposing the Vietnam War. From these concerns came a group called the Consultation of Older and Younger Adults for Social Change, whose name was later changed to Gray Panthers.

The name of the Gray Panthers is a humorous takeoff on Black Panthers, a militant nationalist group for African Americans. Gray Panthers, whose motto is “Age and Youth in Action,” is unlike many other advocacy groups for older people in that it does not set up or feed on competition between old and young people. It advises that by valuing its youngest and oldest citizens, society can become more just and humane. Through national publications and local seminars, the members of Gray Panthers work for improved media sensitivity to age, regulation of the nursing-home and hearing-aid industries, affordable and adequate housing for all, innovative concepts

for jobs and work emphasizing the involvement of people of all ages, and an increased emphasis on intergenerational association.

Greed

DEFINITION: Excessive desire to acquire things; avarice

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Traditionally one of the seven deadly sins, greed is often described both as a personal moral failing and as a sign of societal corruption or decline.

Greed occurs at all levels of human endeavor, and it can occur at the individual or the group level. Donald Worster documents the “greed is good” mentality in the rise of agribusiness. In its greed for short-term profits, it has followed a “slash-and-burn” policy of economic development that has wreaked environmental destruction and bequeathed future generations a legacy of worsening soil erosion, water shortage, dust bowl conditions, and extinction of wildlife.

Greed may also characterize the workings of government. Robert Lekachman stated the liberal argument that the administration of U.S. president Ronald Reagan was motivated by greed. Reagan’s administration purportedly engaged in an enthusiastic and massive redistribution of wealth and power that further enriched the already rich, such as “greedy dabblers in oil, gas and coal properties.” All this was at the expense of the working poor, minorities, and welfare families.

ORIGINS OF GREED

In Western systems of belief, greed is a sin. The biblical concept of Original Sin states that individuals are born as sinners; sin is rooted in human nature.

Rather than viewing greed as an inherent trait or motive, other explanations have looked to the environment. Psychoanalyst Erich Fromm believed that parents are shaped by society to mold their children

in a manner consistent with society’s values. Fromm viewed American society as passing through a series of stages. One of these was the “hoarding character,” which was obsessed with accumulating, holding, and retaining things. In this vein, Ray Porter observed that the noble and virtuous intentions of the Constitution and Bill of Rights, Christian religion, and the capitalist economy actually fostered a mentality of greed that led to widespread destruction of the environment. The right to own and accumulate private property and do with it whatever one wanted was seen as legitimate self-interest. The view that humankind was created in God’s image and had a soul led to the view that plants and animals were subordinate to human purposes. The Scriptures and the Protestant ethic encouraged people to control and exploit nature to their profit. Economics contributed the belief that the source of all that was of value was labor. Nature had no intrinsic value until it was exploited for products and wealth—a “greed is good” mentality.

GREED AND ETHICS

Greed is a sin—that is, a thought, motive, or desire that results in evil behavior because of a wrong attitude toward God. Greed rests in opposition to the eternal law of God and results in alienation from him and possible ruin and destruction. The Old and New Testaments of the Bible contain numerous references to the sinfulness of greed.

The list of the seven deadly sins has been common since the time of Thomas Aquinas. One of these sins is gluttony, which is listed in *Roget’s Thesaurus* and *Webster’s Collegiate Dictionary* as a synonym for greed. Gluttony/greed and the other sins were considered to be root causes of actions or failures to act that constitute serious sins or which are the inevitable source of other sins. They are considered to be deadly because they are directly opposed to virtue.

SOLUTIONS

Both the Bible and modern writers agree that greed is bad and potentially destructive to the individual and to society. Both also agree that greed needs to be replaced by contentment with a modest style of living. The Bible extols individuals to “Keep your lives free from the love of money and be content with what you have” (Heb. 13:5). “Godliness with contentment is great gain. For we brought nothing into the world and we can take nothing out of it. But if

we have food and clothing we will be content with that” (1 Tim. 6:6-10).

Psychologist Burrhus F. Skinner believed that people must reduce their consumption, especially of nonessential luxuries that are falsely believed to be necessary for a satisfying life. “The assignment is to somehow induce people to take the future into account and live simpler lives, consuming less and moving less . . . we need to arrange immediate consequences which will induce people to act in ways which have consequences that are ultimately constructive.”

John A. Nevin believes that it is necessary to emphasize the increasingly aversive conditions under which humankind lives and target those responsible: industries seeking short-term profits at the expense of long-term well-being; religions that encourage overpopulation to maintain and increase their membership; and, ultimately, each overavid consumer.

Green parties

DEFINITION: Diverse political parties that are most widely known for promoting environmental issues

DATE: First organized during the 1980’s

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Greens were the first political parties promoting environmental issues to win seats in national legislatures.

Green parties, or Greens, make environmental issues the focus of their political goals. They criticize the social, political, and economic structures and policies of industrialized countries as the causes of the environmental crisis. Greens consider environmental, economic, social, and political problems to be interrelated and global. Because of this relationship, Greens variously espouse grassroots democracy, social justice and equality, peace, and small-scale economics. They often oppose capitalism, the construction of nuclear power plants, and the testing and production of nuclear weapons.

Most Green parties were established during the 1980’s in industrialized countries and became active in every Western European country, as well as in Australia and New Zealand. West Germany’s Green Party (*die Grünen*), one of the most powerful Green parties, in 1983 became the first to win seats in a national legislature. Support for the Greens was strongly linked with active involvement in social movements. The majority of voters supporting the German Green party in 1983 were active in the ecology, antinuclear, or peace movements. Green parties have also won seats in Austria, Belgium, Finland, Luxembourg, the Netherlands, Romania, Sweden, Switzerland, and the European Parliament.

In the United States, the Association of State Green Parties (ASGP), later the Green Party, was formed after the presidential elections of 1996. The first Green statewide officeholder was Audie Bock, who was elected to the California Assembly in 1999, and the Green Party’s choice to run Ralph Nader as its presidential candidate in 2000 arguably changed the outcome of that election.

Greenhouse effect

DEFINITION: Increase in the earth's surface temperature caused by the absorption of reflected infrared radiation by atmospheric "greenhouse gases"

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: The greenhouse effect poses a potential danger to all human life and societies, as well as other species. It raises the issue of the extent of each individual person's and corporation's ethical responsibility to alleviate a threat to the species and to the planet.

The "greenhouse gases"—water vapor and small amounts of carbon dioxide, methane, nitrous oxide, ozone, and chlorofluorocarbons—absorb reflected infrared radiation, thus raising the atmospheric temperature. Without this increase, the earth's mean surface temperature would be about 15 degrees Celsius rather than the observed 17.3 degrees Celsius (approximate); therefore, the "greenhouse effect"

makes the earth habitable. The warming primarily results from absorption and restricted diffusion rather than reflection and is more properly referred to as the "atmospheric effect."

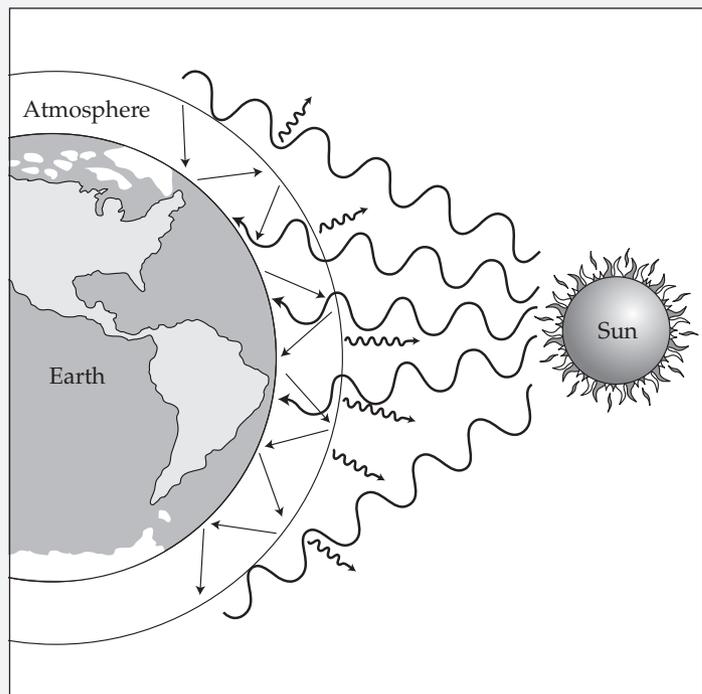

Human production of carbon dioxide, chlorofluorocarbons, nitrous oxide, and ozone may have caused the global warming that has been noted since industrialization. Atmospheric carbon dioxide is increasing about 0.3 percent annually, an increase closely paralleling rates of fuel consumption. Some scientists predict doubled atmospheric carbon dioxide by the year 2080. Chlorofluorocarbons, which are entirely of industrial origin, are increasing by 5 percent per year. Actions to control greenhouse gas emissions include attempts to restrict fossil fuel combustion, which generates carbon dioxide, and reforestation and forest preservation, which remove carbon dioxide from the atmosphere. An international agreement made in 1987 required the halving of chlorofluorocarbon emissions in thirty-one countries by the next century.

Ralph L. Langenheim, Jr.

The Greenhouse Effect

Clouds and atmospheric gases such as water vapor, carbon dioxide, methane, and nitrous oxide absorb part of the infrared radiation emitted by the earth's surface and reradiate part of it back to the earth. This process effectively reduces the amount of energy escaping to space and is popularly called the "greenhouse effect" because of its role in warming the lower atmosphere. The greenhouse effect has drawn worldwide attention because increasing concentrations of carbon dioxide from the burning of fossil fuels may result in a global warming of the atmosphere.

Scientists know that the greenhouse analogy is incorrect. A greenhouse traps warm air within a glass building where it cannot mix with cooler air outside. In a real greenhouse, the trapping of air is more important in maintaining the temperature than is the trapping of infrared energy. In the atmosphere, air is free to mix and move about.

Greenpeace

IDENTIFICATION: International organization dedicated to the protection of the environment

DATE: Founded in 1971

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Greenpeace helped introduce the practice of organized interference with environmentally destructive activities, including governmental activities. The group helped extend the principles of civil disobedience to the environmental movement.

In 1971 Jim Bohlen, Paul Cote, and Irving Stowe formed the Don't Make a Wave Committee, in Vancouver, Canada, and it sent a protest vessel, the *Rainbow Warrior*, to Amchitka in the Aleutian Islands to provoke publicity regarding nuclear testing at that site. An attempt to disrupt the test failed, but the resultant publicity established Greenpeace, the new name of the group, as a major factor in environmental activism. Also, no further tests were held at that site.

Among the notable continuing campaigns of Greenpeace is the attempted disruption of French nuclear tests at Mururoa in the South Seas. This effort led to violence on the high seas when French agents sank the *Rainbow Warrior* in Auckland Harbor, New Zealand, killing one activist. In 1973, Greenpeace began expanding from antinuclear activity to general environmental protest. Interference with sealing and whaling in the St. Lawrence estuary and on the high seas, also involving physical conflict at sea, became prominent. The organization also spread to Europe, the United States, Argentina, and elsewhere, initiating numerous acts of protest and physical interference with such activities as waste disposal.

Sailors from a French naval vessel prepare to board the Rainbow Warrior in September, 1995, when the Greenpeace ship attempted to enter the restricted zone around the South Pacific's Mururoa atoll, where the French were planning to test nuclear weapons. The French later sank the Rainbow Warrior. (AP/Wide World Photos)

Griswold v. Connecticut

THE EVENT: U.S. Supreme Court decision striking down a Connecticut law that prohibited both the use of contraceptives and counseling about contraception

DATE: Ruling made on June 7, 1965

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: *Griswold* has significant free speech implications, but its primary intent and effect are to affirm the existence of a constitutionally guaranteed right to privacy and explicitly to extend the protections afforded by that right to the conduct of one's marriage. It places a limit upon the state's

ability to regulate the intimate details of citizens' private lives.

The Planned Parenthood League's executive director (Griswold) and medical director (Buxton) knowingly violated a Connecticut statute that prohibited the giving of counsel to any person for the purpose of preventing conception. After being convicted in the Connecticut courts, Griswold and Buxton appealed to the U.S. Supreme Court, which overturned the Connecticut birth control law as unconstitutional. Justice William O. Douglas, writing the majority opinion, held that a right to privacy is implied in the Bill of Rights, that the marriage "right of privacy [was] older than the Bill of Rights . . .," and that the state could not invade its freedoms.

Concurring opinions by the court emphasized that the due process clause of the Fourteenth Amendment incorporated the Bill of Rights against any intrusion by state governments. Justices Hugo Black and Potter Stewart dissented on the grounds that the Bill of Rights does not explicitly list a right of privacy, stating that this law did not violate any specific provision of the Constitution and that the high court had no right to invalidate state laws simply because those laws were "capricious or irrational."

Grotius, Hugo

IDENTIFICATION: Dutch philosopher who wrote *On the Law of War and Peace (De iure belli ac pacis libri res*, 1625)

BORN: April 10, 1583, Delft, Holland

DIED: August 28, 1645, Rostock, Mecklenburg

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Grotius pioneered the early modern concept of the secular international society whose members should interact according to an international law based upon norms.

Living in a world embroiled in sectarian religious wars that were both civil and international, Hugo Grotius sought to provide a model for international

relationships that was grounded in natural, God-given guidelines that were fully secular in that they could be learned and understood by unaided reason alone. Any unity in Christian revelation had disintegrated in the success of the Reformation movements, and thus only the action of human reason might lead to certain guidelines. This was essentially an extension of the Renaissance era's program of uncovering the natural truth of classical pagan ethics.

A Dutch Protestant, Grotius believed in the divine ordering of the universe. God's preferences for human behavior were embedded from Creation in what Grotius calls "divine law," which is manifested in God's revelations to people. This is a law that demands a "very high degree of moral perfection" and is associated with the Jewish and Christian moral and ethical systems. Natural law, on the other hand, is also an expression of God's will, but it is discernible through the exercise of human reason alone and requires a rather lower ethical and moral bar than that for God's Chosen or saved peoples. People assent to the first through faith and to the second by what Grotius called the "exercise of Right Reason" and "common consent of mankind."

International relations, especially matters of war and peace, should be carried out according to the natural law that applies to all people and nations at all times. This was Grotius's "primary law of nations." Custom and written agreements constituted a "secondary law," or positive law, that may or may not have been in synch with natural law. To be just and command the obedience of Christians, human-made laws must be based in the natural law established by God. By extension, states' interactions should also conform to the norms embodied in and derived from natural law.

Grotius recognized that the conduct of war was a legitimate activity of a state, but he insisted that just as there were wars acceptable under natural law, there were those that could not be justified, and states and their soldiers had to conform to norms rooted in natural law to be justified in their conduct of hostilities. In important ways he adjusted St. Augustine's comments on just wars and justifiable combat. By grounding these in the same natural law according to which nations should interact among themselves, he laid the groundwork for the modern agreements, such as the Geneva Conventions, that regulate the conduct of war.

Group therapy

DEFINITION: Simultaneous psychotherapeutic treatment of several clients under the leadership of therapists who try to facilitate helpful interactions among group members

DATE: Term coined in 1932

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: In addition to abiding by the same ethical strictures that bind all psychotherapists, group therapists must take special care not to aid one member of the group at the expense of another member. Moreover, all members of therapy groups are morally obligated to hold confidential everything that occurs within group sessions.

Typically, therapy groups consist of three to twelve members who meet once per week for twelve to an unlimited number of weeks. Formats of group therapy differ widely depending on the approach taken by the therapist, but all forms provide an opportunity for members to interact with other members and to learn from these interactions with the help of the therapist.

Compared to individual therapy, group therapy provides a fuller social context in which an individual can work out social problems. Thus, group therapy affords a unique laboratory for working out interpersonal relationships. Members interact in a setting that is more representative of real life than is individual therapy.

Group therapy was developed over the first three decades of the twentieth century by several innovative mental health professionals. The term was coined by Jacob Moreno, also associated with the invention of psychodrama, at a psychiatric conference in 1932. The practice first became popular during World War II, when there were too few therapists available to treat all the psychological casualties of war. Many experienced therapists, however, have come to believe that group therapy has a number of advantages beyond the efficient use of a therapist's time (and lower cost to the individual).

One additional advantage of group therapy is that it encourages members to recognize quickly that they are not the only ones who feel the way they do; it gives them the opportunity to derive comfort, encouragement, and support from others who have similar, perhaps more severe, problems. This recognition tends to raise each member's expectations for improvement, an important factor in all forms of treatment. In addition, members have an opportunity to see themselves as others see them and to obtain more honest feedback about their behavior than they receive elsewhere in everyday life. They receive this feedback not only from the leader but also from other members, whose insights and observations can be very beneficial.

Members also have opportunities to try alternative responses when old ones prove ineffective. Thus, they can actually practice new behaviors in addition to talking about them. Further, members can learn vicariously by watching how others behave and can explore attitudes and reactions by interacting with a variety of people, not only the therapist. Also, members often benefit from feeling that they are part of a group, from getting to know new people, from expressing their own points of view, and from becoming emotionally intimate with others. The group experience may make members less guarded, more willing to share feelings, and more sensitive to other people's needs, motives, and messages. Members may also experience increased self-esteem as a result of helping other members.

Group therapy poses several potential disadvantages. First, some people, because of insecurities or distrustfulness, may be unsuited to group therapy or may need individual therapy before they can function well in a group setting. Second, in some groups, the therapist's attention may be spread too thin to give

each member the attention that he or she needs. Third, the pressure to conform to group rules may limit the therapy process. Fourth, some people may desire more confidentiality than a group can afford or may desire individual attention.

Some types of problems are more appropriate for group than individual therapy. Such problems include substance abuse, eating disorders, child abuse, problems with intimacy, compulsive behaviors (such as gambling), hypochondriasis, narcissism, and post-trauma adjustment (such as post-divorce adjustment or recovering from the effects of sexual victimization). Also, group therapy is a popular form of personal growth therapy; thus, groups are often composed of individuals who are essentially normal but who want to grow or develop more fully.

TYPES OF GROUP THERAPY

Some forms of group therapy currently in existence are sensitivity training or encounter groups, which promote personal growth by encouraging members to focus on their immediate relationships with other members; assertiveness training, in which leaders demonstrate specific ways of standing up for one's rights in an assertive but not aggressive manner; psychodrama, in which an individual acts out dramatic incidents resembling those that cause problems in real life; family therapy, in which two or more family members work as a group to resolve the problems of each individual family member (for example, school phobia in an eight-year-old) and to create harmony and balance within the family by helping each family member better understand the family's interactions and the problems they create; marriage encounter, in which couples explore themselves and try to expand and deepen their marriage relationships; and self-help groups such as Alcoholics Anonymous, Parents Without Partners, Synanon, and Weight Watchers, which often function within a specified structure but without a trained or formal leader.

People most likely to benefit from group therapy are those who can communicate thoughts and feelings and who are motivated to be active participants. Poor candidates are those who are withdrawn, uncommunicative, combative, antisocial, or so depressed or unreachable that they are likely to frustrate other group members.

Guilt and shame

DEFINITION: Painful emotions resulting from self-evaluation either as moral transgressor (guilt) or as morally inadequate in the judgment of others (shame)

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Along with outrage or anger at others' transgressions, guilt and shame are the most visceral and immediate aspects of a person's moral judgment and experience. They play crucial roles in motivating people to avoid moral transgressions.

An individual is "objectively" guilty if he or she is responsible for violating a standard of conduct prescribed by an authority, which violation renders the individual liable to compensation for the transgres-

sion. The violated standard may be a law, a rule of group morality, or a principle of the individual's own conscience. The subjective condition of "feeling guilty" is the sense of having committed an immoral act for which one is answerable to the authority of one's own conscience. Although the compensation to which one feels bound because of this transgression can take a variety of forms (punishment, repayment, being forgiven, and so forth), subjective guilt always involves the sense that one must do or suffer something in order to rectify a moral wrong that one has committed. As defined, the sense of being guilty is not identical with feeling empathic pain for those harmed by the violation. It is also not fear of repercussion or fear of punishment or the sense of having "made a mistake."

A person may be "objectively" guilty of acting against the law or the morals of others and yet not feel guilty. This occurs when such transgressions are not contrary to personal conscience. A person also may be objectively innocent of violating the law or group morality and yet feel guilty. This occurs if the individual violates the dictates of conscience even though the conduct is allowed by the law or others' morals.

SHAME

Shame is the sense that one is a failure because one is regarded as such in the eyes of others. In feeling moral shame, one is thinking of and endorsing a moral condemnation by others (either real or imagined) of some specific fault, which occasions a global sense of one's own moral inadequacy. One is "shamed" by others into being "ashamed of" one's whole self. In feeling guilt, one condemns oneself and does so only for a specific misdeed. This difference between shame and guilt is evident in the way each varies in intensity. Guilt varies as a function of the grievousness of the misdeed and the degree of responsibility of the agent.

A sense of full responsibility for doing something horribly wrong should elicit a severe sense of guilt. A sense of less responsibility for doing something that is regarded as less grievous should elicit a less severe sense of guilt. Moral shame varies in degree as a function of the esteem in which the others who are condemning the self are held. Those who are held in low regard should elicit little or no shame in the individual whom they morally disparage. Those who are

held in high esteem should elicit much shame if they are regarded as being critical (even if what they are morally condemning is regarded by the individual as trivial).

Both guilt and shame play crucial roles in moral motivation. Guilt motivates one to make compensation for wrongs done, by submitting to punishment and/or by making satisfaction for harm caused. Doing either assuages the painful feeling of being guilty by partially "undoing" the wrong. Because guilt is a painful emotion, people are motivated to avoid experiencing it in the first place; that is, to avoid committing the wrongs that cause them to feel guilty. By shame, people are motivated to correct moral defects that they take others to be criticizing in them. This correction serves to assuage the pain of shame by eliminating its cause. It also serves to reestablish good relations with those who are regarded as being critical. Again, because shame is a painful emotion, people are motivated to avoid experiencing it in the first place; that is, to avoid acting in ways that cause them to be ashamed. Thus, people take account of and anticipate the moral judgments of them by others and "adjust" themselves accordingly.

Guilt and shame have closely related origins. When wrongdoing and punishment by parents become sufficiently linked in a child's mind, the mere thought of having done wrong will elicit the associated pain, as in guilt. Parental punishment also establishes a linkage between pain and negative evaluation of the self by others. Hence, the very thought of disapprobation of oneself by "significant" others will come to elicit the associated pain, as in shame.

Whether an individual is more prone to guilt or to shame depends upon whether the wrongs done by the person as a child or the disapproval by others of those wrongs was emphasized by the parents. This emphasis varies across cultures. Some societies emphasize the individual's sense of responsibility for wrongdoing (so-called "guilt societies"), while others emphasize the individual's sense of what others think of the individual's wrongdoing (so-called "shame societies").

Experiencing the appropriate degree of either shame or guilt on the occasion of moral wrongdoing or failure is rational and constitutive of being a moral person. Shame and guilt become irrational, however, when they are unwarranted by the occasion in which they are experienced. Irrational shame and guilt be-

come pathological when they are persistently experienced even after their irrationality is acknowledged.

The Gulag Archipelago

IDENTIFICATION: Book by Aleksandr Solzhenitsyn (1918-)

DATE: *Arkhipelag GULag, 1918-1956: Opyt khudozhestvennogo issledovaniya, 1973-1975 (The Gulag Archipelago, 1918-1956: An Experiment in Literary Investigation, 1974-1978)*

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Solzhenitsyn's *The Gulag Archipelago* examines the history of the penal system established in the Soviet Union after the Russian Revolution and brought to light the cruelties inflicted upon millions of political prisoners.

The word "gulag" derives from the Russian acronym for the Chief Administration of Collective Labor Camps, which was established in the Soviet Union

after the Russian Revolution of 1918. An archipelago is an extensive group of islands, such as exists in the Arctic Ocean off the coast of Siberia. It was in these bitterly cold regions that collective labor camps were built to house more than ten million inmates. In 1973, Aleksandr Solzhenitsyn, a Russian novelist, began publishing a three-volume history of those camps called *The Gulag Archipelago, 1918-1956: An Experiment in Literary Investigation*. Although banned in his own homeland, Solzhenitsyn's work was smuggled to the West, was translated, became a best-seller, and led to the author's expulsion from Soviet territory in 1974. The three published volumes were based on letters, documents, and the experiences of 227 eyewitnesses, including those of the author, who spent eight years in the camps.

HISTORY

Soviet labor camps were first established by Vladimir Lenin, leader of the Russian communists during the revolution, to reeducate and punish enemies of the Communist Party. After Lenin's death in 1924, Joseph Stalin took power and sent millions of Soviet citizens to the camps for "crimes against the state." In a chapter titled "The History of Our Sewage Disposal System," Solzhenitsyn explores Stalin's legal and ethical motivations for carrying out a reign of terror that lasted from 1927 until the dictator's death in 1953. Under the Soviet constitution, written by the dictator himself, any "counterrevolutionary" activity was punishable by ten years of slave labor or even death. Any actions "injurious to the military might" of the Soviet Union, any "intention" to do injury, and any "attempt to weaken state power" could get a citizen thrown into the Gulag.

Other crimes included attempts at armed rebellion, providing aid to the "international bourgeoisie" or capitalist class, espionage, suspicion of espionage, and contacts "leading to suspicion to engage in espionage," including more easily witnessed criminal acts such as "subversion of industry, transport, and trade" by failing to achieve and produce as much as was expected of loyal citizens. One could also be punished for failing to denounce people whom one suspected of having committed any of these crimes. Solzhenitsyn received an eight-year sentence for violating the law against weakening the state by criticizing its leaders. He had criticized Stalin's military leadership in a "private" letter to a fellow army officer, but since all

mail was opened and read by secret police agents, nothing was truly private. The communist judge sent Solzhenitsyn to a labor camp in Siberia. While in the Gulag, he heard many stories of suffering, death, and other horrors, and he pledged to write about those experiences so that they would never be forgotten.

ETHICAL PRINCIPLES

Inside the camps, the most vicious criminals were in charge. According to Stalinist ethics, political prisoners had no human rights because they were inferior beings and enemies of the state. Refusal to obey orders or attempts to avoid work meant immediate death. Millions died from twenty-hour days in gold mines or in clearing forests in 60-degrees-below-zero weather. Inmates were not expected to survive, so they were fed inadequate, miserable food, frequently nothing more than watery potato or "fish" soup and a moldy crust of bread once a day.

The camps were built and maintained according to the ethics of pure force. Stalin's word became law, and his only motive became increasing his own power. "To choose one's victims, to prepare one's plans minutely, to slake an implacable vengeance, and then to go to bed . . . there is nothing sweeter in the world," he wrote. The methods of force that he used included torture and psychological terror. The only way to avoid immediate death at the hands of the police was to confess to everything and to submit to the absolute power of the torturers. Stalinist ethics were based on one principle: Stalin and the party were right, and everything else was wrong. Even children as young as twelve could be executed for crimes against the state, usually upon no more proof than a confession elicited after the child had been subjected to days of continuous questioning, without sleep, in an isolated cell.

The ethics of the Gulag inmates demanded the destruction of all human feeling and trust. Survival depended upon finding meaning in circumstances that evoked only horror, hatred, and degradation. Yet, as Solzhenitsyn discovered, many inmates did survive. He attributed survival inside the camps to a prisoner's

strength of character before he entered the system. The people who surrendered and died or became informers were those who "before camp had not been enriched by any morality or by any spiritual upbringing." Survival demanded a "steadfast faith" in the human spirit or in some religious ethic. People who had found meaning in life before becoming victims of the terrorists could put up with the worst conditions, while those without a philosophy of life surrendered to despair and died horrible deaths. For Solzhenitsyn, this was the lesson of the Gulag: Know how to live and you will survive any conditions within or without the camps.

H

Ḥadīth

DEFINITION: Traditions of the life and sayings of the Prophet Muḥammad

DATE: Developed during the seventh to ninth centuries

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The actions and decisions of Muḥammad, as related in the *Ḥadīth*, are seen as exemplary in Islamic ethics and are, in many traditions, legally binding in those instances in which there are not specific Quranic injunctions.

The first source of ethical guidance in Islam is the Qurʾān and its exegesis. One text, however rich, cannot supply guidance in the particulars of all matters, though, and so great importance usually is placed on the traditions of the actions and statements (way of life, or *sunna*) of the Prophet Muḥammad. The importance of *Ḥadīth* is further grounded in the Qurʾān, which enjoins the faithful to look to Muḥammad's example for guidance. There is a broad range of subjects of *Ḥadīth*, from those that have or are alleged to have mystical import, to those concerned with proper worship, to those that deal with the most everyday matters such as manner of dress.

There has also been a broad range of approaches to the use of *Ḥadīth*. In many Islamic legal traditions, *Ḥadīth* is second only to the Qurʾān in authority and is legally binding. Very often, it is seen as ethically regulative, especially in matters of worship but not always in more mundane matters. There has also been persistent critique of the use of *Ḥadīth* as innovative or unreliable, although such critique tends to be a minority position.

The question of which *Ḥadīth* to accept as authentic became a central concern in Islamic legal and ethical thought because the *Ḥadīth* could determine the community's acceptable range of behavior. Thus arose the science of analysis of *isnād*, the chain of transmission of *Ḥadīth* in which the authenticity and accuracy of each stage of the transmission is ex-

amined. The major collections of *Ḥadīth* were assembled in the ninth century, with the collections by Abū ʿAbdallāh Muḥammad al-Būkhārī and Abū al-Ḥusayn Muslim ibn al-Ḥallāj most often accepted as authoritative. The elections of *Ḥadīth* were at the core of the curriculum at many of the medieval *madrasas* (roughly equivalent to modern colleges). The importance of *Ḥadīth* was also a major impetus to serious, scholarly research into history in the Islamicate world, since the soundness of the chain of transmission of *Ḥadīth* cannot be determined without accurate facts about the history of the transmitters.

Many Sufis often employ controversial *Ḥadīth* with less concern for *isnād* than for transcendent or mystical meaning of the *Ḥadīth*. Ibn ʿArabī, for example, reported the *Ḥadīth* that God had revealed to Muḥammad that God was a hidden jewel, who created the world so that he could be known. Ibn ʿArabī then argued against the independent reality of the phenomenal world, which is merely a mirror of God.

al-Ḥallāj

IDENTIFICATION: Persian mystic

BORN: c. 858, Tūr (now in Iran)

DIED: March 26, 922, Baghdad (now in Iraq)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Al-Ḥallāj's life, his teachings in *The Tawasin* (early tenth century), and his execution and martyrdom were central to the development of Sufism.

Abū al-Mughīth al-Ḥusayn ibn Manṣūr al-Ḥallāj has often been called the martyr of mystical love, because he paid the highest price for his devotion to loss of the ego in pure, unconditional love of God. His burning desire for extinction of the self is reflected in

his verse, "Kill me, oh, my trustworthy friends." He is best known for proclaiming, in a state of mystical ecstasy, "*anā'l-ḥaqq*." *Al-ḥaqq* literally means "the truth" (often in the sense of "true reality"), but is also one of the names of God. *Anā'* is the first-person singular pronoun. This led many to interpret al-Ḥallāj as a pantheist (reading *anā'l-ḥaqq* as "I am God"), which led to his particularly gruesome execution. Al-Ḥallāj's surviving works and the work of Louis Massignon (*The Passion of Ḥallāj*) make clear that the charge was false. Al-Ḥallāj's calm and steadfastness in love of God throughout his execution ensured his later role in much of Sufism as a martyr. Following his execution, most of his disciples fled from Iraq to the more tolerant northeast, where they energized Khurasani and Central Asian Sufism.

Hammurabi's code

IDENTIFICATION: Set of 282 specific laws regulating the social and economic behavior of the people of Babylon

DATE: Established between 1792 and 1750 B.C.E.

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: The code of Hammurabi was one of the earliest and most thorough attempts in history to set up a harmonious social order based on individual rights backed by the gods and the state.

Hammurabi (ruled c. 1792-1750 B.C.E.) was the sixth king of an Amorite (Semitic) dynasty ruling over the city-state of Babylon and one of the most important rulers of ancient times. He united all the city-states of Mesopotamia under his rule and, in time, created a huge empire. As an effective, pragmatic administrator, he desired to establish order by setting up standardized rules of moral conduct and ensuring that people would accept decisions made by courts rather than seek to avenge wrongs on the spur of the moment without restraint.

In order to establish a uniform system of justice and create something approaching universal law applicable to varying cultures from formerly indepen-

dent city-states, Hammurabi used existing laws and court decisions, and he added new laws as different situations arose. Earlier Mesopotamian law codes, antedating Hammurabi's code by one to three centuries, indicate that the great Babylonian king consulted precedent and that his code rested on a widespread ancient Near Eastern legal tradition. Three previous Near Eastern codes are the Code of Ur-nammu (founder of the third dynasty of Ur c. 2060 B.C.E.); the Code of Lipit-Ishtar (c. 1870 B.C.E.); and the Laws of Eshnunna (promulgated c. nineteenth century B.C.E.)

INSCRIPTION

After all the laws and judgments had been collected, they were inscribed on several stelae, which were set up in public in various cities of the empire. Officials were appointed by the king to mete out the prescribed penalties to violators of the law.

A single copy of the Code of Hammurabi was first discovered in the winter of 1901-1902 at Susa, the capital of ancient Elam. The recovered stele is an eight-foot-tall block of black diorite. The upper part displays a relief, or carving, depicting Hammurabi receiving the commission to write the law from the god of justice, the sun god Shamash. This commission provided significant legitimization of the code by showing the world that the gods were behind the establishment of the code and that they desired, as well as expected, mortals to behave according to its principles. There is no hint in the code itself, however, of the concept of *imitatio dei* (the requirement to be holy because God is holy) as the rationale for moral behavior.

The inscription on the stele was divided into three parts: a prologue, the code itself, and an epilogue at the bottom of the stone slab. The epilogue added extra incentive for obedience by reinforcing the promise of rewards to those who obeyed the laws and punishment to those who disobeyed.

ETHICAL PRINCIPLES

Hammurabi proclaimed that he issued his code on divine authority in order to "establish law and justice in the language of the land, thereby promoting the welfare of the people." The main ethical principle upon which the code rested was that "the strong shall not injure the weak." Individuals were not permitted to take the law into their own hands.

An important consideration for modern interpreters of the code, however, centers on how one defines such terms as “justice” and “injury to the weak.” One striking feature of the code is that it was not strictly egalitarian in its application of punishments; the law differed according to the social status of the offender. Aristocrats were not punished as harshly as commoners, and commoners were not punished as harshly as slaves. Still, slaves had rights and received some protection under the law.

The code also rested on the conviction that punishment should fit the crime. Like the Law of Moses in ancient Israel, Hammurabi's code employed the *lex talionis*, “an eye for an eye, and a tooth for a tooth,” and it may be the oldest law code in the ancient Near East to prescribe this system. It operated, however, only among equals. An aristocrat who destroyed the eye of a commoner or slave could pay a fine instead of losing his own eye. As long as the criminal and victim shared the same social status, however, the latter could demand exact retribution.

In an attempt to guarantee a fair trial and a just verdict, the code forbade a judge to change his verdict once a decision had been rendered. Any judge who did so was heavily fined and deposed. There were no public prosecutors in Hammurabi's day, so individuals brought their own complaints before the court and produced supporting documentation or witnesses. In cases of murder, the accuser had to prove the defendant guilty. Any accuser who failed to do so was put to death. This severe measure was designed to prevent frivolous, groundless cases from clogging the courts and wasting the time of defendants.

Hammurabi's code displays an understanding of the difference between accidental deed and malicious intent, but it does not seem to attach to this principle the same importance afforded it by the later Mosaic code.

CIVILIZATION AND MORAL CONTINUITY

Hammurabi's code addressed what it considered to be unethical behavior in a wide variety of situations, demonstrating a significant moral continuity between ancient and modern civilization. The concept of strict accountability is evident in all the laws.

The code mandated consumer protection. Merchants and businessmen had to guarantee the quality

of their goods and services. No one was exempt. A house builder whose careless work resulted in the collapse of a house and the death of its inhabitants was himself put to death. A merchant who tried to increase the interest rate on a loan forfeited the entire loan amount. A surgeon whose patient died during an operation was executed. A surgeon whose patient lost an eye during treatment had his fingers cut off—a punishment that no doubt proved inconvenient to his future career.

Crime was a serious problem in Mesopotamian urban life, so the code ordered that exacting measures be taken against criminals. Burglars caught in the act were put to death on the spot. Anyone caught looting a burning building was thrown into the fire. Such penalties were intended to stamp out crime as well as limit the cycle of violence that sometimes resulted from private vengeance.

Hammurabi's code gave careful attention to marriage and family relationships. Proved adultery with a married woman incurred the death penalty for both participants. The wife was expected to be rigorously faithful, and the husband had virtually absolute power over his household. By the standards of the time, however, certain “rights” of women were set forth in this code for the first time. Husbands who abused their wives without cause had to pay a penalty in silver. If a wife proved herself innocent of charges of adultery, she could take her dowry and leave her husband.

There is debate over how often, if ever, the penalties and provisions of Hammurabi's code were actually carried out. Contemporary legal documents are scanty and silent on the issue, but there is no question that the code greatly influenced the behavior of the civilizations and the people of the Near East long after the fall of Babylonia. It provided the backdrop against which Moses revealed the law to Israel. The Law of Moses contains many similarities and parallels to Hammurabi's code. While it was not the first law code in history, the Code of Hammurabi was the most comprehensive in the world until the Byzantine emperor Justinian ordered the compilation of the *Corpus Juris Civilis* about 550 C.E.

Hare, R. M.

IDENTIFICATION: English philosopher
 BORN: March 21, 1919, Backwell, near Bristol, Somerset, England
 DIED: January 29, 2002, Ewelme, Oxfordshire, England
 TYPE OF ETHICS: Modern history
 SIGNIFICANCE: In such works as *The Language of Morals* (1952), *Freedom and Reason* (1963), *Applications of Moral Philosophy* (1972), *Moral Thinking* (1981), *Essays in Ethical Theory* (1989), and *Essays on Political Morality* (1989), Hare attempted to argue that all moral judgments are commands rather than factual propositions, without sacrificing the normative force of such judgments.

R. M. Hare's moral theory, called "universal prescriptivism," was based on the idea that moral judgments are universalizable prescriptions. Like the noncognitivist, he stressed the commending or evaluating function of value statements. Therefore, at least

part of what it means to say "x is right" is "x is to be commended," or "one ought to do x." Hare also thought, however, unlike the noncognitivist, that moral statements are meant both to guide choices through a veiled appeal to universal principles and to assert on rationally testable grounds that something is the case. He agreed with G. E. Moore that naturalistic theories are fallacious but differed in his account of the reason for this.

Hare's work was one of the most eclectic efforts in contemporary moral philosophy, for his view had certain definite affinities with utilitarianism (in the idea that the basic human good is to maximize rational preferences that embody prescriptions), with existentialist ethics (in his suggestion that one makes a "decision of principle" when one chooses a particular action), with Kantian ethics (in connection with his universalizability thesis), and with emotivism (in his focus on the logic of the language of morals). On the practical side of moral philosophy, Hare showed an unusual philosophical interest in problems related to moral education and moral decision making.

Harm

IDENTIFICATION: Physical or mental damage done to others
 TYPE OF ETHICS: Theory of ethics
 SIGNIFICANCE: An important consequence of wrongdoing, harm is often argued a necessary prerequisite to certain charges of wrongdoing or to set limits on the conduct that the state can legitimately criminalize.

The term "harm" in ethics, as in ordinary language, appears in both noun and verb form. Although vague, ambiguous, and reflecting contested value judgments, the term has a number of discernable meanings in ethics.

Use of the noun "harm" is typically limited to refer to any diminution from an entity's good, welfare,

function or well-being. To cause harm, one must at least cause such diminution. It is, however, often said that harm can only occur to something that not only has a good or function but is also sentient or has interests. Hence, one might harm a person or animal but one cannot directly harm (one can merely damage) a knife or tool. One might still cause harm in a derivative sense to a knife or tool, by damaging something that someone takes an interest in. Some also extend harm to refer nonderivatively to purported harms to certain inanimate entities like the environment. Persons employing such extensions almost always aim to invoke some of the moral objection that they view as warranted by harm to sentient beings.

In verb form, “harm” can be used minimally to mean simply to cause harm. In this sense, inanimate objects, natural events, and people engaging in nonobjectionable conduct can harm others. To say that one has harmed another in ethics is, however, often to make a more serious moral charge of wrongdoing. Hence, only appropriate subjects of moral criticism—such as persons, agents, or groups—can so harm another. To harm another in this morally laden sense, one must also typically negligently, recklessly, knowingly, or intentionally cause foreseeable harm to another by violating another’s rights. Hence, one cannot harm another, in this morally laden sense, by such actions as giving birth to someone who happens to undergo a traumatic death later in life, attempting but failing to cause harm, voting, benefiting from a contract freely entered into, or failing to return another’s love. One does not harm another in this sense by failing to provide a benefit where no special duty is owed.

JOHN STUART MILL’S HARM PRINCIPLE

Perhaps the best-known use of “harm” in ethics appears in John Stuart Mill’s harm principle, which asserts that the state can only legitimately criminalize conduct, or otherwise coerce individuals, to prevent them from harming others. In elaborating this principle, Mill explicitly excludes both purported moral corruption and offenses to others’ moral or religious sensibilities as relevant cases of harm. Others theorists have, however, used harm to include these latter phenomena and have thought that such harms must be taken into account when deciding what laws, norms or state actions are legitimate or good.

Hart, H. L. A.

IDENTIFICATION: English legal philosopher

BORN: July 18, 1907, Harrogate, England

DIED: December 19, 1992, Oxford, England

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Hart defended a distinctively modern version of legal positivism—the view that law can be accounted for in neutral sociological terms, without adverting to moral criteria.

H. L. A. Hart was the most influential Anglo-American legal philosopher of his generation and, arguably, of the twentieth century. He wrote on a wide range of topics, including punishment, the nature of obligation, the illegitimacy of criminally enforcing popular morality, and the role of excuses and causality in morality and law. He is, however, best known for his legal positivist account of what law is. Against natural law theorists, who believed that law is inextricably bound up with moral standards, Hart argued that there is no necessary connection between law and morality. Hart thought this separation critical for the meaningful moral criticism of law.

Drawing on advances in linguistic philosophy, Hart nevertheless argued that prior legal positivists—such as John Austin—who sought to offer similarly neutral, descriptive accounts of law had failed to distinguish between legal systems and situations of gunmen writ large. For Austin, law consisted in sovereign orders, habitually obeyed and backed by coercive threats, but such accounts fail to distinguish between following commands and being coerced. To cure this defect, Hart analyzed social rules as involving widespread attitudes (the “internal point of

view”) toward standards as offering both internal guides to conduct and grounds for criticizing deviations. To Hart, Austinian accounts of law also reduced too many phenomena to the criminal law model, thus obfuscating the way law allows people to vary their normative relations with one another—as in the law of contracts, trusts, and estates. Hart dubbed rules of the latter kind “power-conferring rules.”

For Hart, law is distinctive in that it combines primary rules of conduct with secondary, power-conferring rules, including a “rule of recognition,” which allows officials to identify the law. Law consists in the complex social situation in which a group of officials takes up the internal point of view toward a rule of recognition, which in turn specifies primary rules of conduct for citizens, who typically obey (for any number of reasons).

Hart later clarified that he is an inclusive legal positivist: Rules of recognition are social conventions that can require employing moral criteria. This clarification was meant to deflect Ronald Dworkin’s modern natural law criticisms—namely, that interpreting the law often involves employing moral standards. The clarification nevertheless exposed Hart to Joseph Raz’s exclusive legal positivist criticism that any such reference to moral criteria would prevent law from providing independent practical guidance, as law purportedly claims. That such prominent legal philosophers define their positions partly in response to Hart’s testifies to Hart’s continuing centrality to modern jurisprudence.

Hartshorne, Charles

IDENTIFICATION: American philosopher and theologian

BORN: June 5, 1897, Kittanning, Pennsylvania

DIED: October 9, 2000, Austin, Texas

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Credited with reviving interest in religious ethics among philosophers, Hartshorne was a proponent of process theology—the theory that God is not an absolute but constantly changes in response to events affecting humanity. From his theories of religion, Hartshorne argued for a rational, relative view of ethics.

Despite his prolific publications, Charles Hartshorne was a little-known philosopher of theology. He challenged the traditional view of God as being omnipotent or omniscient while recognizing the existence of God. In more than twenty books and one hundred articles, Hartshorne argued that God suffered and celebrated with his creations as they traveled through life. Hartshorne found the origins of his theories in the work of Harvard philosopher Alfred North Whitehead for whom he worked as an assistant during the 1920’s.

Hartshorne is credited with reviving interest in religious philosophy. As a first step, he applied mathematics to develop sixteen proofs of the existence of God. Arguing that God existed placed Hartshorne beyond the mainstream of philosophers. He then postulated a dipolar view of God. At one pole, the abstract God is unchanging and absolute. The concrete pole is a God who perfectly suffers with his creations.

Late in his life, Hartshorne published many of the writings he had completed but stored away. One of these works was *Omnipotence and Other Theological Mistakes* (1984), which he published when he was more than eighty years old. Hartshorne also developed an expertise in ornithology, specializing in natural selection among birds. In *Born to Sing: An Interpretation and World Survey of Bird Song* (1973), he argued that some birds like to sing simply for the joy of it, even when not in mating season or when threatened.

Despite the volume of his writing, Hartshorne was troubled that his theories did not attract the attention of his peers. However, by the time he died in 2000, he was able to see that his theories were being debated in a reenergized discipline. His writings on

ethical issues, such as abortion, attracted less attention. These arguments were marked by rational, less emotional, views of ethical behavior.

Hasidism

DEFINITION: Form of emotional Jewish mysticism originating in eighteenth century Poland

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Hasidism rejects an intellectual, scholarly model of religious practice and instead insists that true worship is simply the joyous recognition of the immanence of God in all of creation.

Modern Hasidism is based on the teachings of the eighteenth century Jewish leader Baal Shem Tov, who was born Israel ben Eliezer. His relatively uncomplicated message of joyful worship appealed to the predominantly uneducated peasant populations of eastern Europe. Many Jews abandoned the rabbinical, intellectual traditions of Talmudic study to embrace Hasidism's emotionalism. Hasidism stressed God's mercy, the goodness inherent in human beings, the universality of God leading to the spiritual unity of God and humanity, and the joyfulness of religious experience, which frequently found expression in music and dance.

Despite the opposition of Talmudists who, in 1781, pronounced Hasidism heretical, the popularity of the anti-intellectual movement peaked during the early nineteenth century. While less numerous in the twenty-first century, Hasidic communities remain an active force in modern Judaism, and Hasidism has broader influence in both the Jewish and gentile worlds principally through Hasidic composers, artists, and philosophers, including, notably, composer Ernest Bloch and Yiddish writer Isaac Bashevis Singer. Through the works of philosopher Martin Buber, Hasidism has also influenced twenty-first century life, notably, through the adoption of Buber's system of collective farming known as the *kibbutz*.

Hate

DEFINITION: Personal or social antipathy toward others

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Hate is a primary cause of conflict between individuals, groups, and nations. Its moral status varies wildly in different contexts, from the Christian view that hatred is sinful to Friedrich Nietzsche's frank admiration of the great haters who brought about the slave revolt in morality.

Most people understand hate, or hatred, as an emotion felt by one individual for another that is characterized by animosity and sometimes is accompanied by the desire to see the hated person suffer. This highly personal understanding of hate is, however, relegated almost entirely to laypersons; scholars have given it not only moral but also metaphysical, sociological, psychological, and criminological significance.

To the early Greek philosopher Empedocles, hate was a metaphysical reality, one of two forces of change in the universe, the other being love. Empedocles explains all natural objects in terms of four basic material elements—fire, earth, air, and water—which combine and decombine in a cyclical process of production and decomposition. Love is responsible for the attraction between elements and for whatever order and stability the universe possesses. Love is in constant conflict with hate, its cosmic opposite. As the cycle of change unfolds, love is superseded by hate in its turn, and disorder and decay appear in direct proportion to the hate unleashed by the progression of this cycle. The universe is the scene of constant creation and destruction as the dyadic conflict between love and hate proceeds.

SPINOZA AND NIETZSCHE

Baruch Spinoza gives hate a prominent place in his *Ethics* as a fundamental emotion and determinant of human behavior. People love what arouses joy in them, while they hate what arouses sorrow; likewise, one loves the person who "affects with joy a thing which we love" but hates him if "we imagine that he

affects it with sorrow.” Love and hate, the respective responses to joy and sorrow, are psychological constants in the deterministic natural order of which humans are a part, acting as the determinants of the nature of all relationships with others, whether they be individuals, classes of individuals, or entire nations. So strong are these emotions that one may hate an entire class or nation of people because one of its members has done one an injury. Hatred induces “anger,” the desire to injure those one hates; when one’s hatred and anger toward others are mutual and result in an injury being done to one, one develops the desire for vengeance against those who have injured one. Hatred also exists in other forms—“indignation,” hatred of those who injure others, and “envy,” hatred of another’s good fortune.

For Friedrich Nietzsche, hate exists primarily as *ressentiment* (resentment), the vengeful, jealous hatred that reveals the weakness of those who perceive their own self-respect to be threatened by their superiors. The early Christians resented the Romans because of their paganism and their power. Resentment is what was directed by the “herd,” the masses of nineteenth century Europeans, who were bound to one another by mediocrity and conformity, against the noble individual who dared to be different, who determined for himself what his values would be, and who used the life-giving energy provided by his animal instincts to create a superior life characterized by the mastery of those instincts. Consequently, resentment of others, according to Nietzsche, is beneath the dignity of the noble man; if he does experience hatred, it spends itself quickly and is over before it “poisons” him. Hatred festers in the souls of the weak and powerless, who spend whatever creative energies they possess cultivating plans for revenge.

The Nietzschean view of hatred as a psychosocial phenomenon is reflected in the attitudes of twentieth century thinkers, who have made it the object of not only philosophical reflection but also psychological, sociological, and criminological research. Samuel Tenenbaum, in *Why Men Hate* (1947), adopts a distinctly Nietzschean view of hatred: “Hate warps and stultifies the soul. It consumes the individual and fills him with suspicion and distrust. . . . The world becomes a giant conspiracy, where men and women, instead of living normal lives, connive and plot.” The twentieth century saw hatred erupt as animosity to-

ward various racial, ethnic, and religious groups, often culminating in open warfare.

OTHER VIEWS

Jeffrie Murphy, in *Forgiveness and Mercy* (1988), acknowledges several varieties of hatred: simple hatred, which is dislike for someone for some “non-moral objectionable quality,” such as being a bore; moral hatred, which consists of hatred of someone because of the person’s association with an immoral cause, such as Nazism; and, finally, malicious hatred, which consists of the desire to injure another for the purpose of gaining some competitive advantage. Only the last variety of hatred is morally objectionable, but Murphy also argues for the existence of “retributive hatred.”

Retributive hatred is hatred that is motivated by justifiable anger over an unjustifiable wrong, for which the wronged party rightfully expects and is entitled to some form of retribution. No matter how justifiable it is, however, Murphy does not favor acting upon retributive hatred. Moral humility demands that one recognize one’s own limitations of knowledge and virtue, lest one’s hatred drive one to excessive vengeance. In addition, retribution is often either impossible or too costly, and one’s own moral decency imposes constraints upon one’s desire for revenge. For these reasons, although retributive hatred is a proper response to a genuine wrong, it can be dangerous and should be subjected to “reflective restraint.”

Hate crime and hate speech

DEFINITION: Criminal acts and offensive speech directed against individuals because of their race, ethnicity, religion, sexual orientation, or other group affiliations

TYPE OF ETHICS: Human rights

SIGNIFICANCE: The impact and control of hate crimes and hate speech have become significant public policy concerns and raise a variety of ethical questions that may not be obvious.

Since the early 1980's, nearly every U.S. state has passed some type of hate-crime law, and many local governments and other agencies (especially schools and universities) have attempted to regulate hate speech in some manner. These laws and regulations have engendered several important ethical issues. One issue that has arisen is the question of what kinds of groups should be included within hate-crime and hate-speech protections. Although categories such as race, ethnicity, and religion are virtually always included, there has been considerable debate over other categories, such as those pertaining to sexual orientation and gender.

By 2003, approximately sixteen states had hate-crime laws that did not include crimes committed on

the basis of sexual orientation. In addition, one of the primary impediments to the enactment of federal hate-crime legislation has been the question of whether to include sexual orientation. This is a significant issue because research has shown that sexual-orientation-based crimes are almost as common as those based on race and religion. Critics, however, assert that including sexual orientation in hate-crime laws will amount to an official government endorsement of homosexuality, which they oppose because they believe that homosexuality is morally or spiritually wrong. On the other hand, proponents of inclusion claim that when laws address other kinds of bigoted acts but not those motivated by sexual orientation, they send the implicit message that violence against gays and lesbians is acceptable.

By late 2003, gender was included in the hate-crime statutes in nineteen states. Opponents of inclusion have voiced several concerns. Among other things, they claim that gender-based violence is significantly different in character than crime based on categories such as race and religion, and some fear that if all cases of sexual assault and domestic violence eventually become hate crimes, that development will obscure other kinds of bigotry. Conversely, other critics claim that crimes against women will no longer receive adequate attention if they are subsumed under the rubric of hate crime. However, those who wish to include gender claim that these concerns are unwarranted, and that gender-based crimes are very much like those based on more traditional hate-crime categories.

Aside from questions about which groups to include in hate-crime and hate-speech protections, the other major ethical dilemma that has arisen is how to protect people from violent or offensive attacks, while at the same time protecting the freedoms of expression and association. For example, should college students be permitted to hang Confederate or Nazi flags in their dorm windows if other students find such displays offensive? Should there be efforts to regulate the content of Web sites created by white supremacist and other extremist groups? Should people be punished for burning crosses? Answers to such questions are not obvious, and the questions have inspired both debate and legal controversies.

Head Start

IDENTIFICATION: Comprehensive U.S. developmental program of educational, social, and health services for disadvantaged children

DATE: Founded in 1965

TYPE OF ETHICS: Children's rights

SIGNIFICANCE: Head Start was designed to break the cycle of poverty by enabling children from low-income families, as well as their parents, to improve their intellectual development, self-esteem, and physical and mental health.

Created as a result of the Economic Opportunity Act of 1964, Head Start emerged as a social-action program at a time in history when social and political forces, as well as intellectual traditions in the social sciences, had begun to focus on the problem of poverty. The program developed out of the civil rights era and the War on Poverty, the revival of scientific interest in the role of the environment in human development, and the design of educational-intervention efforts for economically disadvantaged children. The lines of its development converged amid an alliance of child-development experts and social policy makers, under whose auspices Head Start grew from an idea to a proposal and finally to an active program. Head Start provides a broad range of services to children and their families. Play, group, and individual

activities with both direct and indirect instruction are offered, as well as medical and dental care.

Health care allocation

DEFINITION: Distribution of health care resources to specific areas and to certain individuals in need of particular procedures

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Health care allocation raises questions of societal obligation and individual rights to health care, as well as values inherent in specific treatment choices.

The allocation of scarce resources is an issue central to every political party, every government, and every organization and company. Whether to allocate 2 percent or 10 percent of the gross national product to health care, rather than defense, or education, or housing, or whatever other particular need is most pressing, is a decision that is central to the type of government and the values of those in power. Once a health care budget is established, the choices become progressively less global and more oriented to the individual recipient of health care. Although the values inherent in the original budget decisions can still be found, they are often less visible than the physician's personal opinions or the assessment of medical or social utility found in specific allocation decisions. Certain salient issues include the need to balance ethical concerns with economic realities, the need to allocate scarce health resources, the call for heightened accountability, and the impact of various policies on vulnerable populations.

MACRO- vs. MICROALLOCATION

Are patients individuals or members of populations? Should health care be regulated as part of the public good? Given a set amount of resources—funding, personnel, equipment, and so forth—to dedicate to health care, a particular system must then

determine the allocation to different areas of health care. Preventive medicine, health care promotion, research, medical education, the physical establishment of new facilities, and technological advancement all compete for resources dealing with the treatment of injured and ill patients. This system-wide form of decision making, along with the initial allotment of resources, is usually considered macro-allocation. The macro level concerns the scope and design of basic health care institutions: the delivery and financing of personal medical services that comprise acute care, including the system of high-technology hospital and clinic, support staff, research institutions, and public health programs involved in prevention.

Macro decisions generally determine the kinds of health care services that exist in society, who will receive them and on what bases, who will deliver them, and the distribution of financial burdens. In contrast, the individual determination of eligibility for a given procedure or selection of patients for treatment is called microallocation. Allocation in general is inextricably linked with societal and individual perceptions of justice. A society that considers inequities in health to be unjust, as opposed to unfortunate, will allocate a proportionately greater amount of its resources to mitigate health differences. If a society deems it a pity but not unjust that some people enjoy better health care than others, it will not feel such a societal obligation to correct these differences.

THEORIES OF JUSTICE

Distributive justice establishes principles for the distribution of scarce resources in circumstances in which demand outstrips supply and rationing must occur. Needs are to be considered in terms of overall needs and the dignity of members of society. Aside from the biological and physiological elements, the social context of health and disease may influence a given problem and its severity. Individual prejudices and presuppositions may enlarge the nature and scope of the disease, creating a demand for health care that makes it even more difficult to distribute scarce resources for all members of society. Principles of fair distribution in society often supersede and become paramount to the concerns of the individual. Questions about who shall receive what share of society's scarce resources generate controversies about a national health policy, unequal distributions of

advantages to the disadvantaged, and rationing of health care.

Similar problems recur with regard to access to and distribution of health insurance, medical equipment, and artificial organs. The lack of insurance as well as the problem of underinsurance constitutes a huge economic barrier to health care access in the United States. Tom L. Beauchamp and James F. Childress have pointed out that the acquired immunodeficiency syndrome (AIDS) crisis has presented dramatic instances of the problems of insurability and underwriting practices, where insurers often appeal to actuarial fairness in defending their decisions, while neglecting social justice. Proposals to alleviate the unfairness to those below the poverty line have been based on charity, compassion, and benevolence toward the sick rather than on claims of justice. The ongoing debate over the entitlement to a minimum of health care involves not only government entitlement programs but also complex social, political, economic, and cultural beliefs.

Decisions concerning the allocation of funds will dictate the type of health care that can be provided for which problems. Numerous resources, supplies, and space in intensive care units have been allocated for specific patients or classes of patients. A life-threatening illness, of course, complicates this decision. In the United States, health care has often been allocated by one's ability to pay rather than other criteria; rationing has at times been based on ranking a list of services or one's age. There are several theories of justice with regard to health care, some of which overlap, and others of which have different possible methods of distribution applicable to the overall concept. Three of the most general theories are the egalitarian, the libertarian, and the utilitarian.

EGALITARIAN THEORIES

Egalitarian theories of distributive justice advocate either the equal distribution of goods and resources to all people or the provision of equality of opportunity in obtaining care. Equal distribution has the major drawback of ignoring differences in health needs in a given population. For example, treatments appropriate to reasonably healthy individuals would certainly not be appropriate for people with diabetes or epilepsy, much less kidney disease or cancer.

Equality of opportunity emphasizes distribution of resources in accordance with what each individual

person needs in order to function at a “normal” level. “Normal” in this sense is usually taken to mean that level that is species-typical. The assumption made is that no one should be denied medical treatment on the basis of undeserved disadvantaging properties such as social class, ability to pay, or ill health. The questions of what constitutes need and what constitutes an undeserved disadvantage, however, make the application of this theory very complicated. For example, does a person with a disfiguring feature, such as a birthmark or scar, need to have plastic surgery in order to enjoy the same social benefits as others?

Problems also arise when a particular system does not have enough resources to provide for all. At what level is it necessary to provide these resources? The range goes from the treatment of common diseases and injuries to the provision (at least theoretically) of heart and liver transplants to anyone who shows a need.

LIBERTARIAN AND UTILITARIAN THEORIES

Libertarian theories of justice, when applied to health care, challenge the concept of health care as a right. If something is a right, society has an obligation to provide it to all people. Libertarians contend that justice results from allowing a society to participate in voluntary exchanges to obtain what they need; in other words, a free-market economy. A person is entitled to health care in proportion to his or her ability to exchange that which has been rightfully acquired. Any redistribution of resources, such as taxing the wealthy to fund health care for the poor, is inherently unjust, because it denies the wealthy the right to use that which they fairly gained. These theories tend to ignore the fact that extreme wealth can give the rich the power to deny the poor the ability to exercise their rights freely.

Utilitarian theories focus on the principle of the greatest good for the greatest number. If x dollars could provide food for fifty starving people or open-heart surgery for one, that money should be devoted to food. Utilitarians think that the government is responsible for enacting laws that promote the general public’s happiness and that the legislature is responsible for inducing people to act in socially desirable ways through a system of incentives and disincentives. They feel that the law should focus on equality of opportunity for all people and that property rights should be protected because the security of property

is crucial to attaining happiness. The problem with utilitarian systems in general is that they tend to lose sight of the individual in favor of the entire population as a whole.

TWO-TIERED SYSTEMS

Many modern health systems are the results of a two-tiered philosophy. On the first level, a minimum of health care is provided to every person in a society, without regard to wealth or class. On the second level, goods are obtained on the basis of individual decisions and ability to pay. This is usually considered a fair compromise in the United States’ health care system. Debate will always exist regarding where the tiers separate, and what decent minimum should be provided for all. There is a lack of consensus on principles for allocating resources.

Hebrew Bible

IDENTIFICATION: Foundational scripture for Judaism and the basis for the Christian Old Testament

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The ethics of the Hebrew Bible are bound up in the sacred story of the ancient Israelites, in which divine implications are at the heart of social actions. Ancient Israelis saw themselves as God's family, a metaphor that forms the basis for ethics in the three Abrahamic monotheisms, in which human beings are socially responsible as well as individually free. The primary ethics of ancient Israel are social justice and mercy, which are indivisible with the commandment to love God unconditionally.

In the religion of the Hebrew Bible, human beings are socially responsible and free to choose. In many religious traditions, the human drama is only part of the vast cosmos. In biblical religion, however, human history is the divine arena and human social action is the center of meaning. At the heart of the concept of monotheism is a god who is intimately related to the acts and feelings of human beings; thus human ethics comes to surpass the sacrificial model of worship. The Hebrew Bible, or Tanakh, is the foundational scripture for Judaism, which became the Old Testament for Christians, and which was also one of the major influences on the formation of the Qur'ān, the sacred text of Islam.

The three Abrahamic monotheisms—Judaism, Christianity, and Islam—ground their ethical assumptions and challenges in a familial relationship between the biblical god and his people. The biblical story is basically one of family, and from these family dynamics, the central characteristics of biblical ethics is formed.

The Hebrew Scriptures, treated devotionally as a single text, constitute a collection, or library, that extends over a millennium of events, ideas, and literary forms. Tanakh is an acronym for the three categories of books in the Bible: Torah, law; Nebiim, prophets; and Kesubim, writings. Each of these categories—law, prophets, and writings—exemplifies a key element of biblical ethics. They can be characterized in these ways: Ethics in Torah is embedded in the narratives of the patriarchs, in the covenantal relationship that ensures devotion to god and to fam-

ily. Ethics in the Prophets is also twofold: devotion to god and social responsibility as worship. Ethics in the writings, in particular the wisdom writings, is also grounded in devotion to god, but without the emphasis on expectations for god's intervention in history, or divine meaning in family or ethnic histories.

TORAH: THE ANCIENT STORIES

Torah is made up mostly of three cycles of stories: tales of the origins of Earth and people; founding tales of the patriarchs, Abraham, Isaac, and Jacob; and the story of the Exodus, the return of the people from slavery to the promised land of Israel. These cosmogonic tales—or myths of origin—generate the basis of biblical ethics, that worship is based in a covenant, or contract, of loyalty toward god and enacted in family or community. Throughout the stories runs a deep thread of human frailty and God's judgment and forgiveness. Some of the ancient stories, particularly in Genesis or Judges, would be difficult to comprehend ethically if they were not understood in the context of the uncompromising devotion to the god of Israel and human relationships as the echo of that devotion to the divine. Otherwise, stories such as the sacrifice of Jephthah's daughter (Judges 11), or even the testing of Abraham (Genesis 22), would make little sense to modern readers.

RITUAL AND ETHICAL LAW CODES

Attached to these sacred stories are law codes, such as the pre-monarchial (before the tenth century B.C.E.) Covenant Code (Exodus 20:22-23:33), perhaps the oldest set of biblical laws, in which appears the "eye for eye, tooth for tooth" sense of justice. It has many parallels to the Code of Hammurabi of the Babylonians. These are case laws (casuistic law), or specific legal questions with an if/then form:

When a man seduces a virgin who is not engaged to be married, and lies with her, he shall give the bride-price for her and make her his wife. But if her father refuses to give her to him, he shall pay an amount equal to the bride-price for virgins (Exodus 22:16-17).

Although women had some protections under Israelite law, the laws favored patriarchal values—women were subject to the authority, or even owner-

ship, of men. Nevertheless, the Covenant Code also reveals compassion for widows, orphans, servants, outsiders, and even beasts. The Deuteronomic Code (Deuteronomy 12-26) is perhaps the “Book of the Law” referred to as discovered in the temple during the reign of Josiah (622 B.C.E.), setting off a reform including centralized worship in Jerusalem. The Holiness Code in Leviticus (17-26) is a priestly concern that lists prohibitions on worship, on sex and daily life for individuals to keep the people of Israel pure, in order to set them apart from their neighbors, the Canaanites. Thus, their purity is bound up also in exclusivism.

TEN COMMANDMENTS (DECALOGUE)

The law codes collected in Torah are attributed traditionally to Moses, the deliverer of his people from Egypt. The Decalogue in particular is tied to a story of Moses ascending the Mountain of God and receiving two tablets of law written by the finger of God. According to the story, Moses descended the mountain only to find his people worshipping a golden calf. Enraged, he smashed the tablets, then ground the golden calf to powder, mixed it with water, and made the people drink it. He then ascended the mountain again, and God again prepared two tablets of law.

It is notable that the story emphasizes the violation of cultic regulations rather than social morality. These apodictic, or unconditional, laws of the Decalogue cover the two crucial aspects of ancient Israelite life: the way to worship God (religious obligations) and the way people should treat one another. Often the Decalogue is emblematic for universally accepted moral behavior; however, the religious obligations belong to a particular way of conceptualizing the divine, and the social obligations may have left room for ownership of human beings in their ancient forms. Modern traditions have shifted their ways of reading the laws or their understanding of the ancient laws. For example, the commandment against killing may have originally been a law forbidding murder of a member of one’s own community, but not forbidding the killing of outsiders, as in warfare. Not only is it difficult to determine what it may have meant historically, modern communities are divided about what the law means for moral behavior today.

THE PROPHETS

Ancient Israel conceived of ultimate reality as a family relationship, of God as father or husband, and the people as wayward sons or unfaithful wives. Around 750 B.C.E., Amos went to the northern kingdom of Israel to utter profound oracles spoken with the authority of Yahweh (God). Amos claimed that Yahweh had said, “I hate and despise your feast days,” meaning that cultic regulations were not sufficient for worship. Instead, he said, “Let justice roll down like waters, and righteousness like a mighty stream.”

Amos’s words became a touchstone for Martin Luther King, Jr., as he cited them in his “Letter from Birmingham Jail,” marking the Civil Rights movement. Thus, beginning with Amos, the writing prophets (Nebiiim), insisted that worshipping God was embedded in moral behavior toward one another. Some of the prophets, notably Hosea, were equally interested in cultic purity, the exclusive worship of Yahweh, uncontaminated by the symbols and practices of the gods of the neighbors—including some Israelites who practiced religion outside the parameters of pure Yahwism.

WISDOM LITERATURE AND STORIES

Two sorts of wisdom writings are represented in the biblical canon: conventional wisdom (such as found in Proverbs), which tends to be practical and answers questions about human behavior, and speculative wisdom (as found in Ecclesiastes), which raises questions about human meaning. The Book of Job is the masterpiece of speculative wisdom; it is an ethical departure from the major thrust of biblical moral principles, as wisdom in the Book of Job is not concerned with Israel’s history or God’s intervention in human affairs; rather, the wisdom writings of the sages is concerned with a search for the moral order of the natural world.

The concern with God’s justice, called theodicy, asks, why is there suffering? Beginning with a folk-tale form, God and Ha-satan (who is a servant of God in this book) hold a contest over Job’s unswerving loyalty to God. Everything is stripped from Job: his riches, his animals, his children (who are marks of his wealth, the blessings that had been heaped upon him), even his health. His friends make the case that Job must have caused the misfortune. However, Job was a blameless and upright man.

Job angrily accuses God, demanding an explanation. God answers out of the whirlwind, with startling, poetic grandeur. He does not justify his ways to humanity, but rather the God of Job is beyond human reason and justification. The poem places God as the maker of nature rather than the maker of social justice. It is likely that the conclusion to Job, in which he gets all his wealth restored and more, is a pious addition to a troubling wisdom writing suggesting the mysteries of God are beyond the realm of the social good.

Stories and rituals, which may seem on the surface to have little to do with ethics and morality, are the source and sustenance of a biblical worldview that posits a god who acts in history for the moral benefit of humans, and humans, whose historical activities have metaphysical meaning. Ethics arise from social order, ritual protections, and the deep stories (or myths) that illuminate those social and ritual activities. Sacred story in the age of the patriarchs is the basis of biblical ethics; social ethics in the age of the prophets is a means to worship.

Hedonism

DEFINITION: Philosophical belief that pleasure is the highest good

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Classical hedonism and its descendants are full-fledged philosophical systems that argue that the rational pursuit of pleasure as the greatest good is a positive moral virtue. Hedonism can also name the rejection of rationality and constraint and the unfettered license of desire. This latter practice is commonly thought of as either immoral or amoral.

From the Greek word *hīdonī*, meaning “pleasure,” hedonism is the ethical theory that maintains that pleasure is the highest good. The term is also sometimes used to refer to the psychological theory that all human behavior is motivated by the desire for pleasure or the avoidance of pain. This second view is properly designated “psychological hedonism” (a theory about the way things *are*) in order to distinguish it from ethical hedonism (a theory about the way things *ought* to be or about what things are good). The English philosopher Jeremy Bentham, in his *Introduction to the Principles of Morals and Legislation* (1789), espoused both of these views when he wrote, “Nature has placed mankind under the guidance of two sovereign masters, pain and pleasure. It is for them alone to point out what we ought to do, as well as to determine what we shall do.”

PSYCHOLOGICAL HEDONISM

Many ethical hedonists point to the purported fact of psychological hedonism in support of their ethical position, but is it a fact? Only if an adherent admits the possibility of a human action not being motivated by the desire for pleasure can psychological hedonism be a factual or empirical claim. Since the adherent cannot admit an exception because he or she equates motivation with desire for pleasure, however,

then the claim is not a factual one; it provides no information.

Philosophers opposed to hedonism have noted that persons who deliberately seek pleasure fail to find it, while, paradoxically, they find pleasure when they seek other things as their end and obtain those other things. This has been called the “hedonistic paradox.”

Further, if psychological hedonism is true and all human actions *are* motivated by a desire for pleasure, then the ethical hedonist’s admonition that people *ought* to seek pleasure is unnecessary.

Ethical hedonists also support their position in other ways. One of these is by claiming that hedonism is true by definition. Examples of this approach can be seen in John Locke, who defined “good” as that which “is apt to cause or increase pleasure,” and in Baruch Spinoza, who defined it as “every kind of pleasure.” John Stuart Mill has also been said to define “good” as the “desirable” and the “desirable” as what is desired, which happens to be pleasure.

This definitional approach is criticized by those who insist that there are things other than pleasure that are intrinsically good and some pleasurable things that are intrinsically bad. Further, G. E. Moore has argued that such attempts to define “good” commit the naturalistic fallacy; that is, they purport to define the indefinable, especially to define a moral entity in terms of a natural one.

THE ANCIENT GREEKS

Aristippus founded an early school of hedonism known as the Cyrenaics, so named for his birthplace, Cyrene. This Greek philosopher, a follower of Socrates, claimed that one’s way of life should be one of as much pleasure as possible, even if followed by pain, but that one should maintain control of the pleasures as opposed to being a slave to them.

The Greek philosopher Epicurus on the contrary, maintained that practical wisdom weighs pleasures against pains, choosing pleasures that are accompanied by the least pain and pains that are accompanied by the most pleasure. Mental pains were especially to be avoided. The Epicureans believed that the fear of death or fear of the gods could be dispelled by the study of atomistic philosophy.

MODERN ENGLISH PHILOSOPHERS

Bentham supported his quantitative hedonism (that is, one that claims that all pleasures are sensual

and hence comparable quantitatively) with a “hedonistic calculus.” The calculus allows the computation of specific values of pleasures in terms of their intensity, duration, certainty (how likely to be realized), propinquity (nearness or remoteness), fecundity (likelihood of being followed by more pleasures), purity (chance of *not* being followed by pain), and extent (number of persons affected by them). Bentham provided his students with a ditty to help them remember:

John Stuart Mill, Bentham’s young friend and protégé, rejected Bentham’s quantitative hedonism for a qualitative one, holding that pleasures differ in kind as well as quantity. “Human beings have faculties more elevated than the animal appetites, and when once made conscious of them, do not regard anything as happiness which does not include their gratification.” “Better to be a human being dissatisfied than a pig satisfied; better to be a Socrates dissatisfied than a fool satisfied. And if the fool, or the pig, are of a different opinion, it is because they only know their own side of the question. The other party to the comparison knows both sides.”

Mill, in his attempt to raise hedonism from the level of a “pig philosophy,” may have espoused a view that abandoned hedonism. If the amount of pleasure ceases to be definitive, and if the only judges qualified to make qualitative judgments must exercise “higher-than-pig” judgments, it seems that Mill is guilty of either circular reasoning (with respect to his choice of judges) or of introducing criteria other than pleasure as being intrinsically good (in his appeal to qualitative differences).

Hedonism has had a long and continuing history in varied forms. As long as philosophers and others ask questions about what is intrinsically valuable or good, hedonism will no doubt remain a popular answer.

Hegel, Georg Wilhelm Friedrich

IDENTIFICATION: German philosopher
BORN: August 27, 1770, Stuttgart, Württemberg (now in Germany)
DIED: November 14, 1831, Berlin, Prussia (now in Germany)
TYPE OF ETHICS: Politico-economic ethics
SIGNIFICANCE: The author of *The Phenomenology of Spirit* (*Die Phänomenologie des Geistes*, 1807) and *The Philosophy of Right* (*Grundlinien der Philosophie des Rechts*, 1821), Hegel was one of the most influential philosophers of the nineteenth century. He put forward an idealist teleological model of history in which all of reality was coming to know and understand itself, and history would eventually end in a world of absolute knowledge, perfect justice, and total social harmony.

Georg Wilhelm Friedrich Hegel's central ethical beliefs include a moral requirement of each person to recognize fully each other person's unique dignity and contribution to the social totality, and the insight that freedom is a property of societies rather than individuals, so that until everyone is free, no one is

truly free. The political and ethical dimensions of his philosophy grow out of his understanding of mind and dialectic.

In Hegel's philosophy, mind (*Geist* in the original German) is defined as "absolute consciousness." "Absolute," in this usage, means "absolved" of relations to objects outside consciousness. As absolute consciousness, mind is consciousness of consciousness itself. The opposite concept, "relative consciousness," is so called because it relates to objects outside itself.

LOGIC AND DIALECTIC

Logic is traditionally understood to consist of unchanging rules that govern thought. Hegel's logic is different. He sees the rules of thought in terms of mind as absolute consciousness. Absolute consciousness, as Hegel understands it, is a process in which mind continuously realizes itself, moving from potential to actual self-knowledge. The laws of thinking that concern Hegel are the steps in this process. The resulting "logic in motion" is called dialectic. It proceeds in a three-step pattern that repeats itself, in spiral form, on ever-higher levels of consciousness.

Hegel's philosophy is known for its difficulty, but anyone who has entered a hall of mirrors can retrace the basic steps of Hegelian dialectic:

Step 1: I become conscious of some object outside my consciousness, for example a stone.

Step 2: I become conscious of my consciousness of the stone.

Step 3: I become conscious of self-consciousness in my consciousness of my consciousness of the stone.

Step 1 (repeated at higher level): The consciousness of self-consciousness just realized becomes the new object of my consciousness. What was consciousness is now distanced from it, no longer consciousness in immediacy, but its object.

Step 2 (repeated at higher level): I become conscious of my consciousness of this new object.

Step 3 (repeated at higher level): I become conscious of self-consciousness in my consciousness—and so on.

The self-consciousness that keeps appearing in this spiral of self-reflection is occasioned by an object outside consciousness (the stone) but is not dependent on it as a specific object. Any other object would do as well. This self-consciousness is also oc-

caused by an individual “I” but is not dependent on any specific person. Anyone will do. Consider the hall of mirrors. Each individual sees his or her own image reflected, but the pattern of reflection, determined by the mirrors and the unchanging laws of optics, remains the same no matter who is reflected. Consciousness of consciousness always has the same form and content, regardless of which specific individual happens to be “reflecting.”

The pure self-consciousness that appears in this spiraling reflection is the phenomenon Hegel refers to when he speaks of mind. The highest level of consciousness occurs when the individual becomes conscious of the universal aspect of this pure self-consciousness, recognizes it as mind, and realizes that this recognition is not so much an individual recognizing mind as it is mind recognizing itself. The individual is an instrument used by mind to come to itself.

The spiraling steps of Hegelian dialectic have names. The first is called “thesis,” the second “antithesis,” and the third “synthesis.” The movement continues as the synthesis becomes the thesis of the next dialectical round.

Thesis and antithesis oppose but do not destroy each other. The synthesis conserves their opposition at a higher level of awareness, in which the condition that held thesis and antithesis together in opposition is discovered to be their underlying unity.

This can be illustrated by reconsidering the stone used above as an example of an object “outside consciousness.” This object is not left behind in the dialectical steps that follow, but is taken along. What changes is the perception of its nature. At a higher level—from the point of view of absolute consciousness—it is seen that the stone did not enter consciousness through the individual’s sense perception, but was in the consciousness from the beginning. What really happened—again, from the Hegelian position of absolute consciousness—is that mind concealed or negated itself with respect to the stone so that the individual consciousness could discover it as an object outside its own consciousness, thus occasioning the dialectical process of progressively greater self-consciousness, in which mind comes to itself.

Ultimately, for Hegel, nothing is truly outside absolute consciousness: All that is, is mind. This is the fundamental tenet of German idealism.

PHILOSOPHY OF HISTORY AND POLITICAL PHILOSOPHY

The dialectical process in which mind realizes itself as absolute consciousness is, for Hegel, not an abstract principle. It is the meaning of history. Hegel’s concept of history is Eurocentric. He believed that history realized itself more perfectly in Europe than elsewhere. Western history begins, Hegel taught, with the Judaic teaching of monotheism, the first awakening of mind to its own oneness. The rest of Western history is interpreted as a process in which mind achieves progressively higher levels of self-awareness, finally approaching full development in Germanic civilization, Hegel believed, the first to completely exclude slavery and conceive of universal freedom.

The bloody French Revolution and slavery in the United States convinced Hegel that democracy would not lead to freedom. History, as the increasing self-realization of mind, must lead to ever-increasing freedom—not for individuals to pursue happiness, but for the state to institute laws integrating culture, religion, and politics into a rational, harmoniously functioning national unity.

Hegel’s philosophy influenced conservative and revolutionary political theory. Hegel used it to justify the Prussian State (a centralized monarchy, enlightened, perhaps, in comparison to others, but an authoritarian regime with police-state tactics all the same). His philosophy also, however, provided the background for the theory of socialistic democracy developed by Karl Marx.

Heidegger, Martin

IDENTIFICATION: German philosopher

BORN: September 26, 1889, Messkirch, Germany

DIED: May 26, 1976, Messkirch, West Germany

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Heidegger's philosophy, espoused in his *Being and Time* (*Sein und Zeit*, 1927), subsumed the discipline of ethics wholly within the discipline of ontology, or the study of being.

Martin Heidegger studied at the University of Freiburg under Edmund Husserl, whom he succeeded as professor of philosophy in 1928. For Heidegger, the basic questions of ethics, such as "What is good?" and "What is it that one ought to do?" are subsumed in the prior ontological question "What is?" Heidegger found, however, that the traditional formulation of the ontological question "What is being?" failed to explicitly thematize the dimension of *meaning*. The leading question in Heidegger's thought, as opposed to traditional ontology, became "What is the *meaning* of being?" The Greek words used by Plato and Aristotle that are commonly translated as "being" and "truth," had meanings, Heidegger showed,

that had been neglected by the tradition. The Greek words for being (*einai*, *ousia*) mean "presence"; the central word for truth (*aletheia*) means "discovered."

Discovering these early meanings for being and truth marked the beginning, not the end, of Heidegger's search for the meaning of being. Why was "presence" the first name for being in the Western tradition? Had not this tradition always taught that "presence" was a mode of time, and that being was essentially timeless, outside the real of history? Is time the original and necessary context for asking about the meaning of "being?" This final question was the question of *Being and Time*, Heidegger's first major publication.

Heroism

DEFINITION: Overcoming of significant danger or difficulty in order to help others or act for the common good

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Heroism as a label is reserved for actions of extraordinary virtue or nobility. It connotes moral admirability of the highest order.

Anxiety is a primary human emotion and is existential; that is, it is a basic, normal part of existence. Anxiety is a pervasive, unpleasant feeling of apprehension, menace, threat, or fear that is produced by a dangerous or difficult situation. Thus, heroism involves the consideration of the advantages and disadvantages of several alternative courses of action that may present a danger or threat to the self and that elicit anxiety and the subsequent choice of a course of action that confronts that danger and anxiety, that is indicated by practical reason, and that promotes the general well-being and common good.

HEROISM AND COURAGE

Courage is widely listed as a synonym for heroism. Courage is certainly a necessary component of

The Components of Heroism

- One particular act is performed rather than another.
- That act is perceived as risky or dangerous to the actor's well-being. To perceive no peril in what one does is not to act heroically. The peril may involve injury or death, economic loss, loss of prestige, ostracism, or censure. The act is likely to be accompanied by feelings of fear or anxiety. The danger involved in performing the act may be formidable enough that most people in the same situation would find it difficult to perform the act.
- The actor believes that performing the act is worth the risk that it entails.
- The decision to perform the act is reasoned and rational, rather than foolish or reckless. A person playing Russian roulette who backs down, afraid to pull the pistol's trigger, is acting wisely, not cowardly.
- The actor is not coerced into performing the act by threats of a punishment more feared than performing the act itself. A soldier who destroys an enemy tank after being ordered to do so or be summarily executed is not acting heroically.
- The act has a purpose or goal that is believed to be important and worthwhile. Heroism is a virtue that is exhibited through goal-directed behavior that benefits the general well-being and public good.

heroism; heroism could not exist without courage. Yet courage lacks a component that heroism possesses. Courage has been called a "self-regarding" virtue because it may primarily serve the purpose of the courageous individual. Heroism, in contrast, represents an "other-regarding" virtue because the welfare of others and the common good are the central considerations. Heroic acts are noble and virtuous in that they are necessarily intended to promote the general well-being of others or the common good. Because heroic individuals can be relied on when the

common good is threatened, heroism is a highly prized commodity.

One can exhibit acts of courage without being heroic, however, if the act does not positively affect the general well-being or the common good. A criminal who executes a daring bank robbery, may be courageous but certainly not heroic.

Cowardice is the opposite of heroism. The coward is beset by excessive fears that prevent him or her from acting on his or her practical reasoning in situations in which it would be reasonable to act. The coward therefore avoids actions that he or she might otherwise perform and is thus incapacitated.

HEROISM AND ETHICS

Heroism is an ethical act of the highest order. Through it, the actor affirms the essence of his or her being and serves humanity in the face of elements that conflict with this affirmation of the self. Since the beginning of the history of Western thought, heroism has been considered to be noble and virtuous. In Plato's *Republic*, it is the unreflective quest for that which is noble. Aristotle believed that heroism led a person to act for the sake of what was noble, which was the purpose of virtue. Heroism is to be praised because it allows one to achieve one's potential.

Thomas Aquinas continued this thought. He often refers to courage, but it would seem that what he says describes heroism rather than courage. For him, courage/heroism was a strong mind that was able to overcome whatever blocked the path to the highest good. Courage/heroism, along with wisdom, temperance, and justice, were the four cardinal virtues.

These themes carry through to modern times. A noteworthy example is F. Scott Peck's famous book *The Road Less Travelled* (1978). To Peck, life is difficult because it continually presents problems that demand confrontation and solution. This fact can make life a painful process, but this is also where life achieves meaning. Problems call forth and create the resources that allow people to solve them. By solving problems, people grow mentally and spiritually. In order to foster the growth of the human spirit, it is necessary to solve problems. When this process incorporates actions that serve the common good and general welfare, human mental and spiritual growth attain high levels.

Hindu ethics

DEFINITION: Ethical systems derived from the Hindu religion and Vedic texts

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Hindu ethics postulates that moral virtue is ultimately rewarded by liberation from a cycle of repeated reincarnations and the achievement of a paradise beyond the mundane world. It sees personal and spiritual well-being as fundamentally interdependent.

Hindu ethics is based on the premise that ethical life is the means to spiritual freedom. Hinduism has behind it a philosophy that is not only a religious doctrine but also a complex web of moral principles. It offers practical guidance, rites, prayers, festivals, and social structures, all aimed at securing social harmony and God realization (direct experience of God). Since God is the embodiment of truth and justice, right action is the means to experience God realization.

Hindu ethical philosophy has been evolving for four thousand years. Its sources are the Vedas, the

oldest known literature in the world. Hindu ethics differ from much of Western ethics in perceiving a direct link between social and spiritual life. Greek philosophy is a "pursuit of truth for its own sake," based on reason and the intellect, in which the wise, the lawmakers, direct people to create a moral society. Hindu ethics is primarily concerned with right action as a means to religious fulfillment.

VEDIC LITERATURE

The Vedas are hymns and rites that glorify the Vedic gods, who are representatives of the divine power of the Supreme God. They deal with personal issues, universal concerns, and theories of creation. Hinduism teaches that reading or listening to the Vedas enlivens the connection between the individual and the Creator. Vedic writings are fundamental to Hinduism.

The *R̥g Veda* and the *Atharva Veda*, the hymns of the Vedas, are quite specific about actions that can be seen as righteous and moral. Honesty, rectitude, friendship, charity, nonviolence (Ahiṃsā, a moral principle that attracted considerable attention when it was espoused by Mohandas K. Gandhi), truthfulness, modesty, celibacy, religious worship, and purity of heart are all listed as desirable and necessary virtues. The *R̥g Veda* also cites bad intentions, swearing, falsehood, gambling, egoism, cruelty, adultery, theft, and injury to life as sinful actions.

The *Bhagavadgītā*, a central text of Hinduism, gives very specific ethical advice. It consists of a dialogue between Lord Kṛṣṇa, an incarnation of one of the three major gods of Hinduism, and Arjuna, a noble warrior. Arjuna is unable to go into battle because his opponents are also his kinsmen. He appeals for help. Lord Kṛṣṇa states that the correctness of the action should be the primary consideration when doing something. He advises Arjuna always to act in accordance with dharma (ethical living). Furthermore, he says, if Arjuna could experience the divine, his actions would spontaneously reflect absolute wisdom and purity, and therefore all dilemmas would evaporate. In this instance, the right course of action is to fight.

There are numerous stories in Hindu literature about morality and how best to behave. Deities advise and guide. In the *Rāmāyana*, the hero, Rāmā, is the embodiment of dharma, teaching the values of obedience, respect, and duty. The later writings of the

Purāṇas, specific to Śiva and Viṣṇu, advocate worship and devotion as a means to liberation.

The Upaniṣads embrace the concept of God as an impersonal Supreme Being, *Brāhmin*. The verses state that divinity is everywhere, that the individual is indeed *Brāhmin* itself—"Ahum Brahmasmi" ("I am the totality"). The Upaniṣads reaffirm that *mokṣa* ("liberation") is the goal of life. To achieve liberation, it is necessary to follow a strict code of ethical and spiritual discipline. Austerity, chastity, silence, and solitude lead the soul forward, while self-restraint, self-sacrifice, and compassion free one from greed and anger.

SOCIAL LIFE

Hinduism asserts that, just as there is order in the universe, human life can be equally harmonious and orderly. Human society should express the divine

purpose. All people belong to social castes determined by character, natural inclinations, and function in society. These castes consist of *Brāhmins* (the wise), *Kṣatriyas* (warriors), *Vaiśyas* (merchants), and *Śūdras* (laborers). Within each caste, the individual can achieve perfection, and the whole system promotes spiritual progress.

Hindu thought divides life into four twenty-five-year stages, giving specific ethical advice for each. The first stage is for learning, the second is the time of the householder, the third is a time for meditation and study of the scriptures, and the final stage is one of renunciation of the outer life. This sequence should ultimately end in liberation, the goal of life. Members of a family should always follow their duty. Children should respect and obey their parents' wishes. Husbands and wives ought to be loving and respectful, advising their families and teaching moral values.

Many Hindu practices derive from the belief that *Brāhmin*, the divine, is all-pervading. If divinity is everywhere, then everything must be respected. Nature is not separate from humanity; therefore, animals are revered, particularly cows. Gandhi defended this as a “practical application of the belief of oneness, and therefore the sacredness of life.”

The importance given to spiritual life in India creates the interdependence between the mystical and the practical. Ethics is central to Hinduism, improving the present and ultimately freeing the individual from the cycle of birth and death. Hinduism, with all its complexity, has unity at the heart of its diversity. Its goals are to raise the quality of life, ensure spiritual awakening, and fulfill humanity’s destiny.

Hippocrates

IDENTIFICATION: Greek physician

BORN: c. 460 B.C.E., Greek island of Cos

DIED: c. 377 B.C.E., Larissa, Thessaly (now in Greece)

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Hippocrates is traditionally credited

with the authorship of a collection of about sixty treatises on medicine and medical ethics, including the Hippocratic oath. This body of writings both created a standard of professional etiquette for the physician and formed the basis of the Western tradition of medical ethics.

Although Hippocrates has traditionally enjoyed the reputation of being the father of Greek medicine, little is known about him. Only a few references to him by contemporary or near-contemporary authors exist. According to these references, he came from the island of Cos, off the southwestern coast of Asia Minor, and was a teacher of medicine. He was a member of the Asclepiads, a family or guild of physicians that traced its origins to the god of healing, Asclepius. For reasons that are not clear, Hippocrates came to be idealized after his death, and he became the subject of an extensive biographical tradition. Four short biographies exist, together with a collection of spurious epistles that are attributed to Hippocrates. They assert that Hippocrates learned medicine from his father, who was also a physician. He is supposed to have taught medicine in Cos (which later boasted a famous school of medicine) and to have traveled throughout Greece, dying at an advanced age at Larissa in Thessaly, in northern Greece. Many of the biographical details recorded in these later works must be regarded as legendary.

A large collection of about sixty medical treatises, the Hippocratic Corpus, came to be attributed to Hippocrates after his death. Most were written during the late fifth or fourth centuries B.C.E., but some were composed much later. The works are anonymous and are marked by differences in style. Even in antiquity it was recognized that not all of them were genuine, and attempts were made to determine which were written by Hippocrates. There is no reliable tradition that attests the authenticity of any of the treatises, and the internal evidence is inconclusive. Most modern scholars believe that none of them can be attributed with certainty to Hippocrates.

HIPPOCRATIC MEDICAL ETHICS

The ethical or deontological treatises of the Hippocratic Corpus (*The Physician*, *Precepts*, and *Decorum*, dates unknown) constitute the earliest writings on medical etiquette. They define the professional duties that should be expected of Greek physicians.

Most of these principles of etiquette are the product of common sense. They recognize that certain types of conduct are inherently detrimental to the practice of medicine. Physicians should behave in a manner that will add dignity to their profession. Thus, they should look healthy and not be overweight. They should be gentlemen, cheerful and serene in their dealings with patients, self-controlled, reserved, decisive, and neither silly nor harsh. They should not engage in sexual relations with patients or members of their households. They are to be sensitive to the fees they charge, should consider the patient's means, and should on occasion render free treatment.

The Hippocratic Oath

I will look upon him who shall have taught me this Art even as one of my parents.

I will share my substance with him, and I will supply his necessities, if he be in need.

I will regard his offspring even as my own brethren, and I will teach them this Art, if they would learn it, without fee or covenant.

I will impart this Art by precept, by lecture, and by every mode of teaching, not only to my own sons but to the sons of him who has taught me, and to disciples bound by covenant and oath, according to the Law of Medicine.

The regimen I adopt shall be for the benefit of my patients according to my ability and judgment, and not for their hurt or for any wrong.

I will give no deadly drug to any, though it be asked of me, nor will I counsel such, and especially I will not aid a woman to procure abortion.

Whatsoever house I enter, there will I go for the benefit of the sick, refraining from all wrongdoing or corruption, and especially from any act of seduction, of male or female, of bond or free.

Whatsoever things I see or hear concerning the life of men, in my attendance on the sick or even apart therefrom, which ought not to be noised abroad, I will keep silence thereon, counting such things to be as sacred secrets.

Many of these precepts are meant to preserve the reputation of the physician, which (in the absence of medical licensure) was his most important asset in building and maintaining a medical practice.

THE HIPPOCRATIC OATH

The best-known, though most puzzling, of the Hippocratic writings is the so-called Hippocratic oath. The oath is characterized by a religious tenor. It begins with an invocation of the healing gods Apollo and Asclepius and includes a pledge to guard one's life and art "in purity and holiness." It is divided into two parts: the covenant, which is a contract between the teacher and his pupil; and the precepts, which defines the duty of the physician to his patients. The oath prohibits, among other things, dispensing a deadly drug, performing an abortion, and practicing surgery (or at least lithotomy).

Several stipulations of the oath are not consonant with ethical standards prevalent elsewhere in the Hippocratic treatises, while some practices prohibited by the oath (induced abortion, euthanasia, and surgery) were routinely undertaken by Greek physicians. It is difficult, moreover, to find a context in which to place the oath. Although it was traditionally attributed (like the other Hippocratic treatises) to Hippocrates, it is anonymous. It has been dated as early as the sixth century B.C.E. and as late as the first century of the Christian era (when it is first mentioned). Most scholars assign it to the fifth or fourth century B.C.E., making it roughly contemporaneous with Hippocrates. It has been suggested that it was administered to students who were undertaking a medical apprenticeship, but there is no evidence that it ever had universal application in the Greek world. Greek and Roman physicians were not required to swear an oath or to accept and abide by a formal code of ethics. To be sure, ethical standards appear in the Hippocratic Corpus, but no one knows how widespread these standards were among medical practitioners in antiquity. The oath appealed to Christian physicians, however, who in late antiquity took over its precepts and infused them with new meaning. It was later adopted by Christian, Jewish, and Muslim physicians as a covenant by which physicians could govern their practices.

There have been a number of attempts to explain away the problem passages of the oath or to attribute it to an author whose views represented those of

a group that lay outside the mainstream of medical ethics as described in the Hippocratic Corpus. The most notable is the attempt by Ludwig Edelstein to demonstrate that the oath originated in the Pythagorean community. Parallels can be found outside Pythagoreanism for even the most esoteric injunctions of the oath, however, and its Pythagorean origin cannot be said to have been conclusively proved.

THE INFLUENCE OF HIPPOCRATIC ETHICS

The medical-ethical treatises of the Hippocratic Corpus have exercised great influence on the formulation and development of Western medical ethics. In establishing not only guidelines for the physician's deportment but also standards of professional obligation, they created both the basis of Greek medical ethics and an ideal of what the physician ought to be. Even in the rapidly changing field of bioethics, their influence continues to be felt to the present day.

Hiring practices

DEFINITION: Methods used by employers to hire new personnel

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The late twentieth century saw a significant increase in government oversight of hiring practices, pressure on employees by special interest groups, and greater efforts to develop fair hiring practices within private companies.

During the last two decades of the twentieth century, hiring processes of private American entities came under increasing supervision by the federal government and various special interest or pressure groups in society. In addition, the presence of human resource departments within companies and their role in the hiring process became more evident and influential in the workforce. All signs pointed to greater efforts by employers to bring ethics into their hiring practices.

However, the task of incorporating ethical processes into hiring is not easy for several reasons. One of the biggest obstacles to ethical hiring practices is the simple fact that different people are sometimes not in agreement as to what constitutes an ethical decision. However, the difficulties that employers face in their attempts to bring ethical behavior to the hiring process should not stop them from trying to bring it about. Companies may not succeed to the extent that they wish when it comes to bringing ethical choices in the hiring process, but even a small amount of success is better than no success at all.

In contemplating how to incorporate ethical behavior into the hiring process, several issues need to be kept in mind. First, it has to be a major goal for employers. This means that its presence has to be foremost in the minds of employers as something they desire to achieve. However, companies must also be honest and demonstrate integrity in the hiring process. This implies that they clearly indicate to future employees what their reasons are for choosing one candidate over others. Employers must also be aware of their need to conform to the law when making employment decisions. The federal government has made it clear that it intends to provide equal employment opportunities to its citizens, and it is important that there be compliance with all legal provisions relating to hiring practices.

Employers must also be careful not to be influenced in the hiring process by subjective reasons and avoid any projection of personal gain. Perhaps one of the best ways to answer the question of whether employers have been successful at incorporating ethical behavior into the hiring process is to ask what an outside committee reviewing the employer's actions might indicate about how it made its choice regarding an employment position.

Hiroshima and Nagasaki bombings

THE EVENTS: U.S. dropping of atom bombs on two Japanese cities during World War II

DATES: August 6 and 9, 1945

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: The ethics of choosing to use a weapon of mass destruction to attack the civilian residents of two densely populated cities have been debated ever since the close of World War II. The philosophical issue revolves around whether it was acceptable to kill tens of thousands of inno-

cents in order to prevent the deaths of hundreds of thousands or even millions more by bringing the war to a swift conclusion. A further practical issue concerns whether it is in fact true that use of the atom bomb ultimately saved so many lives.

The unleashing of atomic weapons on Hiroshima and Nagasaki profoundly shaped the nature of international relations in the post-World War II era. These bombs, so lethal and used only twice in history, have forced humankind to examine critically the nature of modern warfare, especially within the context of "just war theory."

The development of the atom bomb by the U.S. government during World War II is generally regarded as one of the greatest technological and engineering achievements of modern times. What was particularly noteworthy about the atom bomb was the sheer scale of its ability to kill and devastate. Drawing upon the insights and efforts of the most brilliant physicists, mathematicians, and chemists of the nineteenth and twentieth centuries, scientists and engineers were able to liberate the cataclysmic power of the atom, harnessed in a single bomb that had the destructive impact of almost twenty kilotons of conventional explosives.

ETHICAL CONTEXT

Using a weapon of such magnitude raised serious ethical issues, especially as they related to an idea that can be traced back to the ancient Greeks: just-war theory. Considered down through the centuries by such thinkers as Aristotle, Cicero, and Saint Augustine, just-war theory involves the essential notion that war, though intrinsically evil, can be justified morally if certain conditions exist. Although the theory consists of several components, particularly relevant to the bombing of Hiroshima and Nagasaki are the ideas of proportionality and discrimination.

Proportionality refers to the idea that a warring power should not use any means over and above what is necessary to achieve victory. By late July, 1945, according to most military historians, Japan's military situation was desperate. From March onward, Japan suffered almost daily bombings by American B-29 bombers armed with incendiary bombs. Such bombing runs resulted in almost 190,000 deaths from fires and asphyxiation in six major Japanese cities. In addition, the U.S. Navy was taking steps to implement a

full-scale blockade of Japan. After the war, the U.S. Strategic Bombing Survey maintained that such tactics would have eventuated in Japan's surrender by approximately November 1, 1945, without the use of atom bombs.

Those who advocate that the dropping of atom bombs was a proportional response in the war make two points. First, while the bomb that fell on Hiroshima immediately killed 78,000 people and the one that fell on Nagasaki killed 70,000 people, the use of the bombs prevented a large-scale land invasion of the Japanese mainland. While estimates vary, some speculate that total American and Japanese casualties would have approached one million because of the determination of the Japanese people. Hence, the atom bombings, while gruesome, actually prevented

more deaths in the immediate future. A second line of argument holds that given the conduct of the Japanese military during the war—for example, the surprise attack on the U.S. fleet at Pearl Harbor, the Bataan "Death March," and the brutal treatment of Allied prisoners-of-war—the dropping of the atom bombs was a morally justifiable and proportional action.

The concept of discrimination maintains that in the conduct of war, every effort should be made to prevent civilians from suffering the potentially brutal fate of soldiers. The force unleashed by an atom bomb is such that it devastates everything in its wake: combatants, noncombatants, military outposts, hospitals, crops, and so forth. It must be pointed out, however, that the distinction between civilians and

soldiers already had been blurred by more conventional weapons in use during the war. The fires ignited by incendiaries dropped from American planes over Hamburg and Dresden resulted in tens of thousands of civilian deaths. Moreover, Dresden was bombed although it was primarily a cultural center, not a significant military target. Similarly, toward the end of the war, German V-1 and V-2 rockets fell indiscriminately throughout England, resulting in thousands of civilian casualties.

Also apropos of discrimination, some military strategists argued that since many civilians were engaged in supporting a nation's capacity to wage war through their jobs as farmers, machinists, seamstresses, and technicians, the distinction between civilian and military no longer obtained. Indeed, British pilots were explicitly ordered to bomb working-class neighborhoods during their runs in order to reduce both the Nazi war effort and civilian morale. In the conduct of the war, "civilian" deaths increasingly became a regrettable, but accepted, component of modern warfare.

ETHICS OF SCIENCE

After the detonation of atom bombs, the avowed neutrality of science was questioned. For example, because something is theoretically and practically possible (nuclear fission), especially something so powerful as atomic energy, must it be developed? If scientists develop something novel, can they guarantee control of its use? After witnessing the awesome energy released in the first explosion of a nuclear device in New Mexico in July, 1945, some of the scientists working on the bomb's development argued that Japanese officials should be privy to a demonstration of the bomb's power rather than experiencing an actual bombing. Their views were summarily dismissed by the military as impractical.

A final aspect of the ethics of the atom bombing of Hiroshima and Nagasaki concerns utilitarian logic. This model of decision making argues that people must rationally calculate the perceived costs and benefits of pursuing certain actions. From this perspective, the investment of more than \$1 billion and four years of intense work by tens of thousands of workers and scientists (the bomb's costs) almost guaranteed that the bomb would be used once it was developed (its perceived benefit, shortening the war). No one could have perceived, however, the immense eco-

nomie, political, and social costs associated with the Cold War after "The Bomb," and people still debate whether the decision to drop atom bombs on Hiroshima and Nagasaki was a benefit at all.

Hitler, Adolf

- IDENTIFICATION: German political leader
 BORN: April 20, 1889, Braunau am Inn, Austro-Hungarian Empire (now in Austria)
 DIED: April 30, 1945, Berlin, Germany
 TYPE OF ETHICS: Politico-economic ethics
 SIGNIFICANCE: Hitler initiated the Holocaust against European Jewry, perhaps the single most traumatic event in modern history. As a result, he has come to symbolize the ultimate evil for many, al-

though others think of him as insane rather than evil. Hitler was, moreover, an extremely charismatic figure in his heyday, and his theories of racial and national destiny combined to form a powerfully twisted ethic that continues to attract many people.

It does little good to insist that Adolf Hitler and his Nazi Party were without a system of ethics; to do so demonizes Hitler and perpetuates the unfortunate myth that the Nazi period may be explained by the German nation having temporarily lost its collective mind. The more difficult truth is that a great many German people identified a system of morality in the Nazi party that corresponded with their own.

Adolf Hitler's system of ethics was based upon the twin foundations of race and nationalism. His combination of these traditions in German political life was both of great help to him in his quest for

power and of inestimable force in the drive toward the Holocaust. Believing that might made right, Hitler promoted this ethic within his party—and later his state—with a ruthless zealotry.

ORIGINS

The variety of anti-Semitism that Hitler found in Vienna in the period of 1907 to 1913 was both populist and German nationalist—best described by the German word *volkisch*. Hitler was greatly influenced by the mayor of Vienna, Karl Lüger, who combined vehement anti-Semitism and the political strength to dominate Viennese politics to a degree that Hitler admired. In fact, Hitler, in an uncharacteristic display of humility, described Lüger in his book *Mein Kampf* as the last great German born in Austria.

Another great influence on Hitler's intellectual development in Vienna was the leader of the Pan-German movement, Georg von Schönerer. Schön-

Surrounded by the trappings of the Nazi Party, Adolf Hitler addresses a party meeting in 1938. (Library of Congress)

erer's movement appealed to Hitler on both a racial and a national level. Like Hitler, Schönerer believed that the unification of all German-speaking peoples was an imperative and blamed Germans of Jewish extraction for standing in the way of unification.

In German history, as well, there were many influences on Hitler's thought. Figures as diverse as Martin Luther, Frederick the Great, Houston Stewart Chamberlain, and, most famously, Richard Wagner contributed to Hitler's ideas of race and the destiny of the German people. Their ideas about authority, nationalism, race, and the romantic ideals of war, sacrifice, and destiny all influenced Hitler in ways that many historians have identified as seminal.

RACE

Essentially, Hitler believed that the German race could only succeed if it were "pure." *Mein Kampf* is filled with statements such as "the originally creative race died out from blood poisoning." Hitler blamed the Jews for the apparent dissipation of "pure German stock," particularly in Austria, where he first was introduced to anti-Semitism. Hitler's variety of anti-Semitism differed from that of Lüger and Schönerer, though, in that Hitler insisted that religion had nothing to do with it; race, not religion, was what made Jews different and dangerous in Hitler's mind.

The implications of this idea are grim. If Jews are considered dangerous because of their religion, they can at least convert. This is what happened in a great many cases previous to Hitler. If, as Hitler thought, Jews are dangerous because of their race, there can be no conversion. Extermination is the logical answer in Hitler's convoluted and hateful system of thought. Because he believed that the "parasite" of European Jewry was threatening the strength and virtue (Hitler employed a great deal of sexual imagery in his discussions on this subject) of the German nation, Hitler thought it justifiable to "eradicate the parasite."

NATIONALISM

The second foundation for Hitler's system of thought was nationalism. Considering himself a student of history, Hitler was influenced by a kind of skewed Hegelianism, identifying cycles of world leadership and seeing a sort of dialectical pattern of struggle and destiny in assuming that leadership. Further influenced by the Franco-Prussian War (1870-1871) and the unification of Germany (1871),

and filled with a patriotism that only an envious noncitizen can muster (Hitler was not a German citizen), Hitler came to the conclusion that it was Germany's turn to act as leader of the world. There was no room in the world for Jews, intellectuals, socialists, or liberals.

Much of the intolerance contained in Hitler's nationalism can be traced to the traditions of German Romanticism. The romantic imagery found in Hitler's anti-Semitism was also present in his thought on questions of nationalism (race and nationalism were inexorably tied in his mind). Shunning Christianity as "a religion for cowards," he saw Germany's true heritage in the pagan spectacle of the operas of Richard Wagner. The antirationalism of the Romantic period, as filtered through the German experience, served to create a religion of nationality and race in Hitler's mind, with himself as messiah (Hitler spoke at length about Providence's intentions for him), that was as compelling to the true believer as any other religion could be.

ZEALOTRY

Hitler's religion of blood and nation was compelling to many Germans in large part because of the power it promised. The hate that Hitler felt, his dreams of dominion, could not be fulfilled without both power and an ethic that sanctioned the use of power in ways that most people would describe as morally reprehensible. Hitler worshipped power, and his system of thought relied on it heavily. On reading *Mein Kampf*, one cannot help but be struck by the number of times Hitler wrote the equivalent of "might makes right." Hitler admired the Marxists' tactics of violence and intimidation, preferring to use converted communists as street fighters because they shared his zealotry. His greatest scorn for the liberal parties of his day concentrated on "the weakness of will inherent in parliamentary government."

IMPLICATIONS

Hitler and his millions of followers believed that his vision allowed, even compelled, them to shun questions of everyday ethics. His vision established a new system of ethics defined by race and the nation, utterly devoid of moral restraint. The outcome of this system of thought was, inevitably, the Holocaust.

Hobbes, Thomas

IDENTIFICATION: English political philosopher

BORN: April 5, 1588, Westport, Wiltshire, England

DIED: December 4, 1679, Hardwick Hall,

Derbyshire, England

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: Hobbes was the most prominent seventeenth century English advocate of political absolutism. Author of *De Cive* (1642), *Leviathan: Or, The Matter, Form, and Power of a Commonwealth* (1651), and *De Homine* (1658), he deduced his theories of morality, including his political ethics, from a mechanistic, materialist understanding of reality.

Thomas Hobbes was a proponent of natural rights and monarchical absolutism, although he was dis-

trusted by both Cromwellian republicans and supporters of the Stuart monarchy. As a student at Magdalen College, Oxford University, Hobbes rejected the ethics and methodological perspectives of Aristotelianism, medieval Scholasticism, and Christian philosophy. The moral political philosophy expressed in Hobbes's works was grounded in the methodology of mathematical argumentation, empirical science, and secularism. Hobbes's mechanistic and materialist explanation of existence, including political ethics, was sharply criticized by seventeenth century ecclesiastical leaders for having suggested an agnostic or atheistic metaphysical foundation.

In Hobbes's political philosophical works, moral behavior was scientifically explained and logically reduced to corporal matter in motion. Moral judgments were made in reference to two types of human movements or endeavors: appetites, or motions toward material objects perceived to be desirable; and aversions, or motions away from material objects perceived to be harmful. Hobbes's pessimistic interpretation of human nature, in conjunction with his "resolutive compositive" method, reduced political morality to an individual's most basic fears and passions (for example, fear of violent death and the desire for possessions). In contrast to classical Greek and medieval Christian moral political philosophy, in Hobbes's thought, reason was not the faculty that guided and constrained the passions. Knowledge (or "scientific reason") and power were the prescribed means to fulfill each individual's subjective desires.

Hobbes considered ethics to be an essential field of philosophy and natural rights as the critical subject of ethics. Hobbes's political philosophical works, particularly *Leviathan*, conveyed a moral theory that was focused on the natural right of self-preservation and governmental legitimacy linked to the protection of human life. Although all people were in agreement about the critical value of self-preservation, Hobbes's ethical relativism or nominalism articulated the position that there were no universal objective or absolute moral, political, or spiritual truths. Individuals named or evaluated the moral worth of particular acts based upon the consequences of such acts to their self-interests. *Leviathan* expressed the political theory that sovereign political authority and governmental legitimacy were based on a social contract (government by "institution") or superior physical coercion

(government by “acquisition”). The prescribed commonwealth was conceived as the highly centralized rule of an absolute sovereign—preferably, an absolute monarch.

Holistic medicine

DEFINITION: Approach to medicine that treats the whole person as a unity rather than isolating, attending to, or diagnosing only parts of the whole

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Holistic approaches to medicine usually emphasize noninvasive procedures, patient education, and nontraditional or non-Western practices such as acupuncture, homeopathy, and yoga. Advocates of such an approach see it as ethically admirable, because it humanizes the patient, whereas they believe mainstream medicine often treats patients as mechanical systems or objects.

Holistic health practitioners regard patients as whole persons, teaching health maintenance, offering a wide choice of cures, and freely sharing expert knowledge. Holistic practitioners accept as valid knowledge from prescientific ages, as well as psychological and spiritual knowledge that is accessible to everyone. Therefore, for the holistic practitioner, the best possible health care makes use of ancient as well as modern healing arts from a variety of cultures. It treats people as psychological and spiritual beings as well as bodies and educates them in the care of their own psychological and physical health. Therefore, holistic health maintenance and disease curing typically involve teaching the patient actively to change habits of nutrition, exercise, and self-reflection.

In contrast, mainstream medicine is based on the premise that physical science is the most authoritative field of knowledge, though it can only be understood by trained experts such as medical doctors. Therefore, the mainstream physician offers the best possible care by acting as an expert authority, dis-

persing diagnoses and treatments of bodily diseases with the help of new technologies that are the fruits of science.

Holocaust

THE EVENT: Systematic murder by the Nazi regime of six million Jews, as well as Gypsies, homosexual men, political and religious dissenters, the mentally ill, and others

DATE: 1933-1945

TYPE OF ETHICS: Human rights

SIGNIFICANCE: The Holocaust stands as an evil of incomprehensible, unimaginable scope and horror. Since it occurred, ethics has striven to comprehend how it could have happened and what meaning it holds for systematic formulations of morality.

Referring to their regime as the Third Reich, Adolf Hitler and his Nazi Party ruled Germany from 1933 to 1945. The Holocaust happened during those years. It was Nazi Germany’s planned total destruction of the Jewish people and the actual murder of nearly six million of them. That genocidal campaign—the most systematic, bureaucratic, and unrelenting the world has seen—also destroyed millions of non-Jewish civilians. They included Gypsies (Roma and Sinti), Slavs, Jehovah’s Witnesses, Freemasons, homosexuals, the mentally retarded, the physically handicapped, and the insane. The Nazis believed that their threat to the Third Reich approached, though it could never equal, the one posed by Jews.

In the German language, this unprecedented destruction process became known euphemistically as *die Endlösung*—the “final solution.” The Hebrew word *Shoah*, which means catastrophe, is also used to name it, but the term “Holocaust” most commonly signifies the event. That word has biblical roots. In the Septuagint, a Greek translation of the Hebrew Bible, the Hebrew word *olah* is translated as *holocauston*. In context, *olah* means that which is offered

Estimated Numbers of Jews Killed During the Holocaust

<i>Country</i>	<i>Jewish populations</i>

*Germany did not occupy the entire territories of these republics.

up. It refers to a sacrifice, often specifically to “an offering made by fire unto the Lord.” Such connotations make “Holocaust” a problematic term for the devastation it names. The word’s religious implications seem inappropriate, even repulsive, to many people, including many Jews. Still, Holocaust remains the term that is most widely used.

Nazi Germany’s system of concentration camps, ghettos, murder squadrons, and killing centers took more than twelve million defenseless human lives.

Between five and six million of them were Jewish, including approximately one million children under the age of fifteen. Although not every Nazi victim was Jewish, the Nazi intent was to rid Europe, if not the world, of Jews. Hitler went far in meeting that goal. Although Europe’s Jews resisted the onslaught as best they could, by the end of World War II, two-thirds of European Jews—and about one-third of Jews worldwide—were dead. The vast majority of the Jewish victims came from Eastern Europe. More

than half of them were from Poland; there, the German annihilation effort was 90 percent successful. At Auschwitz alone—located in Poland, it was the largest of the Nazi killing centers—more than one million Jews were gassed.

How did the Holocaust happen and why? Those questions are both historical and ethical. Their implications are huge. As Elie Wiesel, Jewish survivor of Auschwitz and winner of the 1986 Nobel Peace Prize, has rightly said of Birkenau, the major killing area at Auschwitz: “Traditional ideas and acquired values, philosophical systems and social theories—all must be revised in the shadow of Birkenau.”

HISTORY

Hitler became chancellor of Germany on January 30, 1933. He soon consolidated his power through tyranny and terror. Within six months, the Nazis stood as the only legal political power in Germany,

Hitler’s decrees were as good as law, basic civil rights had been suspended, and thousands of the Third Reich’s political opponents had been imprisoned.

Emphasizing the superiority of the German people, Nazi ideology was anti-Semitic and racist to the core. The Nazis affirmed that German racial purity must be maintained. Building on precedents long-established by Christianity’s animosity toward Jews, the Nazis went further and vilified Jews as the most dangerous threat to that goal. Here it is important to underscore that Jews are not, in fact, a race but a people unified by memory and history, culture, tradition, and religious observances that are widely shared. Any person of any race can become Jewish through religious conversion. Nevertheless, Nazi ideology defined Jewish identity in biological and racial terms.

German law established detailed conditions to define full and part-Jews. To cite three examples, if one had three Jewish grandparents, that condition was

Starved concentration camp prisoners who died while being moved by train from one camp to another in 1945. (National Archives)

Death Camps in Nazi-Occupied Territories During the Holocaust

sufficient to make one fully Jewish. If one had only two Jewish grandparents and neither practiced Judaism nor had a Jewish spouse, however, then one was a *Mischlinge* (mongrel) first-class. A person with only a single Jewish grandparent would be a *Mischlinge* second-class. The identity of one's grandparents was

determined, paradoxically, not by blood but by their membership in the Jewish religious community. Once these Nazi classifications were in effect, the identity they conferred was irreversible.

Defining Jewish identity was crucial for identifying the population targeted by the Nazis' anti-Semitic policies. Those policies focused first on segregating Jews, making their lives intolerable, and forcing them to leave Germany. Between 1933 and the outbreak of World War II in September, 1939, hundreds of decrees, such as the Nuremberg Laws of September, 1935, deprived the Third Reich's Jews of basic civil rights. When Jews tried to emigrate from German territory, however, they found few havens. In general, doors around the world, including those in the United States, were opened reluctantly, if at all, for Jewish refugees from Hitler's Germany.

World War II began with Germany's invasion of Poland on September 1, 1939. With the notable exception of its failure to subdue England by air power, the German war machine had things its own way until it experienced reversals at El Alamein and Stalingrad in 1942. By the end of that year, 4 million Jews had already been murdered.

As Hitler's forces had advanced on all fronts, huge numbers of Jews, far exceeding the 600,000 who lived in Germany when Hitler took control, came under Nazi domination. For a year after the war began, Nazi planning had still aimed to enforce massive Jewish resettlement, but there were no satisfactory ways to fulfill that intention. Other tactics had to be found. The Holocaust did not result from a detailed master plan that timed and controlled every move in advance. When one step reached an impasse, however, the next was always more drastic, because the Nazis did not deviate from their basic commitment: Somehow the Jews had to be eliminated.

In the spring of 1941, as plans were laid for the invasion of the Soviet Union, Hitler decided that special mobile killing units—*Einsatzgruppen*—would follow the German army, round up Jews, and kill them. In the fateful months that followed, a second prong of attack in Germany's war against the Jews

became operational as well. Instead of moving killers toward their victims, it would bring victims to their killers.

Utilizing a former Austrian military barracks near the Polish town of Oświęcim, the Germans made their concentration camp of Auschwitz operational in June, 1940, when 728 Polish prisoners were transferred there. By the summer of 1941, the original camp (Auschwitz I) had been supplemented by a much larger camp at nearby Birkenau (Auschwitz II). Within the next year—along with five other sites in occupied Poland (Chelmno, Belzec, Sobibor, Treblinka, and Majdanek)—Auschwitz-Birkenau became a full-fledged killing center. Auschwitz “improved” killing by employing fast-working hydrogen cyanide gas, which suppliers offered in the form of a deodorized pesticide known as Zyklon B. Efficiency at Auschwitz-Birkenau was further improved in 1943 when new crematoria became available for corpse disposal. Optimum “production” in this death factory meant that thousands of Jews could be killed per day. When *Schutzstaffel* (SS) leader Heinrich Himmler ordered an end to the systematic killing at Auschwitz in late 1944, his reasoning was not based entirely on the fact that Soviet troops were nearby. For all practical purposes, he could argue, the “final solution” had eliminated Europe’s “Jewish problem.”

With Hitler’s suicide on April 30, 1945, and the subsequent surrender of Germany on May 7, a chapter ended, but the history and the legacy of the “final solution” continue. Everyone who lives after Auschwitz is affected by the Holocaust. Everyone, moreover, ought to be affected particularly by the ethical problems and moral challenges left in its wake.

ETHICAL PROBLEMS AND MORAL CHALLENGES

Ethics clarifies what people should and should not do. It explores differences between what is right, just, and good and what is wrong, unjust, and evil. What Nazi Germany did to the European Jews clearly belongs in the latter categories. Thus, the most crucial moral problem posed by the Holocaust is that no moral, social, religious, or political constraints were sufficient to stop Nazi Germany from unleashing the “final solution.” Only when military force crushed the Third Reich did the genocide end.

David Rousset, a French writer who endured German concentration camps, understated the case, but he was surely correct when he said simply, “The exist-

tence of the camps is a warning.” Two aspects of that warning are especially challenging.

First, the Holocaust warns about the depth of racism’s evil. It shows that racism’s destructive “logic” ultimately entails genocide. If one takes seriously the idea that one race endangers the well-being of another, the only way to remove that menace completely is to do away, once and for all, with everyone and everything that embodies it. If most forms of racism shy away from such extreme measures, Nazi Germany’s anti-Semitism did not. The Nazis saw what they took to be a practical problem: the need to eliminate “racially inferior” people. Then they moved to solve it.

Consequently, the Holocaust did not result from unplanned, random violence. It was instead a state-sponsored program of population elimination made possible by modern technology and political organization. As Nazi Germany became a genocidal state, its anti-Semitic racism required a destruction process that needed and got the cooperation of every sector of German society. The killers and those who aided and abetted them directly—or indirectly as bystanders—were civilized people from a society that was scientifically advanced, technologically competent, culturally sophisticated, and efficiently organized. These people were, as Holocaust scholar Michael Berenbaum has noted, “both ordinary and extraordinary, a cross section of the men and women of Germany, its allies, and their collaborators as well as the best and the brightest.”

Teachers and writers helped to till the soil in which Hitler’s virulent anti-Semitism took root; their students and readers reaped the wasteful harvest. Lawyers drafted and judges enforced the laws that isolated Jews and set them up for the kill. Government and church personnel provided birth records to document who was Jewish and who was not. Other workers entered such information into state-of-the-art data processing machines. University administrators curtailed admissions for Jewish students and dismissed Jewish faculty members. Bureaucrats in the Finance Ministry confiscated Jewish wealth and property. Postal officials delivered mail about definition, expropriation, denaturalization, and deportation.

Driven by their biomedical visions, physicians were among the first to experiment with the gassing of *lebensunwertes Leben* (lives unworthy of life).

Scientists performed research and tested their racial theories on those branded subhuman or nonhuman by German science. Business executives found that Nazi concentration camps could provide cheap labor; they worked people to death, turning the Nazi motto, *Arbeit macht frei* (work makes one free), into a mocking truth. Stockholders made profits from firms that supplied Zyklon B to gas people and from companies that built crematoria to burn the corpses. Radio performers were joined by artists such as the gifted film director Leni Riefenstahl to broadcast and screen the polished propaganda that made Hitler's policies persuasive to so many. Engineers drove the trains that transported Jews to death, while other officials took charge of the billing arrangements for this service. Factory workers modified trucks so that they became deadly gas vans; city policemen became members of squadrons that made the murder of Jews their specialty. As the list went on and on, so did the racially motivated destruction of the European Jews.

HANS MAIER

Short of Germany's military defeat by the Allies, no other constraints—moral, social, religious, or political—were sufficient to stop the “final solution.” Accordingly, a second Holocaust warning is the challenge that no one should take human rights for granted. To make that warning more personal, consider Hans Maier. Born on October 31, 1912, the only child of a Catholic mother and Jewish father, he considered himself an Austrian, not least because his father's family had lived in Austria since the seventeenth century. Hans Maier, however, lived in the twentieth century, and so it was that in the autumn of 1935 he studied a newspaper in a Viennese coffeehouse. The Nuremberg Laws had just been passed in Nazi Germany. Maier's reading made him see that, even if he did not think of himself as Jewish, the Nazis' definitions meant that in their view he was Jewish. By identifying him as a Jew, Maier would write later on, Nazi power made him “a dead man on leave, someone to be murdered, who only by chance was not yet where he properly belonged.”

When Nazi Germany occupied Austria in March, 1938, Maier drew his conclusions. He fled his native land for Belgium and joined the Resistance after Belgium was swept into the Third Reich in 1940. Arrested by Nazi police in 1943, Maier was sent to

Auschwitz and then to Bergen-Belsen, where he was liberated in 1945. Eventually taking the name Jean Améry, by which he is remembered, this philosopher waited twenty years before breaking his silence about the Holocaust. When Améry did decide to write, the result was a series of remarkable essays about his experience. In English, they appear in a volume entitled *At the Mind's Limits: Contemplations by a Survivor on Auschwitz and Its Realities*. “Every morning when I get up,” he tells his reader, “I can read the Auschwitz number on my forearm. . . . Every day anew I lose my trust in the world. . . . Declarations of human rights, democratic constitutions, the free world and the free press, nothing,” he went on to say, “can lull me into the slumber of security from which I awoke in 1935.”

In *The Cunning of History: The Holocaust and the American Future* (1987), Richard L. Rubenstein echoes Améry's understanding. “Does not the Holocaust demonstrate,” he suggests, “that there are absolutely no limits to the degradation and assault the managers and technicians of violence can inflict upon men and women who lack the power of effective resistance?” Rubenstein's outlook may be debatable, but he believes that “the dreadful history of Europe's Jews had demonstrated that *rights do not belong to men by nature*.” If Rubenstein is correct, then, practically speaking, people can expect to enjoy basic rights such as those proclaimed by the Declaration of Independence—life, liberty, and the pursuit of happiness—only within a political community that honors and defends those rights successfully.

Holy war

DEFINITION: Presence, in a situation of war, of a "sanctifying" principle that transfers religious righteousness to the acts of participants in violence

DATE: Concept developed during the medieval era

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Going beyond the broader secular ethical question of justifying "morally just" wars fought to defeat evil and injustice, the concept of holy war relies on God as the highest authority justifying war against a religious enemy.

Wars involving intense religious animosities have been fought in almost every period of recorded history. However, when it comes to the ethical implications of the concept of "holy war," important distinc-

tions must be made. Political wars involving enemies of different religions do not necessarily involve levels of institutionalization of individual “holy warriors” committed to religiously motivated warfare.

Although examples of holy war have occurred in other civilizations, the most commonly cited phenomena come from the experiences of Islam and Christianity. In both cases, one can find, according to the specific junctures of otherwise political warring actions, forms of religiously institutionalized “sanctification” bestowed on holy warriors. The ethical content of such institutionalization, however, varies between the two dominant prototypes.

MEDIEVAL CHRISTIANITY AND THE CRUSADES

Saint Augustine and other fathers of the early Christian church held that God stood behind certain wars, if their cause could be considered morally just and aimed at destroying evil. Defense of what can be seen as morally “right,” however, did not necessarily mean service to a higher religious cause. These earliest searches for a possible “ethical” justification for some wars, therefore, fell short in a number of ways of the technical phenomenon of holy war. They did not, for example, imply an acceptance of warring in the name of religious principles.

The Christian concept of “sanctification” of warfare in the name of religion dates from the eleventh century, when Pope Gregory VII, adding to the less specific suggestions of the ninth century pope Leo IV (in 853) and the eleventh century pope Leo IX (in 1053), assured Christians that death in war against a religious enemy freed the holy warrior from the consequences of his past sins. From the beginning in 1095 of the Christian Crusades to regain the Holy Land of Palestine from Islam, there was a linkage between the existing institution of knighthood and formal military orders whose fighting members were devoted to the Crusades as a spiritual calling. Historically, various orders—such as the Knights Templar and Knights Hospitaliers—would continue even after the formal period of Crusades to the Holy Land.

Holy Wars in History

POLITICAL-RELIGIOUS WARS APPROVED BY RELIGIOUS AUTHORITIES

- 1618-1648 Thirty Years’ War in Europe
- 1690 William II, Protestant king of Orange, defeats England’s Roman Catholic king James in Ireland
- 1880-1900 Mahdist Uprising in the Sudan
- 1947-1948 Muslim-Hindu strife in the wake of Indian and Pakistani independence

HOLY WARS SANCTIFIED BY RELIGIOUS AUTHORITIES

- 800-1000 Frankish Knights’ war to convert pagans east of former Roman imperial borders
- 1095-1099 First Crusade to the Holy Lands
- 1147-1149 Second Crusade
- 1189-1192 Third Crusade, following Saladin’s recapture of Jerusalem
- 1202-1204 Fourth Crusade
- 1208 Albigensian Crusade by Pope Innocent II against Christian heretics
- 1212 Children’s Crusade
- 1217-1221 Fifth Crusade (in Egypt)
- 1228-1229 Sixth Crusade (a truce makes possible partial Christian control in Jerusalem)
- 1248-1254 Seventh Crusade (Saint Louis—King Louis IX—travels to Egypt)
- 1270 Eighth Crusade (Saint Louis dies in Tunisia)
- 1271-1272 Ninth Crusade
- 1291 Fall of Acre, last Christian stronghold in the Holy Lands

Another aspect of Church “sanctification” of violence in the name of religion that did not disappear with the passing of a particular historical era was the holy war against Christian heretics proclaimed by the Third Lateran Council in the year 1179. Fighters in what was to be known as the Albigensian Crusade, launched by Pope Innocent III in 1208, would receive

the same papal indulgences that were granted to those who had served in the Crusades against the Muslims of the Near East.

HOLY WAR IN ISLAMIC LAW

The Islamic religion, in its “classical” theological origins, identifies two domains: the Dar al Islam (domain of Islam) and the Dar al Harb (domain of war). This is a concept that has often been interpreted as a necessarily continuous state of war between Islam and any representative of non-Islamic belief. Along with this general concept of the hostile separation of the world between Islamic believers and nonbelievers, a more specific term emerged that would be rife with presumptions of ethical obligations falling on individual Muslim believers: jihad. Jihad is not one of the five formal Pillars of the Faith, but an individual conscience-binding obligation on believers (*fard*).

Although it is not uncommon to see jihad translated as “holy war,” one comes closer to the ethical core of this concept through examination of Islamic legal discussions of the term. The first striking observation is that—in contrast to Christian equivalents to holy war—jihad is taken to be a society-wide ethical obligation. Its legal meaning—although clearly extending into the realm of physical struggle to extend the “borders” of the Dar al Islam—includes a sense of effort, in a variety of forms, to strengthen the bases of the Islamic faith. Indeed, the broadest possible legal and ethical sense of individual effort—*ijtihad*, deductive effort to reach balanced decisions—suggests not religious war per se but “individual application” to protect the essential principles of the faith.

This observation notwithstanding, there is considerable evidence suggesting that, at almost every stage of military conflict associated with Islamic expansionism, believers were exhorted to consider their physical struggle to be service in holy war. Although an oft-quoted speech attributed to the first caliph, Abū Bakr, during the early seventh century probably refers to the spirit of later ages, this meaning predominates: “If any people holds back from fighting the holy war for God, God strikes them with degradation.”

On the Islamic as well as the Christian side, it was during the period of the Crusades that an individual ethical dedication to holy war took on its most nota-

ble attributes. Much more modern, and even late-twentieth and early twenty-first century phenomena in both cultures, however, contain elements of dedication to holy war in varying degrees.

MODERN BLENDS OF POLITICAL AND RELIGIOUS ETHICS

The twentieth century saw many cases in which individual dedication to what is essentially a political cause brought about levels of religious ethical devotion that were close to what has been defined as holy war. Among Asian religions, for example, the concept of *kamikaze* (divine wind) pushed Japanese military pilots to undertake suicidal missions to serve the emperor-god in World War II.

Other manifestations of the “mixed” application of religious fervor and essentially political violence approach, but do not fully correspond to, holy war in the ethical sense of the term. Irish Roman Catholic underground forces opposing Protestant domination of Northern Ireland include—as do Protestant “fighting brotherhoods”—a form of spiritual bonding in their secret Irish Republican Army (IRA). Like members of Islamic radical organizations declaring “war” against the state of Israel or, increasingly, against the effects of what they consider to be corrupt secular governments in several Islamic countries, the Irish Catholics have aimed more at the establishment of alternative political regimes. Nevertheless, in some cases, the religious “sanctification” of such struggles (including Muslim-Hindu strife in parts of India beginning during the 1990’s) brings them close to the category of holy wars.

ESCALATING ISLAMIC INTERPRETATIONS OF HOLY WAR

Various circumstances emerged in the late twentieth century that gave rise to vigorous reinterpretations of the Islamic concept of Holy War. Deterioration of political and economic conditions in several Islamic countries spawned a variety of movements that began to use jihad as a rallying point against perceived enemies of Islam. Some of these movements aim at deposing what they see as corrupt secular governments in their own modern nation states. Others claim to defend the whole of the Islamic world against a general enemy represented by the presumed infidel Western world. Although the Islamic reform movement that overthrew the shah of Iran in 1979 in-

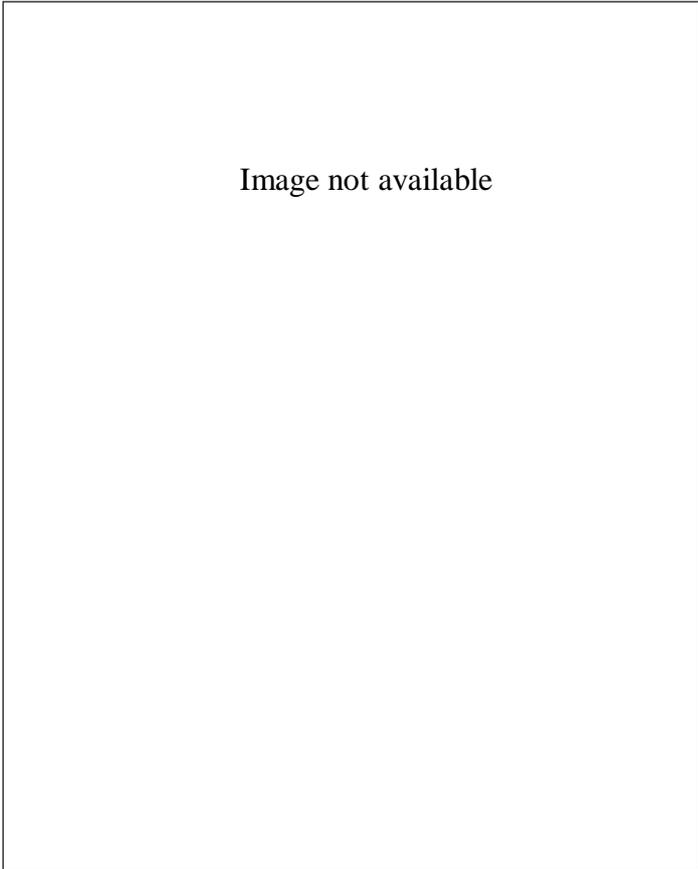

volved more than jihad as a motivating force, it did contain both of these (internal and external) elements.

When “normal” political channels for representing religiously based movements fail, rising militancy in reaction can lead to the adoption by Islamic warriors known as mujahiddeen of violent methods presumably justified by religion. This happened in Algeria in 1991, when elections that should have allowed an Islamic party to join the government were effectively canceled. Algeria’s subsequent experience of more than a decade of continuous violence—mainly in the form of terrorist attacks against both political targets and anonymous victims—tended to cloud distinctions between fanatical opposition politics and calls for holy war.

Another example of what one could call internally directed holy war grew out of political and economic grievances in Egypt during the 1970’s. When Egypt’s secular regime arrested thousands of demonstrators, organized militants under a number of names, including Islamic jihad, carried out the 1981 assassination of President Anwar Sadat. Both violent underground and overt activities involving religious discontent continued to mount over the ensuing decades. Some groups refer to continuation of the status quo in Egypt and elsewhere as reverting to the pre-Islamic “Age of Ignorance” and call for “flight” (*hijra*) within Islamic territory to escape and regroup for a concerted religious struggle.

In this case, which refers to the model provided by traditional accounts of the Prophet Muḥammad’s flight to Medina to confront his enemies in Mecca, many holy war polemicists draw on writings by famous spiritual leaders, such as Sayyid Qutb, who was martyred in Egypt during the 1960’s. Whether Qutb’s intention was to incite actual methods of holy war to achieve the assumed pristine goals of Islam, many of his revolutionary ideas were appropriated by underground movements, not only in Egypt, but beyond its borders. Both the Islamic jihad movement and Hamas (meaning “zeal,” or “ardour”) in Israeli-occupied areas of Palestine, for example, have used Qutb’s ideas to justify terrorist attacks against Israel, even though Qutb made few, if any, references to the specific circumstances affecting the plight of Palestinians. Like Algerian and Egyptian exponents of violence within particular national settings in the name of religion, the Hamas and Islamic jihad movements claim that only a religiously based mass movement can succeed in overcoming perceived injustices that have not been adequately addressed by their secular political leaders.

Other religiously motivated movements have also used the concept of holy war to support forceful actions against presumed threats, both political and moral, coming from outside the Is-

The al-Qaeda terrorists who flew hijacked airliners into the World Trade Center and the Pentagon are believed to have seen themselves as heroes in a holy war against the United States. (AP/Wide World Photos)

lamic world. Until several terrorist attacks against U.S. interests at home and abroad culminated in the September 11, 2001, disasters attributed to Osama bin Laden's al-Qaeda organization, the most outstanding model of mujahiddeen operations against a foreign enemy of Islam appeared in the 1980's in Afghanistan. There religious militants bore arms against the "infidel" Soviet presence in their lands. Ironically, the non-Muslim West, especially the United States, supported what they perceived to be the anti-Soviet focus of Afghanistan's mujahiddeen forces. Only later, when the extremist Islamic Taliban movement took over in Afghanistan and not only harbored, but encouraged, al-Qaeda in its operations against what it considered as the "illegitimate" Saudi government as well as the "infidel" West, did the threat of cross-border holy war become alarming.

Whether in real practical, or mainly theoretical, terms, early twenty-first century linkages involving Islamic religio-political causes in countries as far apart as Indonesia (where the Jamaa Islamiyyah, or Islamic Society, supported antigovernment and anti-Western campaigns of violence), Palestine, and Western-occupied Afghanistan and Iraq have given new global meaning to the phenomenon of holy war.

Homeland defense

DEFINITION: Government preparations for the defense of a nation against foreign enemies during peacetime

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: The September 11, 2001, attacks on the United States underscored the vulnerability of the nation's territory to terrorism and lifted homeland defense from an abstract concept to a subject of public consciousness, while raising questions about some of the methods used to implement homeland defense.

During the twentieth century, the United States relied primarily on its Navy and Air Force to defend its territory against possible enemy attack during peacetime. During the two World Wars, when the bulk of American military troops served overseas, the country relied on a combination of state militia, civilian law enforcement agencies, and some federal military troops to defend the homeland from enemy raiders and saboteurs.

The terrorist attacks of September 11, 2001, vividly demonstrated a threat against which traditional military forces were ill-prepared. Instead of the kinds of conventional military forces that were considered threats, the most dangerous threats to the United States came from a combination of terrorist and criminal forces. Potential targets included civilian populations, segments of the economic infrastructure, computer networks, and other vulnerable areas not considered traditional military targets. After the September 11 attacks were made using hijacked commercial airliners, possible future weapons appeared to include everything from toxic germs and computer viruses to nuclear bombs. To counter such threats, President George W. Bush created a new cabinet-level Department of Homeland Security that would combine federal, state, and local resources to protect the United States from future terrorist attacks.

The concept of Homeland Defense raised few new ethical questions. Defense of the homeland is one of the primary purposes of government, and no nation is expected to ignore homeland defense. However, the methods employed to implement homeland defense can and do raise ethical problems, most of which stem from preventive methods of battling terrorism. For example, the racial profiling of possible

terrorists and the detaining of suspects have raised questions over racism, individuality, and the concept that a person is innocent until proven guilty in a court of law. After 2001, fear of terrorist attacks led to increased use of government surveillance and intrusion of privacy. Civil libertarians have raised concerns over the erosion of what they see as fundamental rights of privacy, whereas security specialists worry about terrorists using the very openness and freedom of the nation as a tool to attack it.

Homeless care

DEFINITION: Public responsibility for the welfare and care of homeless persons

TYPE OF ETHICS: Human rights

SIGNIFICANCE: The question of the responsibility that society takes for its homeless members is an important part of the larger ethical debate about society's responsibilities to the disadvantaged.

One of the most enduring and controversial issues from Franklin D. Roosevelt's New Deal policies of the 1930's and 1940's to George W. Bush's so-called Compassionate Conservatism of the early twenty-first century has been about what should be the level of government assistance to homeless people. The issue has been rancorous because of a fundamental dichotomy in American society. On one hand, the judicial system has historically favored property rights over human rights, and both laissez-faire economics and Calvinist religious traditions have emphasized individualism and self-reliance. On the other hand, Americans have always considered themselves generous and unselfish, with a record of government aid to the poor dating back to the early nineteenth century.

Social Darwinists have claimed that poverty is a historical constant, and that therefore any government assistance to the poor is a futile waste of resources. Most modern Americans, however, ac-

knowledge that society bears some responsibility for those without homes.

THE ETHICAL ISSUES

Does government have an ethical obligation to provide for the needs of all its citizens from cradle to grave? Is there a danger that massive federal expenditures, such as free housing, will destroy the work ethic? Will the higher taxes likely to be needed for such spending increases aggravate the class animosity between those who pay for benefits and those who receive them? These are just some of the questions connected to the issue of government responsibility for the homeless, and each question leads to more. Like most ethical concerns, there are a few consensual answers or absolute truths so the debate will continue.

On one point there is nearly universal agreement: The homeless lead a miserable existence. They are likely to be found in dangerous and unsavory neighborhoods, largely because the affluent refuse to allow them to come near them. People without homes are easily victimized. Many suffer physical, mental, and emotional problems, which make it even more difficult for them to protect themselves. They enjoy no safety, shelter, or security on an ongoing basis, and many are reluctant to seek assistance from police. Government statistics on hate crime indicate that eighteen homeless people were murdered in the United States in 2001. Some attackers killed homeless people because they saw themselves as vigilantes ridding the world of undesirable people, while others committed the crimes for thrills.

Many would argue that the federal government does have an ethical obligation to provide adequate housing to all the nation's citizens. The framers of both the Declaration of Independence and the U.S. Constitution believed in the concept of natural rights. As espoused by Enlightenment era philosophers John Locke and Jean Jacques Rousseau, and echoed by Thomas Jefferson and James Madison, natural rights theory held that God gave people certain rights, such as the right to life. Therefore, government has a moral requirement to provide, when necessary, the basic means of life. The ethics embraced by the Judeo-Christian religious tradition stressed charity and generosity toward others. Socialist and communist political ideology also embraced the idea of government-provided housing.

However, other people equally concerned with ethics have held that there is no such government responsibility.

Adam Smith and others supported laissez-faire economics, which stressed minimalist government and rugged individualism. Thomas Malthus and other Social Darwinists taught that there would always be poor and homeless people and any form of government assistance was both futile and counterproductive. The United States has always held sacred the concept of self-made and self-reliant persons, and such persons would never dream of asking the government for housing or any other form of assistance. Also, the judiciary has historically held in high esteem the property rights of all owners. Until the 1930's, the judiciary was critical of federal welfare programs. Many social commentators, such as former president Herbert Hoover, believed that federally provided housing would help not only to destroy the work ethic but would be an unconstitutional intrusion of big government.

OTHER ISSUES

If there were a universal consensus that homelessness is a problem not to be tolerated, other issues of an ethical nature would arise. Once it is conceded that is government's job to house the poor, then the question would arise of whether government is also responsible for providing food, medicine, utilities, and transportation. How ethical would it be to heavily tax hardworking and productive citizens to provide benefits for idle, nonproductive citizens? Is the core belief of the welfare state that by nature people are incompetent to provide for their own needs? Are people poor and homeless because of their own failures and inadequacies. or are they victimized by capitalism and the wealthy? All these and many other ethical concerns would remain to be addressed.

Homelessness remains a paradoxical issue. Despite vast sums spent by various government entities and substantial assistance from the private sector, the numbers and problems of the homeless remained staggering in the early twenty-first century. Government aid has clearly alleviated the problem and assisted millions who would otherwise be homeless. However, it appeared that no amount of money would totally redress the situation.

Homicide

DEFINITION: Killing of one human being by another

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Legal systems generally treat homicide as a particularly heinous crime, requiring the most severe punishment, but they also allow for justifications and mitigating factors such as self-defense, lack of intent, or insanity.

All modern societies regard the premeditated murder of another human as a crime; the research of various ethologists working amongst a large number of species suggests, however, that it is not uncommon for an animal to play an active role in taking the life of another member of its own species. For example, black widow spiders are named for killing their mates, and chimpanzees have been reported to kill members of their own troops. Such observations may suggest that members of the species *Homo sapiens* have from time to time killed one another for as long as humans have existed. Furthermore, no matter how antisocial or repulsive such behavior may seem, it would be inappropriate to label such action as crimi-

nal or homicidal, since such labels introduce the notion of legality.

Additionally, while the origin of such actions may prompt ethical and moral concerns, various social and natural scientists have discussed the evolutionary advantage of such behavior while addressing kin selection and the origin of altruism. A review of anthropological literature suggests that various human societies have sanctioned the killing of humans in certain specific situations, including suicide, infanticide, war, and euthanasia. Although both activities are legally acceptable, some in the United States have called abortion murder, while others have said the same thing about capital punishment.

HISTORICAL BACKGROUND

Regarding human behavior and the origin and evolution of society, an action did not become criminal until it was covered by a law prohibiting it that prescribed a punishment for it. Crime is generally considered to be an assault against the state or government because it disrupts public order and disturbs social tranquillity. According to fragments of a clay tablet recovered from what was Sumer, the earliest legal prohibitions were prepared by approximately 2000 B.C.E.

The Code of Lipit-Ishtar was established during the eighteenth century B.C.E. and represents the first documented attempt to codify the laws governing human behavior. Specifically, the code outlined the rights and privileges of all members of Sumerian society. Similar codified laws representing a Babylonian dynasty of 1200-1700 B.C.E. are referred to as Hammurabi's code, and like those that preceded them, they outline the legal and social contract between members of society and society. These codes established courts, fines, and penalties, as well as the rights and obligations of each member of society. As is true of present laws, the early laws reflected the values of their time, and therefore, they incorporated the notion of an "eye for an eye." For example, a portion of Hammurabi's code states, "If a man destroys the eye of another man, he shall have his destroyed." Elsewhere it states, "If a man breaks the bone of another man, he shall have his like bone broken." Certainly a notable homicide for some was that of Abel by his brother Cain, which is discussed in the book of Genesis in the Bible.

Throughout the Western world, criminal viola-

tions are classified as those perpetrated against a person (such as kidnapping and rape), those against property (such as robbery), and those against the state (such as treason). Furthermore, they are classified as felonies and misdemeanors based upon society's perception of the severity of each crime and thus the penalty associated with it. In the United States, felonies carry a sentence of at least one year in prison, while misdemeanors are punishable by jail terms of less than a year or by a fine, or both. In the West, traditionally, the three major felonies are murder, arson, and sexual assault, although other crimes such as kidnapping and bank robbery have been added in some countries.

HOMICIDE IN THE UNITED STATES

In the United States, murder is practically the only capital felony, or one that authorizes the death penalty for its perpetration. Under special circumstances, however, a homicide may not be considered a crime. Specifically, in cases involving self-defense, or when a homicide is carried out to prevent the commission of a further serious felony, the perpetrator may not be prosecuted. Homicides are classified as those that are premeditated, those involving manslaughter, and those caused by negligence.

The most serious type of homicide is that which is planned in advance or is premeditated. The least serious homicide is one caused by carelessness or resulting from a negligent act. Manslaughter is defined as a homicide resulting from recklessness or a violent emotional outburst. By convention, homicide rates are reported as the number per 100,000 population, although not all countries distinguish among murder, manslaughter, and negligent homicide.

The homicide rate for various countries from 1940 to 1970 are shown in the accompanying table in five-year increments. Because of the effect of population size, the number of such deaths is also reported. For example, for Australia, the rate jumps from 0.46 to 0.90 between 1940 and 1955, while the increase in the number of deaths is only 50. This is because of the relatively small population of Australia. This should be kept in mind while noting the smallest five-year difference in the number of deaths in the United States (147 between 1950 and 1955), which is nearly three times the difference in number for Australia between 1940 and 1955.

It is clearly demonstrated by the table that the

homicide rate for each country has remained relatively stable (Australia's shows the greatest rate of change—from 0.46 in 1940 to 2.38 in 1970), while there is a notable difference between countries (the lowest thirty-year average is that of England, at 0.70, while the highest is that of the United States, at 5.79). Such intercountry differences may be attributed to cultural differences and a society's attitudes toward the value of human life, the availability of weapons, and accepted techniques for resolving interpersonal conflict.

Homophobia

DEFINITION: Fear and hatred of nonheterosexual people

TYPE OF ETHICS: Civil rights

SIGNIFICANCE: Homophobia may be seen as immoral in itself, and it also causes people to commit immoral acts, from discrimination to hateful speech to acts of violence including murder. Those who subscribe to a moral system that labels homosexuality as wrong would object to the very term homophobia on the ground that it pathologizes their beliefs.

Derived from the Greek *homos*, meaning “same,” and *phobikos*, meaning “having a fear of and/or aversion for,” the term “homophobia” was popularized by George Weinberg in 1972 in his book *Society and the Healthy Homosexual*. Other terms that have been used include: “homophilephobia,” “homoerotophobia,” “homosexphobia,” “homosexophobia,” “homosexism,” “homonegativism,” “lesbian-” and “gay-hatred” or “-hating,” and “sexual orientationalism” (giving a parallel structure with “racism,” “sexism,” and “classism”). “Biphobia” is the fear and hatred of those who love and sexually desire both males and females, and it can include prejudice and acts of discrimination against bisexual people.

“Heterosexism” (a close ally to homophobia) is the system of advantages bestowed on heterosexuals. It is the institutional response to homophobia that assumes that all people are or should be heterosexual and therefore excludes the needs, concerns, and life experiences of lesbians, gay males, and bisexuals. At times subtle, heterosexism is a form of oppression by neglect, omission, and/or distortion, whereas its more active ally—homophobia—is oppression by intent and design.

Heterosexism forces lesbians, gay males, and bisexuals to struggle constantly against their own invisibility and makes it much more difficult for them to integrate a positive identity. This is not unlike the situation of a Jew or a Muslim in a predominantly Christian country, a wheelchair user in a town with only stepped entrances to buildings, or a Spanish-speaking visitor in a country in which Spanish is not spoken.

Homophobia and heterosexism (like all forms of oppression) operate on four distinct but interrelated levels: the personal, the interpersonal, the institutional, and the societal (or cultural).

The personal level refers to an individual’s belief system (bias or prejudice). Forms of personal homophobia include the beliefs that sexual minorities (gay males, lesbians, and bisexuals) either deserve to be pitied as unfortunate beings who are powerless to control their desires or should be hated; that they are psychologically disturbed or genetically defective; that their existence contradicts the “laws” of nature; that they are spiritually immoral, infected pariahs who are disgusting—in short, that they are generally inferior to heterosexuals.

Personal heterosexism, the belief that everyone is

or should be heterosexual, is in operation, for example, when parents automatically assume that their children are heterosexual and will eventually marry a person of the other sex.

The interpersonal level is manifested when a personal bias affects relations among individuals, transforming prejudice into its active component—discrimination.

Interpersonal homophobia includes name calling or joke telling intended to demean or defame sexual minorities; verbal and physical harassment and intimidation as well as more extreme forms of violence; the withholding of support; rejection; abandonment by friends and other peers, coworkers, and family members; and the refusal of landlords to rent apartments, shop owners to provide services, insurance companies to extend coverage, and employers to hire on the basis of actual or perceived sexual identity.

Interpersonal heterosexism occurs, for example, when teachers assume that all their students are heterosexual and teach only the contributions of heterosexuals. This leaves sexual minorities without a legacy and sense of history.

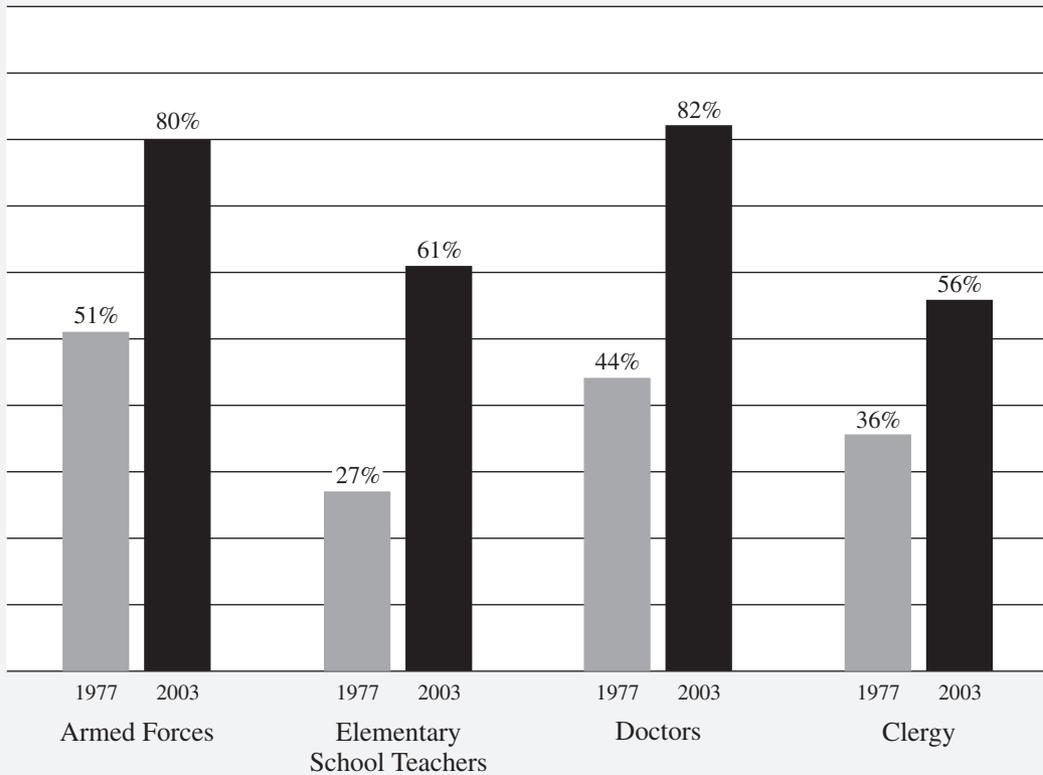

INSTITUTIONAL HOMOPHOBIA

The institutional level refers to the ways in which governmental agencies, businesses, and educational, religious, and professional organizations systematically discriminate on the basis of sexual orientation. Sometimes laws, codes, or policies actually enforce such discrimination.

Institutional homophobia includes “sodomy laws” that remain on the books in many states to punish people engaging in same-sex sexual activity; “anti-gay rights laws,” such as the prototype Colorado Constitution Ballot Amendment 2 (approved by 53 percent of the voters on November 3, 1992) prohibiting equal protection under the law on the basis of sexual orientation; state and municipal policies restricting gay, lesbian, and bisexual people from serving as foster and adoptive parents and making it more difficult for them to win custody of their own children in the courts; military policy excluding gays, lesbians, and bisexuals; the doctrines of some religious denominations that oppose homosexuality; the classification of homosexuality as a “disordered condition” according to the American Psychiatric Association until 1973 and the American Psychological Association

Growth in Public Acceptance of Gays in the Professions, 1977 to 2003

Percentages of Americans responding favorably to the question of whether homosexuals should be hired in these professions.

Source: *Los Angeles Times*, March 30, 2004. Summary of responses of polls undertaken by the Gallup Organization in June, 1977, and May, 2003.

tion until 1975; and school policies clearly stipulating that same-sex couples may not attend proms and other social functions.

Institutional heterosexism includes religious and governmental sanction of the marriages of only heterosexual couples; companies providing employee benefits only to “legally” married spouses and children; the heterosexual bias on government, business, and community groups’ printed forms when listing only the categories “single,” “married,” and “divorced” in reference to relationship status; municipal, state, and national governments giving special tax benefits to heterosexually married couples; medical policy permitting only “blood relatives” or spouses certain hospital visitation rights; and school

dances designed specifically to encourage the socialization of males with females, and vice versa.

The societal (or cultural) level refers to the social norms or codes of behavior that, although not expressly written into law or policy, nevertheless work within a society to legitimize oppression. Societal homophobia includes the stereotypes of sexual minorities that are taught in the culture, ranging from their alleged predatory appetites, to their physical appearance, to the possible “causes” of their desires. It also includes active attempts to falsify historical accounts of same-sex love—through censorship, deletion, half-truths, and the altering of pronouns signifying gender—making accurate reconstruction extremely difficult.

An example of societal heterosexism is evident whenever the only positive and satisfying relationships portrayed in the media are heterosexual. This is not unlike media portrayals of white people, especially in the United States during the 1950's and 1960's, which excluded positive images of people of color.

Gay, lesbian, and bisexual people are not immune to the destructive effects of homophobia, biphobia, and heterosexism. Internalized homophobia and biphobia occur when gay, lesbian, and bisexual people incorporate or "internalize" society's negative notions of homosexuality or bisexuality and of gay, lesbian, and bisexual people, thus inhibiting their ability to establish a positive self-identity or to form close and intimate relationships. This internalization may result in the denial of one's sexual and emotional attractions on the conscious or unconscious level to oneself and others; overachievement as a bid for acceptance; contempt for the more open and "obvious" members of the lesbian, gay, or bisexual community; attempts to alter or change one's sexual orientation; projection of prejudice onto another minority group (reinforced by society's already existing prejudices); delayed or retarded emotional or cognitive development; attempts to "pass" as heterosexual, sometimes marrying someone of the other sex to gain social approval; increased fear and withdrawal from friends and relatives; conflicts with the law; unsafe sexual practices and other destructive risk-taking behaviors, including substance abuse; and suicidal ideation, attempts, and completion.

Homosexuality

DEFINITION: Disposition to feel romantic love for, and to have sexual relations with, persons of one's own sex

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: In modern Western societies, homosexuality is often seen as both a set of practices and a fundamental category of identity. As a result, both individual acts or behaviors and the character of the person as a whole are made the subject of moral judgments. The appropriate content of such judgments is a matter of ongoing controversies that increasingly bring traditional religious values into conflict both with reformist religious movements and with secular egalitarian governmental and social values.

The human body, like the bodies of many animal species, cannot perpetuate itself by itself. Human reproduction requires the union of sperm and egg cells. When this union is initiated within the body of the female of the species, the involvement of the nervous system, especially the brain, results in an awareness of sensory pleasure. Social behavior is enhanced as a result of sexual sensory input into the central nervous system, especially if there is emotional input of care, gentleness, esteem, trust, and increased well-being associated with the outward physical actions. Some

people perform heterosexual activities with their own sex; this is the case with homosexuals. Various disciplines such as psychology, psychiatry, theology, philosophy, sociology, anthropology, and the biological and medical sciences have attempted to gather information in order to understand homosexuality better.

HISTORY

The early legal codes of Mesopotamia do not mention homosexual acts, except for the provision in the code of Hammurabi (1726 B.C.E.) that concerns sons adopted by palace eunuchs. David Greenberg, in *The Construction of Homosexuality* (1988), comments that while some scholars have claimed that the second millennium B.C.E. Hittite law provided for male homosexual marriages, this concept is now found only in the writings of the nonspecialist. At about the same time in Babylon, there was an *Almanac of Incantations*, which contains prayers that bless the love of a man for a man as well as that of a man for a woman and a woman for a man. It is not easy to be sure about homosexuality in very ancient papyri from Egypt. Greenberg was unable to find any basis for a claim that new pharaohs were masturbated and sodomized by priests. It was believed, however, that homosexual intercourse with a god would be a great blessing.

Two fragmented manuscripts from the Sixth Dynasty, about 2272-2178 B.C.E., describe a conspiracy to obstruct a court hearing involving a homosexual relationship between a top royal administrator and his military general. In the Eighteenth Dynasty, a set of religious and mortuary spells called the *Book of the Dead* has the deceased proclaiming the absence of homosexual activity in his life, and a copy of the book prepared for women indicates the existence of lesbianism. The Hebrews address homosexuality, but there is much controversy over dating and interpretation. Homosexuality within Sodom and Gomorrah seems to be implied, and the suggestion of inhospitality as the chief sin of Sodom and Gomorrah could easily include homosexual rape.

Overt homosexuality seems to have been a part of life among the Greeks by the early part of the sixth century B.C.E. Kenneth James Dover, in *Greek Homosexuality* (1989), refers to homosexual expressions that were included in graffiti on the rocks of a Spartan colony, Thera; these graffiti may even be from the

seventh century B.C.E. There seem to be no elements of homosexuality in the poetry from the seventh century B.C.E., even though there are explicit heterosexual references. By the sixth century B.C.E., lesbian poetry from Sparta did exist, as did many indications of male homosexuality. Images on many vases depict every level of intimacy between males, including the touching of genitals.

The period between 570 and 470 B.C.E. seems to be the great age of erotic vase painting. Plays that date from 425 to 388 B.C.E. used homosexuality as material for humor, but this use seemed to decline after the mid-fourth century B.C.E. in Greece. Plato's philosophical writings extol homosexuality. There exists, however, a copy of a trial that dates to 346 B.C.E. in which a citizen of Athens, a politician, was prosecuted for prostituting himself to another man.

THE MIDDLE AGES AND LATER

During the Middle Ages, King Charles V promulgated the *Constitutio Criminalis Carolina* (1532) which punished homosexuality with death by fire. Jonathan Katz, in *Gay American History* (1976), reports that approximately one percent of the erotic Peruvian pottery that dates from 100-1200 C.E. depicts lesbianism. The writings of a Franciscan friar in 1565 refer to sodomy and lesbianism in Mexico. In writing between 1742 and 1750, missionaries of the Moravian church, a German Protestant denomination, describe the Native Americans of Pennsylvania, New York, and North Carolina as decent in public, yet committing unnatural sins in private. The term "berdache" was used for the homosexual male in some Native American tribes.

As early as 1924, prohomosexual organizations existed in the United States. The Chicago Society for Human Rights received its charter as a nonprofit organization on December 10 of that year. This group published two issues of "Friendship and Freedom" and, later, the monthly homosexual emancipation magazine *One*. Various novels and plays appeared that depicted homosexuals as a misjudged and misunderstood minority. In England, Radclyffe Hall wrote *The Well of Loneliness* (1928), which was published in New York after it was banned in England.

In California in 1948, Henry Hay founded the Mattachine Society, a homosexual emancipation organization for males. Two years after attending a meeting of the one-year-old lesbian organization

the Daughters of Bilitis in San Francisco in 1956, Barbara Gittings founded the first East Coast chapter. She was the first editor of its periodical, *The Ladder*, which began publication in 1963. In 1961, Illinois led the way for a number of states to decriminalize homosexual activity in private between two consenting adults. In the summer of 1969, customers at the Stonewall Inn, a homosexual bar on Christopher Street in New York, rebelled against a police raid. This event is considered to mark the beginning of group rebellion, the beginning of the "Gay Rights" movement.

ETHICAL PRINCIPLES AND ISSUES

It is basic that every person be free to make decisions regarding sexual activity within the realm of others' rights. To make a free decision requires that the person has attained maturity and an appropriate level of knowledge. The acquisition of pertinent facts regarding homosexual behavior and reasoned reflection on its outcomes should precede one's decision at all levels of sexual intimacy. One's actions should also, at all times, respect the dignity of life.

Ethical issues in the area of homosexuality fall into one of two categories. They are either microcosmic, related to the concerns and care of the individual or a small unit of society, or they are macrocosmic, related to society on a large scale.

Allowing a person the freedom to make personal choices is one of the highest forms of respect. Some say that this microcosmic approach is the only sensible one. Each person may have programmed limits of freedom that are the result of genes, early family relationships, and cultural relationships. The uniqueness of the human nervous system makes possible an unusual awareness that seems to transcend the physical.

At the macrocosmic level, a society's treatment of minority or marginalized segments of its population is often a significant yardstick for measuring the justice or enlightenment of that society as a whole. Homosexuals, often the object of extremely strong opinions and feelings on the part of a heterosexual majority, are at risk of persecution unless a society takes explicit measures to prevent such treatment.

HEALTH CARE ALLOCATION

In Europe and the United States, late-nineteenth century physicians began to say that homosexuality

was a problem for them to treat rather than something for judges, lawyers, and legislators to address. Karl Heinrich Ulrichs, impressed with the discovery that the early human embryo contained both male and female organs, then lost one set as development continued in the uterus, began using the term "third sex." Psychiatry, especially, began treating people who wanted to be helped. Some states in the United States adopted compulsory sterilization for homosexuals. Some homosexuals during the early twentieth century sought castration to stem unwanted homosexual desires.

The rise of the acquired immunodeficiency syndrome (AIDS) during the 1980's put the homosexual issue firmly into the health care realm. The medical world had not only the problem of dealing with the human immunodeficiency virus (HIV) but also that of treating the many health problems related to a suppressed immune system in the human: pneumonia, AIDS-related cancers such as Kaposi's sarcoma, and various types of brain involvement. Homosexual men are at particularly great risk of contracting AIDS.

RESEARCH

Psychological studies show that environmental influences, especially parental relationships before age two, may irreversibly determine a person's sexual identity. Sigmund Freud suggested that people who react negatively to homosexuals are exhibiting "reaction formation"; there is a desire but the super-ego forbids its expression. The transmission of this prohibition happened at an early age, but this does not explain the origin of the primary prohibition. Even though research into homosexuality continues, in 1975 the American Psychological Association deleted the word "homosexuality" from its *Diagnostic and Statistical Manual of Mental Disorders*.

Many religions attest the perversity of homosexual activities. To Jews, moral law and natural law are products of the one God, and nature clearly seems to intend that human males and females should engage in sexual relations only with each other. Not only Judaism and Christianity but also Islam and Zoroastrianism condemn homosexual actions. In the Hindu civilization, the Laws of Manu impose only a mild penance for homosexual conduct.

Sociological inquiry into homosexuality has attempted to find out how the homosexual stigma has produced dramatic consequences for these individu-

als. A landmark paper by Mary McIntosh, "The Homosexual Role," which was published in *Social Problems* in 1968, states that only when the homosexual person sees himself or herself in terms of a social category does that person start to act in terms of that role. The homosexual role is not universal, even though homosexual experiences are. In 1978, Barry Adam presented the results of his study in *The Survival of Domination: Inferiorization and Daily Life*. He shows that gays have restricted opportunities, their lives are dominated by unacceptance, and their mental lives are devalued. Not all sociologists, however, consider homosexuality an issue of social concern that is worth their research time and effort.

Anthropological studies on homosexuality are sparse and do not give a clear picture. In most societies, however, sexual activity takes place in private. In 1976, Gwen Broude and Sarah Greene, in their article "Cross-Cultural Codes on Twenty Sexual Attitudes and Practices," published in *Ethnology*, suggested that little homosexuality is reported because it is not customary to do so. Information on the frequency of homosexuality is given for only 70 of 186 societies in the Human Relations Area File's Standard Sample, and there are only 42 reports on attitudes toward homosexuality. Native reluctance to share such information with Western, white anthropologists has been reported. Many anthropologists have been men, so questions on lesbian activities have been prevented by norms of propriety. If sex is a part of religious ritual, that can be a further reason for secrecy.

Scientific research has shown that hormones, chemicals circulating in the blood, have a profound effect upon sexuality, but human sexual activity is not totally controlled by hormones and cycles, as it is in many animals. In 1982, Christine de LaCoste-Utamsing and Ralph Holloway reported, in *Science*, the presence of sexual dimorphism in the part of the brain called the corpus callosum.

In 1985, a sexually dimorphic nucleus, or area that consists of a collection of nerve cell bodies (gray matter) surrounded by the white matter of the brain, was reported in the hypothalamus, a primitive part of the

brain that functions in eating as well as in reproductive activities. In 1991, Simon LeVay published in *Science* the results of his study of forty-one human brains. Six were from heterosexual women, sixteen were from heterosexual men, one was from a bisexual man, and eighteen were from homosexual men. Four nuclei in the anterior part of the hypothalamus (interstitial nuclei 1, 2, 3, and 4) were studied. Differences were found only in the interstitial nuclei 3 in these postmortem brains. Nucleus 3 was twice the size in the homosexual men compared to its size in the heterosexual men. The size of this nucleus in the homosexual men was about equal to that found in the heterosexual women. The sample size used in this study was small. Also, it is not known whether nucleus 3 was larger at birth, became larger in early childhood, or became larger as the result of homosexual activity. The last possibility is important to consider, because the projections, or dendrites, from

Homosexuality in Broadway Dramas

Although often obliquely presented, homosexuality surfaced on the American stage as early as the 1920's. Gay elements pervaded such plays as Lillian Hellman's *The Children's Hour* (1934) and plays by Tennessee Williams, including *The Glass Menagerie* (1944), *A Streetcar Named Desire* (1947), *Cat on a Hot Tin Roof* (1955), and *Suddenly Last Summer* (1958). However, it was not until the late 1960's that gay themes became more overt in dramatic productions. In 1967, New York State officially lifted its edict banning homosexuality from the stage. That edict had long violated the First Amendment rights of both authors who wished to write about life's realities and audiences who wished to see such plays.

In 1968, one year after the New York ban was lifted, Mart Crowley's overtly homosexual play, *Boys in the Band*, opened on Broadway. A quarter century later, Jonathan Tolins's *The Twilight of the Gods* (1993) presented audiences with the ethical dilemma of a homophobic family whose daughter's unborn fetus tests positive for the "gay gene," raising thorny questions about whether to abort the fetus. The play asked the question of whether being gay is so horrible that it justifies killing an unborn infant. Meanwhile, other thoughtful dramatic presentations on screen as well as on stage have posed complex ethical questions and helped to cast homosexuality in a context related to issues many families with homosexual members confront.

pyramidal cells in the cortex of young mammals increase with sensory input.

Some studies of the sexual preferences of twins have shown a high correlation between them. In one study, 52 percent of identical twins were homosexual, compared with 22 percent of fraternal twins and 11 percent of adopted brothers. Again, the sample size is small (only 161 sets of twins).

NATURE OF HOMOSEXUALITY

Science has not shed definitive light on the physical basis of homosexuality, although biologists tend to look to genetics for an answer. History seems to indicate that homosexuality was a part of ancient civilizations, but it was especially banned by the Hebrew religious code, which separated homosexuals from others who were called pagans. The Hebrew evaluation of homosexuality was adopted by the Christian community, and especially, by the Roman Catholic Church, which holds that each person can be respected even though the actions of the homosexual person are difficult to judge and are not approved. There have always been those who have been both heterosexual and homosexual in their activities. The members of the “gay movement” want homosexuality to be a way of life that is accepted and considered equal to heterosexuality in every way.

ETHICAL DECISION MAKING

This activity involves both content and process. For the individual, there needs to be a clear understanding of the preference to seek sexual pleasure with the same sex and the performance of the action at whatever level of intimacy it may be. One needs to reflect upon the effect of sexual sensory input into the central nervous system, and especially the human brain, with its ability to remember, imagine, and affect the entire person. The process might also include answering some of the following questions. How do my actions relate to the dignity of my personhood? Do my actions show responsible stewardship of the human species? Does this pleasure ensure my future health and well-being? Do my actions promote the common good?

PUBLIC POLICY

Greenberg relates governmental laws regarding homosexual activity to the rise of capitalism. The development of the political power of the working class

resulted in the state’s assuming a greater role in civil society. As the industrial revolution continued, educational requirements for jobs increased. The public education of both male and female children caused children to be considered asexual. By 1885, the law put English children into a category that was out of the sexual reach of adults. In the United States, statutory penalties for homosexual activity were enacted. For example, the 1881 *Revised Statutes for the State of Indiana*, section 100 of chapter 32, states,

Whoever commits the abominable and detestable crime against nature, by having carnal knowledge of a man or a beast, or who, being male, carnally knows any man or any woman through the anus, and whoever entices, allures, instigates or aids any person under the age of twenty-one years to commit masturbation or self-pollution, is guilty of sodomy, and, upon conviction thereof, shall be imprisoned in the State prison not more than fourteen years nor less than two years.

Between 1880 and 1890 the number of people in prison in the United States for homosexual activity increased 350 percent compared to a 25 percent increase in population.

During the 1970’s, attempts were made to change public policies on this matter in the United States. On June 7, 1977, in Dade County, Florida, a referendum to ban discrimination regarding housing, employment, and public accommodations based on a person’s public statements regarding affectual or sexual preference failed to pass. A similar bill in New York City had been defeated in the city council by a vote of twenty-two to nineteen on May 23, 1974. Many laws that favor professed homosexuals did pass, however, especially in Washington, D.C., and San Francisco, California. In many situations, no questions are asked regarding one’s sexual preference, and during the early years of the twenty-first century, San Francisco and other major cities were even openly condoning gay marriages.

Honesty

DEFINITION: Fair and truthful conduct, free from deception or fraud

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Honesty is the one virtue most commonly subjected to situational ethics. While dishonest acts that cause harm are generally treated as clear ethical violations, dishonest acts that protect the happiness of others may be condoned or even recommended, and honesty itself is often deemed embarrassing or even morally questionable depending on its context.

As a virtue, honesty belongs to the ethical *genus* of justice. Other concepts relative to honesty are dignity, uprightness, fidelity to the truth, and chastity in words and actions. Because they harm other people, the opposites of honesty are generally condemned; among those opposites are lying, dishonesty, sham, covetousness, unscrupulousness, inaccuracy, treachery, and infidelity in words and actions.

DISHONESTY, SOCIETY, AND INDIVIDUALS

All groups, including the family, the clan, and the larger society as a whole, must practice honesty, for to do otherwise would undermine the group by destroying mutual confidence. Subsequently, the group would disintegrate. Treachery of any kind can flourish between hostile groups but never within a group, for it scatters people and breaks down groups.

Dishonesty is a type of war in disguise. Unless honesty and truth are observed and practiced by people, no one can trust anyone else and no one can know what to expect from others. Society would then fragment and—as Thomas Hobbes mentioned long ago—revert to a "state of nature," a war of one against all and all against all. Life, Hobbes said, would become "solitary, poor, nasty, brutish, and short." Another philosopher held that falsehood was the worst of "evils" because its negative consequences—including the end of society—would be so great.

Many types of dishonesty exist. One type involves lying in an attempt to deceive, and prevarication is probably the most effective form of lying. Prevarication is the attempt to leave a false impression by using words that in some other sense might be true. The best example of prevarication is the case of the two diplomats who promise that their two countries will remain at peace so long as they stand upon “this earth.” Immediately after such agreement, both diplomats go to a private place to remove their shoes and pour the sand out of them. Thus can a lie be told with words that are technically “true” but are false in context.

A lie can be told without words—by means of gestures or silence. A forger lies with the pen, a medical quack with fraudulent prescriptions, a smuggler by “expert” packing, and the pickpocket with his hands. Robbers and thieves are also, in a sense, liars, for they are dishonest when they take money or goods that rightfully belong to someone else. Such lies and dishonesty in effect break the implied promise that civilized people make to one another to be truthful and to cause no harm.

In addition to harming others, the dishonest one also hurts himself or herself. The liar’s attacks on society wear it down, and as society “loses,” so, too, do its individuals. Furthermore, dishonesty tears away at the character of the offender. Once the dishonest one is caught in a crime or even a simple lie, society damns him, and no one will ever believe him again, not even when he speaks the truth. Additionally, many dishonest people eventually start to believe their own lies or justify their crimes, whatever those crimes may be. Someone, for example, might steal goods and “justify” it by saying, “The rich owe me this much” or “Society owes me at least this much.” When such thinking occurs, internal honesty is replaced by internal dishonesty and self-deceit. Since inner truthfulness is a key to moral growth and personal vigor, the dishonest person throws away his or her chances to achieve that growth and vigor.

DEVELOPING A PHILOSOPHY OF HONESTY

First, the question of relativism must be resolved, and one type of relativism involves recognition that different cultures have differing customs and mores. Different cultures may also have different moral values. One need look no further than Eskimo society. The men not only practice polygamy but also share

their wives with male guests, for such behavior is considered the proper sign of hospitality. Furthermore, a dominant male might also have access to all other men’s wives. Eskimos also practice infanticide, with female newborns being most likely to be killed. Eskimo society also approves of leaving old people, who have ceased to be productive, out in the snow to die. While American laypersons might be shocked by such practices, relativists are not. They argue that there is no standard “right” and “wrong” and that moral rules vary from society to society. In other words, cultural relativists challenge the view that there are universal moral truths.

Despite the arguments described above, many thinkers remain critical of relativism. First, critics contend that relativists confuse what people simply believe or want with objective truth. For example, if nations make war to enslave other people, is that war justified simply because the aggressive nation believes that it is? During the World War II era, Nazi Germans had elaborate reasons to justify the murder of millions of Jews. Were such exterminations justified simply because the Nazis thought that they were? Similarly, in some societies of the past, people believed that the world was flat, but does that mean that there is no objective truth in geography? No. Similarly, there are objective truths in moral philosophy, and honesty is one of them.

Cultural relativism’s “big brother” is relativism in general. Some thinkers hold that there should be no fixed principles to guide human words and actions. According to them, everything is relative and ethical decisions must be rendered on a case-by-case basis. The idea that all is relative is, however, a fixed principle. Everything is not relative, and certain ethics *should* be obeyed by all. An ethical philosophy of honesty, for example, allows but few examples wherein it is “right” to be dishonest or to lie.

The case of the “inquiring murderer,” however, does bedevil a thinker: Jane Doe sees a man running down the street on a dark, rainy night. As the man turns a corner and disappears, a second man rushes up. Jane notices that the second man is carrying a gun at just the moment when he asks Jane, “Which way did he go?” Should Jane tell the truth? That course might lead to the murder of another human being. Here, one must conclude that no, in this case Jane should lie because saving a human life outweighs Jane’s responsibility to tell the truth to an armed man.

Said another way, one duty that Jane owes humanity is greater than another. Thus, there are times when honesty and dishonesty are relative, but those cases are few and far between. Only a person's strongest powers of reason can discern the rare occasions when it is correct to be dishonest.

PHILOSOPHY OF IMMANUEL KANT

Exceptions aside, honesty in most avenues of life is still the best policy. One really needs to look no further than the philosophy of Immanuel Kant to justify that policy. Kant held that there were certain absolute rules—called “categorical imperatives”—that were not relative and that did not change no matter what the circumstances. Basically, his imperatives called for people to think, speak, and act only in ways that would be acceptable if they were mandated as universal laws to be followed by all people everywhere; that is, people should ask, before they decide on an action, should my behavior become a universal law? Thus, is it permissible for one to steal the money or goods of another? No, because if everyone became a thief, civilized society would crumble. Is it permissible to lie (except in a life-threatening emergency such as that of the aforementioned Jane Doe)? No, because if lying became a universal law, the war of all against all would start. Kant's imperatives would also ban such acts as armed robbery, murder, adultery, incest, and so on. Except for certain moral dilemmas, Kant's system seems to work well as a general guide for determining honesty: Tell the truth, do not rob or steal, do not kill others, do not physically or mentally assault others, and so on.

Kant's lines of reasoning are as follows: You should take only those actions that conform to rules that you are willing to adopt as universal laws. If you are dishonest, you are announcing that universal dishonesty is permissible. The last point is absurd, however, because it is a self-defeating proposition. If all people were liars, cheats, and thieves, people would stop trying to believe one another, and it would do no good to be a dishonest liar, because one would not be believed. Therefore, it is best not to lie, cheat, or steal.

Kant's categorical imperatives seem even more correct if one considers other philosophical doctrines. For example, some thinkers still hold that religion is the key to truthfulness, honesty, and right action: Simply do what God commands. Such a view

does little, however, to guide atheists or agnostics. Kant's imperatives do.

The utilitarian philosophy is also unacceptable as a replacement for Kant's imperatives. The three founders of utilitarian thought—David Hume, Jeremy Bentham, and John Stuart Mill—and their followers held that people should be guided by the principle of happiness and the greatest good for the greatest number. To make people happy was the greatest good, and questions about honesty and dishonesty would become the servants of the greatest good; that is, dishonesty could be practiced if it made people happier. To give Hume, Bentham, and Mill their due, all three were reformers who were trying to make English law and society more just, but their philosophy falters on the issue of dishonesty. For example, consider the person who breaks into a home and steals most of the family's treasures, including jewelry, televisions, personal computers, microwave oven, and money. The thief next distributes the goods to his many friends. If one were a strict, no-exceptions-allowed utilitarian, one would have to conclude that the theft was acceptable because the thief made more people happy than unhappy.

Utilitarianism in its extreme form is hedonism, a philosophy that justifies behavior based on how people “feel.” If what one “feels” is the criterion for action, then all is allowed—even dishonesty. Additionally, other virtues might well disappear if they conflict with hedonism, virtues including, but not limited to, justice, the rights of other human beings, and truthfulness.

HONESTY AND DISHONESTY IN MODERN AMERICAN SOCIETY

Although many millions of Americans are most likely honest in all their endeavors, if one looks at public life, one must conclude that it is a rare public official who tells the truth. Scandal has been the order of the day for decades. In the Cold War era, for example, some individuals in the state department, the military, and the Central Intelligence Agency (CIA) were dishonest with the American people in striving to make them terrified of the Soviet Union, which was only a regional power at best. During the Vietnam War, the same agencies were regularly dishonest in what they told the people. Then, when the Gulf War was being fought during the 1990's, generals “managed” the news about the war, leaving an im-

pression that the American victory was greater than it really was. It was only later that investigators discovered, for example, that “friendly fire” killed many soldiers and that American missiles had not been as accurate as the generals had said. As the turn of a new century neared, many Americans became so jaded that they took it for granted that the government would be dishonest and would lie about most military matters.

Dishonesty is also rampant in American internal affairs and has been for decades. By 1952, despite his own best efforts, President Harry Truman’s administration became hopelessly corrupt; that fact helped the Republicans retake the Oval Office, but the Dwight D. Eisenhower administration had its scandals, too. President John F. Kennedy contributed to the trend of dishonesty among public figures. He received the Pulitzer Prize for *Profiles in Courage* (1955). The problem? He did not write it. His staff, headed by Theodore Sorensen, did. Next, President Lyndon B. Johnson did his best with the internal War on Poverty, but he lied about the shooting war in Vietnam. One need say little about the Richard M. Nixon administration except one word—Watergate. On and on the trend goes. During the 1992 political cam-

paign, president-to-be Bill Clinton was less than candid about certain matters in his private life. His immediate predecessors, Ronald Reagan and George Bush, were no better; both became mired in the “Irangate” arms-for-hostages scandal.

Dishonesty also flourished in Congress, especially during the 1980’s, as one scandal after another occurred. For example, in their bank, members of Congress regularly engaged in the practice of check “kiting.” In their post office, other irregularities occurred. In their restaurant, members of Congress charged but refused to pay their bills—this while voting themselves such massive pay raises that they could disengage themselves altogether from the concerns of the lower and middle classes. Even though some dishonest members of Congress were “retired” after the scandals, many of the guilty returned to Washington to continue their corrupt careers. Sex scandals, racism, gender discrimination—all these ills can also be laid at the feet of Congress, and all such ills have an aspect of dishonesty about them.

In the modern United States, it is not only politicians who are dishonest. Before he left office in 1961, President Eisenhower warned about the development of the “military-industrial” complex. Indeed, the alli-

ance between the military and big business grew by leaps and bounds, and dishonesty flourished as many defense contractors defrauded the government. Worse, many businesspeople seemed to lose whatever honesty they might have had. During the 1980’s and 1990’s, for example, Americans had to watch the spectacle of the savings and loans scandals. For decades, taxpayers will pay billions of dollars and therefore be punished for the criminal acts of a handful of dishonest bankers.

Religionists are also numerous among the dishonest. In front of a television audience that numbered millions of people, Protestant fundamentalist Jimmy Swaggert thundered against sin and actually laughed heartily about all the awful tortures that sinners would receive when they all went to Hell. He said that shortly before he was caught more than once be-

ing unfaithful to his wife by frequenting prostitutes. Jim Bakker was a “man of God” who built a ministry of millions of both people and dollars, only to be convicted later of fraud and sent to prison. Yet Protestants were not the only guilty religionists. Newspapers reported one case after another of Roman Catholic priests who molested children or adults, while Jewish rabbis heading schools that received federal and state money enrolled imaginary students to receive more money.

In almost any field that one surveys, dishonesty exists, and society is in danger of decline as trust is increasingly lost. Worse, when the young see the dishonest behavior of preachers, lawyers, physicians, politicians, and so on, they come to believe that dishonesty is acceptable. When those children grow into young adults, they may become corrupted by tempting situations wherein they must choose between honesty and dishonesty.

CONCLUSIONS

All people who wish to live ethically must understand the consequences of dishonesty. First, it threatens all of society. If dishonesty becomes widespread enough, civilization itself will decline. Second, dishonesty also threatens the dishonest person by slowly working to destroy that person’s character, integrity, and honor. It may well be time to reembrace Kant and to declare that of his categorical imperatives, the imperative that demands honesty is one with the greatest reason on its side. Dishonesty can never become universal or “natural” law, because it is self-defeating in the end.

Honor

DEFINITION: Consciousness of self-worth and corresponding code of behavior thought particularly appropriate to individuals whose self-esteem is grounded in their ancestry and breeding

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: A worldly and exclusive ethic, honor was particularly compatible with traditional, hierarchical societies in which allegiance was directed to individuals rather than to an impersonal state governed by abstract law.

Honor is an elusive term whose meaning has undergone considerable change from antiquity to the present. It refers to a personal sense of worth and dignity as well as to a corresponding code of behavior or standard of conduct expected by one's peers. Honors are marks of approbation or recognition bestowed by virtue of one's actions in accordance with such codes and standards.

Some social scientists contend that honor is universal, found in virtually all societies. Some scholars refer to "primal honor," as evident in pagan and Indo-European societies, signifying a code of behavior that emphasized valor, the reputation of family and group with which the individual identified, male virility and ferocity, and loyalty. Primal honor, as the term suggests, was archetypal and universal, the moral property of the whole community and consequently neither class-based nor elite-based. Above all, it valued the opinion of others as a gauge of self-esteem and worth. It was, however, an exclusively masculine property. Presumably, the more traditional the society, the more visible would be the qualities of primal honor.

Literary scholars and historians are more inclined to confine honor to Western civilization, as an ethic first evident in antiquity, altered in the Middle Ages, and subsequently transformed during the Renaissance and later. Honor's primal qualities were transmuted by the medieval Roman Catholic Church in the cult of chivalry that elevated the lady. When applied to the lady, honor referred to purity or chastity. Nevertheless, if a lady's honor was impugned, it remained a man's responsibility to defend it. Renaissance humanists joined learning, manners, and civility to the earlier code and produced, especially in the Anglo-Saxon tradition, a more reified code of

honor. With its emphasis upon inner worth along with external expressions of respect and esteem, this more elevated variety of honor was exclusive, as opposed to primal honor's alleged universality. The historian Jacob Burckhardt referred to the Renaissance concept of honor as "an enigmatic mixture of conscience and egoism."

In medieval England, an honor was originally a large estate granted by the crown. It was a physical property that was the outward sign of a man's dignity and was heritable. While honor's meaning was subsequently translated from land to character, its heritability was retained, as was its elitist associations. Honor was a quality associated with the hereditary ruling elite and was to be emulated. Thomas Hobbes referred to honor as "the opinion of power." Edmund Burke considered honor a quality "to be found in the men the best born, and the best bred, and in those possessed of rank which raises them in their own esteem, and in the esteem of others, and possessed of hereditary settlement in the same place, which secures with a hereditary wealth, a hereditary inspection." Honor, then, was a peculiarly aristocratic quality.

While some critics of the Scottish Enlightenment professed that honor was universal, the examples they provided of its operation were invariably drawn from the world of privilege. Even such critics of honor as William Paley, who saw it as an instrument of social control, defined honor as an aristocratic code that "regulates the duties *betwixt equals*."

THE "MAN OF HONOR"

Insofar as a man of honor sought the rewards of approbation, honor was a worldly ethic that was often at odds with the ascetic or other-worldly aspirations sometimes associated with a higher morality. The man of honor subscribed to a code distinct from and sometimes in conflict with the laws of God or the laws of his country. A sensitivity to personal reputation was foremost, and, especially in early modern European history, the "point of honor" became the duel, despite condemnation of the practice by both Church and state law.

Many theorists from the Renaissance to the Enlightenment sought to reconcile honor with public virtue, particularly in the form of benevolence. For such theorists as Adam Smith, Baron de Montesquieu, and David Hume, aristocratic honor was necessary for the preservation and transmission of lib-

erty. Nevertheless, the association of honor with traditional societies that valued privilege and patronage resulted in its attenuation and further transformation once those traditional societies were replaced by the modern industrial state.

The French Revolution's assault upon the old regime's world of privilege implied a rejection of the code of aristocratic honor that had been linked with monarchy, the king having been the "fount of honor." The quality that had once been personal, however, having been associated with serving the monarch, came to be associated with serving the impersonal nation. Hence, in the nineteenth and twentieth centuries, the concept of national honor became prominent. It was not an altogether new concept, since varieties of collective honor persisted when men of rank identified with their families or clans. Moreover, while honor as a personal ethic characteristic of elites was being weakened, the collective honor associated with those elites was strengthened.

When aristocracies controlled their nations, national honor was a projection of their personal honor. In the nineteenth and twentieth centuries, the concept of national honor acquired mass appeal, as the nation displaced the individual as the object of loyalty. Numerous statesmen appealed to national honor in the diplomacy of the countries they represented, and the phrase "peace with honor" was frequently used to justify a particular policy or arrangement. It has been invoked by such disparate figures as British prime ministers Benjamin Disraeli, after the Congress of Berlin in 1879, and Neville Chamberlain, when he returned from his meeting with Adolf Hitler at Munich in 1938. In seeking to conclude the Vietnam War, President Richard Nixon and Secretary of State Henry Kissinger claimed to bring peace with honor.

Honor systems and codes

DEFINITION: Obligations that members of groups—such as students—accept by taking oaths binding them to follow group rules without external compulsion

DATE: First student honor code adopted at the University of Virginia in 1842

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Honor codes establish principles of behavior within certain social contexts, but such principles may conflict with universal theories of ethics based upon deontological or utilitarian concepts of morality.

By pledging to follow a code of honor, members of a group expect to be trusted on the basis of their oaths to carry out certain obligations under any circumstances. For instance, the medieval code of chivalry and the Bushido, the code of Samurai warriors, both maintained that vassals should remain loyal to their lords. Failure to live up to such fealty was considered the highest form of disgrace. Similarly, the young men of many North American Indian societies took oaths never to retreat in the face of danger, and the *mafioso* (men of honor) are sworn to a code of silence about the criminal activities of their brethren.

Students sworn to college and university honor codes accept responsibility for the academic integrity of their classrooms. They pledge to uphold the

Academic Honor Codes on the Web

The Web site of the Center for Academic Integrity (www.academicintegrity.org) offers links to Web sites of more than one hundred member colleges and universities that have honor systems. Most of these sites offer the complete texts of the institutions' honor codes and explanations of their enforcement policies. Among the types of information found on these pages are detailed definitions of cheating, plagiarism, collusion, and other offenses, as well as descriptions of the positive behaviors that students are expected to exhibit.

codes by conducting themselves honestly in all grading activities and by reporting any violations of fellow students (under nontolerance clauses). Faculty members recognize student honor codes by not proctoring exams and allowing students to adjudicate by themselves any charges of cheating. Under some university honor codes, students found guilty of academic dishonesty, no matter what the violation, are punished by expulsion. Single sanctions for all degrees of cheating rest upon the idea that what is being punished is not merely a particular violation of classroom rules, but the breaking of one's pledge to the code itself.

Nontolerance clauses and single-sanction punishments are two ethically controversial features of academic honor codes. Turning in classmates for violations may appear to be a kind of betrayal, while single-sanctions punish both trivial and serious violations with the same severity. Around the turn of the twenty-first century, extensive cheating scandals at honor code schools and at the U.S. military academies raised questions about the effectiveness of strict honor codes. In response, many universities have adopted "modified" honor systems, which do not necessarily require reporting violations and that offer a variety of punishments.

Huineng

IDENTIFICATION: Chinese Buddhist monk

BORN: 638, Southwest Guangdong, China

DIED: 713, Guangdong, China

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The sixth patriarch of Chinese Chan (Japanese, Zen) Buddhism, Huineng taught that liberation consisted not in overcoming desire but in not producing it in the first place.

Both the life and thought of Huineng are recounted in records that are legendary and polemical, so certainty about either is impossible. It is likely, however, that Huineng came from an impoverished family and went to the East Mountain in 674 to study Chan with Hongren, quickly gaining enlightenment. Huineng succeeded his master at Hongren's death, becoming the sixth patriarch. He emphasized that enlightenment came all at once. Subsequent to enlightenment, one engaged in various exercises to develop what had been born or discovered. Huineng was monistic but did not care to elaborate that monism. Consequently, he believed that good and evil, while contradictory, are only temporal realities. Behind that dualism lay a unity out of which the enlightened person acted. The implication of this idea is that acts are not so much right or wrong as measured by some standard as they are in harmony or out of harmony with the unity of things. Differently put, since there is no difference between oneself and others, one harms oneself if one harms others. If one realizes that there is no self, one will produce no desire.

Human Genome Project

IDENTIFICATION: International project launched by the U.S. National Institutes of Health and Department of Energy whose goal was to build a complete sequence map of the entire human genome, locating all the genes on their respective chromosomes

DATE: Begun in 1990

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: While the potential for good held out by the project is vast, it is recognized that firm legal, ethical guidelines for the use of human genetic information must be established and enforced.

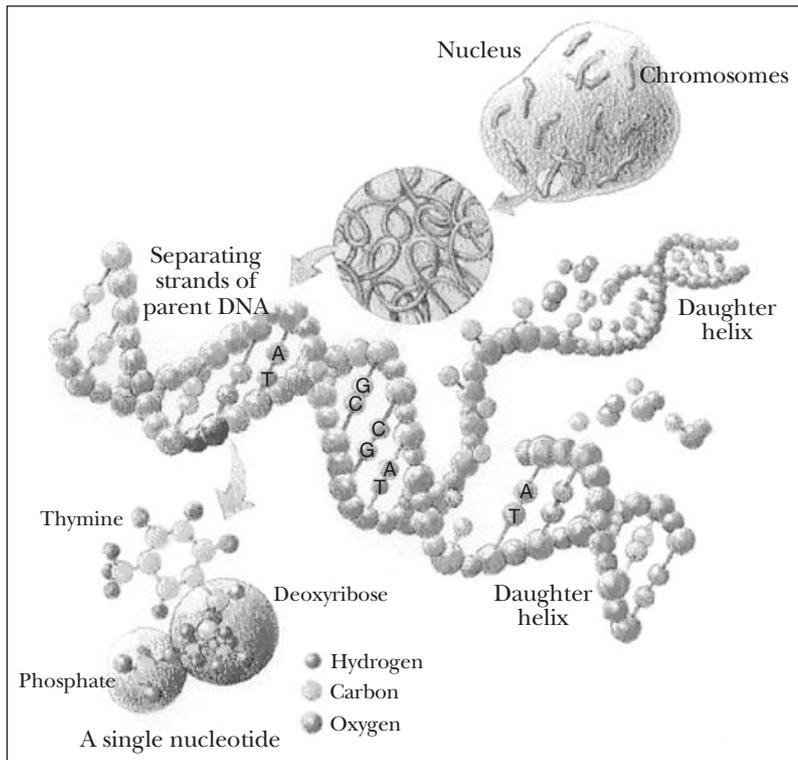

The Human Genome Project began in 1990 with the goal of better understanding the human genetic makeup and providing a free database to be used for

the common good of everyone. The project released its first draft of the human genome sequence in February, 2001. The chemical structure of each gene sequence provides scientists with the necessary information to identify which genes are associated with specific human traits and with diseases such as cancer, diabetes, cardiovascular, arthritis, Alzheimer's, deafness, and blindness. Through ethical use of the human genome information, the hope is that serious diseases will be treated more effectively and eventually eliminated through the development of new drugs and gene therapy.

Although the results of the Human Genome Project are based on the principles of science and technology, the project itself is permeated with complex ramifications related to politics, public opinion, public relations, economics, and ethics. Issues of genetic privacy, genetic discrimination, and genetic determinism arise. One fundamental question that has

Image not available

André Rosenthal of Germany's Human Genome Project explains genome sequencing at a press conference in June, 2000. (AP/Wide World Photos)

This illustration from the Human Genome Program of the Department of Energy shows the basic context of DNA replication from the cellular nucleus, which contains the chromosomes, to the separation of DNA strands and their replication at the molecular and atomic levels into daughter helices. (U.S. Department of Energy Human Genome Program, <http://www.ornl.gov/hgmis>.)

arisen is who should be genetically tested to determine his or her risk for contracting a debilitating disease and what should be done to prevent the misuse of such information. People undergoing genetic testing might face significant risks by jeopardizing their employment or insurance status. Since the process involves genetic information, such risks could also be easily extended to other family members. Confidentiality and privacy of an individual's genetic formation must be protected.

Other ethical concerns raised by the project include human cloning and the possible manipulation of genes to produce superior traits. Animal cloning has proven to be inefficient and often produces animals with debilitating conditions. Many scientists and physicians strongly believe that it would be unethical to attempt human cloning.

Genetic information derived from the Human Genome Project is expected to help future researchers gain a better understanding of the human system, including particular organs, tissues, and the complete chemistry of life. As this progress continues, scientists and ethicists have pointed out that legal and ethical guidelines must be established, updated, and enforced to prevent the misuse of human genetics from leading to the abuse of human beings. The U.S. Department of Energy and the National Institutes of Health have devoted about 5 percent of their annual Human Genome Project funding toward studying and dealing with the ethical, legal, and social issues associated with the availability of human genetic information. Positive benefits of Human Genome research must be maximized, while social, economic, and psychological harm must be minimized.

Human nature

DEFINITION: General inherent character or innate disposition of humankind

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: All ethical theories take a stance, whether explicit or implicit, on human nature. Some are based in a model of humanity's inherent virtues, which must be cultivated. Some are based in a model of humanity's inherent vices or sinfulness, which must be overcome or redeemed. Some hold that there is no human nature, and any attempt to assert one does violence to those whose characters do not conform to the model of humanity being put forward.

The question of "human nature" figures prominently in ethical theory. There is a broad consensus that, for all practical purposes, ethics must take into account the basic facts of human nature. Otherwise, it will be inefficient and ineffective. Although moral philosophers agree on the centrality of human nature to ethics, they do not agree on its meaning.

DEFINITIONS

Some definitions of human nature seek to identify the essential qualities and universal characteristics that all people have in common. Here it is necessary to distinguish between human nature and animal nature. While all people, by nature, have physical needs such as air, food, sleep, and an imperative to survive, these exigencies are by no means uniquely human. In addition, some distinctly human attributes or features, such as art, culture, creativity, cruelty, and historical consciousness, are by no means universal. Plenty of people lack a disposition toward creativity, a personality capable of torture, or a historical sense of themselves in relation to their ancestors and progeny.

Further complicating the problem of definition is the fact that human nature is a subject of study in numerous academic disciplines, each of which has a different approach. Philosophers must consider the views of psychologists, anthropologists, economists, criminologists, theologians, and sociobiologists, and reconcile the ways in which they understand and use the term "human nature." Another problem is the challenge posed by skeptics, such as Hannah Arendt, Jean-Paul Sartre, and Richard Rorty, who deny, on

various grounds, that there is such a thing as human nature. Skeptical claims rest on defining the term in a way that emphasizes its universal aspects (for which exceptions provide falsification) or emphasizing the importance of environmental influences (which serves to downplay the innate dimension of human personality). The varieties of usage and the many existing definitions create a problem of ambiguity. A useful working definition of human nature is "the general inherent character or innate disposition of humankind."

PERENNIAL QUESTIONS

Since ancient times, debates about human nature have revolved around the most basic questions of philosophy. Are humans essentially spiritual beings or primarily physical and rational beings? Are people basically good? Are human actions determined or does free will exist? To what extent are humans influenced by heredity and environment? Does human nature change? Are women significantly different from men? Although often posed as false dilemmas, these questions help define the parameters of the debate. Responses to these complex questions result in varying approaches to ethics.

Most controversial, perhaps, is the tension that exists between spiritualism and secularism. For those who regard humans as essentially spiritual creatures, it follows that ethics should help bring out humans' divine nature or promote their religious/spiritual welfare. Those who hold such a view believe that it is appropriate for ethical teachings to present people with the highest ideals. Religions call upon their adherents to master their natures. Moral responsibility implies that through knowledge, self-discipline, and will, people can control their desires, passions, and moods. Unfortunately, the variety of religious beliefs gives rise to conflicting prescriptions of right action. For those who embrace a secular view, religious ethical ideals lead to frustration and failure because they seem more appropriate for angels than for humans. Emphasizing spiritual values is illusory, often distracting people from the urgent problems of this world. For those who believe that humans embody souls, however, emphasizing the ephemeral, materialistic aspects of life neglects that which is truly important.

A belief in the basic goodness of people generates a moral outlook that is optimistic and trusts people to

behave ethically. David Hume observed that humans are distinguished by their capacity for benevolence. People have sympathetic feelings that stem from the consciousness that others experience pleasure and pain. Social theorists Jean-Jacques Rousseau and Karl Marx and humanistic psychologists Carl Rogers and Abraham Maslow all believed that humans are basically good, and they attributed human evil entirely to societal influences.

Rousseau and Marx regarded people as communitarian, and they sought to re-create society in a way that would bring out moral goodness. The humanist psychologists held that to be human is to have virtually unlimited potential for growth, and they called for freedom to promote self-actualization. Thomas Hobbes and Jonathan Edwards, however, denied the inherent goodness of people. Hobbes regarded people as fundamentally selfish, and Edwards saw people as morally depraved—deserving of hellfire and damnation. To control evil human impulses, both thinkers called for restraint to prevent human negativity from manifesting immoral behavior.

The vast majority of ethicists believe in free will. If actions are determined, people cannot be held morally responsible. Nevertheless, many metaphysicians, theologians, psychologists, and scientists argue for determinism in ways that would have dramatic ramifications for ethics as well as for education, law, and criminal justice. Arguments for determinism come in many forms: divine foreknowledge or fate, Sigmund Freud's claim that early childhood experience determines the basis of adult personality, B. F. Skinner's claim that human behavior is explainable in terms of operant conditioning, and scientific claims that "biology is destiny" and that "genes hold culture on a leash." If one accepts any of these theories, then one must reexamine the ethical principles of human accountability, autonomy, and choice. Moreover, these determinist theories also have various implications for the ongoing nature/nurture controversy.

Gender also raises interesting questions. Influenced by Stoic philosophy, some early Christian theologians, such as Tertullian, Saint Augustine, and John Chrysostom, based a belief in women's moral inferiority on Eve's sin of tasting the forbidden fruit in the Garden of Eden. Many feminists, such as Betty Friedan, argue that aside from the obvious physiological distinctions, the differences between men and

women are caused by cultural factors and that conceptions of femininity are essentially social constructs. Motivated by an activist agenda for political and social change, the feminist movement emphasizes the environmental factors in shaping sex roles. Attributing gender differences to human nature makes permanent change less likely, since it is far easier to change society than it is to alter nature.

Carol Gilligan, showing that Lawrence Kohlberg's model of moral development has been misapplied to females, argues that the sexes conceptualize moral problems differently. Gilligan explains that the male-dominated culture idealizes the moral values of autonomy, independence, and impartial justice. Women, who tend to stress such communitarian values as caring, relationships, and responsibilities to others, are unfairly held to a male standard. Hence, they are judged to be less developed morally rather than appreciated for communicating "in a different voice." A parallel view in traditional Judaism carries this idea further in claiming that women are, by nature, more gentle, caring, and refined than men, and that therefore they require fewer laws to regulate their behavior.

LEADING THEORIES

Perceptions of human nature lie at the heart of several important ethical theories. Ethical egoism asserts that only self-interest is intrinsically good and that a person ought to do that which is in his or her self-interest. This follows directly from psychological egoism, which claims that human beings are so constituted that they act only in ways that promote their (perceived) interest. The operative principle here is that "ought implies can." If one accepts this descriptive claim, then a practical moral system must appeal to a person's self-interest. An ethics based on altruism would be contrary to human nature and would therefore fail. Many cite the collapse of the Soviet Union to illustrate this point.

The egoist view is shared by Thomas Hobbes and Ayn Rand and is supported by capitalist economic theory. Sophisticated versions of ethical egoism attempt to create a moral order by channeling the natural motivative force toward self-interest in a way that is beneficial for society as a whole. Those with an "enlightened self-interest" recognize their personal interest in the welfare of society. It is noteworthy that although religions preach altruism, they all appeal to

self-interest by promising rewards and threatening punishments.

Hedonism is another moral theory that makes a normative claim based on a descriptive claim. Ethical hedonism asserts that happiness (that is, the presence of pleasure and the absence of pain) is the sole intrinsic good, and thus one always ought to do that which will promote the greatest happiness. This follows from the claim of psychological hedonism that humans are constituted in such a way that they always pursue pleasure and avoid pain. The fundamental tenet of Epicurus's moral teaching is that pleasure is the standard by which every good and every right action is evaluated.

Similarly, the British utilitarians Jeremy Bentham and John Stuart Mill considered hedonism to be the primary law of human nature, and their ethical writings stress the need to maximize pleasure and minimize pain. In their theory, hedonism is distinguished from egoism by its commitment to the universalist value of taking everyone's happiness into account. Simply pursuing one's own happiness is selfish and unethical. Defending hedonism, Mill's version of utilitarianism emphasized the distinctly human capacity to develop and refine one's tastes and preferences, and he underlined the importance of pursuing the "higher pleasures."

Ethical theories that regard humans as basically rational creatures make appeals to reason to motivate people to right action. Some major theories, such as those of Aristotelian and Kantian ethics, objectivism, and natural law, rely on humans' power of reason to lead them to universal moral truth. Theories such as subjectivism and relativism, however, discount the power of reason. They are also based on the belief that humans are characterized by individuality and diversity. This belief leads to a denial of absolute, objective, and universal values and points instead to the importance of personal feelings, tolerance, and cultural influences. Many proponents of these beliefs deny that there is such a thing as universal human nature.

Hume, an outspoken subjectivist, believed that human reason is limited. He was a skeptic who recognized the unlikelihood of uncovering the ultimate qualities of human nature, yet he also thought that careful observation of human behavior could lead to some knowledge about human nature. His empirical approach led him to emphasize passions or feelings

as the source of voluntary actions. In *A Treatise of Human Nature* (1739) he wrote: "Reason is and ought only to be the slave of the passions, and can never pretend to any other office than to serve and obey them." Hume argued that feelings of benevolence and sympathy are universal tendencies of human nature. People have a natural concern for the welfare of others, just as they care about themselves. He recognized self-love as a powerful principle of human nature, but he rejected Hobbes's sweeping claims for psychological egoism.

Hume also incorporated hedonism into his theory. He identified good with pleasure and evil with pain, establishing happiness as the moral standard for judging behavior. Moreover, he gave a central role to utility (defined as "usefulness" or the "tendency to ulterior good") in assessing right and wrong. By combining a number of motivating factors into his theory, Hume avoided the trappings of reducing human nature to a single, dominant drive.

Another nonreductionist theory was developed by the American philosopher John Dewey, who sought to base morality on a scientific understanding of the human being. For Dewey, morality involves the relationship between human nature and the social environment. He describes human nature as an unorganized mass of reflexes and impulses that are shaped by the social forces of habit, custom, and institutions. Because human nature is a part of nature, morality is linked with the natural sciences. Likewise, because people interact with others in social settings, morality is linked with the social sciences. Dewey held that people live in a social world characterized by change and that people have the ability to restructure their social environment and change human nature. Ethics entails making choices, and Dewey advocated conscious, reflective conduct that would lead to growth and improve the world. Through education, it is possible to encourage those habits that foster creative problem solving and intelligence.

An important, ambitious theory of human nature that presents a challenge to moral philosophy is E. O. Wilson's sociobiology, which he defines as "the systematic study of the biological basis of all forms of social behavior in all kinds of organisms, including man." Drawing upon genetics, population biology, ethology, and entomology and interpreting them all in terms of Darwinian evolutionary theory, Wilson sees genetic survival as the overriding aim of life.

Morality is subordinated to this goal, because the cultural development of higher ethical values will not overcome the power of genetic evolution.

Wilson incorporates such phenomena as love, altruism, aggression, and religion into his theory and insists that a practical system of ethics must conform to that theory. For example, he considers altruism to be “disguised genetic selfishness.” Sociobiology remains highly controversial. It rocks the premises of both religious and secular ethics by questioning the view that humans are the only rational animal as well as the claim that humans have a morally distinct status. Moreover, sociobiology can be construed to justify the status quo or to offer a rationale for Social Darwinism. Wilson’s own interpretation argues for tolerance, cooperation, diversity, peace, and environmentalism, but these lofty (and vogueish) values do not necessarily follow from his descriptive claims.

CONCLUSION

The many theories touched upon here have something to teach. While most of them identify some aspect or truth about human nature, sweeping reductionist claims to validity generate exceptions or contradictions that are not easily resolved. For example, a stubborn proponent of egoism or sociobiology must really stretch to redefine all acts of altruism as ultimately selfish. The many competing theories and the different approaches to ethics that follow from them underscore the difficulty of reducing human nature to a single factor or tracing it to some given set of causes. This is because reality does not easily conform to theory or handy categorizations. People are not uniform, and their priorities, interests, and values are legitimately diverse. The numerous perceptions in circulation lend credence to the conclusion that there may be a variety of human natures, just as there are a variety of personality types.

While it may contradict the claims of hedonism, not everyone pursues a life of happiness. Some people shun physical comfort or emotional and intellectual pleasures and instead choose to endure suffering and hardship. A soldier, artist, or religious devotee may rationally pursue a lifestyle characterized by sacrifice and pain, without any desire or hope for happiness. Similarly, while many people live according to the principles of sociobiology, many do not. It is hardly unusual to encounter people who have no interest in having children; or who are kinder to

strangers than they are to their own relatives; or who consider cats, whales, or jewelry more important than people.

The existence of diverse human natures is not only evident among people or groups of people on a macro level, it is also observable on a micro level. Individuals, over time, demonstrate a combination of drives that support several theories in a limited way rather than inclusively. For example, a man may be motivated by self-interest as a consumer; by aggression, self-sacrifice, and selfless devotion to strangers as a soldier; by altruism and generosity as a father; by piety when performing religious rituals; and by some combination of these characteristics in his professional career. Moreover, the same man may act with reckless disregard for his health, family, religious beliefs, and career while intoxicated or angry.

Human diversity and intricacy on both the individual level and the group level make the task of articulating universal generalizations about human nature extremely problematic. Thus far, the complexity of the human experience lends itself neither to a clear and convincing theory of human nature nor to a moral philosophy upon which most people agree. The questions surrounding human nature remain unresolved. For this reason, the study of human nature continues to be a fascinating and open field for speculation and research.

question of who gets to define the human, and who gets excluded when such definitions are created.

Dewey, John. *Human Nature and Conduct*. Vol. 14 in *The Collected Works: The Middle Works*, edited by Jo Ann Boydston Carbondale: Southern Illinois University Press, 1985. Analyzing the interaction between psychology and ethics, Dewey focuses on the social power of habit. Individual human nature is an unorganized mass of impulses that comes to be shaped by the social environment. By reconstructing society, people can change human nature. Social institutions such as education can promote habits that constitute intelligence and growth.

Hobbes, Thomas. *Leviathan*. Edited by Richard Tuck. Rev. student ed. New York: Cambridge University Press, 1996. Hobbes bases his political and moral philosophy on the presupposition that all humans are equal in the sense that they are all vulnerable to being murdered while they sleep. Reduces “human nature” to this vulnerability and implicitly rejects any more substantive definitions or claims.

Hume, David. *A Treatise of Human Nature*. London: Everyman, 2003. Hume’s masterpiece follows his conception of philosophy as the inductive science of human nature. His observations of human thinking and behavior lead him to a nonreductionist ethical theory that combines benevolence, sympathy, self-love, hedonism, custom, and justice.

Mandler, George. *Human Nature Explored*. New York: Oxford University Press, 1997. A comprehensive analysis of the concept of human nature, incorporating evolutionary and genetic theory, psychology, social and political philosophy, and philosophy of mind.

Wilson, Edward O. *On Human Nature*. Cambridge, Mass.: Harvard University Press, 1978. A readable and thought-provoking synthesis based on Wilson’s theory of sociobiology. His consideration of evidence is somewhat uneven, since he gleans information from academic studies ranging from anthropology to zoology.

Human Nature and Conduct

IDENTIFICATION: Book by John Dewey (1859-1952)

DATE: Published in 1922

TYPE OF ETHICS: Modern history

SIGNIFICANCE: *Human Nature and Conduct* fostered a positive, liberal view of human nature, proposed that philosophy should provide practical service to humanity, and reemphasized the role of creative intelligence in controlling events.

The American philosopher John Dewey bared many of his seminal ideas in *Human Nature and Conduct*. Drawing on themes found in Charles Darwin’s *On the Origin of Species* (1859), one of the modern world’s most influential studies, Dewey defined human beings as creatures within the natural order who, like members of other species, were obliged to adapt continually to one another and to their environments in order to survive. In this context, Dewey argued that past philosophies had been too abstract and too concerned with constructing intellectual systems to serve humanity’s practical needs.

Much like his fellow American philosopher William James, Dewey also believed that truth was what happened to an idea and therefore, that truth changed over a period of time. For Dewey, life began and ended in human experience; in other words, humans who used appropriate methods could successfully negotiate life’s confusing, obscure, and indeterminate situations. The key to coping with such problems, Dewey insisted, was using insight to define problems, establishing a set of possible solutions, determining the likely consequences of each possibility, and then evaluating the best possibility through observation and experiment.

These flexible steps, which produced what Dewey called “warranted assertibilities,” were, he believed, as relevant to social reform as they were to laboratory science. The purpose of warranted assertibilities and the inquiries of which they were a part was changing specific situations. Ideas, in short, were instruments. Humankind, like other species, had no fixed natural end; therefore, events could be shaped by open-ended, democratized inquiry and the freeing of human intelligence. The greater the number of human alternatives, the freer humans could become.

In *Human Nature and Conduct*, Dewey championed both naturalism and instrumentalism, upon

which he elaborated later in his many writings. As a reformer, he earned international esteem for the fresh directions that he advocated in education and in the democratization of social and political institutions—a democratization that he regarded as essential to human adaptability and the problem-solving play of the human intellect.

Human rights

DEFINITION: Body of rights believed to belong fundamentally to all persons

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Advocates of human rights believe that those rights exist independently of their recognition by any legal or political authority. Indeed, the purpose of the concept of human rights is to provide an apolitical moral principle that will form the basis for efforts to protect those people who are not protected, or who are harmed, by their own sovereign governments.

The idea of human rights as a field of study and as a body of legal rights and obligations is a relatively recent phenomenon that has grown out of ancient roots and faces two timeless problems. The fundamental problems facing the enterprise are, first, what to recognize as a human right, and, second, and even more troublesome, how to guarantee the protection of such rights once they have been recognized. These problems have been part of the political and social life of human beings for all time. How does one protect people from the unjust and sometimes brutal treatment of their fellows? Many governments throughout the ages have devised legal systems to reduce, mitigate, and relieve injustices committed by citizens or subjects against one another, but how does one protect the citizens or subjects of a country from their own government? These timeless and fundamental problems continue to face governments in both their domestic and their foreign affairs.

From the standpoint of ethics, human rights serve

as a statement of the aspirations of peoples and governments toward ideals that are not always attained in practice and that at times lead to contradiction and conflict. Human rights represent an effort by governments, international agencies, and nongovernmental (NGO) advocacy groups to overcome the harsher aspects of political life within and between countries.

Although considerable progress was made in recognizing human rights during the twentieth century, the fact that they are referred to as human rights rather than legal rights reminds one how far modern practices are from stated ideals and aspirations. Moreover, the pursuit of human rights objectives involves hard choices about whether members of the international community may, how they should, and even whether they can punish the most egregious offenders of human rights, which are often governments that can claim and defend traditional rights of sovereignty against external scrutiny and encroachment.

HISTORY

The notion of human rights is a relatively recent innovation in the history of political thought, tracing its roots to the social contract thinkers, such as Thomas Hobbes and John Locke, who insisted during the seventeenth and eighteenth centuries that individuals possess certain natural rights that serve as the very foundation of political order and that may not be legitimately revoked by governments. This revolutionary concept served as the foundation upon which the great statements of individual rights and liberties—the American Declaration of Independence and the French Declaration on the Rights of Man—were based.

If the concept of natural rights is relatively new, the notions that individuals deserved dignity and respect and that particular citizens of particular cities were invested with certain rights were ancient. The ancient Greek polis, for example, recognized that its citizens had certain rights and privileges that were denied to aliens, while also recognizing that the polis and its individual members might have obligations to aliens, but whatever rights or privileges a citizen or subject enjoyed by custom, tradition, or statute were potentially subject to revision. The rights, in other words, were conventional in nature. They could be granted or taken away. They did not inhere in individual persons. Indeed, whatever rights citizens or even

aliens might have been ultimately overshadowed by their duties to the state and to their fellow citizens or subjects. So it was later in Rome. A Roman citizen might have a right to suffrage and a means of political participation through the tribunes in republican Rome, but the empire's constitutional shift to monarchy saw these rights substantially altered. Rights came and went with the vagaries of politics and constitutions.

In the ancient world, the emergence of the Stoic and the Christian conceptions of human equality and dignity foreshadowed a more universal and abiding conception of rights. Both the Stoics and the Christians believed in the divine origin of creation. Both believed that human beings were endowed by that creator with a basic equality and that virtue rather than vice, mercy rather than severity, and charity rather than cruelty were the standards of upright living, whether for the ruler or the ruled. Yet still the concept of rights rested on convention and was rooted in the tumultuous, changing, and unreliable world of politics, where brutality was often respected as greatly as clemency was admired.

In Europe, after the eclipse of Roman domination, Christianity gradually gained ascendancy. The rulers as well as the ruled operated within a system of duties and responsibilities defined by Christianity itself. Customary and canonical restraints helped to prevent outrages against humanity, but the rough and tumble of political competition was never really fully tamed, and centuries of contention over the proper roles of the church and state in moral and temporal affairs culminated in the brutal wars of religion during the sixteenth and seventeenth centuries, following the Protestant Reformation. Roman Catholic and Protestant monarchs and princes gradually recognized that a new order resting on the sovereignty of states would be necessary to quell the sectarian violence. States would create their own rules and regulations without outside interference. They would treat their citizens as they pleased, without regard to any "higher law" that a church might assert. They would be the ultimate sovereigns.

It was at this time, then, that Hobbes and Locke asserted the conception of natural rights, offering to ground the newfound virility of the independent and sovereign state on a principle that would recognize the rights of its people. Their notion did not find wide support among the monarchs of their own time, who

were just then enjoying the unlimited powers associated with the rule of an absolute sovereign, but in time the conception of natural rights took root. Modern experiments with democratic regimes founded on the principle emerged, and with them came regimes that were committed to a universal conception of human rights.

RIGHTS AND CONSTITUTIONALISM

Realization of this broader conception of human rights was hampered, however, by the very international system that made it possible for certain governments to develop constitutions that were rooted in conceptions of natural and human rights. Democratic regimes resting on such principles found themselves in contention with authoritarian regimes that either did not recognize such principles or only paid them lip service. Even the democratic regimes often failed to live up to their own standards. Nevertheless, democratic states during the late nineteenth and early twentieth centuries made the first international efforts to protect human rights by pursuing the gradual abolition of slavery and beginning to enforce anti-slave-trading measures. Similarly, during the early part of the twentieth century, governments in Europe took interest in protecting minority populations and promoting the development of humanitarian law, especially to protect vulnerable groups in time of war.

Human rights today, as in the past, can only be effectively guaranteed by individual governments that agree to respect them. The international system is still composed, even in the twenty-first century, of sovereign states that have exclusive legal control over their own territories and citizens. There is no world government or authority higher than the governments of states that can impose human rights obligations, although some regional systems for protection of human rights have developed, particularly in Europe. Rather, governments, at their sole discretion, may agree voluntarily to develop domestic legislation guaranteeing human rights or to sign international agreements promising to respect them.

Nevertheless, the twentieth century witnessed a veritable explosion of human rights activity, much of which was given impetus by the horrible atrocities witnessed during two global wars. First, after World War I, the League of Nations, gingerly and without great success, and then, after World War II, the United Nations (U.N.), with greater effectiveness,

addressed the problems of collective insecurity, war, and abuse of human rights. Governments determined the pace of progress in these endeavors, since the League of Nations and the United Nations lacked sovereignty and possessed only those authorities and mandates that had been granted to them by their member states. Nevertheless, especially since World War II, the world has witnessed a proliferation of U.N.-related human rights agreements by which governments sought to recognize, promote, and guarantee the development of human rights. Most of the guarantees, however, are very fragile, and continue to call upon governments as the principal mechanisms through which human rights are protected.

UNITED NATIONS ACTIVITY IN HUMAN RIGHTS

Article 1(3) of the U.N. Charter stipulates that one of the purposes of the United Nations is “to achieve international cooperation . . . in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion.” Numerous additional references to human rights are made in the Charter. The Charter also stipulates in Article 2(1), however, that “the Organization is based on the principle of the sovereign equality of all its Members,” and in Article 2(&) that “Nothing contained in the present Charter shall authorize the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state.”

Protection of human rights may be a fundamental purpose of the United Nations, but state sovereignty serves as a fundamental organizing principle. States, not the United Nations, would do the determining about how human rights would be encouraged and protected, although they agreed to pursue these ends jointly and separately. To this end, U.N. member states created a Human Rights Commission that would report to the Economic and Social Council (ECOSOC). In short, the U.N. Charter reflected the still rather ambiguous status of human rights. They became a priority for governmental attention, but governments preferred to protect their sovereign prerogatives. Hence, governments paradoxically remained, as they had for centuries, the chief guarantors, as well as the chief violators, of human rights.

Despite setbacks, much progress in recognizing, if not in fully protecting, human rights has been made. The U.N. General Assembly, on the recom-

mendation of the Human Rights Commission, adopted the Universal Declaration of Human Rights in 1948. This declaration, though not legally binding, did articulate the full range of human rights that states proclaimed should be respected, including the rights to life, liberty, security of person, nationality, and equal protection under and nondiscrimination before the law, and freedom from slavery and torture, freedom of religion, of political preference, and of movement, to name only a few of the most important provisions. Subsequent human rights treaties sought to provide legally binding protections, while many governments incorporated the declaration in whole or in part into their constitutions.

Not all governments that have taken these steps are known for their scrupulous adherence to human rights principles, while many others have not signed the most important conventions—the Covenant on Civil and Political Rights and the Covenant on Economic and Social Rights—which were adopted by the U.N. General Assembly in 1966 and entered into force for the signatories in 1976. Numerous treaties dealing with more specific issues have also been promulgated, including international agreements on refugees, stateless persons, elimination of racial discrimination, the political rights of women, the rights of children, and the rights of migrant workers. Added to this are numerous regional treaties, the most important and effective of which is the European Convention on Human Rights.

Like all past efforts at protecting individual rights and liberties, U.N. activity has faced the question of how to enforce human rights standards given the prevailing standard of state sovereignty. In general, formal international enforcement mechanisms remain rather weak, with states taking the leading role through their domestic systems in protecting human rights standards through domestic legal institutions. Informal pressure through private diplomatic channels, NGO advocacy groups, and the public media does, however, often lead to better state compliance with human rights standards.

ETHICAL CONSIDERATIONS

To a large extent, human rights standards remain guidelines for how governments *should* behave, rather than legal descriptions about how they actually *do* behave. Moreover, human rights often posit potentially contradictory standards. Human rights obli-

gations may require states to ensure that their people receive adequate nutrition, security of person, and a rudimentary education while at the same time calling for popular political participation, free elections, and freedom of speech. In a very poor country plagued by civil war, however, achieving stability may be incompatible with modern democratic norms. Governments are concerned primarily with survival and only secondarily with reform.

Human rights are most regularly and routinely violated in countries where meeting the most basic needs of people is most difficult. These governments may well subscribe to international human rights treaties, but if domestic political circumstances are not favorable, compliance with them is doubtful. Some human rights treaties bow to this reality, granting states the right to derogate from certain human rights obligations once due notice and explanations are provided. The U.N. Covenant on Civil and Political Rights, for example, allows governments, during times of national emergency, to revoke or curtail rights to privacy, liberty, security of person, peaceable assembly, and political activities. Other rights, however, such as freedoms of religion, thought, and conscience, as well as prohibitions against slavery and torture, remain obligatory at all times.

What should be done with those governments that routinely shock the conscience of humanity by brutalizing their own citizens? An ethical dilemma is created here, since the principle of sovereignty imposes a duty of nonintervention in the affairs of states. A state may have a legal right to intervene to protect its own citizens from human rights abuses at the hands of other governments, but what right does it have to do this on behalf of another state's citizens? Under current international mechanisms, such an intervention would have to be conducted under U.N. auspices and justified, not by recourse to human rights, as such, but as a matter constituting a threat to international peace and security.

These questions have been faced in several modern civil war situations, including Iraq's treatment of Kurds and Shi'ites, Serbian treatment of Muslims in Bosnia, and in Somalia. In cases in which a country's population is facing genocide or disaster threatens large numbers of people, strong and quick action is required to save life. In all such situations, the problem that emerges is whether and how force should be used to achieve human rights objectives.

One consideration that must be taken into account is the circumstances surrounding the threat to life. Does the threat exist because of the deliberate policy of the government or because of the government's inability to cope with disaster? In Somalia, the situation involved anarchy produced by the lack of any effective government. Humanitarian intervention in that case was relatively easy to justify and to accomplish. The issue is considerably more complicated and dangerous when governments undertake deliberate genocidal or persecutory policies. How much killing should the international community resort to in order to prevent killing? What severity of economic pressure should be imposed to prevent persecution or ensure nondiscrimination? What degree of force will be effective? Is any degree of potential force or pressure likely to succeed?

Enforcement of international law and human rights in conflict situations sometimes presents very painful ethical and prudential choices. This explains in part the international indecision about how to deal with ethnic cleansing in Bosnia, where the use of force to achieve human rights objectives raises a series of thorny questions. In the case of Iraq, a more determined U.N. response to Iraqi government persecution of its own people was made possible by its clearly illegal invasion of neighboring sovereign, Kuwait, and by the cease-fire obligations it agreed to in the aftermath of its expulsion from Kuwait by coalition forces.

There are relatively few cases in which the courses of action open to governments, international agencies, and private groups are so stark. In most instances, the ethical questions for international human rights policy turn on how to apply the right amounts of persuasion, diplomacy, and publicity to realize humanitarian objectives. The humane treatment of prisoners, for example, is constantly monitored by the International Committee for the Red Cross and Amnesty International. By pursuing quiet modes of diplomacy or by publicizing human rights violations, such groups can bring pressure to bear on governments to comply with more acceptable human rights practices. These informal efforts, together with ongoing attempts to convince governments to ratify and comply with international human rights agreements, hold out hope that human rights will in fact one day become legal rights widely protected by governments.

Human Rights Watch

IDENTIFICATION: Independent, nonprofit human rights advocacy organization

DATE: Founded in 1978

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Human Rights Watch is one of the largest and most influential advocacy organizations that documents abuses of political, social, and economic rights around the world.

Human Rights Watch is an organization predicated on the idea that human rights are universal, applying equally to all individuals. The organization is concerned with traditional political rights, as well as

broader social and economic rights. The mission of the organization is to document and publicize rights violations, whether they are committed by state or nonstate actors, in order to shame and hold the rights violators publicly accountable.

Human Rights Watch was established in 1978 as Helsinki Watch, an organization that focused narrowly on tracking Soviet and Eastern European compliance with human rights commitments made by those regions' governments in the 1975 Helsinki Accords. Over its first decade, the organization and its mission steadily expanded. During the 1980's, a series of regional "watch committees," such as America's Watch, arose. In 1988, these watch committees were brought together and the overall organization was renamed Human Rights Watch.

By the first years of the twenty-first century, Human Rights Watch was the largest human rights organization based in the United States, with nearly two hundred full-time staff members and an annual budget of approximately twenty million dollars. It accepted no public money and raised all its funds from private donations. Headquartered in New York City, Human Rights Watch also maintained permanent offices in Washington, D.C., San Francisco, Los Angeles, London, Moscow, Brussels, and Hong Kong.

ACTIVITIES

Human Rights Watch is often compared to Amnesty International; however it deals with a broader set of issues than the latter organization and carries out its advocacy by different means. While Amnesty International focuses mainly on physical abuses—such as political imprisonment, torture, and killings—Human Rights Watch addresses a much broader set of rights. Human Rights Watch concerns itself with such issues as press freedom, discrimination, the conduct of war, the use of land mines, fair labor practices, and social and cultural rights.

Human Rights Watch also pursues a different methodology than that of Amnesty International. While the latter organization mobilizes its membership to lobby directly on behalf of individual human rights victims, Human Rights Watch seeks to document and publicize patterns of abuses. The intent is to shine a bright light on abuses, to shame and embarrass abusers, and, by extension, to deter potential future abusers. In pursuit of this strategy, Human Rights Watch conducts fact-finding missions, pub-

lishes extensive reports, and then works with governments and international organizations to build pressure for change.

Beyond its publications and topical reports, Human Rights Watch has provided expert testimony in international war crimes trials, played a lead role in a coalition of organizations drafting a treaty to ban the use of child soldiers, and, along with other organizations in the International Campaign to Ban Landmines, won the 1997 Nobel Peace Prize.

Humane Society of the United States

IDENTIFICATION: Advocacy group devoted to the alleviation of animal suffering

DATE: Founded in 1954

TYPE OF ETHICS: Animal rights

SIGNIFICANCE: The Humane Society of the United States was founded to counteract the conservatism its founders believed was then inhibiting the effectiveness of other animal welfare societies, such as the American Humane Association and the Society for the Prevention of Cruelty to Animals.

During the 1940's, legislation was passed requiring the provision of animals for research laboratories by federally supported humane societies. Initially, the

The Humane Society and Elephant Ethics

By the turn of the twenty-first century, animal rights organizations were focusing increasing attention on zoos. Of particular concern was the welfare of captive elephants, which require great amounts of space and costly and difficult care. Many public zoos acknowledged their inability to provide adequate space and conditions to keep their elephants physically and mentally healthy and were giving animals with health problems to other zoos with better facilities. In May, 2004, however, the directors of the Detroit Zoo decided to give away its elephants for another reason. One of largest public zoos in the United States, the Detroit Zoo already provided a spacious facility for its two Indian elephants. However, its directors concluded that Detroit's cold climate was not good for elephants and that the elephants would do better in a more spacious animal sanctuary. Wayne Pacelle, the chief executive officer of the Humane Society of the United States, applauded the Detroit Zoo's decision. He pointed out that the zoo was the first with spacious grounds and adequate care to give up its elephants for ethical reasons and expressed the hope that other zoos would follow Detroit's example.

American Humane Association (AHA), led by president Robert Sellar, vigorously opposed these "pound seizure laws." With Sellar's death, however, a new conservative leadership was elected to the AHA. Frustrated by the ineffectiveness of their organization, three key AHA personnel, all appointees of Sellar, formed a new association, the Humane Society of the United States (HSUS). Dedicated to the alleviation of suffering in domestic and wild animals, the HSUS polices animal research centers, zoos, and the entertainment industry. Furthermore, the HSUS opposes all hunting sports and calls for a drastic reduction in the use of animals in biomedical experiments.

The society also lobbies for the strengthening and extension of legislation protecting animals. Public education related to the inherent rights of animals and human responsibility in securing those rights is

furthered through a division within the society, the National Association for the Advancement of Humane Education.

Humanism

DEFINITION: Philosophy based on the freedom, responsibility, and rationality of human beings, and the centrality of human values

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Humanism is embraced by those who believe in human nature and who seek a secular, nonsupernatural value system, or a universalist, nonsectarian religion. It is attacked by those who reject the idea that all humans have a common nature or values and who are therefore suspicious of the supposedly universal values put forward in the name of Humanism. It is also rejected by sectarian religious movements.

Although it has classical and Renaissance roots, modern Humanism is a child of the European Enlightenment. Elsewhere—for example, in India, Japan, and China—it appears in some forms of Buddhism (Theravāda Buddhism, Zen) and Confucianism. Among Humanism's modern antecedents were "natural religion," Deism, "free thought" and "the religion of humanity" (proposed by the nineteenth century French sociologist Auguste Comte).

The development of natural science, of liberal democracy, and of secular society marked the institutional context of Humanism. Nineteenth century social reform in the United States and democratic socialism in England and Europe reinforced the move toward a human-centered philosophy. Critical studies—for example, the "higher criticism" of scripture, archeology, and comparative religious scholarship—encouraged a skeptical view of transcendent and supernatural bases for ethics and politics. With the advent of Darwinism and the development of modern biology, sociology, and psychology, the stage was set. Thus, during the early decades of the twentieth

century, modern Humanism appeared as both a secular philosophy of living and a religious movement.

The term “Humanism” was not always used. For example, American pragmatism and instrumentalism were both naturalistic and humanistic. Explicit use of the term in its modern form appeared with the emergence of a “religion without god” in the thought of three twentieth century Unitarian ministers: John H. Dietrich, Curtis Reese, and Charles Francis Potter. While they and a few of their colleagues in Unitarianism and the Ethical Culture Societies were moving toward a “religious” Humanism, a secular expression of the same notion was appearing in the work of naturalistic philosophers such as Roy Wood Sellars and John Dewey. Both threads came together with the publication of *The Humanist Manifesto* (1933).

A second *Manifesto* (1973) and *A Secular Humanist Declaration* (1981) expanded but did not alter the meaning of the 1933 document. Signed by some thirty-five philosophers and religious leaders, *The Humanist Manifesto* marked the entry of an independent explicit Humanism into the Western world. Before that, Humanism had been attached to existing movements, such as Christian Humanism and Socialist Humanism, or had other names, such as Ethical Culture and Free Religion. With the founding of The American Humanist Association (1941) and The North American Committee for Humanism (1982), Humanism as a philosophy of living was formally established. After World War II, similar developments in Great Britain, Netherlands, Belgium, France, Germany, and India led, in 1952, to the organization of the International Humanist and Ethical Union, which had its headquarters in Utrecht, Netherlands.

PHILOSOPHICAL BASES

Humanism rests, philosophically, on two classical notions: the sophist Protagoras’s belief that “man is the measure of all things” and the poet Lucretius’s naturalistic interpretation of life and world. In these two root ideas, the career of modern Humanism was foreshadowed. The human-centered feature of Humanism appears in its commitment to human responsibility and freedom. Denying the mistaken view that Humanism is merely the arrogant replacement of God by the human person, freedom and responsibility require human beings to acknowledge their obligation to judge, choose, and act and their opportunity to make a difference to themselves and the world around them.

Human beings, thus, are autonomous moral agents (for example, see the ethics of Immanuel Kant).

From this view flows the commitment to democracy as the social and political expression of agency, to education as the method of developing competence as an agent, and to science as the outcome of organized intelligence. From this view, too, flows Humanism’s skepticism about God and the gods, a skepticism rooted in a rejection of authoritarianism at least as much as in a theological argument about the existence or nonexistence of an all-powerful and all-knowing Being.

From classical Humanism comes modern Humanism’s acknowledgment of the interdependence of all beings as well as an appreciation of the beauties and harmonies of the world. At the same time, a tragic note is heard, since Humanists are sensitive to the fact that the world is as precarious as it is dependable and that experience is as surprising (for good or ill) as it is predictable. Thus, Humanist agency is admittedly finite as human insight, and human existence itself is finite. A stoic quality, therefore, attaches to Humanism, a sense of acceptance of the givenness of the world and of the uncontrollable in nature and the individual. Admittedly, the Enlightenment notion of “progress” interpreted the direction of history as ultimately positive, and early twentieth century Humanism interpreted “evolution” as confirming that direction. Post-World War II Humanist thought, particularly because of its Existentialist inspiration, is likely to acknowledge the darker sides of both the individual and the world.

Finally, agency and creativity evolve on the basis of human rationality—the ability to make and understand distinctions, to grasp connections and consequences, and to draw sensible conclusions. Institutionally, this appears as Humanism’s commitment to science. It also appears in the celebration of human powers, which it owes to Renaissance Humanism, the move from naturalistic appreciation to Humanist aesthetic sensibility. Overall, then, Humanism is a philosophy of living that views the human person as a rational agent living in a world that both supports and limits him or her. Instead of bemoaning fate or escaping to another and more secure world—a supernatural or transnatural world—the Humanist accepts, enjoys, and works within the constraints that he or she acknowledges as given with the givenness of being.

Hume, David

IDENTIFICATION: English philosopher
 BORN: May 7, 1711, Edinburgh, Scotland
 DIED: August 25, 1776, Edinburgh, Scotland
 TYPE OF ETHICS: Enlightenment history
 SIGNIFICANCE: The most famous and influential proponent of skepticism in the modern era, Hume worked to free ethics from a metaphysical basis rooted either in religion or in natural law. His most important works include *A Treatise of Hu-*

man Nature (1739-1740), *An Enquiry Concerning Human Understanding* (1748), and *An Enquiry Concerning the Principles of Morals* (1751).

In his philosophy and in his theory of ethics—or morals, the term he preferred—David Hume was the complete empiricist. That is, he denied the validity of any knowledge that existed outside the realm of sensory experience. His ideas and writings were diametrically opposed to the teachings of the established church, which maintained that a vast body of metaphysical knowledge existed that could be revealed to humankind only by the grace of God. This was the basis for the formulation of Christian ethics, which were considered eternal.

The philosophers of the Enlightenment had in many ways created a similar metaphysical world of science or nature and had charged humankind with the task of discovering its secrets. For Hume, no knowledge for which there was no antecedent sense impression could claim any validity.

A TREATISE OF HUMAN NATURE

This seminal work has had a profound effect on the development of Western philosophy in many areas: on the evolution of human institutions, on the limitations of knowledge, and on changing moral values. The book is, in a sense, Hume's only work, since all of his subsequent writings were either related to or were reworkings of parts of the original work. Divided into three parts, "Of the Understanding," "Of the Passions," and "Of Morals," the book consists essentially of two parts: one examining how knowledge comes into being and another focusing on the relationship of knowledge to the development of ethics or morals.

AN ENQUIRY CONCERNING HUMAN UNDERSTANDING

The basic theme of the *Enquiry*, a reworking of the first part of *A Treatise of Human Nature*, is that all opinions, all theories, and all knowledge, in order to be validated, must be submitted to the test of experience. The idea of unknowable substance has no empirical justification in either the spiritual or the material sense. Hume posited the validity of causality. A given cause has always been followed by a given effect. Only custom, repeated experience, and familiar-

ity, however, make it possible to ascertain the development of the effect. Were the knowledge or theory not in the mind, it would not exist. Hume anticipates the relativity of the nineteenth century when he asserts that the opposite of every fact remains possible and that no amount of deductive reasoning from first principles can determine in advance what course nature actually will follow.

AN ENQUIRY CONCERNING THE PRINCIPLES OF MORALS

To free ethics or morals of their religious bases, Hume first had to attack the religious establishment, which he did in a subtle but devastating manner. So fearful were his supporters of the reaction to his work that *An Enquiry Concerning the Principles of Morals* was published posthumously. In his *Essay on Miracles*, published in 1748, Hume stated that a miracle in the sense of a supernatural event as a sign of the divinity cannot possibly be established. Rather than constituting evidence of moral and spiritual value, such events are characteristic of sorcery or wizardry.

Once he had stripped away the religious connection, Hume developed his theory of ethics or morals on the basis of pleasure, pain, and utility. It was useless to reason that virtue was “natural” and vice was “unnatural,” since both were “natural.” Reason is equally useless. Perfectly inert, it can never be the source of so active a principle as conscience or a sense of morality. The solution devolves on the individual. Inherent in all humans are basic feelings or instincts toward family, neighbors, and society. Turning inward, one tends to project oneself into another’s situation and to imagine how one would feel under certain circumstances. Happiness in others creates joy, while misery generates sorrow. In other words, conduct is good in proportion to its capacity for producing happiness; conversely, conduct is evil in proportion to its capacity to produce pain. The result of the first is virtue; the result of the second is vice. The greater the pleasure or joy, the greater its utility. It is left to the cognitive and reasoning facilities of humankind to create from these myriad pleasure-pain-utility experiences a coherent ethical code.

Limiting the hedonistic application of this system of ethics and morals based on pain and pleasure was Hume’s concept of justice. This was not arrived at by nature but by human conventions. Of all the animals, humans alone suffer a great disparity between their

David Hume. (Library of Congress)

wants and their means of satisfying them. Stability of possession, transference by consent, and the performance of promise are the three fundamental laws of nature. Society is necessary for human existence, and society in the name of justice doles out the rewards that may seem capricious but upon which the peace and security of human society depend.

IMPLICATIONS FOR ETHICAL CONDUCT

The implications of Hume’s thought are threefold. First, Hume broke the individual’s tie with God and transferred it to society. Punishment and rewards were immediate, not confined to the hereafter. Second, Hume invited human society to create its own system of ethics. Third, rather than being static, based on values created by other societies in other times, ethics and morality are organic and ever-changing. Since ethics are subjective, it is society that determines their applicability.

Humility

DEFINITION: Self-deprecation, modesty, or submission; lack of egoism or arrogance

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Humility may be based in a belief in one's inferiority or simply in one's lack of superiority rooted in the equality of all. Its ethical status is very different in different value systems: Individualist and nonegalitarian systems despise humility, while those for whom pride is a sin esteem humility as one of the greatest goods.

Humility is a disposition of character that is usually acquired through training. It consists of an inner attitude of low self-esteem that motivates an outward pattern of deferential behavior. Humble persons are not self-assertive, since they do not pridefully suppose that they possess much merit of their own. Their sense of inferiority leads them to defer respectfully to the wishes of those whom they regard as superior.

To be sure, the term "humility" sometimes is used in other ways. For example, the feminist Sara

Ruddick (in her *Maternal Thinking*), after saying that humility is an important virtue for mothers to have, then reveals that she thinks it consists in recognizing that one cannot control everything. Her usage is potentially misleading because she is equating humility with the mere absence of something contrary to it.

Every society regards at least some degree of humility as desirable in at least some of its members. Parents often want their children to be humble toward them, and many customers prefer to be served by humble salespersons. Societies differ greatly, however, in the degree to which they think this trait of character ought to pervade life. Some prize humility highly and advocate it for everyone; others think that inferior members of the community should be humble but that superior ones should recognize their own merits proudly.

In the Judeo-Christian tradition, humility is assigned a prominent place among the qualities that all human beings ought to cultivate in themselves. Although Christianity does not classify humility as one of the cardinal virtues, it nevertheless continually commends humility, and Saint Thomas Aquinas described humility as the foundation of all other human virtues.

This stress on humility comes about because one of the most distinctive features of the Judeo-Christian tradition is the vast moral difference it sees between God and human beings. God is described not only as all-powerful and all-knowing but also as supremely good. He is the one faultless being. Moreover, he is quick to become angry at those who fail to show him respect. To heighten the contrast between the human and the divine, human beings are regarded as utterly contemptible in their sinful weakness and moral corruption. They are seen as deserving no credit for any good qualities that they may possess, since these come entirely as gifts from God. Pride is considered to be the fundamental vice, because it involves a declaration of self-worth apart from God. Thus, the Judeo-Christian view is that human beings should recognize their lack of any independent worth and should seek to walk humbly before God, desiring that in all things his will, not theirs, be done.

ANCIENT GREEK PHILOSOPHERS

The ancient Greek outlook is substantially different. Although believing that their gods were power-

ful and that it was dangerous to fail to show them respect, the Greeks did not consider their gods to be morally superior. Indeed, according to the Greek myths, every type of misbehavior of which mortals are capable was engaged in by the gods. Far from regarding all human beings as corrupt and contemptible, the Greeks thought that only some of them (especially the non-Greeks) were so. They believed that humans of the better type sometimes can manage on their own to be temperate, courageous, and wise, and are entitled to be proud of such great deeds as they occasionally succeed in performing.

In his *Nicomachean Ethics*, Aristotle lists many moral virtues, each of which he interprets as an intermediate (or “golden mean”) between two vices, one of excess and the other of deficiency. With regard to self-appraisal, he sees one extreme as overweening pride, or boastfulness (the vice of having an excessively favorable opinion of oneself), and at the other extreme, he places humility (the vice of being deficient in favorable opinion of oneself). For him, the balanced, correct attitude is proper pride. Thus, he sees constant groveling before the gods as a sign of faulty character; people show excellence, he thinks, who have merits of their own and do not hide this from themselves or anyone else.

Aristotle seems to have supposed that the habit of appraising one’s own merits accurately should always be cultivated. Some Judeo-Christian thinkers might agree with this recommendation, but they embrace a view of human nature that is different from Aristotle’s, and so they think that accuracy dictates an abysmally low appraisal of all merely human qualities. Yet surely accuracy is not quite what one should be seeking here.

Consider someone whose humility is admirable; someone, for example, who displays extraordinary courage in a good cause or unusually energetic devotion to helping the unfortunate, and who then brushes aside praise, sincerely denying that what has been done was in any way remarkable. In such a person, this self-deprecation is inaccurate, since what was done really was outstanding. Yet here this self-deprecation makes the individual’s character more admirable, for courage or devotion combined with such humility is even better than courage or devotion without it. An element of self-deception is thus to be welcomed; it is admirable to have trained oneself to underrate one’s own merits to some extent.

Why is it deemed to be admirable that people should cultivate an inaccurate humility, rather than strict accuracy in self-appraisal? Surely it is because inflated self-estimates are so widespread and troublesome that society needs to fight against them very forcefully. To set up accuracy in self-appraisal as one’s goal would not be sufficiently forceful. Stronger than that as a defense against the pressing dangers of overweening pride is the requirement that one should underrate oneself. Inaccurate humility, because of its social utility, thus rightly comes to be valued above accurate self-appraisal.

Hunger

DEFINITION: Desire or need for food

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Hunger is one of the fundamental physical needs of all people. On an individual level, it can motivate crime and self-destructive bouts of consumption. On a social or global level, hunger stands for some as both symbol and consequence of the unequal distribution of wealth and resources and as a grounds for the moral condemnation of social and economic systems.

Hunger is as old as history. More than 15 percent of the world's people are malnourished in even the best of years, and this situation has existed throughout recorded history. In bad years, up to 67 percent of the world's people may suffer from malnutrition. Hunger is an ordinary part of life for many people, even in developed nations such as the United States. Millions of people do not get either enough food or enough nourishing food, and the results are disease and death. Globally, 50 percent of malnourished children in poor countries die before reaching the age of five. Countless others become physically or mentally handicapped for life because of malnutrition.

Hunger is deadly during famines. Throughout history, famines have afflicted one area or another every few years. The principal causes of famine are drought, floods, plant disease, and war. Of these causes, drought is the most frequent.

DROUGHTS AND FLOODS

In 3500 B.C.E., the Egyptians documented the first famine to be recorded, which was caused by drought and a plague of locusts. The death rate was extremely high, but no accurate estimates of the number of lives lost are available. The Romans documented the second known drought in 436 B.C.E. Thousands of Roman citizens threw themselves into the Tiber River so that they would not have to face starvation. Many early civilizations believed that famines were punishments sent by God.

Mohandas K. Gandhi once said, "If God should appear to an Indian villager it would be as a loaf of bread." Five of the ten deadliest known famines have occurred in India. Most were caused by the failure of the monsoon rains, which caused drought and crop failure. One of the worst famines in Indian history occurred in 1865, when the monsoons failed to arrive.

Image not available

India was a British colony at the time, but Great Britain decided to export the extra food that was produced in India rather than send it to the areas that were affected by the famine. The reason that the British gave was that the people in the affected areas could not pay for the food, whereas hungry people in other countries could. Ten million people ultimately died. The monsoon rains failed again between 1876 and 1878, killing 5 million people. A three-year drought that occurred in China between 1876 and 1879 killed more than 13 million people. Tragedy struck again in the Calcutta region of India in 1943 and 1944, killing 1.5 million people.

During the early 1970's and again in 1984, drought plagued many African nations. The Sahel nations lost more than a million people during the 1970's, and eastern and Southern Africa lost more than 1.5 million people throughout the 1980's because of drought.

Archaeologists believe that droughts have caused the collapse of whole civilizations. About 4,500 years ago, a great civilization arose in the Indus River valley. Drought caused this civilization, whose major cities were Harappa and Mohenjo-daro, to vanish by 1700 B.C.E. In the southwestern United States, the civilization of the Cliff Dwellers may have ended as a result of drought in approximately 1300.

Although the lack of rainfall is the major cause of famine, too much rain can also be disastrous. China has suffered hundreds of famines because of floods of the Yellow River. These disasters are so common that the Chinese have nicknamed the river "China's Sorrow." In 1889, as many as 2 million people died in floods, and between 1929 and 1930, the river claimed another 2 million lives. People died in such large numbers that they were buried in mass graves called "ten-thousand-man holes." Women and children were sold to obtain food, and cannibalism spread rapidly. Hurricanes also cause floods that cause famines in many nations.

PLANT DISEASES

Plants suffer from diseases just as humans do. Plant diseases can wipe out crops, causing famine and starvation. Perhaps the most famous example of such a famine occurred in Ireland during the 1840's, when a fungus wiped out most of the crop of potatoes, which were the staple food of the Irish. The resulting famine claimed more than a million lives.

Ireland was a British colony at the time, but the British expended little effort to help Ireland. In fact, Irish peasants who could not pay their rent were thrown out into the cold and left to starve in ditches. Many perished, and others tried to escape by migrating. The emigrants were so weak when they boarded ships leaving the country that these ships became known as "coffin ships" because so many people died on board of sickness and starvation before reaching America, England, or Australia. More than a million Irish emigrated because of the "Great Hunger."

WAR

Drought, flood, and plant diseases have caused tremendous suffering, but the hunger and famine caused by war are even more horrifying because they are avoidable.

The people of Russia, the largest country in the world, have suffered often because of famines caused by humankind. One of the worst such famines occurred between 1921 and 1922. World War I was the cause of this tragedy. When many Russians went off to war, beginning in 1914, agricultural production dropped sharply, and by 1920, food was scarce. A drought hit the Volga River valley in 1920. By 1921, much farmland looked like desert land, and 30 million Russians went hungry. People made bread out of tree leaves, dirt, and water, and they ate cooked grass. Civil war made it difficult to send donated food to the affected areas, and ultimately 5 million people died from hunger. More Russians were killed by the famine than were killed in World War I.

During the Biafra civil war in Nigeria between 1967 and 1970, more than a million people, mostly women and children, died of starvation when federal forces withheld food from rebels to force them to stop trying to secede from Nigeria. It is not uncommon for governments to use famine as a weapon of war. The Ethiopian government used such tactics in its war against Eritrea, and they have also been used in Mozambique and Angola. The results were that thousands of people died.

EFFECTS OF HUNGER

People who lack food lose weight and grow weak. Many become so weak that they die of diarrhea or other simple ailments. This weakened condition is called marasmus. Children who have some food but not enough suffer from kwashiorkor, or malnutrition.

One symptom of kwashiorkor is edema, which manifests as a swollen stomach, puffy face, and swollen arms and ankles. Hair and skin often take on an orange or white color. Those who survive kwashiorkor often suffer lifelong mental and physical handicaps. In addition, when the human body is weakened by hunger, it cannot fight off disease. During most famines, survivors crowd together into relief centers to wait for food, creating the potential for epidemics of influenza, measles, cholera, dysentery, typhus, pneumonia, and tuberculosis.

Worse yet are the effects of skyrocketing crimes during droughts, floods, wars, and famines. Desperate people loot, steal, and kill to secure goods that are not otherwise available to them. They may sell stolen goods to purchase food. Women may prostitute themselves for food or sell their children for a meal. Children may band together to obtain food by looting. Violence may break out near food distribution centers, creating panic and anarchy, as occurred in Somalia in 1992. Adaptation to hunger can lead to desperate responses such as cannibalistic murder, which would not be practiced under other circumstances.

Crops are not the only things to be destroyed; livestock often die in record numbers during prolonged famines. Those that do not die may be killed for food. In addition, seed reserved for planting may be eaten to avoid starvation. This lowers agricultural production levels and makes returning to a normal way of life extremely difficult.

CONCLUSIONS

The English philosopher Thomas Hobbes noted that people are inherently selfish, mean, and aggressive. History demonstrates that, when they are hungry, parents will take food from the mouths of their own children. The Chinese have argued that if a child dies, it is easy to make another, but an older person who dies is more difficult to replace. During the Italian famine of 450, known as “Dufresnoy,” parents allegedly ate their children. Well-fed people are likely to be content; are less likely than hungry people to be angry, hostile, and aggressive; and are less inclined to engage in desperate behavior that may cause harm to others. Therefore, it is in the interest of humankind to reduce or eliminate hunger. A world without hunger would be a safer place for everyone.

Husayn

IDENTIFICATION: Grandson of the Prophet Muḥammad

BORN: January, 626, Medina, Arabia (now in Saudi Arabia)

DIED: October 10, 680, Karbalā', Iraq

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The death of Ḥusayn was one of the formative events in Shī'a Islam, and its annual remembrance is the most important occasion in Shī'a communal life.

Ḥusayn and Ḥasan were the sons of ʿAlī ibn Abī Ṭālib, the cousin of Muḥammad, and Fāṭima, Muḥammad's daughter. Following Muḥammad's death, leadership of the Islamic community passed to, in order, Abū Bakr, ʿUmar, ʿUthmān, and ʿAlī. This succession was not without controversy: the “party of ʿAlī” (*shīʿat ʿAlī*; later, simply the Shīʿa) had

always held that ʿAlī should be *khalīf*, or leader, of the community. The assassination of ʿAlī in 661 led to a convulsive dispute.

ʿAlī was succeeded by Muʿāwiyya, of the Umayya family (whom many mistrusted as outwardly converting to Islam only for selfish gain). Although Ḥasan relinquished his claims to the khalifate (and died c. 670, some claim of poisoning), his younger brother Ḥusayn gathered the *shīʿat ʿAlī* to challenge Muʿāwiyya. Ḥusayn and most of his party were killed by Muʿāwiyya's troops at Karbala. Shīʿa Muslims recognize that as the martyrdom of Ḥusayn, and their annual public remembrance serves as a visceral reminder that human lives belong only to God and are to be surrendered to his service.

Hussein, Saddam

IDENTIFICATION: Authoritarian president of Iraq from 1979 to 2003

BORN: April 28, 1937, Tikrit, Iraq

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Hussein brutally suppressed internal opposition in his own country and led it into three devastating wars before international intervention ended his regime.

Saddam Hussein liked images that portrayed him with a sword in hand. A nominal Muslim, he apparently viewed the Islamic religion as a list of rules about external behaviors and demonstrated little concern for humanistic values such as altruism or human brotherhood. Indeed, he gave every indication of being proud of using violence to exact revenge and maintain power. He even spoke favorably about the methods of Adolf Hitler and Joseph Stalin.

Hussein experienced a harsh and deprived childhood. He was raised without a father in an inhospitable part of Iraq where members of rival ethnic, religious, and tribal groups constantly fought one another. After moving to the capital city, Baghdad, in 1955, he joined the radical Baath Party, which endorsed violent means to achieve socialism and Arab

nationalism. Rising rapidly within the party, he participated in a failed attempt to assassinate the military president of Iraq in 1959. After the Baath Party took over the government in a *coup d'état* in 1968, Hussein gained power by controlling Iraq's infamous security agencies. In 1979, he was installed as president.

SUPREME LEADER

Hussein's first act as president was to purge the party of every person suspected of disloyalty to him. During the twenty-four years of his rule, all anti-government dissent—no matter how trivial—was punished as treasonous. The regime commonly used torture to exact confessions. Although a few elections were held for the national assembly, as president, Hussein had the power to override the assembly's decisions. For reasons such as this, social scientists classify his regime as totalitarian. Many Iraqi citizens, nevertheless, supported Hussein because of his progressive social policies designed to improve education and help the poor.

Hussein wanted to make Iraq the dominant military and economic power in the Persian Gulf. In 1980, he ordered the invasion of Iran with the purpose of annexing the oil-rich province of Khuzistan. Lasting eight years and resulting in the deaths of perhaps a million people, the war accomplished nothing. During the conflict, Hussein brutally suppressed an Iranian-backed Kurdish insurrection and gassed the village of Halubjah, killing about five thousand civilians. In 1990, Hussein ordered the invasion of Kuwait, giving him control over a fifth of the world's oil supplies. In 1991, a large international coalition, led by the United States, ousted Iraqi troops from Kuwait, but left Hussein in power.

Between 1991 and 2003, the United Nations passed several resolutions that prohibited Iraq from acquiring weapons of mass destruction (WMD). Hussein never fully complied with United Nations demands for inspection, although the evidence suggests that he probably stopped development of the WMDs. In 2003, the United States, in coalition with Great Britain and a few other countries, used his noncooperation as a basis for invading Iraq and overthrowing his regime. Scholars and philosophers disagreed about whether this preemptive action could be justified by just-war theory. In December, 2003, Hussein was finally captured, and plans were made to

put him on trial for crimes against human rights. In April, 2004, it was announced that he would be tried by an Iraqi court.

Hypnosis

DEFINITION: State of consciousness, achieved through techniques of induction, in which a person is unusually open to suggestion

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: Because hypnosis gives the appearance of yielding control of one's behavior and mind and conforming to the wishes of the hypnotist, a potential for abuse is perceived.

Although the eighteenth century Viennese physician Franz Anton Mesmer no doubt hypnotized some of his patients ("mesmerism"), the concept of hypnosis was unknown before the work of the English physician James Braid. Braid invented the term "hypnosis" and conducted the first scientific studies of hypnotism. Braid devised numerous techniques for inducing the hypnotic state and extensively studied the psychological factors involved. Braid and the British physicians John Elliotson and James Esdaile made extensive use of hypnosis in their medical practices as an adjunct to surgery. Esdaile, for example, reported more than three hundred cases in which he performed major operations on unanesthetized but hypnotized patients who apparently experienced no pain.

The psychoanalyst Sigmund Freud found that hypnosis could be used to relieve symptoms of neurotic and abnormal behavior. Freud repudiated hypnosis as a therapeutic tool, however, because it could only relieve symptoms; it revealed nothing about the causes of the behavior.

Modern interest in hypnosis has passed from the physician and psychoanalyst to the experimental psychologist. Psychology's concern with hypnotism involves understanding its nature and mechanisms. Clark L. Hull's 1933 book *Hypnosis and Suggestibility* was the first systematic attempt to apply modern psychological methods to hypnosis, and Ernest R. Hilgard (b. 1904) and others added significantly to the understanding of this phenomenon.

ETHICAL ISSUES OF HYPNOSIS

The aforementioned characteristics of the hypnotic state raise the question of whether the hypnotized person becomes unduly dependent upon, controlled by, or influenced by the hypnotist. While in the hypnotic state, could the person be persuaded by an

Characteristics of the Hypnotized State

1. Planfulness ceases. Hypnotized subjects do not wish to initiate activities; instead, they prefer to be given suggestions by the hypnotist.
2. Attention becomes more than usually selective. Subjects attend to what the hypnotists command and ignore other events.
3. Enriched fantasy is readily produced. Unreal events, not unlike dreams, can be experienced easily.
4. Reality testing is reduced and reality distortion is accepted. Altered perceptions of the real world can be produced and believed; for example, talking with an imagined person believed to be sitting in a chair.
5. Suggestibility is increased. Subjects willingly agree to cooperate with the induction technique in order to be hypnotized. Some increase in suggestibility—but less than is commonly assumed—also appears to follow.
6. Posthypnotic amnesia is often present. Some subjects, if instructed to do so, will forget most of what occurs during the hypnotic suggestion. When prearranged signals are given, memories are restored. Also, a signal introduced during hypnotic suggestion, when given posthypnotically, may cause the previously hypnotized person to carry out a prearranged action even though the person has no memory of having been given the instruction.
7. Responsiveness to hypnotic induction varies. About 5 to 10 percent of people cannot be hypnotized at all, a similar percentage are easily hypnotized, but most people fall in between the two extremes. What appears to be the best predictor of susceptibility to being hypnotized is the degree to which a person enjoys daydreaming, can produce vivid mental images, and has a rich imagination.

unethical hypnotist to engage in behaviors that he or she otherwise would not perform? Is it possible to induce, for example, irrational, antisocial, criminal, unethical, immoral, or self-destructive behaviors such as impulsively buying a new car, robbing a bank, committing murder, injuring oneself, committing suicide, or having sex with one's hypnotherapist?

The consensus firmly states that hypnosis cannot

induce or persuade a person to do anything that he or she would not otherwise do. The belief otherwise undoubtedly arises from the misconception that hypnosis is a condition induced in the person by the hypnotist.

In fact, the hypnotist acts simply as a facilitator, guiding and teaching the person how to think and what to do to produce a particular behavior within the person's capabilities. The person is responsible for and decides whether to perform that behavior. Before a behavior can occur, the person must be willing and able to produce it.

Therefore, the question of ethics is really a pseudoethical issue. The hypnotist is not doing anything to which the person does not consent and cannot compel a person to commit an act that is repugnant to that person or beyond his or her capabilities. As Roy Udolf cogently observed, antisocial and self-destructive behavior can and has been obtained in hypnotized persons, but the hypnotist cannot induce the hypnotized person to commit those acts. The person had decided to do so already. An unethical hypnotist could, however, facilitate the performance of that act. For example, a hypnotist could make a criminal less nervous and more self-assured during the commission of a crime.

Hypocrisy

DEFINITION: Feigning to be what one is not, assuming a false appearance of virtue or religion, “posturing”

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Acts of hypocrisy are generally thought of as immoral in themselves, but they are also taken to impugn the character of the hypocrite, such that all of his or her other actions are rendered suspect as well.

Hypocrisy—pretending to have more virtue than one actually possesses—is, in one manner of speaking, the exact opposite of a moral and ethical philosophy, for its practitioners are liars, deceivers, and manipulators. People living according to a just ethical standard must exercise care, for hypocrites can copy the attitudes and behaviors of “good” people and will try to control the good for their own self-centered gain.

HYPOCRITICAL BEHAVIOR

The words “hypocrite” and “hypocrisy” connote the very dispositions and characters of people who are immoral or amoral but who hide their relative immorality with the appearance of morality. The hypocrite “undervalues” noble ideals and is ruled by inferior passions; he or she is inclined to do “bad” things rather than “good” things. He or she is totally corrupt and is a willful liar yet always presents the image of a virtuous person.

In their worship, religious people worldwide pray, lament, and make promises to their gods. Too often, they promptly forget those promises as they scurry to make money, showing little love, little mercy, little trust, little kindness, no brotherhood, and no forgiveness. Many people who call themselves Christians, Muslims, Jews, and so forth are curiously unmoved by the suffering of others.

To find religious hypocrites, one need not look be-

yond religious leaders. In the United States alone, the 1980’s and 1990’s witnessed many religious scandals. The Christian televangelist Jimmy Swaggert, a married parent, in preaching to his flock, often condemned sinners and showed much glee as he sadistically described their suffering in the “pits” of Hell for all eternity. Later, he was photographed patronizing a prostitute who later claimed that he was a “pervert.” The televangelist then tearfully repented on his television show. Later, Swaggert was again caught patronizing a prostitute, but he continued his television show, the main purpose of which seemed to be to beg for money; the same man had earlier ruined another preacher by making references to the other’s bad character.

Jimmy Bakker, another televangelist, famed for the development of a religious theme park, was eventually imprisoned because he misappropriated contributions from the faithful. Although several pentecostal leaders appeared to have attracted the largest news headlines, Roman Catholic priests have not been immune to criticism. In recent years, many priests have helped women commit adultery and have engaged in various sex crimes, including the molestation of children.

The world’s hypocrites come not only from the realm of religion but from all “walks” of life. During the 1970’s, as the United States faced the Watergate scandal, President Richard Nixon, in a nationwide television broadcast, righteously proclaimed that he was not a “crook”; this event occurred shortly before he resigned rather than face impeachment proceedings. Later, during the 1980’s and 1990’s, bankers all across the land lied to cover up their part in the savings and loan scandals, with many still lying just before authorities indicted, convicted, and sentenced them to very light terms in white collar prisons. Additionally, during the 1990’s, many members of Congress showed “self-righteous indignation” upon learning that their “bank” was under investigation; shortly thereafter, it was proved that many of them were overdrawn and in arrears (check “kiting” is a crime, and common folk most likely would have been prosecuted).

Even the world of sports has its own kind of hypocrisy. A former football star of the University of Oklahoma’s Sooners made television appearances on behalf of the “Just Say No” campaign against drugs. Additionally, he spoke on many occasions to

youth groups—all this shortly before he was found guilty and sent to prison for the illegal use of drugs.

CONCLUSION

The dangers that the hypocrite poses are largely self-evident. The hypocritical politician “looks out for number one.” While bespeaking the public interest, he or she may “sell out” to special interest groups and, if found out, will likely scream about assaults on his or her good character. The hypocritical religious leader will use—for selfish purposes—the very foundations of religious faith. Even the action of the aforementioned hypocritical football star had the negative effect of affecting young people’s views of the adult world, in which leaders and “stars” too often are consummate liars—to the detriment of society.

I

I and Thou

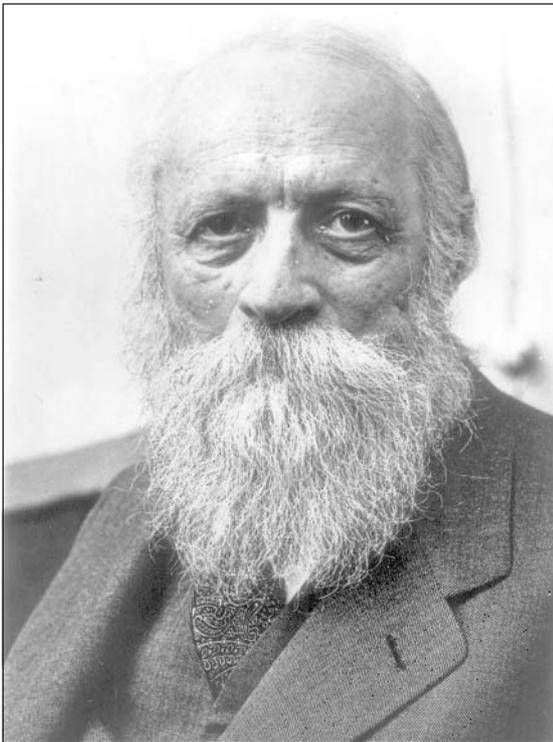

IDENTIFICATION: Book by Martin Buber (1878-1965)

DATE: *Ich und Du*, 1923 (*English translation*, 1937)

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Buber's work views reality as fundamentally social, consisting of interpersonal relationships. These relationships are defined in moral action and are expressed in the symbiotic kinship of humankind and nature.

Buber's central question of the meaning of humanness is expressed in his recurring word *Wesen* (es-

Austrian philosopher Martin Buber, the author of I and Thou. (Library of Congress)

sence, being, nature), as understood in terms of two primary word pairs: “I-You” and “I-It.” The I-You relationship is total involvement of self and other in intimacy, sharing, empathy, caring, openness, and trust. The I-It relationship consists of self viewing other in abstract terms, resulting in possession, exploitation, and distrust. The I-It pair permits the self to objectify the other, creating a state of manipulative dependency, and the I-You pair encourages an atmosphere of interdependence, permitting growth and respect. Only through genuine I-You encounters do people discover their humanity and, by mutually affirming and confirming one another, come face to face with the Eternal Thou.

Realistically, Buber recognized that every I-You can become an encounter, and in his poetic *Sprachdenken* (“thinking in terms of language”), he counseled that one’s essential humanity is lost if one treats every You (animate and inanimate) as an It (acts of hate, killing, vandalism). “Without It man cannot live; but he who lives with It alone, is not a man.” In the area of religion, Buber insisted that any religious form that is not in the category of I-You is illicit or at least nonreligious. Thus, he was critical of Jewish Halachah (religious orthopraxy) and Christian sacraments; he believed that the nature and essence of God are not restricted to doctrines and dogmas. Buber’s classic statement on essentials is essentially existential.

Ibn al-^cArabī

IDENTIFICATION: Arab philosopher

BORN: July 28, 1165, Murcia, Valencia (now in Spain)

DIED: November 16, 1240, Damascus, Ayyūbid Empire (now in Syria)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: In such works as *Meccan Revelations* (thirteenth century) and *Gems of Wisdom* (1229), Ibn al-ʿArabī put forward a systematic philosophical account of Sufism. Still widely influential in modern practice, his work is often seen as the creative zenith of Sufism.

Ibn al-ʿArabī's work captured the devotional spirit of earlier Sufism, gave it sophisticated and original philosophical expression, and, in so doing, both gave it new force and made it more acceptable to more conservative Muslims. His singular obsession was with *wahdat al-wujūd* (perhaps, "the unity of Being"). He argued that God is the only true reality (*al-ḥaqq*) and the inner nature of all things; the phenomenal world is a manifestation or mirror of that reality. God, considered as manifestation, is creation (*al-khalq*)—a claim that has led to controversies about whether Ibn al-ʿArabī was a pantheist. Annihilation or immersion of the soul (*fanāʾ*) in the real unity of Being is, he argued, the ultimate human good. Humans occupy a special position in the cosmos because they are able to know God both in his phenomenal nature through sense perception and in his inner nature by achieving *fanāʾ*. One who has perfected all the potentials of the soul is the Perfect Man, who, in Ibn al-ʿArabī's thought, is exemplified by Muḥammad.

Ibn Gabirol

IDENTIFICATION: Arab philosopher and poet

BORN: c. 1020, probably Málaga, Caliphate of Córdoba (now in Spain)

DIED: c. 1057, probably Valencia, Kingdom of Valencia (now in Spain)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Considered one of the greatest poets of the "Golden Age" of Spanish Jewry (ninth century through twelfth century), Ibn Gabirol was also an important philosopher: He introduced

Neoplatonism into Europe and strongly influenced the Christian Scholasticism of the Middle Ages. He is author of *The Source of Life* (eleventh century).

Orphaned early in life and raised in Saragossa, Ibn Gabirol devoted much of his life to the pursuit of wisdom (philosophy), in which he found solace from his serious physical ailments and his squabbles with wealthy patrons and town elders, which caused him great mental anguish. His *The Source of Life* (*Fons vitae*) is more Neoplatonic than Aristotelian, more religious than theological. It holds that the purpose of human life is for the soul to commune with the upper world, and it emphasizes knowledge and contemplation rather than action. The subjects of *The Source of Life* are three: God, or pure spiritual substance; divine will, which is separate from the essence of God; and universal matter and universal form, which, in combination, produce universal reason. The universe is a gradual series of emanations of substances, and the farther a substance is from the source of all, the more material and corporeal it becomes.

The gradation of substances is unified by the divine will, which permeates the whole series of gradations. In this point, Ibn Gabirol departs from classical Neoplatonism, which teaches the system of emanations in a mechanical way that is totally alien to the Jewish idea of creation. The human soul, an emanation of the world-soul, is eternal, but, in uniting with the body in the corporeal world, it is lowered from its pristine purity. The soul retains its desire to return to its source, however, and this is accomplished in two ways: through knowledge of the divine will as it extends into matter and form, and apart from matter and form; and by reason, by means of which the soul unites with world reason and ultimately attaches to the "source of life." Ibn Gabirol's long philosophical poem *Keter Malkhut* (*The Kingly Crown*, 1911) is addressed to the human intellectual aspiration to discover God ("I flee from You, to You") and praises figuratively the attributes of God. This classic poem is included in the High Holiday services of Ashkenazic and Sephardic Jews.

Ibn Khaldūn

IDENTIFICATION: Arab philosopher

BORN: May 27, 1332, Tunis, Tunisia

DIED: March 17, 1406, Cairo, Egypt

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Ibn Khaldūn was the first and one of the greatest practitioners of the philosophy of history. His mammoth work *The Muqaddimah* (1375-1379) lays out a philosophical analysis of, and foundation for, the methodology of historical research and writing, and it constitutes the earliest known work in the theory of social and cultural history. Ibn Khaldūn also developed a system of political ethics that he hoped would benefit society and aid in the development of civilizations.

Born into a family of scholars and government officials, Ibn Khaldūn lost his family in 1349 to the bubonic plague. After the completion of his formal studies, he became a roving ambassador, serving a series of rulers in North Africa and Moorish Spain. At the same time, he began collecting material for his *Kitāb al-ʿibar*, or universal history, which he completed in 1382. The most important part of this work was its “Prolegomena,” or introduction, which made an attempt to establish a purpose for history.

Disturbed by the decline of the Muslim states and Muslim civilization, Ibn Khaldūn sought to find reasons for it, after which he set forth a series of ethical principles that he believed must be followed to reverse the decline. Although he was a good Muslim, Ibn Khaldūn introduced the concept of natural causality. He believed that society was the creation and the responsibility of human beings. Ibn Khaldūn believed that social organization, and especially the state, was the key to improved individual welfare and the refinement of civilization. He held that rulers should develop ethical political principles such as placing the welfare of society before individual aggrandizement, ameliorating taxes, infusing the state with a sense of purpose, and avoiding unnecessary wars. Ibn Khaldūn spent the final years of his life in Cairo, where he was a Muslim judge and a professor.

Ideal observer

DEFINITION: Person or being who has an ideal degree of nonmoral knowledge and the ability rationally to comprehend and analyze that knowledge

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The model of the ideal observer is used by some rationalist ethical systems to think about or define the nature of the good. It is anathema to systems based on emotion or moral sentiment rather than reason, as well as to those epistemological models that hold prejudice or perspective to be constitutive of knowledge.

The idea of an ideal observer emerged in the eighteenth century in the work of British moralists such as Francis Hutcheson, David Hume, and Adam Smith. These writers emphasized the importance of full information and impartiality in moral judgment, and they considered the approval of an observer with such characteristics to define moral truth. For the British moralists, such approval depended on the existence of certain moral sentiments, such as benevolence and sympathy.

By the twentieth century, the ideal observer, which had come to be thought of as mainly self-interested, was used to provide naturalistic theories of moral judgment and moral truth. For example, Richard Brandt has defined a person's own good as what that person would want if he or she had full information and had reflected on it in the appropriate way. Some philosophers, such as John Rawls, have also defined moral rightness in terms of the idea of self-interested, impartial observers.

Idealist ethics

DEFINITION: Ethical system, such as Plato's, based on the proposition that perfect forms and values actually exist in the world, or an ethical system, such as those of the German Romantics, based on the proposition that the nature and structure of the self's experience constitutes the necessary beginning and central object of all philosophical inquiry

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Platonic idealism counts moral concepts among the universal, unchanging Forms studied by philosophers: Under this type of idealism, one is ethically obligated to determine the nature of those absolute and eternal values and then to act in conformity with them. Kantian and post-Kantian idealism are characterized by the so-called "Copernican turn" inward, in which the self is placed at the center of the philosophical system: Under this type of idealism, moral principles are deduced transcendently by examining the properties of human subjectivity and drawing conclusions based upon the nature of reason and the structure of phenomenological experience.

Most proponents of idealist ethics view values as unchanging, timeless realities. Values are real existents. The efficacy of values is situated in an ongoing, vital interrelationship between the uniqueness of a person's value experiences, on the one hand, and the harmonious totality of life, often termed the "Universal Self" or "Absolute," on the other hand. The ethics of human behavior are governed by immutable universal moral laws that are binding on all persons. These laws are known through the exercise of human reason.

HISTORY

The early Greek originator of idealist ethics, Plato posited a world of absolutes consisting of eternal Ideas or Forms, on the basis of which to formulate ethical concepts. These Forms include "goodness," "justice," and "virtue," which Plato discussed respectively in *Protagoras*, *Republic*, and *Meno*. Plato's assumption that the ethical quality of human life is governed by the person's obligation to form a rational moral personality, succinctly stated in the maxim "All virtue is knowledge," is present in the views of

his disciples regarding ethical behavior. The Christian Platonist Saint Augustine viewed human behavior as governed by a priori absolutes (that is, absolutes that exist prior to experience and can therefore be discovered by reason alone): the right direction of love, for example.

During the Enlightenment, a new kind of idealism was developed by Immanuel Kant. Kant's German Idealism influenced other German Romantic thinkers, notably Georg Wilhelm Friedrich Hegel, as well as American Transcendentalists such as Ralph Waldo Emerson. Like Plato, Kant believed in an objective reality, which he referred to as the noumenal realm, and he differentiated it from the reality experienced by human beings, the phenomenal realm. Kant argued, however, that the only way to know anything about noumena was to examine the structure of one's experience of phenomena and to make rational deductions based upon that structure. He referred to this strategy as "transcendental deduction."

Kantian ethics, as with all of Kant's philosophical system, was ultimately concerned with determining the nature of human freedom, and Kant argued forcefully that acting in accordance with a universal moral law, a law that has noumenal and not mere phenomenal existence, is the only way to achieve freedom, because it is the only way to act neither randomly, based upon capricious internal desires, nor according to purely external impositions. Hegel also employed a strategy of transcendental philosophy, but instead of examining the structure of experience from the outside, he attempted to engage in a transcendental philosophy from a first-person point of view. Hegel's species of idealism embraced absolute ideals, but not immutable ideals, because he believed that philosophy, society, and all of reality, exist fundamentally as a process of historical evolution. So for Hegel values do change over time, and their universality is as much an aspect of those changes as it is contained within their final form.

More modern idealists, such as Josiah Royce and Alfred North Whitehead, continued the Platonic tradition of founding ethical considerations on absolute, presumed permanent ideals. Royce's student Herman Harrell Horne applied idealist ethics to education in his *This New Education* (1931), which was reminiscent of an earlier American idealist's work: that of William T. Harris, editor of *The Journal of Speculative Philosophy* and post-Civil War spokes-

person for the neo-Hegelians of the St. Louis, Missouri, Philosophical Society. Of Plato's impact on the subsequent development of Western philosophy, Whitehead wrote: "The safest general characterization of the European philosophical tradition is that it consists of a series of footnotes to Plato."

PRINCIPLES OF IDEALIST ETHICS

Platonic idealist ethics originates in human comprehension of and adherence to the Platonic ideational forms of the "good": justice, knowledge, and virtue. Enunciated in the *Republic* by Plato's allegory of the metals, the just society is an idealized one in which rulers, guardians (those who enforce rulers' decisions), farmers, and crafts-people harmoniously coexist by internalizing the four cardinal virtues of wisdom, courage, temperance, and justice, the latter defined as a state of human affairs in which each contributes to society according to the predetermined limits of his function.

Kantian idealist ethics originates in a dedication to obeying a universal and universalizable law that has the form of law as such, regardless of its content. This is necessary both because only considerations of formal structure can yield a truly objective law—everyone will disagree about moral laws based on their content—and because only universal laws discovered and willed through pure practical reason are constitutive of human freedom rather than constituting a form of constraint. The universal law exists as much within the reasoned reflection of the self as it does in the external noumenal world. Therefore, for Kant, to act morally is to be free, and to be free is to act morally. Any other course of action makes one either a slave to one's desires or a slave to external impositions.

Nineteenth century philosophy was largely post-Kantian philosophy, in the sense that almost all major philosophers saw themselves as either refuting or completing Kant's system, and sometimes doing both at once. Hegel, in particular, took Kantian idealism and rendered it historical, teleological, and collective. In his *Phenomenology of Spirit* (*Die Phänomenologie des Geistes*, 1807), Hegel used dialectical logic to perform a transcendental deduction, much as Kant did. Hegel's deduction, however, very quickly broke with Kant, when it was discovered that remaining focused on the level of the single individual would make it impossible to achieve objective

knowledge. Only when a self-conscious mind interacts with another self-conscious mind, discovers and confronts desire in itself and its counterpart, and goes on to create social structures based on what it has learned through its confrontations, Hegel argued, can it discover an absolute moral law. If for Kant such a law was a pure formal construct deduced through individual detached reason, for Hegel absolute morality existed only through collective, intersubjective, historical practice in the world.

Idealist ethics accents the principle that human self-realization occurs within a societal context providing development and nurture; morality or ethical behavior is, however, often essentially ideational in nature. Hence, for many idealists the ethics through which human lives are lived results not from sensory experience but from cognitive deliberation. For others, though, the distinction between perception and cognition is at best a problem and at worst a misunderstanding of the nature of the mind.

IDEALIST ETHICS: AN APPRAISAL

During the late nineteenth century and throughout the twentieth century, principles of idealist ethics were on the defensive. Realist Bertrand Russell saw in idealist ethics a failure to distinguish between a person's perceptual act and the separately existing content, or "sense datum," of that act, a weakness attributed to the British empiricist George Berkeley's statement *esse est percipi* ("to be is to be perceived"). In *Religion and Science* (1936), Russell viewed ethical values as totally subjective and hence unknowable: "What science cannot discover, mankind cannot know." Positivists and pragmatists have disagreed with the idealist accent on the pivotal place of the ideal or the spiritual in determining the criteria for ethical behavior. Linguistic philosophy finds ambiguities in the technical terms of idealist ethics; existentialists and phenomenologists take exception to the Platonist assumption that there exists in the universe a normative, prescriptive, intelligible or spiritual reality, independent of the sensory world, as the source of ethics.

While idealist ethics are on the wane in Western culture, support for the principles of idealist ethics—indeed, advocacy of those principles—has not diminished. Claiming Plato's *Republic* as "the book on education," Allan Bloom argues for a return to the "essential being" of idealist ethics through a "com-

mon concern for the good” in *The Closing of the American Mind* (1987). Moreover, Kantian philosophy still sets the agenda for much of the Western canon. Philosophers must either agree or disagree with elements of Kant’s system; ignoring it is all but impossible. It is difficult, then, to view idealist ethical concerns and their underlying rich tradition as absent in the modern world.

Identity theft

DEFINITION: Appropriation of another person’s confidential information for the purpose of committing theft or fraud

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Identity theft is a crime that not only may rob victims of their possessions and access to their own private accounts but also may damage their reputations, credit ratings, and freedom by causing them to be accused of unethical or criminal behavior.

Identity theft is a major violation of ethical norms. It confronts its victims with the unenviable task of proving negative truths: that they themselves are not criminals and did not behave in an unethical manner. Passage of the Identity Theft Deterrence Act in 1998 made it a federal crime to use another person’s means of identification either to commit or to aid unlawful activity.

Impersonation for profit is an age-old crime. The book of Genesis in the Bible records how Jacob pretended to be his brother Esau and tricked their father into giving him his brother’s birthright. In sixteenth century France, an imposter claiming to be Martin Guerre persuaded Guerre’s wife to accept him. He was exposed only after the true Martin Guerre returned home after a long absence. The prizewinning 1990 play and 1993 film *Six Degrees of Separation* fictionalized the adventures of a young man who deceived wealthy New Yorkers into believing he was the son of a famous actor.

SOURCES OF PERSONAL DATA

With the advent of credit cards, computers, and the Internet in the late twentieth century, theft of personal information became easier to perpetrate than it had ever been in the past, and its consequences became more serious. Thieves seeking identification documents steal other people’s wallets and purses or intercept mail containing financial data. By searching through trash, a practice known as “dumpster diving,” criminals may even find discarded preapproved credit card applications. Some careless people throw away documents containing such information as their Social Security, bank account, and credit card numbers.

Another technique that identity thieves use for ob-

taining confidential information is pretext calls, a technique colloquially termed “phishing.” They call victims claiming that banks or credit card companies need to confirm personal information, such as critical account numbers. An ingenious variation on “phishing” uses e-mail, headed with the logo of an established company, to request that updated identification data be sent to the thieves’ Internet addresses.

By posing as prospective employers or landlords, thieves can acquire credit reports displaying vital identification numbers. Corrupt employees with access to credit records have been known to sell clients’ names and Social Security numbers for sums as low as twenty dollars. A surprising amount of personal material is available on the Internet, sometimes

placed there by the unsuspecting victims themselves. Information brokers advertise their willingness to provide confidential records for a fee; the service is legal and valuable for creditors seeking absconding debtors or wives tracking husbands who have abandoned them, but when identification data are sold to a criminal, the result may be disastrous for the target.

USES OF IDENTIFYING DATA

The impersonal nature of the Internet makes it particularly attractive to identity thieves. Only a card number and its expiration date are needed to order easily resalable merchandise. Armed with another person’s name and valid Social Security number, an impersonator can change addresses on existing accounts and ask credit companies to send new cards.

When addresses are thus changed, the victims may not discover the unauthorized charges being made on their accounts for months or years. If thieves alter the means of verifying account holders’ identities—such as by changing the maiden names of the account holders’ mothers—the victims will not even be able to access their own accounts to find out if fraud is occurring.

By using victims’ Social Security numbers, identity thieves can open new credit card accounts; take out loans; open new bank accounts to issue bad checks; and purchase automobiles, furniture, and jewelry, without ever paying for anything with their own money. People who always pay their bills on time, and thus have clear credit reports, are particularly desirable targets for identity theft. Older persons with mortgage-free homes are equally attractive to thieves, who may use personal data to obtain mortgages on the true owners’ homes and then abscond with the money advanced on the loans.

REACTIONS TO IDENTITY THEFT

Some identity theft victims first learn of their problems when their checks bounce, they are denied loans, or collection agencies call, demanding immediate repayment of debts they never incurred. First awareness of trouble for some may even occur with police officers arriving to

eBay and E-mail “Phishes”

By the year 2004, the online auction site eBay had expanded to become one of the most popular and prosperous e-businesses on the World Wide Web. With literally millions of dollars changing hands through auction sales every day, the online site’s huge membership list presented a tempting target to identity theft specialists. A popular scam among such criminals was to send eBay members official-looking e-mail containing messages similar to this one:

During our regular update and verification of the accounts, we couldn’t verify your current information. Either your information has changed or it is incomplete. As a result, your access to bid or buy on eBay has been restricted. To start using your eBay account fully, please update and verify your information by clicking below.

Containing the familiar four-color eBay logo and coming from what appeared to be authentic eBay e-mail addresses, such messages could be very persuasive, making recipients who feared losing their eBay privileges very nervous. Recipients who followed instructions by clicking on the links provided were then taken to equally authentic-looking Web pages. Most recipients would not know how to tell that the ostensibly authentic eBay URL addresses to which they were directed actually hid the identity thieves’ real URL addresses. However, savvy eBay members—who knew that eBay itself pledged *never* to ask for confidential information—knew something was wrong when they were asked to reveal their user passwords, credit card numbers, and sometimes even their ATM PIN numbers.

serve arrest warrants for crimes committed through the false use of their names.

The discovery that a thief has misused one’s identity is always a major shock. Victims’ reactions may include anger, rage, disbelief, denial, and feelings of shame and embarrassment. Nearly 80 percent of people who report identity theft to the Federal Trade Commission (FTC) have no idea how the thieves acquired their personal information. Many such persons blame themselves for their misfortune.

Protestations of innocence are greeted with skepticism by banks and merchants, who may suspect that their customers are simply trying to evade paying their legitimate debts. As one sufferer complained,

victims of identity theft are assumed guilty until proven innocent, but criminals, when apprehended, are assumed innocent until proven guilty. Criminals are entitled to a public defender, while victims have to hire lawyers at their own expense. Proving one’s innocence to every creditor is an arduous and expensive process that can take years to accomplish.

Despite passage of the Identity Theft Deterrence Act in 1998, the problem continued to increase throughout in the United States. In 2002, the Federal Trade Commission’s hot line for fraud recorded 162,000 complaints of identity theft in 2002—an 88 percent increase over the previous year’s total of 86,000 complaints. In September, 2003, the FTC reported that more than 27 million people had suffered misuse of personal information over the previous five years. More than one-third of the victims, nearly ten million people, had experienced such misuse in the preceding year alone. The cost to banks and other businesses in that year exceeded \$47 billion. Individual victims reported spending thousands of dollars of their own money to clear their names. Despite the magnitude of financial losses caused by identity theft, victims have insisted that the worst aspects of the crime are the shock, emotional stress, time lost, damaged credit reputation, and feelings of having been personally violated.

Ideology

DEFINITION: Any set of beliefs and values or a set of false ideas used to conceal reality

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: If ideology is false consciousness, social critics believe there is an ethical imperative on the part of those who see clearly to reveal the truth to those caught within ideology. If all beliefs are ideological, critics believe there is an ethical imperative on the part of all people to understand the way in which their particular beliefs relate to current power structures and struggles. In either case, the question of the extent to which ethics itself is ideological—the extent to which it is an instrument of political power and social control—is a pressing one.

The French savant Antoine Destutt de Tracy can be credited for coining the term “ideology” in 1795. For Destutt de Tracy, ideology had a neutral value signifying only ideas and ideals. In the history of its development, ideology has acquired two distinct senses. In a general sense, it applies to any set or system of ideas, whether they are philosophical, political, theological, or ethical. In a more critical sense, ideology refers to any false set of ideas used by the dominant classes to control the subordinate classes.

Approaching ethics from an ideological point of view means to inquire into the relationship between ethics and social classes. Ideological critique presupposes a conflictual model of society in which dominant social classes and subordinate or oppressed social classes struggle for power and autonomy.

THE MARXIST TRADITION

The Marxist tradition has given more prominence to ideology in its social and ethical analysis than to any other theory. Karl Marx partly derived his concept of ideology from his intellectual mentor, the German philosopher Georg Wilhelm Friedrich Hegel, who, in his philosophy of history, set forth the

claim that human history moves forward by the “Cunning of Reason,” independent of any individual human awareness. From Ludwig Feuerbach, a critic of Hegel, Marx appropriated the idea that theological, moral, and metaphysical beliefs stem from the wishful projections of human psychology. Marx, however, deepened Feuerbach’s position and asserted the sociological roots of ideology.

In his 1859 preface to a *Contribution to a Critique of Political Economy*, Marx summarized his historical method. He utilized a structural approach that divided society into “structure” and “superstructure.” By structure, he meant the economic and social relations generated by the productive sphere. By superstructure, Marx referred to the state, its juridical-legal system, and the cultural realm of morality, religion, art, and philosophy—in short, ideology.

Marx believed that the form of the economic foundation of the state determined the form and content of the state’s ideological superstructure. For example, in a capitalist society, the laws protect private property and moral norms justify the disparity between the rich and poor. In an earlier work called the *German Ideology*, Marx criticized the ideological nature of German philosophy for its justification of the Prussian state. There also appears the metaphysical claim that the material conditions of life determine forms of social consciousness.

In *Das Kapital*, Marx claims that capitalism generates a form of illusory consciousness that Marx names “commodity-fetishism.” By commodity-fetishism, Marx means the false belief that commodities exchange on the basis of intrinsic value. In reality, values are extrinsic to the commodities and are based on ratios of social labor. In the *Critique of the Gotha Programme*, Marx refers to morality as ideological nonsense and calls the modern liberal ideas of equality and justice “bourgeois” and “ideological.” Nevertheless, Marx was not beyond inveighing moral dictums against the exploitative and alienating features of capitalism like a Hebrew prophet.

Later Marxists followed the lines of thought opened up by Marx. Antonio Gramsci, founder of the Italian Communist Party, formulated the concept of hegemony to express the ideological forces of the modern bourgeois state. Hegemony refers to the power and authority attained and maintained by the ruling classes through the coercive apparatus of the state and through the consent gained by the cultural

institutions of civil society. Louis Althusser, a French communist philosopher, developed the idea of ideological state apparatus. Briefly put, in order for society to maintain the status quo, it must also reproduce the fundamental economic social relations, that is, reproduce workers who submit to the bourgeois social control. This submission is made possible by ideological state apparatuses such as schools and churches, which express the ideas of the ruling classes. Jürgen Habermas stressed the notion of legitimation as the acceptance of a social system by the members of that society.

MAX WEBER AND KARL MANNHEIM

In the sociology of knowledge tradition, intellectuals sensitive to the crisis of relativism and skeptical of human rationality developed similar notions of ideology critique parallel to those of the Marxists. Max Weber linked certain religious tendencies to affinities with different social classes. He also set forth the idea of a theodicy of legitimation for the privileged and a theodicy of compensation for the oppressed. For Weber, ideology meant the consciousness of an epoch. Thus, ideology entailed ethical relativism.

Karl Mannheim showed how Christianity provided an ideology for the dominant classes and utopias for the oppressed. He also believed that there was a need for a class of individuals freed from any social class loyalty. These he found among academic intellectuals, the so-called free-floating intelligentsia. Sociology in general studies how social structures coerce individual human behavior and morality.

Several questions are raised by an ideological approach. How do social classes develop forms of consciousness containing particular ideologies? What role do ideologies play in social change? Does not the claim that ethics is ideological lead to ethical skepticism and ethical relativism?

Illness

DEFINITION: Lack of health; presence of disease

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: An accepted definition of illness defines the parameters of the responsibilities of medical professionals, patients, and society in the treatment of both healthy and ill people.

During the twentieth century, particularly after World War II, advances in medicine took place so rapidly that the health care profession ballooned. With this expansion has come consistently increasing, often unattainable, expectations about what can and should be treated by the medical profession.

It is impossible to focus on a particular definition or viewpoint of illness without looking at its counterpart, health. Some people hold that illness is simply lack of health, but any definition of health is controversial. The World Health Organization (WHO) in 1946 offered this definition: "Health is a state of

complete physical, mental and social well-being.” It is easy to see why this is controversial. This definition places in opposition to health such states as grief as well as such social problems as racial oppression and poverty. Simultaneously, by classifying these things as health problems, it obligates the health care profession to broaden its scope to include them. Many people have taken issue with the WHO definition of health, but no one has yet been able to formulate one that is any more widely accepted.

VIEWS OF HEALTH AND ILLNESS

There are three predominant views of the concepts of health and illness. The first, the empirical view, proposes that the health of any organism is determined by whether that organism functions the way it was designed by nature to function. Illness, then, is any situation or entity that hinders the ability of the organism to function in the way in which nature intended. Proponents of this view point out that this definition is equally applicable to plants, animals, and humans. An organism is determined to be ill or healthy without reference to symptoms subject to interpretation by either the patient or the evaluator.

Another view of health and illness holds that health is that which is statistically normal, and illness is that which is statistically deviant. The problem with this view is that it ends up classifying many things society sees as positive traits, such as extreme intelligence or strength, as illness. Proponents, however, point out that what nature intended for a specific organism is often determined by statistical evidence.

The third view is that of normativism. Normativists believe that the concepts of health and illness incorporate cultural and societal values, because what is viewed as illness depends on what the particular culture considers desirable or undesirable. For example, in seventeenth century America, there was a “disease” called drapetomania, which caused otherwise content slaves in the South to have the uncontrollable urge to escape. The designation of illness also depends on the ability or willingness of a society to recognize a situation as undesirable. A society without writing would not be likely to consider dyslexia an impairment.

The normative view is especially prevalent (and compelling) in the field of mental health. The designation of what is a disease is a product of the culture

of the time. For example, in the nineteenth century, women who enjoyed sexual intercourse were considered mentally dysfunctional, while in the twentieth century, the opposite is true. Certain factions, such as advocates for alcoholics, have fought long and hard to have their particular problems labeled as disease. Others, such as homosexuals, have fought equally hard to keep themselves from being so labeled.

IMPLICATIONS OF DEFINITIONS

Why is the label of illness so desirable or undesirable? When a particular set of symptoms or problems is labeled as an illness, its presence carries with it certain properties of the “sick role.” Behaviors that would otherwise be seen as unacceptable or immoral are excused. Responsibility is diminished, both for actions and for inaction. The label of illness also carries with it, however, a certain stigma, that of the necessity to strive for a cure. This is why groups such as homosexuals have fought it so strenuously.

On a more general level, definitions of health and illness define the boundaries and obligations of the medical profession. It is reasonably clear that ideas about health care needs follow the line of ideas about health. The current conception of health care in Western society, the medical model, tends to support the paternalism of health care professionals as interventionists who relieve patients of their responsibility to care for themselves. A nonmedical model, however, tends to emphasize individual responsibility for health.

DISEASE VS. ILLNESS

Most people consider the terms “disease” and “illness” to be synonymous. Some, however, separate illness into a subcategory of disease. This separation bridges the gap between the empirical and the normative definitions of health. Disease is seen as simply the impairment of natural function, as in the empirical view. Illnesses are diseases that incorporate normative aspects in their evaluations. An illness is a disease whose diagnosis confers upon its owner the special treatment of the sick role. Not all diseases are illnesses. Diseases such as sickle-cell anemia may not impair the health of the individual, and thus do not incur the sick role.

Generally accepted definitions of health, illness, and disease are becoming more necessary as the health care profession grows. Until society clarifies

these concepts, health care will be called upon to mitigate every problem society has, not only the enormous number it is traditionally expected to solve.

Immigration

DEFINITION: Flow into countries of people seeking to change their nationalities

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Governments regulate by force who may leave their territories and especially who may settle within their borders. Border controls designed to exclude unwanted immigrants may be viewed as legitimate forms of collective or

communal self-determination, but critics argue that they often violate the individual right to freedom of movement and the ideal of equal economic opportunity for all.

During the 1990's, the U.S. government took unprecedented and costly measures to prevent migrants in search of greater economic opportunities from illegally crossing its long border with Mexico. The federal Immigration and Naturalization Service (INS) almost tripled its budget, doubled the size of its Border Patrol, and created a border of fences, cameras, and policing by helicopters. Concerns with security eventually led to further steps to close the border. Nations in the European Union have taken similar measures. However, it is unclear how effective various efforts at border control have been.

Although millions of illegal migrants were arrested throughout the world and returned to their countries of origin, there were still at least six million illegal immigrants in the United States and more than three million in Western Europe at the beginning of the twenty-first century. The cost in human suffering is also high. Every year, hundreds of migrants die trying to enter what critics of strict border controls call "fortress Europe and America." The moral question raised is what justifies governments' effort to exclude ordinary people who seek to improve their lives.

THE COMMUNAL RIGHT TO EXCLUDE

The communitarian philosopher Michael Walzer argues that communities have a right to determine the rules governing their cooperation and with whom to exchange the goods of their cooperation, including membership. He compares political communities to clubs, noting that within clubs existing members choose the new members and that no one has a right to join a club. Another aspect of the analogy is that people have the right to leave their clubs and so they have a right to emigrate. Walzer adds that political communities are also similar to families. The children of citizens are automatically citizens, and states typically give preference to would-be immigrants who are genetically related to its existing citizens. For Walzer, the right to exclude is not absolute: He argues that all states should take in some political refugees since every person has the right to belong to some political community.

There are many reasons that citizens may have for

wishing to exclude other people from entering their countries. Walzer stresses the danger of immigrants undermining a national culture and a shared way of life. Other grounds for exclusion are limiting population growth, protecting the environment and resources, shielding native workers from wage depression and increased competition for scarce jobs, and preventing an overburdening of welfare programs, public education, and other social services.

Critics of restrictive border policies contest the view that admitting many immigrants with different cultural backgrounds threatens national unity. They point out that cultural blending is common and that, at any rate, a multicultural society enriches the lives of its citizens. This latter view was challenged in the United States after the terrorist attacks of September 11, 2001, heightened public fears of Muslims living in the country.

On their account, national unity can be based on respect for individual rights and need not include a

deep sharing of specific cultural values. They also argue that immigration contributes to economic growth and that many immigrants take jobs that natives find undesirable. A final perceived benefit of immigration is that it counteracts the shrinking or graying of the native populations of many Western nations.

ARGUMENTS FOR OPEN BORDERS

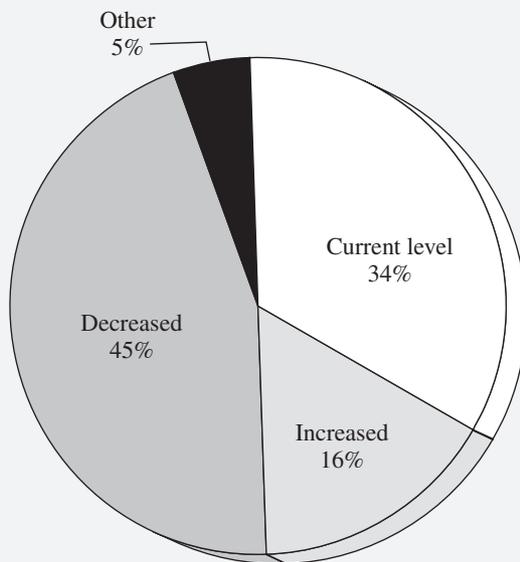

Proponents of open borders typically argue that even if more immigration does not benefit the receiving country, this does not necessarily warrant exclusion. Some utilitarian moral philosophers argue that the state must impartially balance the interests of its citizens against the interests of immigrants. Liberal human rights theorists maintain that individuals have a right to freedom of movement, arguing that just as people should be able to move from one city in the United States to another—whether or not their movement benefits the communities—so they should be able to move across borders. Egalitarian liberals hold

European immigrants sailing to the United States in 1906. (Library of Congress)

Public Opinion on U.S. Immigration Levels in 2004

In January, 2004, a CBS News/New York Times poll asked a cross-section of Americans whether legal immigration into the United States should be kept at its current level, increased, or decreased.

Source: Roper Center for Public Opinion Research. Figures reflect responses of 1,022 adults surveyed in January, 2004.

that closing borders to immigrants from the developing world is unjust because mere location of birth should not determine one's chances for economic success. As the liberal philosopher Joseph Carens puts it, keeping economic immigrants out by force makes citizenship in Western democracies a modern variant of feudal privilege.

IMMIGRATION POLICY STANDARDS

During the late eighteenth and nineteenth centuries, the United States placed few restrictions on immigration other than excluding the seriously ill, the criminally convicted, and certain non-Western populations. National origin quotas were adopted in 1921 and the Border Patrol emerged in 1924. Congress abolished this quota system in 1965 with the understanding that it was racist and replaced it by a system of preferences for relatives of citizens and permanent residents. Congress also reserved immigration slots

for professional workers, a preference that has become more extensive in recent years.

The active recruitment of immigrants with valuable professional skills has led to a "brain drain" from some developing countries to Western societies. Some countries of the developing world have lost anywhere from 25 percent to 75 percent of their highly skilled workers, including engineers, scientists, and physicians. It is generally held that professionals from these nations should not be denied the right to emigrate from their home countries; however, some ethicists have also argued that it would be appropriate to impose exit taxes to be paid by the hiring agencies to compensate for the economic loss to the sending countries and to reimburse them for their educational costs. Increasingly, professional immigrants view it as their duty to establish networks with professionals in their countries of origin and to promote local businesses and educational developments.

Immigration Reform and Control Act

IDENTIFICATION: Federal law designed to ease social and economic problems caused by illegal immigration

DATE: Passed in 1986

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: With the Immigration Reform and Control Act (IRCA), the U.S. government attempted for the first time to punish the employers of illegal immigrants, not only the illegals themselves, recognizing both as lawbreakers contributing to a national problem.

Authored by Senator Alan Simpson, the Immigration Reform and Control Act was passed after emotional debate in Congress. Nearly everyone recognized that immigration policy needed to be overhauled, but many opponents felt that the proposed law was designed specifically to keep out Hispanics and other people of color. The act had three main goals. Illegal immigrants already in the United States lived in fear of being found and deported; therefore, they were easily exploited by unscrupulous employers who paid unfair wages. Under the terms of the act, illegal aliens who came forward to register were granted amnesty and could eventually apply for citizenship.

The act also further increased funding for Immigration and Naturalization Service (INS) to turn back illegals at the borders. Later years showed this attempt to be very successful. Finally, the act made it more difficult for illegals to be hired for work in the United States; it was hoped that this would discourage them from attempting to come in the first place. Employers were now required to document that new employees were legally eligible for work in the United States.

Immortality

DEFINITION: Eternal life

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Many people believe that ethical grounds such as the demand for moral perfection, the justice of the universe, the value of the individual, and the goodness of God support or require belief in the immortality of the human soul.

Immanuel Kant, in his *Critique of Practical Reason* (1788), argued for the immortality of the soul along the following lines.

We are morally obligated to achieve moral perfection, a complete correspondence between our intentions and the moral law. Anything we are obligated to do is something we can do. But we cannot achieve moral perfection in this life. So given that moral perfection is obligatory, an infinite life during which moral perfection can be attained must be postulated.

In effect, Kant claims that the moral law requires as a corollary the immortality of the soul.

Kant's argument has several questionable aspects. Some people, claiming that morality is solely a matter of societal opinion or individual feeling, will reject outright the idea of a moral law and therefore will not be moved by Kant's argument. Even objectivists in ethics may claim that Kant's argument does not prove the existence of immortality, since it does not prove an objective moral law. Optimists about human nature may say that if people can control themselves in any given case, they may also be able to control themselves in every case, and therefore moral perfection in this life is possible even though it is difficult.

Others may question whether people are obligated to be morally perfect. Does the moral law require people to be perfect as well as to do their duty? If people are not obligated to achieve moral perfection but only to strive to achieve it, there is no need to postulate immortality. Those who think that they have independent grounds against the belief in immortality may say that no one is obligated to be morally perfect, since it is not possible to achieve such perfection in a single lifetime. Finally, it may be asked why achieving moral perfection requires pos-

tulating immortality rather than an extremely long afterlife.

Other moral arguments for immortality clearly rest on religious assumptions. Some appeal to a divine recompense, as follows: "In this life, the virtuous are not always rewarded, and the vicious are not always punished. Since God is just and powerful, however, there is an eternal life in which each receives his or her just recompense." No doubt, many people are motivated by a desire to avoid Hell and reach Heaven. Others worry that raising questions about immortality will undermine the motivation to act morally. They think that if there is no ultimate recompense, it is irrational for people to do what is right when it conflicts with their self-interest.

It is a mistake, however, to assume that moral behavior cannot be rational unless it promotes one's own welfare. If rational behavior instead only promotes one's ends, then since one can have altruistic ends, one can behave rationally without promoting one's own welfare. Thus, moral behavior that is not rewarded in this life can be rational even if it is not rewarded in a future life. A major motive for moral behavior is concern for other people, respect for their value. This kind of motivation does not depend on immortality, and this kind of concern is an important part of a fully human life; therefore, it is not irrational.

THE RELEVANCE OF GOD

The recompense argument is based on the assumption that God exists. To accept God's existence on faith is to accept immortality on faith. To the extent that God's existence is not proved, the future life based on it is not proved. Granting God's existence, would divine recompense take an eternity? Even if it would, would God balance the scales of justice? Some people maintain that God's goodness would require this, but that conclusion does not follow. Even if a just God regards human mortality as bad, that does not mean that God should or would end it. To do so may require God to sacrifice something he regards as more important. God's overall best plan for the universe may include this evil as well as others. The evil of human mortality may be a necessary part of a greater good.

Some claim that a good and powerful God would

guarantee human immortality because people are such valuable beings, full of infinite potentialities, or because God would not disappoint those in whom he has instilled a desire for immortality. These reasons are not convincing.

It is a mistake to think that humans cannot be valuable if they are not permanent. Many things, such as good health, are valuable even though they cannot last forever. It also seems clear that Socrates and Mohandas K. Gandhi were valuable individuals even though they did not last forever. From the claim that humans are worthy of being immortal, it does not follow that humans are immortal.

The idea that a good God would not disappoint those in whom he has inspired a natural desire for immortality also does not stand scrutiny. Does this desire come from God or from society? Many Hindus and Buddhists do not desire immortality. They strive to avoid being reborn, because they believe that blessedness involves a complete extinction of the individual. Even assuming that the desire for personal immortality were universal, it is clear that a good God would not necessarily satisfy every human desire.

Impartiality

DEFINITION: Absolute or relative freedom from prejudice or bias; fairness

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Impartiality is a central concept in several ethical theories that otherwise differ significantly. Many theorists assert that an ethics without impartiality is impossible. Others assert that to deny the fact of human partiality and assert a commitment to radical impartiality is to falsify the nature of the way people's minds and moral judgments actually work.

The concept of impartiality is suggested by various early writings and is implied by the Golden Rule of Jesus, which states that you should do unto others as you would have others do unto you. The idea of freedom from prejudice, even from prejudice toward oneself, however, occurs most often in ethical writing after 1700. David Hume claims that impartiality prevails when making moral judgments. Socially useful acts are approved. In "The Standard of Taste" (1757), Hume asserts that people accept as their own "the judgments of an impartial observer." Immanuel Kant, putting forward a very different theory from that of Hume, also stresses impartiality. He claims that duty is the same for all people. John Stuart Mill, developing a utilitarian ethical theory, asserts that utilitarianism requires one to be strictly impartial.

This concept of impartiality also occurs in writings of the twentieth century. In *The Moral Point of View* (1958), Kurt Baier states that the same rules should pertain to all. He asserts that we must adopt an impartial viewpoint. John Rawls, in *A Theory of Justice* (1971), urges a "veil of ignorance" where the rules of society are established by individuals who do not know what their own position will be in the society. In this approach, the rules that are developed will be impartial and fair to all.

In vitro fertilization

DEFINITION: Physiological union of sperm and ovum outside the female's body

DATE: First human born through in vitro fertilization on July 25, 1978

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: In vitro fertilization permits the separation of the genetic from the gestational role of motherhood. It makes technically possible a range of practices that raise serious ethical questions, including surrogate motherhood, sex selection, and other types of genetic screening or manipulation.

The term's origins are unknown, since the terms *in vitro* ("in glass") and "fertilization" have long been used in science. Attempts at in vitro fertilization (IVF) were reported as early as 1878 but were not confirmed until M. C. Chang reported successful pregnancies from rabbit ova that had been fertilized externally and placed in foster wombs. After scientists mastered the preliminary steps to human IVF, Patrick C. Steptoe and Robert G. Edwards reported a tubal pregnancy in 1976. In 1978, Steptoe and Edwards conducted the first IVF procedure to lead to a successful human birth.

In 1995, 2.1 million married couples in the United States were infertile. IVF and related technologies show promise for 10 to 15 percent of those who do not respond to other treatments. The government reported about five thousand births from IVF worldwide by 1988.

NONCOITAL PARENTHOOD

The Roman Catholic Church and some non-Catholic theologians oppose all noncoital reproductive techniques, including artificial insemination, because they separate the marital and the reproductive functions of love. Others see nothing problematic about achieving human parenthood "artificially," since control over the environment intrinsically defines human nature. A middle position admits that IVF's artificiality may harm marriage but holds that the overall benefits provided by parenthood outweigh those harms for some couples.

Similar secular objections are that IVF's artificiality will affect society's conception of humanness and will lead to the objectification of all embryos and

of women. Others worry about its psychological effects on the parents and children. Most consider the reproductive technologies to be no more of an “interference with nature” than is any other medical procedure.

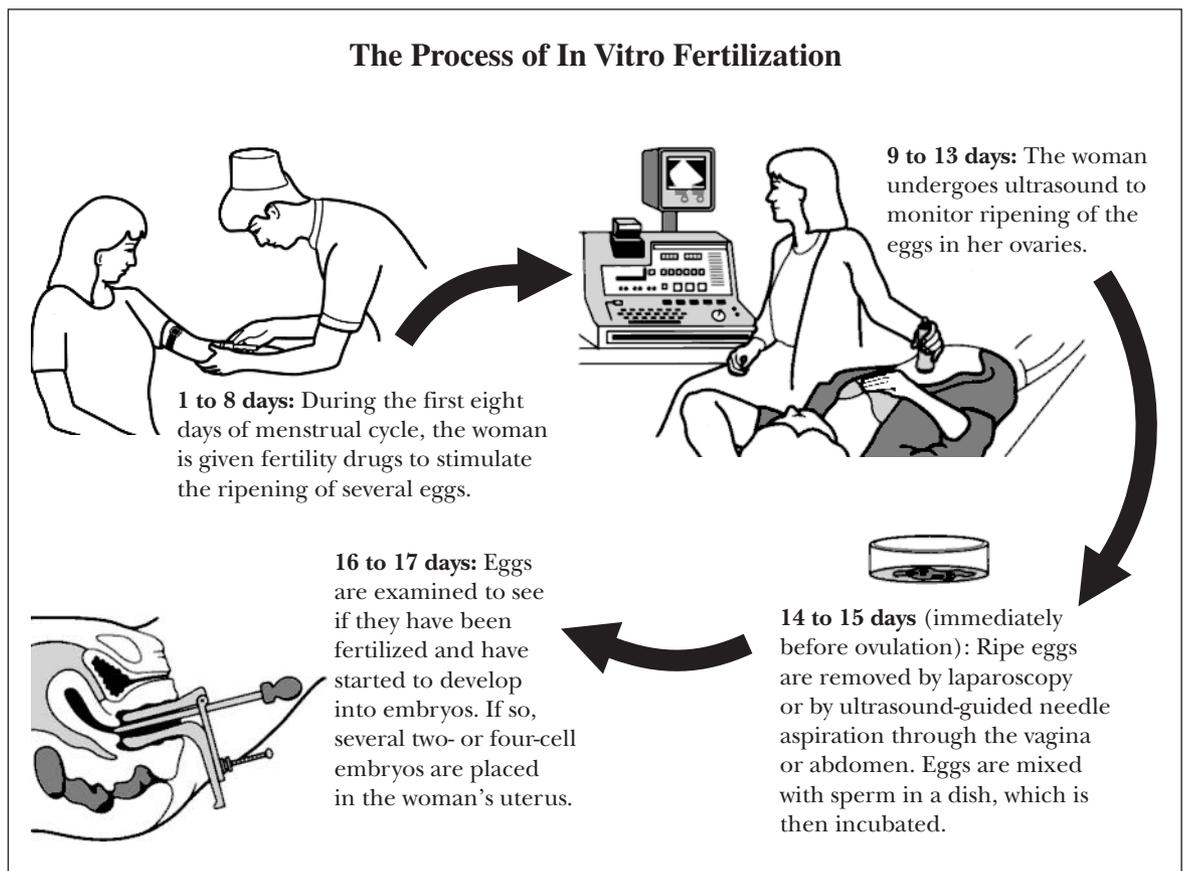

Many IVF programs do not accept unmarried or lesbian women. Although many would argue that children should be raised in traditional families, this screening singles out IVF and makes physicians the moral arbiters for society. Some allege that IVF reinforces, without examination, societal views that women must provide husbands with a genetically related child in order to achieve full womanhood.

THE EMBRYO’S STATUS

When a single embryo is implanted to produce a live birth, IVF closely resembles coital conception. For those who believe that human life and personhood begin at implantation or later, the em-

bryo’s status presents few problems. For those who believe that human life and personhood begin at conception, however, IVF can be problematic, especially when it is used to study embryonic development or contraception. Does using embryos in research to provide a cure for diabetes or Parkinson’s disease constitute unauthorized experimentation on unborn children? Even as a substitute for normal conception, IVF results in greater “wastage” of embryos because of more failures to implant and more miscarriages.

Because “harvesting” ova is expensive and invasive, women are often hormonally induced to produce several ova. Often, physicians implant multiple embryos to increase the chances of live births; this procedure increases the possibility of multiple births or selective abortion if too many embryos are implanted. Alternatively, because cryogenic preservation is possible after fertilization, some physicians

(Hans & Cassidy, Inc.)

Birth of Louise Brown

On July 25, 1978, Louise Brown, the first baby conceived outside a human mother's body in a laboratory dish, was born to Gilbert and Lesley Brown. The Browns were childless, because Lesley's fallopian tubes were blocked with adhesions and had to be surgically removed. Consequently, eggs from her ovaries could not migrate down the tubes, which prevented their possible fertilization and uterine implantation. To overcome this biological problem, physicians Patrick Steptoe and R. G. Edwards used in vitro technology. An egg surgically removed from the mother was combined with ejaculated sperm from the father in a laboratory dish to induce conception, or fertilization. The fertilized egg was then implanted into the mother's uterus, where its development culminated in the birth of Louise Joy Brown.

Among the most widely publicized events of its era, Louise's birth helped to turn the tide of public sentiment. The issue of in vitro fertilization (IVF) had been publicly debated with increasing fervor in the mid-1970's. Many feared the technologization of the reproductive process due to its potential miscarriages and abuses, and articles heralding a potential cure for infertility ran alongside articles decrying IVF's potential monstrosities. Louise Brown and her parents put a human face on IVF, however, and garnered popular support for the procedure.

implant embryos one at a time. Should excess frozen embryos be allowed to "die" or be donated to other infertile couples? A wealthy couple's 1983 death raised the issue of whether their frozen embryos should become their heirs. What happens if a couple divorces? A judge facing the issue awarded "custody" to the mother who wanted the embryos implanted. In 1992, the Tennessee Supreme Court reversed that decision, declaring that the embryos were neither property nor persons but an interim category entitled to respect because of their potential for human life; it held that both parents had rights to decide the embryos' fate prior to implantation but that the father's right not to be a genetic parent outweighed the mother's desire to donate the embryos.

All the government commissions examining the embryo's status adopted this interim category, recommending that experimentation be allowed until the fourteenth day of development and that the embryo be "treated with respect" but not accorded full rights of personhood.

EXPERIMENTAL TECHNIQUE

As soon as IVF live births demonstrated success, "infertility centers" sprouted around the country. Since humans were only the fourth species that demonstrated success with IVF, some people accused scientists of rushing to experiment on women before properly studying IVF in animals. During the 1980's, many infertility "specialists" were inadequately trained and promised overgenerous results. Although there are no apparent problems, negative effects on the children of IVF cannot, as the DES tragedy demonstrated, be ruled out until the test group is larger and reaches reproductive age. Moreover, the long-term effects of superovulating women are unknown.

A de facto federal moratorium on funding IVF has resulted in no regulatory research to demonstrate the efficacy or safety of IVF and no development of guidelines; most research is connected with commercial interests. Moreover, IVF is expensive and has a low rate of successful pregnancies (an average rate of 10 to 15 percent per procedure during the late 1990's); some question making these expenditures to overcome infertility when resources are needed to care for or adopt living children and for research into avoiding the causes of infertility. Distributive justice concerns are also raised; even if covered by health insurance, which often declares IVF too experimental, IVF will not be affordable for most couples. At the beginning of the twenty-first century, IVF procedures alone could cost as much as nine thousand dollars in the United States, and the costs of drugs and donor eggs could easily raise the total cost to more than fifty thousand dollars.

POSSIBLE USES OF IVF

As with artificial insemination, IVF makes the donation of gametes possible; this possibility raises questions of the advisability of separating the genetic from the other roles of parenthood, including the possibility of detrimental effects on the children's identities. In fact, through surrogacy, the gestational

mother need be neither the biological mother nor the intended mother. IVF is used to treat both male and female infertility. Some people question the reliance on using surgery on the woman to overcome the husband's low sperm count, particularly in the light of the dearth of research on the causes of and cures for male infertility. Preimplantation genetic testing of the embryo can be accomplished harmlessly, thus raising the advisability of genetic screening, including sex selection.

Incest

DEFINITION: Sexual intercourse or sexual activity between close relatives

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Incest is taboo in most societies. Usually, incest between a child and an adult relative is considered especially heinous. Sibling incest, while still taboo, is usually judged to be more pathological than criminal.

Incest seems to be a growing problem. In the United States, at least, reported cases of incest were on the rise during the 1990's. Prior to the 1970's, incest seemed to be kept hidden. Increasingly, however, victims and their protectors began speaking out, and the public and legal authorities became more aware of the problem than ever before.

The "typical" offender in incest cases is the father (in approximately 90 percent of the reported cases), and the victim is usually his daughter. Fully 97 percent of all reported cases of parent-offspring incest involve father-daughter couplings or arousing sex "play." Only 3 percent of the perpetrators are female. When incest involves the father and the son, as it does in approximately 7 percent of reported cases, the young male has a second issue to grapple with—that of the father's bisexuality or homosexuality. Men who take sexual advantage of young relatives typically suffer from low self-esteem brought on by physical, mental, and, sometimes, sexual abuse that they suffered as children.

Many reasons for forbidding incest have been offered. Society has been "told," for example, that incestuous relations are likely to produce mentally and physically defective offspring. Although modern geneticists have learned that that fear is unfounded, laypersons still fear incest for this reason. Another reason to forbid incest involves family stability: Incest could create chaos in the family by causing jealousies and the exchanging of, or confusion about, roles, which could cause the family to become "organizationally dysfunctional." Such a family would not survive as a unit, and if enough families engaged in the practice, society itself would break down. Hence, a ban or taboo on the practice becomes a "functional prerequisite" for society.

Another reason to avoid incest exists. Many authorities emphasize the psychological harm done to

victims. The “crime” is so heinous that victims are often sworn to secrecy, becoming in a sense “responsible” not only for the act but also for keeping the family together by not talking. Fighting such strains, victims emerge with poor self-esteem and related psychological problems. As time passes, most victims cannot engage in “age-appropriate” play, and they tend to develop few outside interests. Some create discipline problems at home and at school. Furthermore, incest teaches some victims that if they like someone, they should act out their feelings sexually.

APPARENT EXCEPTIONS

Some scholars have begun to question the “negative only” view of incest. One study, for example, cited an investigator who studied twenty brother-sister marriages that occurred in one state. The investigator reported that the couples, all of whom were living in middle-class suburbia, led fruitful lives and were happily raising their offspring as normal human beings. Another case involved a twenty-eight-year-old married middle-class woman who regularly visited her old widowed father to clean his house and cook for him. The two regularly had sex because the woman had promised her mother that she would “take care of Dad.”

Another case involved a nineteen-year-old college coed. When she was preparing a research paper for a class in abnormal psychology, she had a severe anxiety attack that required hospitalization. She had just read that incest was a taboo, a heinous crime; in apparent innocence, she had been having sex with her father and three brothers since she was thirteen. Her analyst reported that she had had to take over the domestic duties of the family upon the death of her mother and that she had “assumed” that sex was part of her “responsibility” because men “needed it.” Furthermore, the analyst reported that the coed seemed well adjusted, happy, and guilt-free—until she went to the college library and read about the “horrors” of incest.

Such cases led some experts to talk of “functional” incest, which makes possible a shift in traditional family “roles” that enables the family to continue as a unit rather than to disintegrate. One scholar analyzed 425 published case studies of incest from America and Europe and identified 93 as “nonpathological” cases in which incest was a “functional” response that allowed the families to stay together.

One researcher recounted the story of a family in South America whose members had been shunned by their community because some family members engaged in prostitution and others engaged in bootlegging. The ostracism eventually resulted in incestuous relations among as many as forty family members and created a monstrous problem for those exploring the family genealogy. One man had relations with his mother, who bore his daughter. Years later, he had relations with his daughter, who then had a daughter. He thus became father, brother, and mate to his first daughter and grandfather, father, brother, and mate to his second daughter. In this case, however, incest did not mean disintegration of the family; in fact, the family members handled the cross-generational and sibling incest quite well. The family stayed together, and the individual members seemed well adjusted and happy.

Such cases should be regarded as exceptions. In most cases of incest, tragedy and suffering result; incest usually tears a family asunder, partly because of the behavior itself and partly because of the learned aversion to incest.

Income distribution

DEFINITION: Distribution of various forms of income among members of society and their families

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: The consumption opportunities and senses of self-worth of individuals are strongly affected by the individuals' incomes and their views concerning the fairness of how society's total wealth is distributed.

The incomes of most Americans take the form of salaries paid by employers, interest and dividends from investments, rents on properties, and profits from businesses. Most income revenue comes from the private sector, but a significant share also comes from government sources. Incomes are also distributed and redistributed within individual family households, and unpaid household services performed by family members constitute important nonmarket forms of real income.

BUSINESS INCOME

Most incomes paid by business are wage payments for labor services. In addition, firms make income payments for interest, rent, and dividends. Business profits constitute income for business owners, even if those profits are plowed back into the businesses.

Businesses pay out money in order to obtain labor and other productive services. They also make rental payments to obtain productive land, buildings, and equipment. Moreover, they pay interest and dividends in order to obtain funds that finance capital investments. Firms attempt to maximize profits and thus are motivated to pay as little as possible to obtain needed services. However, in order to compete with rival firms to obtain workers and other services, they must pay competitive wages. The individual worker's freedom of job choice is the most effective protection against workplace unfairness. Dissatisfied workers can always quit and go elsewhere or even start their own businesses. Employers experiencing

heavy turnovers in employees have an incentive to pay higher salaries to make their jobs more attractive to their workers.

Incomes from business are affected by taxation and by the activities of labor unions. Unions tend to display more concern for fairness than employers. A common union policy is seniority, a system wherein the workers who are employed the longest are given special consideration in pay and promotion decisions and protection against layoffs. However, seniority systems may work against efficiency and unfairly place younger workers at a disadvantage.

PRODUCTIVITY ETHICS

The most widely accepted economic theory of incomes from business is that each supplier of productive services receives payment equal to the value of its marginal product—in the simplest case, the value of additional output that results from adding that individual's services. To many economists, this seems eminently fair: Each person takes from the economy an amount of goods and services equivalent to the value that person contributes. Furthermore, the system promotes a high level of economic productivity. Workers and wealth-owners shop around for opportunities that yield them the best incomes. In the process, their services flow into highly productive outlets. Workers have incentives to improve their productivity through extra training and harder work. Investors have incentives to obtain information about the profitability of various firms. Firms look for employees whose work helps generate the highest possible profits. This process leads both workers and employers into efficient patterns of production.

Evidence that labor incomes reflect differences in productivity comes from the higher pay that goes, on average, to persons with more education, more experience, and greater on-the-job supervisory responsibility. These variables account for much of the earnings differentials involving women and members of ethnic minorities. Young persons and others entering the labor market for the first time usually have low productivity and consequently receive low pay. Recent immigrants to the United States are particularly vulnerable to initially low incomes.

INCOME DISTRIBUTION IN THE FAMILY

To assess the morality of market income distribution, one must be aware of the second system of in-

come distribution, which is the family. In 2001, about 135 million Americans were employed. Many of the remaining 150 million people—particularly the 65 million people under sixteen years of age—were household members with those employed. Their incomes depended partly on the incomes received by other members of their households and partly on the nonmarket ways in which incomes were divided among members of the household. Families also provide other methods of rewarding virtues such as kindness, loyalty, altruism, optimism, and creativity that are not always rewarded in the business world.

INCOME FROM GOVERNMENT

The third principal source of income is government. In the United States, about one sixth of employed persons work for some level of government. Fairness is a more significant factor in government employment. Workers qualify for government civil service positions by taking examinations, and the rules for pay and promotion are publicly known. In the United States, government jobs have helped to improve opportunities for women, members of minorities, and persons with disabilities. However, excessive concern with providing employment can mean that efficiency is sacrificed and government offices overstaffed.

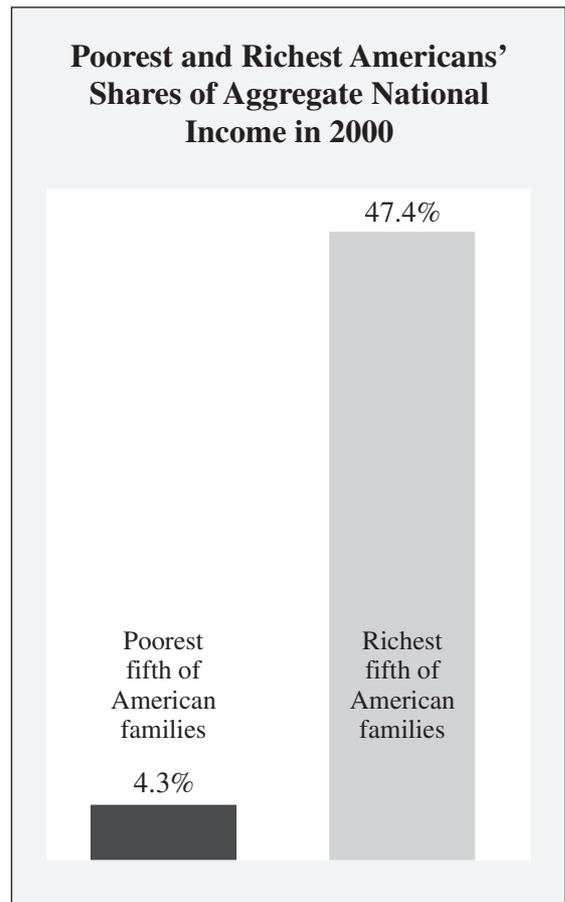

Governments also pay large amounts of income in the form of transfer payments: old-age pensions, unemployment compensation, disability benefits, and other income supplements for the poor. In 2000, one-eighth of personal income received by Americans came from transfer payments. In addition to cash incomes, government provides or subsidizes services such as medical care, education, and housing. People earn their government Social Security benefits by paying wage taxes while they are employed. Others earn interest from government bonds by lending money to the government. However, need rather than earning is the basis for government income programs for poor persons.

Government payments combine concerns for fairness with political expediency. For example, the first generation of Social Security retirement beneficiaries received far more than actuarial calculations would have warranted during the brief time the program had been in place. Conversely, working-age adults in the twenty-first century were paying much higher Social Security taxes than their parents had.

Medical benefits under Medicare and Medicaid have been the causes of a chronic political battleground. Before the federal welfare reforms of the 1990's, some opponents of government welfare programs argued that welfare benefits would subsidize irresponsible child-bearing.

WHAT IS FAIR?

The productivity ethics position is that individuals should receive rewards equal to their contributions to national output. However, this approach has led to wide disparities in income. In the year 2000, the one-fifth of American families with the lowest incomes received only 4.3 percent of the nation's aggregate income, while the top one-fifth of the population received 47.4 percent. The productivity standard is most obviously inappropriate for children, the elderly, and persons with disabilities, who cannot be expected to be very productive.

Even in a free-market economy, incomes do not always match productivity. In every sizable workplace there are always some workers at who are extremely competent and reliable and others at the same pay level who are lazy, careless, or troublesome. Employers often have only imperfect knowledge of these differences among their employees. At the same time, workers often have imperfect knowledge of alternative job opportunities that might be open to them. Imperfect matching between incomes and productivity may arise from monopoly conditions and from union activities that exclude people from certain occupations.

The market standard for “productivity” equates it with anything people are willing to pay for—even illegal drug dealers, pimps, and pornographers. Hence, the morality of income distribution depends partly on the morality of the activities from which people derive their incomes.

There is much potential injustice in property incomes. Some people accumulate wealth by hard work and frugality and invest it wisely. However, much wealth is transmitted from one generation to another through inheritance or family gifts and reflects no particular merit on the part of the recipients. At best, the recipients of such wealth are called on to exercise skill and responsibility in the way their wealth is managed. The belief that an egalitarian society should not allow the accumulation of unearned wealth across generations has been the chief argument in favor of the estate tax, which imposes a tax on already taxed income prior to its inheritance.

Another possible standard of fairness is equality. Because someone needs to do the work in every society, and because there needs to be an incentive to do it, a complete equality standard has never been very practical. However, many people feel that income distribution in a free-market economy is unduly unequal and is particularly unfair to children. In 2000, American households below the poverty income line accounted for nearly one-sixth of all children, and nearly 30 percent of black and Hispanic children.

CHILDREN

The potential of individual people to achieve high-paying jobs depends greatly on their family backgrounds. Some children grow up in stable two-parent households that provide well for their nutrition, medical care, and education. Others live with parents who

have little education or job skills. Differences in intellectual capacity, physical fitness, and attractiveness can also affect earning capacity.

Poverty among able-bodied working-age adults often results from their life-style choices—drug and alcohol abuse, dishonesty, irresponsible pregnancies, violence, and neglect of their educations. However, large numbers of children are innocent victims of their parents’ poor choices. Marital status is a good indicator of life-style choice. In 2000, married-couple households had median incomes about double those of female-headed households.

Concern for children leads inevitably to the idea that fairness requires equality of opportunity. Government programs and charitable efforts to provide for children’s basic needs have the support of a large majority of the American people. In the early twenty-first century, the enormous disparities in public schools were a particular focal point for such concern.

GOVERNMENT MEASURES

Much of what government does displays its concern for changing income distribution. Income fairness has been a major consideration in government policies to end discrimination based on gender and ethnic identity. In this regard, the armed forces have set particularly high standards for fairness—for taking care of service members and in providing excellent schooling for children of military families.

A modified version of the equality standard is that each person has the same basic material needs—for food, clothing, shelter, medical care—and the society should provide for these.

Traditionally, many economists have favored progressive tax systems, which impose higher tax rates on persons with higher incomes. In 2000, the top 25 percent of American income receivers—those with incomes of \$55,000 and higher—provided 84 percent of total U.S. income tax revenues. However, much government revenue comes from other types of tax that are not progressive.

Several moral objections have been raised against the principle of structuring taxes for the purpose of income redistribution. Taxation, by its nature, involves coercion. Taxation can impose heavy compliance costs and other forms of excess burden. Like all government actions, taxation reflects political expediency. All government measures are bent to serve

powerful special interests. Moreover, taxation does not in itself raise the incomes of the poor.

At the beginning of the twenty-first century, much government redistribution came through transfer payments. Poverty among older Americans has been greatly reduced by Social Security, Medicare and Medicaid, and need-based supplements. Federal, state, and local governments provide extensive safety-net programs aimed at children. Their effectiveness is often impaired, however, by parental delinquency or indifference.

INTERNATIONAL DIMENSIONS

A broader question involves the enormous differences in incomes across the regions of the world. Efforts to remedy these by government foreign aid programs over the last half of the twentieth century proved relatively unsuccessful. Low-income countries generally have low incomes because their productivity is low. The reasons for low productivity often reflect defective legal and political environments as well as purely economic considerations. Well-meaning gestures from benefactor nations sometimes make matters worse. For example, donating food to a low-income nation may depress its local agricultural prices and thereby weaken its domestic agricultural sector.

Incommensurability

DEFINITION: State that develops when it is impossible to measure competing choices against a common denominator

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The difficulty of choosing rationally between choices that cannot be evaluated on the same scale can raise special ethical problems.

Situations involving incommensurability frequently occur in everyday life. For example, parents must often choose between putting their careers on hold in order to raise their children at home and sending their children to day-care centers while continuing to work. Faced with such decisions, individuals may try to make their decisions on the basis of cost-benefit analyses. Can people, however, place a value on raising their children at home and plug it into an equation opposite the value of their working? Early nineteenth century British philosopher Jeremy Bentham's theory of utility calculus requires similar quantifications of all goods in order to determine how to maximize utility.

By contrast, theories of incommensurability argue that the values of some goods are *not* interchange-

able. An economist might assign monetary values to a person's career and the time the person spends with a child and compare them accordingly, but for many people such values cannot be measured in financial terms. Incommensurability can therefore be understood as a problem of translation, conversion, or compensation, as no amount of praise for the book that a mother writes during a year that her child is in day care might compensate her for the experiences that she does not share with her child. Aristotle's claim that no amount of one virtue can compensate for a lack of another challenged Plato's theory that all goods are ultimately instantiations, or reflections, of one essential good.

Problems of incommensurability also arise in political debates, typically when inherently valuable goods are at stake. For example, when considering whether a certain parcel of land is more valuable as a wildlife reserve or as an oil field, environmentalists are apt to object to conceptualizing the value of nature in financial terms.

Index librorum prohibitorum

IDENTIFICATION: Now-defunct list of books forbidden by the Roman Catholic Church

DATES: 1559-1966

TYPE OF ETHICS: Arts and censorship

SIGNIFICANCE: Members of the Roman Catholic Church were forbidden, except in special circumstances, from reading or even possessing books included in the *Index librorum prohibitorum*, on the theory that such works were harmful to the faith and morals of practicing Catholics, and that it was the function of the church to protect its members from such moral harm.

The *Index librorum prohibitorum* was never intended to be an exhaustive catalog of forbidden literature.

Index Librorum Prohibitorum Time Line

- 1557 First *Index librorum prohibitorum* is drawn up by the Congregation of the Inquisition, under Pope Paul IV but never published.
- 1559 First *Index* is published, in larger and more extensive format than that compiled in 1557.
- 1571 Pope Pius V establishes special "Congregation of the Index" to oversee list and revise it as necessary.
- 1664 *Index* begins to list books and authors alphabetically.
- 1753 Pope Benedict XIV develops detailed rules to be followed in future *Index* compilations.
- 1757 Under Benedict, *Index* is revised extensively and cleared of previous errors.
- 1897 Pope Leo XII's *Officiorum ac munerum* outlines censorship duties for diocesan bishops that include control of literature judged contrary to faith or morals. *Index* begins growing less prominent in hierarchical Church affairs.
- 1917 Pope Benedict XV transfers charge of the *Index* to the Holy Office.
- 1948 Final edition of the *Index*, with 4,100 entries, is published.
- 1966 *Index* is abolished after Vatican Council II and becomes a historic document for Roman Catholicism. However, Church officials retain the authority to prohibit future books that constitute a threat to the faith or morals of Catholics.

Rather, it represented those works condemned by the Roman Catholic Church in response to specific requests from people around the world. The majority of works included in the *Index* were theological in nature. During the first century (1559 to 1649) of its four centuries of existence, 469 texts appeared in the *Index*; in its second century, 1,585 were added; in its third, 1,039 were added; and in its final century, 1,585 were added.

By the time the *Index* was suppressed in June,

1966, it contained 4,126 entries. Some entries denoted specific titles, whereas others designated authors with Latin notations such as *omnia opera dramatica* (“all dramatic works” [forbidden]) or, the most severe censure, *opera omnia* (“all works” [forbidden]). Among those whose writings were forbidden were such notables as Émile Zola (all works), Stendhal (all love stories), Samuel Richardson (*Pamela: Or, Virtue Rewarded*, 1740), Laurence Sterne (*A Sentimental Journey Through France and Italy*, 1768), Edward Gibbon (*The History of the Decline and Fall of the Roman Empire*, 1776-1788), and the complete works of British philosophers Thomas Hobbes and David Hume. Only four American authors (whose writings were theological in nature) were ever listed on the *Index*.

Individualism

DEFINITION: Theory that individual human beings are the fundamental units of reality and value

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: In Western culture, liberal individualism is the dominant mode of understanding society, history, and one’s role within society and history. In ethics, individualist moral systems are founded upon the values and subjective experiences of the individual, and they valorize the rights of the individual and autonomist virtues above all else. Individualism opposes or marginalizes collective and communitarian theories of history and ethics, as well as other-centered virtues, such as nurturing, consensus-building, or responsibility to the community.

At the core of most debates about human nature, ethics, and politics is the debate about the power and value of the individual. In analyzing human nature, individualists emphasize that individuals have the power to control their own thoughts and actions and therefore to form their own characters by their choices. In ethics, individualists emphasize the value and potential of each individual, and so they encour-

age self-reliance, independence, and the quest for each person to realize his or her own unique self. In politics, individualists encourage laissez-faire—that is, leaving individuals free to pursue their own ends—and therefore they encourage free enterprise and limited government. In each area, individualists oppose the collectivist idea that individuals are molded by or subordinate to larger social groups.

HISTORY

Individualist ideas predate the use of the term “individualism.” Early in the modern era, Thomas Hobbes and John Locke argued that political power begins with individuals and is consequently transferred to governments. They opposed the traditional idea that power naturally resides with an aristocracy or monarchy and is imposed on individuals. Government exists to serve its citizens, not vice versa. A gradual decentralization of power followed the rise of individualist ideas, giving rise to more democratic political institutions and free market economic institutions.

A highlight year for individualism was 1776, for in that year the United States of America was founded explicitly on individualist political ideas and Adam Smith published *The Wealth of Nations*, an influential description and defense of the free market system of economic individualism.

Alexis de Tocqueville is usually credited with the first use of the term “individualism,” in his *Democracy in America* (1835-1839). He used “individualism” to describe the American character to which he had had mixed reactions; while he admired the energy and vitality of American individualism, he also feared that it would eventually degenerate into atomic selfishness.

F. A. Hayek has noted that the Saint-Simonians (named for Claude Saint-Simon), the founders of modern socialism, used “individualism” to describe the free-market, competitive society they opposed.

INDIVIDUALISM AND EGOISM

Individualism in ethics is associated with egoism, the theory that each individual’s life is his or her highest value. Individuals are ends in themselves, not servants or slaves to the needs or interests of others. In order to survive and prosper, individuals need to think and act independently; therefore, self-reliance, initiative, pride, and courage in the face of disap-

proval are encouraged as virtues. Individualism thus is opposed to collectivism in ethics, the theory that larger social groupings are more important than the individuals who make them up and that individuals have a duty to sacrifice for the benefit of the group, whether the group be class, race, tribe, family, or nation. Individuals recognize the great value of cooperation but emphasize that cooperative social groups exist solely for the benefit of the individuals that participate in them; individuals do not exist to serve the group.

POLITICS

Individualism has important implications for economics and politics. Economically, valuing independence of thought and action translates into encouraging economic independence. Independence does not mean that individuals live as hermits. Rather, in a society based on the division of labor, it means providing for one's needs by producing the value-equivalent of what one needs and trading with others for mutual benefit.

Politically, valuing independence translates into recognizing and protecting individual spheres of autonomy. Individual autonomy can be violated in three broad ways: killing, assault (including slavery and kidnapping), and theft. Therefore, protecting individual autonomy means protecting individuals' lives, liberties, and property. The social institution established for this purpose is government, and to prevent abuses, political power will be decentralized as much as possible and limited to protective functions.

Thus, individualism encourages the decentralization of both political and economic power. The foundation of political authority resides in the individual citizens, and the power of government is limited to serving individuals' need for autonomy. Along with political decentralization goes economic decentralization: Economic power resides in individual ownership of property, and investment and consumption decisions remain in individual hands. Individualism is thus associated with limited government and free enterprise.

HUMAN NATURE

All the above depends on an analysis of human nature. To support individualism in ethics and politics, individuals must be both capable and worthy of autonomy. This leads to the three most fundamental

debates about human nature between individualists and collectivists:

1. Whether only individuals exist and groups are only aggregates of individuals, or social groups are organic wholes of which individuals are only dependent fragments.

2. Whether individuals are born cognitively and morally *tabula rasa* ("blank slate") or are born with the inherently destructive elements (for example, with Christian Original Sin or a Freudian id) and therefore require strict social constraints.

3. Supposing that individuals are born *tabula rasa*, either they have the capacity to create their own characters and destinies by controlling their own thoughts and actions or they are formed and controlled by the social groups to which they belong.

The second and third issues raise the complex of nature versus nurture versus free will issues, and it is in the resolution of these issues of human nature that the fate of individuals lies.

Industrial research

DEFINITION: Technical inquiry and experimentation to develop new products, new manufacturing technologies, or more profitable and efficient techniques for creating and distributing commodities

TYPE OF ETHICS: Scientific ethics

SIGNIFICANCE: Industrial research raises a host of ethical issues involving fair employment practices, intellectual property rights, environmental responsibility, industrial espionage, workplace safety, and government oversight.

During the mid-twentieth century, the sociologist Robert Merton stated the norms of the scientific research community: communality, organized skepticism, originality, universality, and disinterestedness. To these should be added self-motivation, an openness in sharing results, and a readiness to change when objective evidence calls for it. To some degree, all these ethical norms are challenged by the practice of industrial research. The discussion that follows identifies some of these challenges, both to the individual and to the corporation.

THE INDIVIDUAL SCIENTIST

People with research degrees (usually doctorates) in the sciences are accustomed from their university experience to being their own bosses in choosing and executing research projects. In industry, by contrast, they are assigned a research problem and must report regular progress to a boss who reports to a higher boss, on up to the research director, with results appearing not in professional journals, but only in internal reports. The problem is less acute in very large, research-oriented companies, where the projects are correspondingly larger and more interesting. In companies with very small research operations, the problems can be depressingly trivial (for example, it is difficult to care how to lengthen the time it takes cornflakes to become soggy in milk). It is also less uncomfortable for graduates without university research training to be trained in a particular company's laboratory and absorb the company's goals with the training. Nevertheless, nearly all industrial researchers occasionally feel that they are compromising true science and must find their own way to be comfortable with this.

RESEARCH PRACTICES WITHIN CORPORATIONS

Companies must make money to survive. The problem for their research divisions, then, is to do as wide-ranging and complete research as possible within budgetary restraints. The urge to cut off research projects that do not pay off quickly must be resisted, as must the urge to stop a successful project the instant a product becomes possible. A more pernicious ethical problem is that of actually doing the research. Chemical procedures have sometimes been made up out of whole cloth, because "we know that's how they'd come out anyhow," and products have been represented as research breakthroughs that were nothing of the kind. Patent policy is worth mentioning: American firms customarily claim patent protection not only for a specific invention, the patent's subject, but also for any similar device or process that can be related to it, thus closing out research efforts by other firms. A topic that is too large to deal with here is the ethical handling of animals in industrial laboratories.

RELATIONS WITH OTHER CORPORATIONS

All companies examine competitors' products with the idea of improving their own or claiming a share of the market. So long as this practice does not infringe patents, it is legitimate. What is not legitimate is deliberate industrial espionage—hiring a firm to place a person on the competitor's payroll to ferret out secrets of process or formulation that can be obtained in no other way. Equally unethical is the hiring away of key employees to exploit their privileged knowledge. Some firms have explicit policies that forbid this practice; many require professional employees to sign contracts that forbid their working for a competitor for a specified time after leaving the company. A separate issue of marketing that touches on the research side is that of firms that compete, not by improving manufacturing and distribution processes to reduce costs, but by blitzing competitors with a steady flow of new products. A weak firm can be driven out of business by such practices.

RESPONSIBILITY TO CUSTOMERS

Customers need to know a great many things that only the industrial research laboratories can tell them—for example, about product safety. The Food and Drug Act was passed in 1906 to ensure the purity of foods and the safety and efficacy of drugs; even so,

many errors have been made that have stemmed from careless, if not unethical, practices: the pediatric syrup of sulfa drugs marketed during the late 1930's that used toxic ethylene glycol as solvent; the grossly teratogenic drug thalidomide, which was withdrawn from the market during the 1960's; diethylstilbestrol (DES), which is carcinogenic in women even to the second generation; and a host of other drugs and food additives, some quietly taken off the market when studies that should have been done in the original research showed unacceptable side effects. Environmental effects should be investigated (although these cannot always be anticipated): for example, pesticide residue toxicity, chlorofluorocarbon depletion of the ozone layer, and so forth. Finally, customers need to know that new research products are genuine innovations: Could the ingredients of a new two-drug pill have been prescribed separately more cheaply? Will this new research-hyped cosmetic really make one sixteen years old again? Do automotive gimmicks such as rectangular headlights or hideaway headlights make a car safer or mechanically superior? Although some of these examples border on marketing and salesmanship, many relate to the research laboratory.

CONCLUSION

As the foregoing discussion indicates, industrial research deviates in many respects from pure research. Nearly all these points of deviation call for ethical decisions. No attempt has been made here to say what decisions should be made; the purpose of this article is descriptive rather than prescriptive.

Inequality

DEFINITION: Absence of an ethical entitlement of all people to the same legal, civil, economic, and social rights

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Although most people would agree that some forms of inequality are immoral, there is considerable ethical disagreement over how to distinguish just and unjust forms of inequality.

Inequality is a subject of concern in many areas of ethics, including politico-economic ethics, legal and judicial ethics, and business and labor ethics. A number of widely affirmed ethical principles address the issue of inequality. These include equality of opportunity, equality before the law, and the principle of treating people with equal concern and respect. Each principle represents an attempt to specify a kind of inequality that is regarded as unjust. For example, equality of opportunity is usually understood as precluding racial, religious, sexual, and ethnic discrimination for positions in business, government, and education.

Most ethicists argue that inequalities that arise from differences in race, religion, sex, or ethnicity are unjust inequalities. For example, people denied jobs at a corporation because of their religious beliefs are being treated unjustly: Religious beliefs are generally regarded as irrelevant to determining a person's qualifications as an employee in a secular orga-

nization. Long-standing moral and legal practices affirm the injustice of such forms of inequality.

Some argue that the best way to distinguish just from unjust inequality is to focus on the link between the forms of inequality and the choices that people make. According to this view, inequalities that result from unchosen differences, such as sexual inequality, are unjustified. By contrast, if two employees have equal opportunities for success on their jobs, the one who works harder may be said to deserve more income than the other. The fact that the other person earns less money is not necessarily unjust. Such a situation distinguishes inequalities that result from choices made by persons who have equal opportunities from those who do not. On this view, the first type of inequality is acceptable; the second is unjust.

There is much controversy about how to distinguish inequalities that reflect choice and inequalities that are beyond a person's control. The issue is complicated if one considers the role of luck in a person's chances for success in life. For example, people do not choose their own natural talents. Likewise, no child chooses the economic status of his or her parents. On the other hand, people can make choices about whether and how to develop the natural talents that they do have. However, there is little agreement among ethicists on such matters as the point at which ambition and effort matter more than luck for determining whether inequalities are just or unjust, whether society has an obligation to compensate inequalities that are not chosen, and whether affirmative action policies are a just means of eliminating racial inequalities.

Infanticide

DEFINITION: Intentional killing of human infants

TYPE OF ETHICS: Children's rights

SIGNIFICANCE: Arguments over what constitutes human life permeate abortion debates and flow over into the issue of infanticide. A key point in the debate concerns when human beings become persons with protected rights. Infanticide also has ethical implications for the broader issue of euthanasia.

If the question is asked whether killing a neonate (newborn) or infant human is equivalent to killing an older child or adult, the answer is yes—according to the law. However, in most past societies, and some modern societies in certain parts of the world, the distinction is not as clear. Leading modern ethicists, bioethicists, and sociobiologists continue seriously to debate under what, if any circumstances, infanticide may be justified.

Many sociobiologists point to the fact that killing even normal infants in particular circumstances, such as overpopulation, is common to most primates and is part of the complexities of intergroup reactions or reproductive strategies. Among prehistoric human societies, infanticide was used to help ensure the survival of older siblings. Infants with severe physical or mental handicaps rarely survived childhood. Even in the modern world, there is a strong medical and economics-driven argument that newborn babies with severe disabilities pose intolerable burdens on the scarce resources of both their families and society at large. Moreover, it is also argued that because infants with such disabilities may be doomed to short and painful existences, it is inhumane not to perform euthanasia (mercy killing).

REAL PEOPLE

In the debate over abortion, it is argued that the fetus is not a real person with an independent identity. Rationalizers of infanticide argue that a newborn is no different, and life and death issues should be under the

jurisdiction of the biological parents. Furthermore, it is argued that a newborn human is a primitive creature with no self-concept, lacking the self-sufficiency and will to survive found in other mammals. In fact as the well-known ethicist and animal-rights activist Peter Singer pointed out, in his landmark study *Animal Liberation* (1975), humans eat a wide variety of life-forms that are much more advanced than human infants. Therefore, to argue against infanticide as being unethical is mere hypocrisy. Singer is joined by bioethicist Michael Tooley, who defined fifteen characteristics of personhood, all of which neonates lack. Although infants are clearly human beings, Tooley argued that they do not begin to become persons until the age of three months. Thus killing a baby younger than three months old clearly does not equate to killing an actual person.

PRO-INFANTICIDE PHILOSOPHERS

Neither Plato nor Aristotle, as is true of most ancient Greek philosophers, found anything wrong with infanticide of defective and unwanted newborn babies. Much like modern bioethicists, some major philosophers such as John Locke (who viewed human infants as being born into the world as “blank tablets” lacking personhood) and Immanuel Kant (who defined persons as beings that are conscious of themselves and able to consider themselves as themselves) approved of infanticide. In addition, the utilitarianism of Jeremy Bentham stressed the principle of the greatest good for the greatest number as well as the principle of avoiding pain and seeking pleasure. Consequently utilitarianism could be used to justify euthanasia of infants with serious birth defects or killing of infants merely to benefit the larger social unit.

ARGUMENTS FOR AND AGAINST INFANTICIDE

Some cultural historians have pointed to infanticide as a concern primarily within the Judeo-Christian and Islamic world. Nevertheless, until the late twentieth century, the fact that few questions were asked when infants died is an indication that Western societies tacitly accepted infanticide. Poverty and illegitimacy were major causative factors of infanticide. Infants abandoned to foundling homes generally received death sentences through neglect. Many unwanted infants in their parents' home fell victim to neglect so severe that it amounted to passive infanticide. Infanticide thus appears to have been an integral

part of the human experience throughout the ages and not merely an aberration.

There are strong arguments for the notion that people actually protect their own lives by valuing life in general. In *Abortion and the Ways We Value Human Life* (1999), Jeffrey Reiman points to a natural human love for infants produced by evolution—an impulse exemplified by the attention and protectiveness given to infants even by strangers. Such love is necessary for human infants to survive precisely because human babies are the most helpless infants among all mammals. Likewise, respect for the development of humans from neonates to adults is needed for human survival. An example of this value of life is supported by the care devoted to the disposal of human corpses.

CRIMES AGAINST HUMANITY

Ethicists and historians point to euthanasia programs conducted by Nazi Germany under Adolf Hitler to eliminate people with mental and physical disabilities. Since such practices were condemned as crimes against humanity at the Nuremberg trials, a turn toward euthanasia would resurrect horrors of the past. Because older persons suffering from severe dementia or Alzheimer's disease may also be said to lack personhood and self-awareness, they too could be included in euthanasia programs.

Another argument against infanticide is that it victimizes the defenseless. Democratic societies provide individuals with rights precisely to protect the weak from being harmed by the strong. Worldwide, those suffering most from infanticide are female babies. Permitting infanticide is thus also contrary to the goal of redressing gender inequalities. Moreover, many historians would argue that the fact that infanticide pervades human history does not justify the practice. The institution of slavery also pervades human history, but few would argue that this fact justifies the institution.

Infomercials

DEFINITION: Paid commercials that mimic the lengths and formats of conventional television programs and are typically designed to sell specific products

DATE: First broadcast during the mid-1980's

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: The dramatic rise in infomercial broadcasting at the end of the twentieth century posed ethical questions regarding truth in advertising and the blurring of lines between commercial and noncommercial television programming.

The two- to four-minute television commercials for household gadgets that entrepreneur Ron Popeil began broadcasting during the mid-1950's are often considered precursors of modern infomercials, which typically devote thirty minutes or more to promoting a single product or line of products. In 1984, the administration of President Ronald Reagan relaxed federal guidelines limiting the time that television stations could devote to advertising, paving the way for lengthier and more detailed on-air sales pitches. Later that same year, the HerbaLife company aired a sixty-minute advertisement for its diet products that is commonly regarded as the first true infomercial. Infomercials then proliferated rapidly throughout the rest of the decade and into the 1990's, fueled by budget cuts that forced local television stations to increase their advertising revenues.

Infomercials are frequently designed to mimic

news programs, talk shows, or public service announcements, creating the illusion that the information they present meets journalistic standards of credibility and objectivity. Infomercial advertisers are often accused of utilizing these formats to reinforce outrageous claims and sell shoddy merchandise to consumers who are sometimes emotionally or intellectually vulnerable. Critics of this practice cite laws against deceptive advertising as well as the ethical tradition of the regulated market economies of Western nations, which holds that businesses and advertisers should not mislead consumers by lying or misrepresenting facts.

Defenders of infomercials argue that according to the dictates of the free market, infomercial producers and broadcasters have a fiduciary obligation to maximize profits that supersedes their obligation to consumers, that the disclaimers commonly included in these programs provide sufficient notification to viewers as to their content, and that consumers must assume at least partial responsibility for distinguishing between news and advertising.

Information access

DEFINITION: Ability to obtain, utilize, and disseminate information, especially personal information, stored on computers

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: The advent of one integrated set of technologies, the computer network, to both store and transmit information, renders information both less secure and more easily exploited or disseminated once it has been accessed, by an order of magnitude. As a result, new ethical principles are required to arbitrate and safeguard the traditional right to privacy in the Information Age.

The ability to store and exchange computerized information about individuals raises ethical questions about access to that information. Who should have access to personal information? Does the right of the government to know take precedence over an indi-

vidual's right to privacy? What kind of information should not be kept or shared? Complicating these issues is the tendency to accept information obtained from a computer as totally accurate. Given authorized access, how can the information be verified as accurate? Do people have a right to examine information pertaining to them?

RISE OF INFORMATION TECHNOLOGY

Since World War II, computer and communications technologies have combined to produce a major influence on Western society. The first generation of electronic computers had thousands of vacuum tubes, required huge amounts of electricity for power and cooling, and cost so much that only governments and very large corporations could afford them. The development of the transistor, the integrated circuit, and the microprocessor led to generations of ever-more-affordable computers. By the 1980's, computer technology had reached virtually every level of the economic infrastructure. Computers became repositories for criminal and tax records, health and employment records, and credit and financial information. The communications revolution parallels the computer revolution. Satellites and fiber-optic lines have made possible the almost instant transmission of data between geographically distant computers.

The first two decades of computer technology progressed without much public discussion of ethical issues. By 1965, the Federal Bureau of Investigation (FBI) had begun to develop the National Crime Information Center as a central repository of criminal arrest records. That same year, the proposed idea of centralizing government records of individual citizens in a National Data Center was met with strong opposition in Congress. Debate over the National Data Center focused national attention for the first time on the issue of invasion of privacy as people began to fear the prospect of an Orwellian all-seeing, all-knowing government becoming reality.

In *Menard v. Mitchell*, a landmark 1971 federal case, the U.S. Supreme Court ruled that a "compelling public necessity" had to be proved before an individual's arrest record could be widely disseminated. Legislation by Congress followed. The Privacy Act of 1975 regulated the use of criminal justice information, and the Freedom of Information Act of 1977 gave individuals the right to access non-classified government records.

Ethical Questions Posed by Information Technology

What is the moral status and nature of ethics presented by artificial intelligence?

Are machines capable of being moral, or, should human beings be considered moral machines?

What is humanity's moral relationship with high-tech information technology, and what obligations does each owe to the other?

What can be done about the "digital divide" between the haves and have nots in access to computers and the Internet?

What moral issues arise from the impact of computers on work, the family, church, and other social institutions?

Should "bad" information technology be prohibited?

Is it possible for hackers and other "deviant" users of information technology to be considered ethical?

THE PRIVATE SECTOR

The first attempt to regulate the retail credit industry's use of personal credit information had come with the Fair Credit Reporting Act of 1969. By the 1980's and 1990's, however, personal information had become a lucrative commodity driving a huge industry. The two largest credit bureaus maintained separate databases of more than 150 million files, which they made available to banks, credit card companies, and virtually any other business willing to pay for the service. Many people believed that the protection of the Fair Credit Reporting Act was no longer adequate. Reports by the news media and consumer advocates documented cases of individuals being victimized by false and ruinous credit information. A 1991 Consumer Union study found inaccuracies in nearly half the records it sampled.

Smaller companies specialized in providing demographic and consumer information to direct marketing firms. For a small monthly fee, customers had access to detailed information on millions of households, including address, telephone number, property ownership, and legal records. Manufacturers of-

ten routinely sold information taken from cards returned by consumers for product warranty registration to direct marketers, who used it to target potential customers more accurately.

PROSPECTS FOR REGULATION

Because access to personal information has reached virtually every level of modern society, regulation by a single law or agency is impossible. Federal and state governments struggle to sort out the questions of access versus privacy and enact appropriate legislation, while some critics question the government's ability to regulate itself. By 1982, U.S. government computers contained more than 3.5 billion personal files. The FBI continues to build a database of the arrest records of 25 million people, whether or not their arrests resulted in convictions.

During the 1970's, the National Security Agency (NSA) and International Business Machines (IBM) developed the Data Encryption Standard (DES) to ensure secure transmission of classified information over telephone and data lines. Data or conversations that are transmitted between two points are encrypted with a mathematical key. In 1993, the introduction of a DES integrated circuit chip, to be made available in commercial products, led the Clinton administration to support its widespread use. Privacy advocates hailed the advent of the DES chip but worried that a new standard with government control of the keys could trigger abuses of wiretapping and that computer hackers might be able to duplicate the new standard's classified algorithm.

Meanwhile, groups such as the Consumer Union and the American Civil Liberties Union, as well as individual citizens, continued to press for protection against abuses by both the government and the private sector.

SUMMARY

The ethics of information access began with the issue of privacy versus the government's right to acquire knowledge for the public good but expanded as businesses began to perceive their access to personal information as part of their right to do business in a free-market economy.

Some social analysts claim that the Information Age has brought a change in values to modern society, where the benefits and convenience of free access to information outweigh the individual's right to

privacy. It has even been proposed that since an individual's personal information is a commodity with commercial value, that person should be compensated with a royalty whenever the information is sold.

The Industrial Revolution was welcomed as an unmixed blessing to humankind for many years before society began to consider such ethical issues as child labor and pollution. The Information Age has brought sweeping changes to society at a much faster pace. Sorting out the ethics of information access and creating systems for control is a slow process, with much opportunity for abuse in the meantime, because the very concepts of information and privacy are being redefined by this rapidly developing technology.

Inside information

DEFINITION: Confidential knowledge possessed or obtained by people in positions of power or with privileged access to information within a company, organization, or government

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: Inside information can be put to many uses with ethical implications. It can be used to profit the person who possesses or obtains it, it can be passed on to authorities or to a public whose interest in such knowledge is arguably legitimate, or it can be used to harm, or violate the privacy of, individuals, companies, or organizations. All of these uses are the subject of ethical codes and many are subject to legal regulation as well.

Confidential information that derives from the fulfillment of professional or civic duties is a valuable commodity. Misappropriation of such knowledge is a common occurrence in the banking and securities industry, where frequent opportunity exists to convert one's knowledge into a monetary profit through the buying and selling of stocks about which one has secret information. The Securities and Exchange Commission explicitly prohibits such practices and vigorously prosecutes violators.

Media professionals, too, have access to information that is proprietary in nature and that has the potential for misuse. The wide scope of the First Amendment and the privileges guaranteed to the press therein, however, preclude the existence of both a regulatory body and legal restrictions designed to control the use of information. Therefore, the press, as with other questions of conduct, is obliged to address the ethical issues on a situational basis, weighing circumstances along with values, loyalties, and journalistic principles.

Two central issues exist regarding the issue of inside information: how the information is obtained and how it is used. In regard to the securing of information, journalists are morally obligated to remain objective and uncompromised and to respect the boundaries of legal as well as ethical codes. Because a journalist's primary obligation is to distribute information, however, even these simple tenets must be weighed in the light of a situation's defining circumstances. *The New York Times*, for example, in the

publication of the Pentagon Papers (the documents that exposed the illegal activities of the Nixon administration during the 1972-1973 Watergate Affair), knowingly accepted stolen materials in the light of what the editors reasoned was a greater moral good—the exposition of a governmental effort to misrepresent the realities of the Vietnam War.

The second question concerns how inside information can be ethically used by media professionals. The code of ethics of the Society of Professional Journalists states that journalists who use their professional status as representatives of the public for selfish or other unworthy motives violate a high trust. A vigorous and effective press relies on the public trust, so it is incumbent upon journalists to use information humanely, intelligently, and ethically. This process involves questioning the motives of both the reporter and the source of the information, any obligation that may be created on the part of the journalist in exchange for the information, and the nature of the relationship in which the information became known.

That the public interest is best served by making known everything that is knowable is a journalistic standard that justifies much of what is presented as news. When journalists become the recipients of confidential information, however, an ethical dilemma arises that challenges this utilitarian philosophy and the accompanying assertion that an action is just as long as it achieves the greatest good for the greatest number. The debate lies in an opposing belief that people are not to be treated as a means to a journalistic end. A corollary to this principle is that the journalist should not allow himself or herself to be so treated, which may well be the case when publishing information “leaked” from confidential sources. Journalists, therefore, are morally obligated to seek out competing perspectives and confirming information and to question whether they are being used by someone whose interest is counter to the public interest, such as a campaign worker who might provide information about an opponent's sexual history.

Journalists must also inquire about their own motives for pursuing confidential information. During the 1970's, Bob Woodward and Carl Bernstein of *The Washington Post* were guilty of unethical conduct when they sought to lure information from grand jurors hearing evidence on the Watergate case

who were sworn to secrecy. Even though a corrupt administration was eventually driven from office partly as a result of their investigation of the Watergate break-in, they did not foresee this event at the time, and the means they employed to obtain information violated ethical codes.

OBLIGATIONS OF REPORTERS

A second ethical question raised by the use of inside information relates to the obligation it establishes on the part of the reporter. Does the journalist incur responsibility toward the informant when he or she has taken risks to provide the information? If he or she has broken the law to do so, does the reporter assume culpability as well? Such concerns refer again to the principle that people are to be treated with respect and not as a means to an end, and also begin to encroach into other ethical problems for journalists, those of source-reporter confidentiality and the use of anonymous sources.

Finally, the issue of respecting the nature of the relationship in which confidential information is learned presents yet another ethical challenge. Reporters, as representatives of the public trust, frequently find themselves privy to sensitive information that they are obligated to preserve in respect to their roles as journalists. Even seemingly insignificant violations of the public trust, such as providing friends with advance notice of an upcoming sale to be advertised in the local paper, are unethical by intention regardless of the consequences.

The press, by nature, is not governed by a concise, explicit code of professional conduct. The ethics codes that do exist offer guidelines for performance and not absolute standards of behavior. Journalists and other media professionals, therefore, are encouraged to weigh situational factors along with their principles of duty in a thoughtful, critical effort to determine the ethical use of inside information.

Insider trading

DEFINITION: Use of information not available to the public to guide decisions to buy or sell publicly traded securities

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Federal laws regulating insider trading in the United States are designed to create a level playing field for all investors, on the theory that for the stock market to be fair, it must in principle be both equally accessible and equally unpredictable to all participants.

Insider trading has been prohibited in the United States since the passage of the Securities Exchange Act of 1934, whose Section 10(b) laid down restrictions. The federal regulations on securities were designed to prevent corporate executives, directors, attorneys, accountants, investment bankers, and other "insiders" from using their positions to gain unfair advantages in the market trading of their corporations' securities. To buy or sell securities on the basis of confidential information or to recommend trading to others on that basis constitutes a violation of federal securities regulations, potentially subjecting violators to both criminal prosecution by the Security and Exchange Commission (SEC) and civil lawsuits by injured investors.

Over the years, the SEC and the courts developed a detailed description of insider trading in numerous individual cases, most notably in the U.S. Supreme

Court's decisions in *United States v. Chiarella* (1980) and *Dirks v. Securities and Exchange Commission* (1983). Insider trading became widely publicized during the 1980's, when two prominent financiers, Ivan Boesky and Michael Milken, were convicted of numerous securities violations, sentenced to prison, and fined more than \$700 million.

No formal definition of insider trading was written into federal law until 2002, when the U.S. Congress passed the Sarbanes-Oxley Act. That law spelled out the conditions constituting lawful and unlawful insider trading and established ground rules for legal insider trading. These rules required dealers to file insider transactions, electronically, within two business days to the SEC and to post the transactions on their companies' Web sites within one day of filing the information with the SEC. Under previous legislation, insider traders had at least forty-one days to report their transactions, making it nearly impossible to detect abuses until well after damage was done. For example, executives of the failing Enron corporation did not report they had sold off most of their own stock in the company in 2001 until after the company's collapse was made public. By the end of the calendar year, the value of the company's stock fell from more than eighty-one dollars per share to virtually nothing.

Institutionalization of patients

DEFINITION: Involuntary confinement in mental health facilities of mentally ill individuals

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: The involuntary institutionalization of people who are deemed to be mentally ill cre-

ates a conflict between the ethical values of personal autonomy on one hand and beneficence or care on the other. The question is when it is appropriate to violate the wishes of individuals for their own good. This question is made much more complicated by the fact that what has counted as mental illness and as legitimate grounds for institutionalization has changed significantly over time, which can cause any given standard to seem more arbitrary than it otherwise might.

Religions teach that the least among us deserve aid and comfort. To apply this rule to the mentally ill often requires some degree of forced institutionalization. To fulfill the ethical rule not to restrict liberty without good cause means to allow people to live on the streets and to conduct costly court hearings. Many solutions to the problem of the seriously mentally ill have been tried, but all are flawed.

A HISTORY OF INSTITUTIONALIZATION

Various societies at various times have attempted to find humane solutions to the problem of mentally ill persons. Many homeless mentally ill persons wandered the towns and roads of the American colonies. In 1752, Benjamin Franklin influenced the Pennsylvania colony legislature to open the first mental hospital in the thirteen colonies. During the mid-nineteenth century, many people hailed Dorothea Dix as a great reformer because her efforts on the behalf of the homeless mentally ill resulted in the creation of thirty mental hospitals that soon were filled with patients. Placing people in mental hospitals deprived them of liberty. Common law principles allowed the taking of a person's liberty only if that person was dangerous to himself or herself or the community, required due process, and maintained that a defendant was innocent until proved guilty. Application of the common law rules could have stopped physicians from attempting to treat the mentally ill.

In 1849, the Association of Medical Superintendents of American Institutions for the Insane (now the American Psychiatric Association) appointed a well-known expert, Isaac Ray, to draft a model law for involuntary confinements. He proposed that the involuntary confinement of the deranged for treatment be treated as a medical decision without legal formalities. After several years, most states accepted

Ray's idea. During the nineteenth century and the first half of the twentieth century, the states constructed many large mental asylums. In the United States in 1963, 679,000 persons were confined in mental hospitals, whereas only 250,000 were confined in state and federal prisons. From the medical viewpoint, confinement in mental institutions represented an opportunity to "help" those suffering from a disease.

THE DEINSTITUTIONALIZATION MOVEMENT

By the 1950's, many critics, including the well-known psychiatrist Thomas Szasz, attacked the involuntary confinement of the mentally ill unless the patients were dangerous to themselves or others. For Szasz, mental illness was a myth, a name for problems in living rather than a medical condition correctable by medical action. He proposed the deinstitutionalization of mental patients and the dismantling of community mental health centers. Szasz pointed to misuses of psychiatry in the former Soviet Union to institutionalize and "treat" political prisoners.

Patients' rights advocates who sued hospitals to release patients and improve conditions joined forces with fiscal conservatives who recommended the release of patients to more cost-effective community care. Judges forced mental hospitals to use more stringent criteria for involuntary admissions, to grant extensive rights to patients, to stop exploiting patients economically, and to improve conditions. The "need for treatment" criterion was rejected, and only the mentally ill who were a danger to themselves or others or were gravely disabled could be confined involuntarily and then only by means of a judicial decision. By 1984, the mental hospital population had dropped to roughly 125,000.

The courts also granted mental patients basic rights. Mental patients were to be treated as normal human beings, they were not to be embarrassed by disclosure of their patient status, and they were to be paid for work done in the institutions. They had a right to refuse most extreme treatments, such as shock therapy. Their rights included absolute access to an attorney and qualified rights for free communication. The restrictions on commitment and the new rights for mental patients made it more expensive and difficult to commit patients and more expensive to keep them. Mental hospitals had partially supported

themselves by the unpaid labor of the patients, but this was now forbidden.

The theory behind deinstitutionalization was that community mental health facilities such as halfway houses would replace the large asylums, but legislatures did not fund adequate numbers of the new centers and communities resisted having the facilities in their midst. Outpatient care using chemotherapy was initiated, but most patients did not use such services. Deinstitutionalization freed patients but did not improve their overall welfare. Many freed patients moved to the streets and endured terrible conditions. Some had children on the streets. Citizens complained about the activities of mental patients in their neighborhoods. The argument that the mentally ill should have the same legal protection as criminals is flawed. The consequences of confinement and freedom for each group of persons and for society are different.

Today, state laws specify the procedures for involuntary confinement of the mentally ill. The normal grounds for such confinement are that the patient is a danger to self or others or is gravely disabled. As patients' loss of liberty increases through longer confinements, the courts play a larger role and patients have more due process rights. The state must provide an appointed attorney if one is requested and must allow jury trials.

TREATMENT AND A CLASH OF VALUES

A second factor that acted together with court rulings to promote the deinstitutionalization of the mentally ill was the discovery of powerful antipsychotic drugs during the 1950's. Chemotherapy treated symptoms but did not cure the mentally ill, and it often produced very unpleasant side effects. Because most patients could function as long as they took their medication, it made it possible to release many of them. Many patients improved during confinement because of therapy and drugs, won release, stopped taking their medication, and then relapsed.

Ironically, once the patients' rights advocates won the deinstitutionalization battle, they then attacked forced chemotherapy. Psychotherapists argued that chemotherapy liberated the mind from delusions. A majority of state courts granted patients rights to refuse chemotherapy, while the federal courts applied a "need-for-treatment" analysis and left the decisions in the hands of psychiatrists. As chemotherapy de-

clined, hospital stays became longer and the use of physical restraints increased.

The basic institutionalization issue involves deciding which profession and which set of ethical values will control the treatment and confinement of the mentally ill. The patients' rights attorneys see themselves as being in conflict with arrogant physicians who deprive patients of civil rights. In fact, most therapists do tend to overdiagnose mental illness. The idea that judging a sick person to be well is more to be avoided than judging a well person to be sick is built into the medical model. Therapists are wary of public criticism and of lawsuits triggered by the violent acts of a few dangerous released mental patients, and they view involuntary confinement and treatment as being ethically required to protect patients and the public.

Integration

DEFINITION: Incorporation as equals of the members of different groups, especially races, within an organization, institution, or society

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: The Civil Rights movement of the 1950's and 1960's in the United States helped bring about both a federal policy and eventually a general societal ethic of racial integration, replacing and stigmatizing previous segregationist practices and policies. The appropriate parameters of that ethic are still being debated, in relation to such practices as affirmative action and school busing.

A racially integrated society would be one in which African Americans can participate in all aspects of national life without being handicapped by their color. In such a society, there should be no neighborhood where an African American could not reside simply because of being black; no hotel, restaurant, or other public facility that an African American could not use on equal terms with whites; no school that an African American child could not attend because of being black; no kind of vocational training, university education, or line of work from which an African American would be barred because of being black; and no public office for which an African American could not contend. In an integrated society, whites would see African Americans not as pariahs but as fellow Americans, fellow veterans, coworkers, and neighbors. By the turn of the twenty-first century, the goal of a racially integrated society, despite much progress, was only half achieved; the role that public policy should play in creating a more racially integrated society was still a matter of lively debate.

ETHICAL AND LEGAL PRINCIPLES

Those who discuss the ethics of integration are dealing with the ethics of public policy rather than (as is the case, to some extent, with prejudice and racism) the morality of private behavior. The promotion of racial integration has been seen by its proponents as essential to the realization of an important value in public policy ethics: that of equality under the law regardless of race or color. This principle had first been publicly recognized in the United States by the Fourteenth Amendment to the Constitution (ratified in 1868), which mandated that every state guarantee its

citizens the equal protection of the laws. Liberals tend to be more optimistic about the possibilities for achieving greater racial equality through government-sponsored integration; conservatives tend to perceive a conflict between government-mandated integration and other cherished American values.

Signposts of progress during these years (which witnessed the flowering of the Civil Rights movement) included the gradual desegregation of the American military, which began with President Harry S. Truman's executive order in 1948; the Supreme Court decision of 1954, which struck down the constitutionality of segregated schools; the admission of African Americans into southern state universities; the Civil Rights Act of 1964, which established the right of equal access to public accommodations and banned discrimination in employment; the Voting Rights Act of 1965; the Supreme Court decision of 1967 that overturned state laws against black-white intermarriage; and the federal fair housing law of 1968. By 1990, many of these changes had achieved general acceptance; efforts to integrate employment, schools, and housing, however, continued to arouse controversy.

AFFIRMATIVE ACTION CONTROVERSY

By the late 1970's, affirmative action, in which the presence or absence of a fixed percentage of African Americans in a business, government department, or university is used to determine whether that institution discriminates, had become the chief tool by which the federal government tried to open up opportunities for African Americans. In 1975, in the book *Affirmative Discrimination*, the white sociologist Nathan Glazer condemned the application of this policy in both private businesses and government employment. Glazer argued that affirmative action undermines respect for merit and encourages ethnic and racial divisiveness; unlike many liberals, he denied that the underrepresentation of African Americans in a particular job or profession is necessarily evidence of discrimination. Some African American conservatives believe that affirmative action stigmatizes as inferior those African Americans who do gain entrance to prestigious universities or get good jobs. Yet other thinkers—white as well as African American—argue that many employers would hire no African Americans at all if they were not prodded to do so by the existence of a numerical goal.

SCHOOL INTEGRATION AND THE SUPREME COURT

In *Brown v. Board of Education*, in 1954, the Supreme Court declared that officially enforced school segregation by race (then found mostly in the southern states) violated the Fourteenth Amendment to the Constitution. In a 1968 decision, the Supreme Court exerted pressure on southern school boards to end segregation more quickly; in a 1971 decision, *Swann v. Board of Education*, the Court held that school busing—the transportation of children out of their neighborhoods for schooling—might be an appropriate tool for achieving desegregation.

During the 1960's, the question arose of what to do about the de facto racial segregation of the schools, based on neighborhood racial patterns rather than on the law, found in many northern cities. In 1973, the Supreme Court ordered, for the first time, a northern school district (Denver, Colorado) to institute a desegregation plan. In 1974, however, the Court, in a sudden shift, banned (in the decision *Milliken v. Bradley*) busing for integration purposes across city-suburban boundaries. In general, the Court has ordered steps toward ending de facto segregation only when evidence exists that local authorities have deliberately rigged school district boundaries to keep the races apart.

INTEGRATION OF ELEMENTARY AND SECONDARY SCHOOLS

Ever since 1954, people have argued about how necessary integration of the races in the classroom is to providing equal educational opportunities for African American children. During the 1980's, even some maverick conservative African American thinkers, such as Thomas Sowell and Robert Woodson had their doubts. Woodson argued that a neighborhood school, even if it is exclusively African American, can become a valuable focus of neighborhood pride for low-income city dwellers; Sowell pointed nostalgically to a high-quality African American secondary school of the pre-1954 era of segregation, Dunbar High School in Washington, D.C. (Critics stress how atypical Dunbar was.)

Integrationist scholars, however, argue that forcible exclusion from the company of white schoolchildren stigmatizes and psychically wounds African American children; the African American journalist Carl Rowan thinks that such exclusion is psychically

wounding even if it results from white flight to the suburbs rather than government edict. White liberal political scientist Gary Orfield suggests that racial integration of the schools is necessary if African American children are to have greater access to information about jobs and other opportunities; white liberal education writer Jonathan Kozol contends, like many African American thinkers, that all-African American public schools are more likely than integrated ones to be starved of money by legislatures that are beholden to white-majority electorates.

INTEGRATION VS. PARENTAL RIGHTS

Although the compulsory busing of children into schools predominantly of the other race may be necessary to achieve racial integration in some cases, it does severely limit the rights of parents, thereby causing some resentment. The Supreme Court's 1974 ban on busing across city-suburban boundaries means that the most bitter white foes of school integration could often shield their children from it by moving to the suburbs; even if this decision were overturned, achieving complete racial integration of the schools in defiance of segregated neighborhood patterns would be both a herculean task and a politically controversial one.

The rights of parents over their children are, as the African American philosopher Bernard R. Boxill points out, by no means absolute. There is a societal interest in promoting interracial harmony, Boxill suggests, that perhaps should be allowed to prevail over the wish of bigoted white parents to preserve their children from all contact with African American children. Rejecting the notion (found in the writings of African American conservative Glenn Loury) of an unresolvable tension between integrationist goals and individual rights, Boxill also argues that government can use inducements as well as penalties to promote integration, in education and in other areas.

To promote integration of the schools while keeping busing to a minimum, some local school authorities have instituted so-called magnet schools. By placing elementary and secondary schools with above-average endowment in facilities and curricula in the middle of African American neighborhoods, authorities hope to persuade, rather than force, white parents to accept racial integration of the schools. Yet because funds are limited, the number of magnet schools that can be established is also limited; inevi-

tably, some African American schoolchildren remain in all-African American schools, and some white parents cannot get their children into magnet schools. The magnet school solution is not perfect.

ACHIEVING HOUSING INTEGRATION

By 1990, neither the federal Fair Housing Act of 1968 nor the many state and local laws banning discrimination in the sale or rental of housing had solved the problem of racially segregated neighborhoods. One troublesome issue that arises with respect to housing integration is the tension between individual rights and the goal of keeping a neighborhood integrated over time. Many whites are reluctant to live in a neighborhood or an apartment complex when the percentage of African American residents exceeds a certain number. To prevent wholesale evacuation by whites, so-called benign quotas have been introduced limiting the African American influx in the interest of stable integration. Benign quotas have been used by realtors in the Chicago suburb of Oak Park and by the management of the Starrett City apartment complex in New York City; in the latter case, the constitutionality of benign quotas was challenged during the 1980's.

Another difficult question is whether poor as well as middle- or upper-income African Americans should be given the chance to live in the prosperous and mostly white suburbs. White suburbanites who might tolerate the occasional prosperous African American homeowner as a neighbor would almost certainly oppose the building of public housing projects in suburbia; yet it is the poorer African American who might benefit most from the greater employment opportunities found in the suburbs. In Chicago, the Gautreaux program attempted to circumvent the problem by settling small numbers of carefully selected poor African American families in prosperous white suburbs.

Nathan Glazer, in a 1993 magazine essay, argued that only an extremely intrusive government could make racially integrated neighborhoods remain racially integrated over time. Bernard Boxill contends, however, that not every action that is beyond the penalties of law is necessarily moral, and that government, if it cannot force whites to stay in integrated neighborhoods, can at least offer inducements for them to do so.

Integrity

DEFINITION: Consistent adherence to moral, intellectual, professional, or artistic principles despite temptation to abandon them

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Integrity is an important personal characteristic in ethical systems based on virtue and moral character.

The etymology of the word "integrity" reveals its relationship to the Latin *integritas*, meaning "soundness, health, unimpaired condition," and to the English "integral," meaning "necessary for completeness" and "made up of parts forming a whole." On the assumption that this etymological relationship is relevant within a moral context, integrity as a moral virtue may be identified as early as the fourth century B.C.E. in Plato's ethical theory. The Platonic soul is tripartite, consisting of reason (intellect), spirit (feelings), and passion (desire). The harmonious interaction of these three parts, with reason dominant over the other two, is central to human virtue. The virtues corresponding to the correct exercise of each of these three parts are, respectively, wisdom, courage, and self-control, which together constitute the virtue of justice. A person in whom either spirit or passion is out of control is both morally and psychologically impaired, existing in a state of moral fragmentation. In such a case, the tripartite soul is splintered, making the person less than morally whole or complete. If justice is the harmonious interaction of the three parts of the soul, then Platonic justice is Platonic integrity, and Plato's understanding of integrity simultaneously serves as the benchmark for subsequent Western ethical theory and presages the development of modern moral psychology.

If integrity is defined as the willingness to abide by and defend one's principles, whether they are artistic, intellectual, professional, or moral, it is evident that the first three kinds of integrity are rooted in a more fundamental moral integrity, since without the latter, one cannot be relied on to retain and to act on whatever other principles one holds. The definition of integrity entails that, because of deeply held beliefs and commitments, there are some things that one is unwilling to do, an unwillingness that may persist even under extreme circumstances.

The artist whose artistic identity and principles are rooted in her originality might refuse to produce tasteless but lucrative popular art, even if this refusal means a life of relative poverty. A scholar, to preserve his intellectual integrity, may refuse to publish anything that will not make a genuine, worthwhile contribution to his discipline, even if he might advance professionally with more frequent but less qualitative publication. The businessperson, faced with the temptation to compromise important professional principles, declines to do so in the interest of both personal

and corporate integrity. Moral integrity, which is at once more fundamental and more comprehensive, requires that an individual refuse to abandon important moral principles even when it is advantageous to do so and that the content of these principles be such that reasonable people would recognize them as moral. Moral steadfastness on behalf of manifestly sound moral principles entitles one to the esteem of others as an honorable person who maintains a high degree of consistency between principle and behavior when faced with the temptation to do otherwise.

In modern ethical theory, the discussion of integrity has centered more on its importance than on its definition. Emphasis on moral traits such as integrity is a defining feature of ethical systems based on personal virtue, in which individual moral character assumes primary importance and moral evaluation focuses on persons rather than (or in addition to) actions. For consequentialist ethical systems such as utilitarianism, however, actions and consequences rather than persons are the primary object of moral evaluation. The latter system is more typical of modern ethical theory, while the former is more traditional, dating back to the Greeks and Romans, and especially to Stoicism, in which personal character assumes a centrally important place. This difference reflects the modern tendency to distinguish between an individual's personal character and that individual's actions and to regard actions as being morally more important than character, since they have direct or indirect consequences for the well-being or harm of others.

Bernard Williams, in *Utilitarianism: For and Against* (1987), underscores the traditional importance of integrity by making it a focal point in his criticism of utilitarianism, according to which an action that increases the totality of human well-being is moral, regardless of the motives or character of the agent. Williams argues that one of the chief flaws in utilitarianism is that it constitutes an attack upon personal integrity by dismissing as unimportant the deeply held commitments from which emanate a person's most significant actions. Utilitarianism, which by its nature mandates taking into account only the consequences of actions, requires that one disregard personal convictions in favor of doing what ensures, on balance, an acceptable utilitarian outcome of greater good than harm. How one feels about one's action is irrelevant. Integrity is a strong component of moral conviction, however, and conviction is an im-

portant source of action. Williams argues that alienating a person from strongly held convictions by requiring that they be disregarded is unreasonable and unfair, amounting to the destruction of much of what constitutes the agent's identity.

Alasdair MacIntyre, in *After Virtue: A Study in Moral Theory* (1984), argues for a reintegration of character and action, contending that since personal virtue is an important determinant of actions, character is therefore an essential component of any complete moral context. To separate character and action is to displace virtues such as integrity from this context, making comprehensive moral judgments impossible. Such a separation destroys the "unity" or wholeness—integrity in the Platonic sense—of an individual life. A person's life, to be of genuine moral significance, must be one in which a set of virtues, firmly held and consistently acted upon, unifies the various roles that the individual occupies, and confers upon that individual a corresponding set of obligations. Such a life requires integrity (in both the ancient and modern senses), which is intelligible only in relation to a more universal good.

Finally, integrity is a characteristic for which one bears special individual responsibility, as enunciated by Aleksandr Solzhenitsyn upon receiving the Nobel Prize in Literature: "And the simple step of a simple courageous man is not to take part in the lie, not to support deceit. Let the lie come into the world, even dominate the world, but not through me."

Intellectual property

DEFINITION: Ideas, devices, techniques, or representations whose ownership and control by their creators is recognized and enforced by law

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Accepted public policy thinking holds that society has an interest in assigning ownership of ideas or expression for a limited duration. The initial right to profit from a creation motivates people to create things, while eventual transference of ownership to the public domain allows for the expansion and development of the initial ideas or expression in ways not envisioned by their creator, to society's benefit.

Society has a vested interest in encouraging useful inventions and artistic creations. Modern legal theory treats the ideas, designs, texts, images, or musical compositions of such persons as their private intangible property and allows them to restrict the use of this intellectual property for a set time or until certain events occur. Intellectual property law generally recognizes four forms of intellectual property: trade secrets, patents, copyrights, and trademarks. Inventors are considered to have the right to keep their invention trade secrets if it is practicable for them to do so but are encouraged to disclose fully their inventions in return for the exclusive rights provided by the issuance of a patent to practice their inventions for a fixed period of time.

Authors, artists, and composers generally can

claim a copyright for their work, which will prevent others from using their ideas or reproducing or performing their creative work without permission, for which they may then receive a fee or royalty. A trademark is a word or symbol that a manufacturer can use to distinguish its products from those of its competitors. In effect, a trademark allows a firm to profit from its (intangible) reputation for quality or reliability. The owner of intellectual property is free to sell it to another or to grant a license for its use. Unauthorized use of intellectual property is called infringement. Plagiarism, the intentional misrepresentation of an idea or creation as one's own, is considered a serious breach of ethical behavior in almost every area of creative endeavor.

HISTORY

In ancient times, no formal protection was given to inventors, who had to resort to secrecy to prevent others from using their inventions. In the absence of printing presses and high-speed communication, there was little point in forbidding others to copy a work. In the Middle Ages, ideals of personal modesty encouraged anonymous authorship. It is only with the rise of capitalism and economic competition that the notion of intellectual property entered into legal and ethical thinking.

A monopoly is an individual or group that has been awarded an exclusive right to conduct a business or practice a profession. Since monopolies can demand a higher price for goods and services than can businesses that have competition, the existence of monopolies is generally considered undesirable unless required in a given area for the public good. The development of patent and copyright law is usually considered to begin with the English Statute of Monopolies of 1623, which in general was an attempt to eliminate monopolies but excepted patents on inventions and methods as necessary means of encouraging the development of industry. The Constitution of the United States expressly grants to the federal government the right to issue patents and copyrights "to promote the progress of science and the useful arts."

ETHICAL PRINCIPLES

Underlying the general concept of intellectual property is the notion that an individual is entitled to compensation for the products of his or her labor. In

the case of inventions, there is the additional question of the inventor's right to privacy. In most legal systems, someone who develops a new process or recipe for, say, a long-lasting paint, is under no obligation to share the process with the public. He and his heirs may treat it as a trade secret forever. If anyone else, however, were to discover the process by any legitimate means, such as chemically analyzing a can of paint that had been purchased, he or she would be free to manufacture and sell the identical product at a lower price. In applying for a patent on this process, the inventor, in effect, enters into a contract with society in which secrecy is abandoned in return for the exclusive right to control the use of the process for a fixed number of years. Very few individuals could afford to be authors, composers, or filmmakers if anyone who wished to could make multiple copies of their works and sell them freely.

ETHICAL PROBLEMS

The question of where to draw the line between individuals' rights to their intellectual property and the welfare of the public has not been fully resolved. Some countries, including the United Kingdom, refuse on humanitarian grounds to issue patents for medicines. Many countries permit the suppliers of military hardware to infringe the patent rights of inventors, possibly with a provision for compensation but without advance permission, when such an act is justified by the requirements of national security. Even the existence of public libraries in effect deprives authors of the revenue they might otherwise gain from the readers of their books. The development of computer networks allows, in effect, many persons to use the same copy of a copyrighted program.

There are also possible conflicts between the rights of authors, artists, and composers and the rights of subsequent owners of a copyright. Many governments recognize as moral rights of creative individuals the rights of attribution, or recognition as being the creator of one's own work, and of integrity, or having one's work presented as a whole or in an acceptable abridgment, even though the work may have been purchased or performed for pay. It can also, of course, be argued that allowing the owners of intellectual property greater control over the form in which it is disseminated could increase their profits and thus ultimately benefit the creators.

Intelligence testing

DEFINITION: Measurement of human intelligence

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Intelligence testing raises ethical concerns involving potential cultural bias of tests as well as the differential treatment of people based on their test results.

Alfred Binet and his colleagues first devised tests to assess the mental abilities of French children during the 1890's. A child's "mental age," divided by chronological age, gave an "intelligence quotient" (IQ). Binet thought that IQ scores could be improved through education, but many British psychologists insisted that intelligence was hereditary. Data on this issue were gathered by Cyril Burt, but some of his data were later shown to have been fabricated. American psychologists modernized Binet's tests but applied them, with considerable bias, against African Americans and immigrants.

Despite early claims that the tests measure "in-

Alfred Binet, inventor of one of the earliest intelligence tests. (National Library of Medicine)

nate intelligence,” careful studies show that educational influences are strong and that most early studies were flawed. In particular, a fifteen-point average difference between unselected whites and African Americans disappears when comparison is made between samples matched by social status, family income, and similar factors. African Americans who have attended good schools and have had similar advantages achieve higher scores than do students from disadvantaged backgrounds regardless of race.

Test bias occurs because the test is given in a particular language and because it assumes a middle-class cultural environment; the results are therefore biased against the poor and against those who speak a different language. More subtle bias includes questions about activities that are common to middle-class white males, thus discriminating against females and blacks. Bias-free exams are difficult to write.

Proponents of eugenics have advocated favorable treatment of high-IQ individuals and unfavorable treatment (including sterilization) of low-IQ sub-

jects. Since test results can be modified by education and are subject to bias, such proposals have lost much favor since about 1940.

Intention

DEFINITION: Purpose or aim of an action; that which is intended

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Agents typically must intend to do something or be directed toward a certain intended state of affairs in order to be morally responsible for their actions.

The idea of the intentionality of action is commonly attributed to Aristotle’s *On the Soul* (335-323 B.C.E.). Aristotle’s theory was transmitted through late medieval to modern philosophy primarily by Thomas Aquinas and William of Ockham. In the nineteenth and early twentieth centuries, intentionalism was associated with Franz Brentano’s 1874 work *Psychology from an Empirical Standpoint* and his 1889 *The Origin of Our Knowledge of Right and Wrong*. Modern moral philosophy in the intentionalist tradition includes the work of, among others, G. E. M. Anscombe, Robert Audi, Roderick M. Chisholm, Donald Davidson, Joseph Margolis, and Richard Taylor.

An agent’s intention is what the agent intends to do. It is the possibly nonexistent state of affairs that the agent assumes as the purpose or goal of action, toward which the action is directed. Some examples of intentions are to help another person, to perfect one’s abilities, to achieve a career objective, and to move a finger.

It is standardly agreed that agents are not morally responsible for their actions unless they intend to do them. Behavior performed entirely without intention is not action or doing in the philosophically correct sense of the word, but something that a person suffers or undergoes. Doing something unintentionally, when there is no negligence or overriding obligation to determine the likely effects of an action, is often

considered to render a person morally blameless for bad consequences. Agents are sometimes praised or blamed even for their unrealized or failed intentions, as a reflection of their moral attitudes and inclinations.

The main division in moral philosophy between deontological and consequentialist ethics can be drawn in terms of the role that intention is thought to play in moral evaluation. For the deontologist, having a good or morally approved intention, usually one that intends an action because it is prescribed by duty, is the most important factor in ethical conduct, regardless of the consequences. Consequentialists are unconcerned with the state of mind with which an action is undertaken, except insofar as it leads to good consequences, which are often understood as whatever maximizes happiness. Although the concept of intentionality does not resolve the dispute between these two types of moral philosophy, the fact that their disagreement can be characterized in terms of intentions indicates the importance of the concept of intentions to moral theory.

International Covenant on Civil and Political Rights

IDENTIFICATION: Legally binding promise by signatory nations to ensure civil and political rights within their sovereign territory

DATE: Adopted on December 16, 1966; took effect on March 23, 1976

TYPE OF ETHICS: Civil rights

SIGNIFICANCE: The covenant represents a practical attempt to enforce the principles advocated in theory by the Universal Declaration of Human Rights.

For years after the 1948 Universal Declaration of Human Rights, the United Nations struggled to prepare treaties that would oblige nations to guarantee the rights and freedoms described in the declaration. In 1966, two covenants were presented: the International Covenant on Civil and Political Rights, and the International Covenant on Economic, Social, and Cultural Rights.

Those nations who are party to the Covenant on Civil and Political Rights have agreed to guarantee to all individuals under their jurisdiction certain basic rights. No distinctions are made because of race, color, sex, language, national origin, and so on. The rights and freedoms guaranteed under this covenant include the right to life and liberty, freedom from slavery, freedom from torture or inhuman punishment, freedom from arbitrary detention, the right to travel freely, and the freedom of thought and religion. Furthermore, the covenant guarantees protection for ethnic, religious, and linguistic minorities, and guarantees that no one may be forced to testify against himself or herself. Signatory nations found to be in violation of this covenant may be held accountable by the United Nations.

International Criminal Court

IDENTIFICATION: Permanent court established in The Hague, Netherlands, by the international community

DATE: Founded in 2002

TYPE OF ETHICS: Human rights

SIGNIFICANCE: The International Criminal Court (ICC) is the first standing international court designed specifically to prosecute individuals for war crimes and crimes against humanity. Its mission is to prosecute egregious criminals who enjoy impunity in their home countries and further to refine and articulate international laws of war and laws promoting human rights.

Creation of the International Criminal Court culminated a century of developments in international criminal law. While there has always been a belief that certain crimes are of such a hideous nature that their prosecution demands an international response, the political will to develop a serious legal institution to confront these crimes was long lacking. Prior to the establishment of the ICC, the only courts in which war criminals and other politically powerful criminals could be prosecuted were domestic courts or ad hoc tribunals—temporary courts convened only to prosecute a particular individuals or groups for crimes occurring at specific times and places. While such courts have had some success, their influence has been sharply limited by their inherently transitory nature. Other international courts, such as the International Court of Justice and the infrequently used Permanent Court of Arbitration, deal only with grievances among states and do not handle claims regarding individuals.

To address this issue, a large number of states convened in Rome to draw up plans for a court that would fill this gap in international law. Founded by the resulting Rome Statute of 2003, the ICC is designed as a standing body that can prosecute certain crimes almost anywhere in the world.

CONTROVERSY AND JURISDICTION

The ICC is not without its critics. In particular, the United States has been a strong opponent of the court, fearing that its own citizens may become targets of politically motivated prosecutions and that it may lose some of its independence to an unaccount-

able international power. In 2002, the U.S. government took the unprecedented step of removing its signature from the Rome Statute. In addition, it pressured smaller nations to sign agreements that would prevent them from sending Americans to the ICC, should the court seek to prosecute them. This policy has, in turn, met with stiff resistance from other countries throughout the world and from the European powers in particular, who see the court as an important first step in the creation of a more peaceful and just world order.

The ICC cannot pursue cases against anyone it wishes. For a prosecution to be authorized, the crimes must either take place in states that are party to the treaty or involve accused persons who are citizens of one of those states. In a novel development in international criminal law, domestic courts may first elect to investigate and prosecute accused criminals and then, if they are unable or unwilling to pursue the case, the ICC's own prosecutors may take over the prosecutions—a process known as “complementary jurisdiction.”

The ICC has special jurisdiction over several types of crimes: war crimes, as defined by the Geneva Conventions; genocide; crimes against humanity, such as slavery, mass rape, ethnic cleansing, and apartheid; and aggression. The last crime is notoriously vague, and the treaty delays any prosecutions for aggression until the concept can be adequately defined.

ETHICAL ISSUES

The ICC faces a great number of ethical issues. At its founding, the hope was that an international judicial body would be better able to provide justice for many people who have been unable to find it in their home countries. Some of the most egregious crimes in history have been committed by powerful leaders, such as Adolf Hitler and Joseph Stalin, whose power placed them beyond traditional forms of legal accountability.

However, according to some critics, it is unclear whether it is practical to make political leaders subjects of ICC prosecutions. Tyrants who face possible international criminal trials are likely to hold onto power much longer if abdication means that they may face humiliating trials in The Hague and lengthy imprisonments. By contrast, if such rulers were instead offered immunity from prosecution and rela-

tively comfortable retirements, they might be more easily persuaded to give up power without committing additional crimes or causing further suffering. Such a benefit, critics contend, is more concrete than any abstract notions of “justice” that the ICC can provide.

CRITICISMS

Some critics have contended that the justice that international courts apply will be biased in favor of the interests of wealthy and powerful countries and those countries’ provincial value systems. The leadership of weaker states with difficult domestic problems and substantial civil strife may be unable to meet the standards of stable Western democracies. Some critics contend that it is unfair to hold such states to standards that they cannot possibly meet. Further, when the powerful states commit criminal acts, their governments are likely to possess the political clout to stop prosecution of their leaders. Thus, the court is not likely to provide justice for all, but rather will simply be another forum in which the powerful bully the weak.

However, the court’s defenders have insisted that without some legal accountability for international criminals, victims will be forced to find justice outside of the law. They argue that resorting to vigilante justice will only prolong and deepen the bloodshed already caused. By providing a public record of the atrocities committed by the powerful, the ICC should provide the closure necessary for societies to move forward. Additionally, the court may deter powerful would-be criminals by publicly reminding them that they are not beyond the reach of the law.

Regardless of whether the ICC proves to be a success, its creation marks a turning point in the moral and ethical thinking of much of the world. For the first time, the vast majority of the world’s nations have accepted that large-scale human suffering is not only a matter for local authorities but is always a concern for all of humanity.

International justice

DEFINITION: System established by sovereign nations to resolve disputes and punish offenders of international law; or principles of just and equitable treatment of nations and individuals applied to geopolitical analysis and activism

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: The concept of international justice transcends the parochial interests of individual nations in the name of larger concerns such as human rights or simply stable international relations. As a result, it is often based in universal, egalitarian or humanist moral systems, and it has the potential to threaten the sovereignty of individual nations.

The term “international justice” has three connotations. First, it refers to the mechanisms by which governments seek to fairly and legally resolve disputes among themselves. Second, it refers to the formal and informal systems by which governments are punished for wrongdoing. Finally, and more broadly, it has in recent years been used to call for a more fair allocation of global resources among nations.

Ethical considerations surrounding all these connotations are conditioned by the lack of centralized and completely effective mechanisms by means of which international justice can be effected. The international system is built on the principle of national

sovereignty, which requires coordination of state policies to attain justice, rather than a system of subordination under which countries submit to a global authority exercising ultimate and binding jurisdiction over them. As sovereigns, nation-states are the highest authorities and are beholden to no higher authority unless they voluntarily concede by treaty to limit their sovereignty. Conflict in such a system is an ever-present threat. The achievement of order and justice, then, is accomplished by mutual accommodation, negotiation, political maneuvering, and sometimes through the use of collective force. Ethical constraints are not irrelevant in this system, but they are typically subordinated to political interest.

LEGAL RESOLUTION OF DISPUTES

Assuming that governments prefer to resolve disputes peacefully, rather than through conflict or force, numerous options are available to them, including political mechanisms such as direct bilateral negotiation, third-party mediation and conciliation, and legal mechanisms such as arbitration and adjudication. Political solutions are very common means of resolving international disputes. Arbitration and adjudication are less common at the international level. Disputes between citizens or business interests of two countries are quite common, however, and these are often resolved by the domestic courts of the involved countries or by mixed claims commissions that have been established by treaty.

When a legal dispute arises between two governments, they may choose to seek arbitration and adjudication to avoid conflict. When seeking arbitration, governments agree to submit the legal issue to an ad hoc panel of experts composed of members proposed by each of the countries involved and whose final judgment is accepted in advance as binding both parties to the dispute. Arbitration has been practiced for centuries by nations, and its roots go back at least as far as the ancient Greeks in the fifth century B.C.E. In modern times, states created the Permanent Court of Arbitration, which was established by the Hague Peace Conference of 1899 but has been resorted to only infrequently since World War I.

In addition to arbitration, states may seek to adjudicate disputes through standing courts, such as the International Court of Justice (ICJ) at the international level, or through various regional courts, such as the European Court of Justice. The sole interna-

tional court, the ICJ, lacks compulsory jurisdiction over states, which means that no state is required, unless it consents to do so, to bring cases before the court or to appear in court to defend itself from suits brought against it by other states. Fewer than a third of the members of the United Nations recognize the ICJ's jurisdiction as compulsory. Once governments agree to the ICJ's jurisdiction, however, they are bound to abide by its decisions. Enforcement of court decisions, however, has not been completely satisfactory or effective. The ICJ operates, then, in a less than perfect environment in which states are not required to submit disputes to it and, even in those rare cases when they do, there is no guarantee that its judgments will be honored.

PUNISHING WRONGDOERS

Given its weak legal structures, international justice is often conducted either through collective punishment of offending states or by the self-help of individual governments. Members of the United Nations are required by the U.N. Charter to resolve disputes peacefully. Aggressor states that violate this obligation may be punished by the United Nations through the collective application of economic sanctions and even force. If the United Nations cannot agree to punish an aggressor, however, the injured state is left to defend itself. It may do so by recourse to the traditional laws of retaliation. Ultimately, the success of all such collective and individual efforts depends on the cooperation of powerful states. When powerful states are on the side of justice, justice can be done. If they are not, or if powerful states actively flout international law, the only prevailing justice is that of the strongest.

Apart from the legal resolution of disputes and the use of force to punish aggressor states, international justice is increasingly used to refer to the fair distribution of global resources. Significant inequities currently prevail among nations. This leads many poorer countries to call for a fairer international economic order. In many of the poorest countries, however, wealth is equally badly distributed. The ethical claim of the elite in such a country to an entitlement to greater access to international wealth for their nation rests on shaky ground. There exists no current legal principle by which wealthy states must transfer wealth to poorer ones, and even where ethical considerations demand it, as in the case of famine or disas-

ter, the claim of a wealthy elite in a poor country to have absolute control over the internal allocation of foreign aid lacks justification.

CONCLUSION

The achievement of international justice depends to a very large extent on the voluntary cooperation of governments and peoples. Governments often do cooperate to mutual advantage. They often resolve disputes peacefully and help each other in time of need, but there is no world government to ensure that they do so. They do so out of a sense of either political interest or legal or ethical obligation. A government's first obligation is to its own people's security and prosperity. At the international level, its obligation to the security and prosperity of other nations is governed by traditional friendships and ties, by voluntarily accepted treaty and legal norms, and by prudence and expediency.

International Labour Organisation

IDENTIFICATION: Specialized agency of the League of Nations, and later of the United Nations, that attempts to improve global working conditions and standards of living

DATE: Founded in 1919

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Formation of the International Labour Organisation (ILO) served to recognize and legitimize the ethical ideals of international labor groups.

As a result of lobbying by international labor unions and the governments of several countries, the Treaty of Versailles, which ended World War I, recognized the International Labour Organisation. Its declarations and resolutions were not, however, made enforceable.

During the Great Depression, the ILO encouraged governments to plan for the reemployment of workers and to develop relief and unemployment insurance schemes. The United States joined the ILO in 1934. Other countries had delayed joining; some also dropped their membership.

The ILO was the first specialized agency to be affiliated with the United Nations, which was created in 1946. It took on a more proscribed role, with some of its concerns delegated to other agencies. Its membership also changed, including many more developing rather than industrialized countries. The ILO became more of a statistical and information center that also provided technical assistance to developing countries. It turned its attention more to problems of poverty and social conditions rather than narrow labor issues. The agency is concerned with international disparities in the treatment of workers, and it attempts to prevent exploitation. As part of that program, it promotes relatively free immigration and emigration of workers. The ILO is unique among intergovernmental agencies in that member states send representatives not only from their governments but also from worker and employer groups.

International law

DEFINITION: Body of obligatory customs, conventions, rules, and principles by which governments of nation-states order their interrelations

TYPE OF ETHICS: International relations

SIGNIFICANCE: International law seeks to minimize international conflict, to promote cooperation among nations, and to protect individuals victimized by their own nations or caught in the middle of hostilities between nations.

Unlike domestic systems of law, in which supreme legislative, executive, and judicial organs make, enforce, and interpret law, international law has developed between and among rather than above states in international relations. Possessing sovereignty, these states alone can make international law, and when they do so, it is of their voluntary accord rather than under the compulsion of any higher authority. This lack of a higher authority above states leads potentially to a system of anarchy in which evils of unspeakable proportions can be committed. Governments have, since the earliest dawn of civilizations, attempted to limit their sovereign prerogatives in an effort to avoid anarchy, preserve harmony in their interrelations, and promote the welfare of their respective populations. Even when cooperation broke down and war occurred, governments recognized a need to limit their behavior, protect innocent life, and curb the excessive brutality associated with violent war. They did so by devising systems of international law.

HISTORY

The roots of international law can be traced back at least to the times of the ancient Greeks and Romans, who developed principles of interstate law to govern diplomatic exchanges, treaties, the legal status of aliens, usages in war, and principles of citizenship and asylum. These ancient states saw the benefits of reciprocity—that is, of treating citizens and representatives of other nations with decorum and respect so that similar treatment would be accorded

their own citizens and representatives by other states. Much of this law was based in custom, but some was established by statute and treaty.

The Roman conceptions of *jus civile*, *jus gentium*, and *jus naturalae* established the foundation on which international law is today based. The *jus civile*, or law of cities, concerned the rules distinct to each city of the Roman Empire based on its own customs and traditions. The *jus gentium*, or law among nations, was the law that applied to citizens of all states in their relations to one another. The *jus naturalae*, or the natural law, comprised those overarching principles in nature that human reason could discern regardless of national affiliation. The closer the *jus civile* and *jus gentium* approximated the *jus naturalae*, the more perfect they became.

THE MIDDLE AGES AND BEYOND

During the Middle Ages in Europe, Christian moral principles served as a means of inhibiting the excesses of governments against their subjects and against other governments. Rules of war called for the protection of civilians and noncombatants, humane and fair treatment of prisoners, and even proscribed conflict during certain seasons and on certain days. Laws of diplomatic immunity persisted and developed. Rules for acquiring and disposing of territory gradually developed.

With the onset of the Protestant Reformation and the resulting religious wars in Europe, however, the princes and monarchs of Europe ultimately found it necessary to establish clear rules regarding state rights and duties. At the Peace of Westphalia in 1648, they determined that states were sovereign, equal, and independent; the sovereign within a particular territory had exclusive control over it and the right to determine its laws and its religion. No sovereign was obliged to abide by any treaty or rule that he or she did not explicitly and voluntarily accept or recognize. These principles continue to serve as the basis of modern international law, although governments in the intervening centuries have shed themselves of monarchs and in many instances adopted republican government.

As the Industrial Revolution, commercial expansion, and colonial competition grew, governments found the need to recognize both customary and treaty principles in order to promote a degree of cooperation and to curb excessive conflict. In the twen-

tieth century, states agreed that force should not be used to settle international disputes, unless used in self-defense or under the aegis of a collective authority such as the United Nations. In addition, governments increasingly developed rules to protect aliens living, traveling, and working in foreign lands. States undertook the responsibility to protect aliens at a level commensurate to that enjoyed by their own citizens. Should the host state fail in this responsibility, an injured alien could, after exhausting available local remedies, appeal to his or her country of nationality to file a claim against the host government to obtain redress for the injury.

TWENTY-FIRST CENTURY ETHICAL PRINCIPLES AND ISSUES

As noted earlier, most international law is made and observed by states out of reciprocal self-interest. Once states make promises to one another in treaties, they are obliged to honor them, and in the vast majority of cases they do. If states should fail to honor their treaty or customary legal obligations, however, the injured parties may seek judicial remedies, or failing this, they may seek to punish offending states through sanctions or other retaliatory measures. When engaging in such retaliation, governments are obliged to observe the principle of proportionality, which means that they can take actions of roughly similar kind and degree against a state committing a prior wrong. Excessive retaliation is itself considered wrong.

During the twentieth century, with the emergence of guerrilla wars, total wars, and nuclear weaponry, the old distinction between civilian and combatant was blurred in practice. The customary laws of war, in turn, have often been disregarded, and many innocent lives have been lost. The Geneva Red Cross Conventions and Protocols have been promulgated to reassert the distinction between combatants and non-combatants and to preserve the rights of prisoners of war.

In addition, since World War II, governments have increasingly adopted a wide range of human rights declarations and treaties in order to define more clearly the respective rights and responsibilities of individuals and states under international law. Such agreements include the Universal Declaration of Human Rights, the Genocide Convention, and the

Conventions on Civil and Political and Economic and Social Rights. Thus, although states remain the principal subjects of international law, they increasingly recognize the need to protect, usually through domestic legal mechanisms, the human rights of their respective citizens. In turn, individuals can be held directly accountable for a variety of international crimes, including war crimes, piracy, genocide, counterfeiting, and slave trading.

International law represents one of the means by which governments have countered the anarchic tendencies of international relations and thereby remained conscious of their legal and ethical obligations to one another and to their own citizens as well as to aliens.

International Monetary Fund

IDENTIFICATION: Organization that monitors the health of the world economy by lending money to countries facing balance-of-payment problems

DATE: Founded in December, 1945

TYPE OF ETHICS: International relations

SIGNIFICANCE: Ethical debates have arisen over the question of whether the International Monetary Fund's (IMF) free enterprise policies promote the welfare of the global poor, enhance democratic decision making, and protect the world's natural environment.

The International Monetary Fund, along with the World Bank, was first conceived in 1944 at the United Nations conference held in Bretton Woods, New Hampshire. Conference delegates believed an international agency was necessary to promote balance and growth in international trade. The IMF makes temporary loans to nations facing economic or financial crises. Since the Thatcher-Reagan era of the 1980's, the IMF has increasingly insisted that debtor nations adhere to free-market policies (known as "the Washington consensus"). Nations receiving IMF loans often must agree to structural adjustment programs (SAP), which may require eliminating tariffs and restrictions to the flow of capital and implementing policies of fiscal austerity and privatization.

Advocates of market liberalization such as the IMF, as well as defenders of protectionist policies, generally agree that ethical fairness means that the rich have some degree of obligation to help the worst-off, but they differ on the short- and long-term economic measures that best guarantee such assistance. Since IMF loans are made under stipulations that may cause short-term hardships, IMF policies raise ethical questions. The free market may improve economic efficiency and undercut bureaucratic graft in the developing world, but austerity policies may also force declines in wages and increase unemployment. While personal suffering may only be a short-term consequence of market adjustments, critics argue that it is morally unacceptable to force such hardship upon those least able to bear it

RICH VS. POOR NATIONS

The power that rich industrialized nations exercise over developing nations through the IMF raises

other ethical debates. The vast imbalance of power between the IMF and client countries means that the latter are sometimes pressured to accept loan conditions in conflict with the will of the nation or its traditional values. Critics charge that such "conditionality" in effect gives the IMF undue influence upon the democratic determination of domestic policy. Furthermore, IMF negotiations are often cloaked in secrecy out of legitimate concern that required loan conditions might provoke domestic unrest, but this lack of transparency subverts the citizen's right to know government plans. Similarly, the liberalization of financial markets (removing barriers to the flow of investment) may undermine the power of a nation to control its own economic development. Defenders of globalization and the IMF argue that greater global equality and prosperity rests upon extending free trade practices across the world.

International Organization of Consumers Unions

IDENTIFICATION: Global non-governmental organization that seeks to protect and expand the rights of consumers

DATE: Founded in 1960

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The International Organization of Consumers Unions (IOCU) is the main vehicle through which national and regional consumers' groups share information and coordinate action.

Headquartered in The Hague, Netherlands, the International Organization of Consumers Unions is affiliated with 175 national and local consumer organizations in sixty-eight countries. Its purpose is to bring together the efforts and results of these smaller organizations to increase the power of consumers worldwide. Specifically, the IOCU has worked on such issues as the safety and effectiveness of infant formulas, and the safe distribution and use of pesticides.

The IOCU gathers and shares published information from its affiliates; provides a forum for further sharing of information and problems; encourages nations to cooperate with one another in testing product safety and in sharing the results of these tests; and studies and interprets local, national, and international laws relating to consumers. Because it works closely with the United Nations and other international bodies but not with any individual national governments, the IOCU can be an important advocate for consumers in developing nations. These consumers have sometimes been deceived or coerced into buying products that have been judged too dangerous or ineffective for sale in the developed nations where they were manufactured. Working with the United Nations, the IOCU offers consumer education and protection programs in developing nations.

International Red Cross

IDENTIFICATION: Charitable organization created in Switzerland to ameliorate the horrors of war by providing relief to its victims

DATE: Created in 1863

TYPE OF ETHICS: International relations

SIGNIFICANCE: Through the Geneva Conventions with which it is closely associated, the Red Cross

Image not available

Red Cross workers cleaning buckets at a prison in northern Afghanistan, where the organization fed starving prisoners and greatly improved conditions in early 2002. In the Muslim world, the Red Cross is known as the "Red Crescent." (AP/Wide World Photos)

has helped develop the concept of combatants adhering to ethical standards of conduct during military conflicts.

In 1859, the sight of wounded soldiers suffering on the battlefield after the Battle of Solferino in Italy so horrified a young Swiss businessman named Jean Henri Dunant that he wrote an impassioned book, *A Memory of Solferino* (1862), in which he called for the creation of an army of volunteers to treat the wounded and for the establishment of international conventions under which such an army would function. In 1863, a committee of five prosperous citizens of Geneva, Switzerland, took up Dunant's ideas and arranged an international conference that led to

the first Geneva Convention on the treatment of wounded soldiers. The committee, which became known as the International Committee of the Red Cross because of the badge it adopted for its volunteers, initiated further conferences that produced additional conventions.

The Geneva Conventions established rules for the humane conduct of war in an attempt to alleviate the horrors of warfare. These rules included provisions facilitating the treatment of wounded soldiers by recognizing both the wounded and the medical personnel treating them as neutral. Later rules called for the humane treatment of prisoners of war, civilians affected by war, victims of civil wars, and political prisoners.

Although the central purpose of the Red Cross was to introduce ethical standards into military conflicts, some observers criticized its efforts on ethical grounds, arguing that by making the conduct of war more humane, the Red Cross was also making war more acceptable and thus encouraging rather than discouraging war. Some critics, including the noted English nurse Florence Nightingale, also said that providing a volunteer army of nurses and other medical personnel also made war easier for combatants by relieving their military authorities of medical responsibilities and freeing up their resources.

However, in the twentieth century, especially after World War I, there was general acceptance of the importance of the relief work carried out by the Red Cross under the Geneva Conventions. Ethical debates did arise, however, over how best to enforce the conventions, and the Red Cross, which generally preferred private communication to public denunciations, was criticized for not speaking out publicly against the treatment of the Jews by Nazi Germany during World War II.

Debates also arose over the political use of relief, especially during the Nigerian civil war during the late 1960's, and over the treatment of combatants in guerrilla wars. Historically, the approach of the Red Cross has generally been one of neutrality. The Red Cross does not judge the merits of conflicts; instead, it encourages humane treatment of all those affected by such conflicts.

Dunant, the founder of the International Red Cross, shared the first Nobel Peace Prize in 1901, and the organization itself received the award in 1917, 1944, and 1963.

Internet chat rooms

DEFINITION: Internet forums in which strangers engage in live and usually unsupervised discussions

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The anonymity and undisciplined nature of online chat rooms exempts their participants from the responsibility to adhere to normal social and legal mores, and makes gullible, immature, and inexperienced participants vulnerable to deceptive and unethical practices.

Anonymous chat lacks ethical boundaries, a sense of place, and social rules. Private individuals and public authorities—sometimes even police officers—are lured into public displays of immoral behavior and such acts of deception as providing false identities and setting up entrapment schemes. So many married people have been known to flirt with strangers over the Internet that growing numbers of divorces have been fueled by online affairs.

Emotionally unstable people try to live out their fantasies by exaggerating their personal attributes and hiding their true selves from those they deceive and seek to exploit. Neurotics play roles, criminals try to recruit collaborators, and sexual exhibitionists find ready audiences. Racist, sexist, and homophobic speech is uncensored. Sexual predators and those entrapping predators offer pornographic images and statements. The types of legal protections from gov-

Surreptitious Advertising

Is it ethical for companies to promote their own products by having their employees enter chat room discussions to rave about their products, without revealing their connections with the companies? This very question was posed to Rabbi Asher Meier, the author of the online column *The Jewish Ethicist*. He answered by citing the Torah, which forbids putting “a stumbling block before the blind.” Failing to reveal one’s true identity in a chat room discussion is, in effect, leaving other participants “blind.” This practice is not only unethical in Jewish law, but also violates the American Marketing Association’s code of ethics, which counsels against “sales promotions that use deception or manipulation.”

ernment intrusion that are ordinarily provided to mail, telephone conversations, and face-to-face conversations are generally not extended to Internet chat rooms, instant messaging, and e-mail, making online communications ripe for official abuse.

Despite the possibilities for unethical behavior on Internet chat rooms, the actual incidence of improper activity may be less common than has been thought. An AT&T WorldNet study conducted in 2004 found that the online behavior of most people who use the Internet online is the same as their behavior in everyday life. Early twenty-first century studies of young people who had been raised on the Internet found that they question assumptions they are asked to accept by those they meet online. The young people were constructing their own rules for online behavior and etiquette, making ethical judgments about message content, critically evaluating and responding to improper behaviors they encountered and dispensing online discipline for those who behave improperly in chat rooms.

Internet piracy

DEFINITION: Unauthorized duplication and distribution of copyrighted materials taken from computer networks, usually to avoid paying for the use of commercially licensed materials such as music, motion pictures, photographs, computer software, and texts

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Internet piracy is considered unethical because it prevents creators from being able to profit fairly from their works or regulate their use and distribution. The growing practice of Internet piracy raises issues concerning the ethical assumptions presupposed by intellectual property, fair use, and copyright laws.

Perhaps no new technology has created a more daunting challenge to traditional notions of intellectual property rights and their relationship to personal privacy than the popularity and ready availability of file-sharing mechanisms on the Internet. Internet use worldwide skyrocketed in the 1990’s, as did the use of free and easily accessible computer software that allows users to make and share digital copies of music, video, and other media.

A significant portion of the material that was being exchanged in the early years of the twenty-first century consisted of illegally pirated works, copies of commercially recorded music, software, and similar materials originally created and distributed for profit. Encryption technology that might prevent unauthorized duplication of digitized materials was not able to keep pace with the software allowing users to “rip,” or digitally duplicate, copyrighted materials via the Internet. Industry estimates in the late 1990’s put the number of computer users exchanging pirated music, not to mention other commercial electronic media, in the tens of millions.

THE PIRACY PHENOMENON

In 1997, a small group of college students developed and made available free of charge on the Inter-

net a software program that allowed its users to easily “rip” copies of music from compact discs and upload them to centralized storage servers. Other users could then access the servers to download the illegally copied music without charge. Initially used only by a handful of music enthusiasts, word of Napster’s capabilities spread rapidly, and by 1999, Napster’s developers estimated that their program had been downloaded about sixty million times. If even only a small fraction of Napster’s users were robbing the entertainment industry of potential revenues, the courts viewed its existence as a potential disaster for the music industry. Consequently, Napster was shut down by a U.S. federal court injunction in 2002.

However, by that time, similar renegade file-sharing systems were proliferating the Internet. Some of these systems allowed users to swap not only music with ease but also a range of other types of digitized files—computer software, games, and full texts of books. In contrast to Napster, the new systems were decentralized, not requiring the use of central servers for storage of pirated material. Consequently, illegal piracy became more difficult to trace back to its sources. Identifying and attempting to shut down even a small fraction of the users of pirated files proved impractical if not impossible. Despite government and entertainment industry campaigns to inform users of the unethical and illegal use of Internet file-sharing systems, Web-based piracy continued to grow even after Napster’s highly publicized court battles.

FAIR USE AND BIG BUSINESS

Many online file sharers have claimed that theirs is a victimless crime, asserting that they are merely sharing duplicated materials for their own personal use. Some have even argued that online file sharing actually leads to increased sales of music, games, and video materials because it increases exposure for commercial artists. However, representatives of the entertainment industry vehemently disagree. The Recording Industry Association of America (RIAA), a music industry trade group, attributed to the popularity of online piracy a significant plunge in music sales in the years following the proliferation of Internet file-sharing programs. In 2001, sales of compact discs (CDs) in the United States dropped 6.4 percent, and the following year, they plunged another 8.7 per-

cent. During the same period, the number of Internet users who admitted downloading ever more music while buying less of it outnumbered those who claimed downloading led them to buy more music by a two-to-one margin.

Both the entertainment and software industries tend to regard virtually *all* unauthorized duplication of their products as acts of piracy. However, certain considerations complicate the issue. The copyright laws of most countries, including the United States, provide for the “fair use” of protected artistic and intellectual materials. In other words, it is legal for those who own copyrighted copies of music, movies, and in some cases computer software, to duplicate them for their own private use—provided they do not share their “personal” copies with others. It is legal for a person who has purchased a collection of compact discs to make CD collections of their favorite songs, provided they do not share the copies that they make. The ethical and legal problem lies in what constitutes “sharing” such copies. Surely, giving a friend a copy of one’s “personal” CD would infringe on copyright. Nonetheless, if one makes a “personal” copy of a song and plays it in the presence of a visiting friend, does this infringe on the rights of the copyright holder to profit from the friend’s hearing the music?

Privacy advocates strongly oppose what they see as the entertainment industry’s draconian efforts to invade personal privacy by limiting “fair use.” They also warn against allowing software companies to have almost absolute control over their software’s source code, pointing out that in many cases this limits the individual’s rights to fair personal use and impedes the natural course of technological progress.

A HAPPY MEDIUM?

In 2003, the RIAA sued major Internet service providers Verizon and Earthlink, demanding that they turn over the names of their customers known to download or exchange copyrighted media files. However, in reality such lists only allowed the RIAA to verify the names of Internet subscribers from whose computers illegal file exchanges had occurred. They could not verify which particular members of these households had been sharing pirated materials because no electronic mechanism exists that can pinpoint exact violators. In one highly publicized case, the RIAA sent a letter threatening a size-

able lawsuit against a grandfather whose name appeared on a list of Internet accounts from which illegal downloads had allegedly been made. In truth the computer owner's grandson, who only visited his home occasionally, was actually downloading pirated music on the family computer. Privacy advocates view the RIAA's efforts at enforcing their rights as copyright holders as displaying an unethical disregard for personal privacy rights when taken to this extreme. They place the responsibility for preventing piracy on the entertainment companies themselves, suggesting that they develop and market new ways of copy-proofing their products rather than playing Big Brother and haphazardly attempting to target individual copyright violators. They maintain that although copyright infringement takes place on a widespread basis on the Internet, targeting individuals has a serious cost—the potential sacrifice of personal privacy and the significant risk of punishing the underserving.

Intersubjectivity

DEFINITION: Communicative interaction or struggle between two or more conscious minds

TYPE OF ETHICS: Theory of ethics; beliefs and practices

SIGNIFICANCE: Intersubjectivity is a key concept in several influential theories of communication, knowledge, and desire. Ethical theories that focus

on intersubjectivity emphasize the importance of one's ability to understand the points of view of others, to recognize the validity of their projects, and to negotiate conflicts between their desires and one's own.

Whereas subjectivism makes truth and knowledge dependent upon an individual knower, and objectivism holds that truth exists independently from any subjective state of mind, intersubjectivity makes the objective validity of truth depend upon the consensus of a community of subjects. In so doing, intersubjectivity avoids the relativism of subjectivism without granting to truth a status independent of the human mind. Intersubjectivity has been used as a heuristic concept to aid in the formulation of solutions for two thorny issues. First, how is meaning determined? Second, what is the foundation for the possibility and validity of ethics?

THE PROBLEM OF MEANING

Charles Sanders Peirce established pragmatism as a philosophical method for determining meaning and truth. Two elements stand out in his pragmatic theory. First, the conception of an object consists of the conception of its effects. Second, truth is indefinite. Truth is that upon which the ultimate community of investigators would agree. The ultimate community of investigators constitutes the intersubjective precondition for the possibility of meaning and of science.

In addition to pragmatism, Peirce also developed a theory of semiotics, the science of the interpretation of signs. He rejected the traditional philosophy of consciousness that interpreted knowledge in terms of a two-place relationship—the object in the world and its mental representation. Semiotic theory introduces a third element; that is, a sign not only stands for something in the world but is also addressed to an interpreter. The three-place relationship is essentially intersubjective. Signs have meaning only within the intersubjective framework of an interpretation community. The traditional role of the subject of knowledge is replaced by the interpretative community. Subjectivity is replaced by intersubjectivity. Signs can represent only if they are related to the intersubjective world of interpreters, and only those assertions are true that would be reaffirmed by an indefinite community.

Jürgen Habermas, influenced by the pragmatism of Peirce and his semiotic theory, formulated discourse ethics. Discourse ethics emphasizes the use theory of meaning. Meaning consists of a threefold relationship—what is meant, what is said, and the way it is used. Use theory builds on the third element and focuses on the interactive contexts of communication in which expressions function. These contexts were called “language games” by Ludwig Wittgenstein. Language games include the totality of linguistic expressions and nonlinguistic activities. The analysis of language games discloses the intersubjectively shared backgrounds of the forms of life and lifeworlds that influence the meaning and function of language.

Meanings of symbols, therefore, are never subjective but always intersubjective. Symbolic meaning does not derive validity from private interpretation but from intersubjective agreement.

Because of the interconnectedness of language and lifeworld, intersubjectivity is fixed in ordinary language. Interactive communication and agreement between human beings make social life possible.

Habermas also rejects the traditional concept of the subject understood as an ego. The subject is a community of investigators. For Habermas, the moral subject, as a subject of action, cannot even be conceived apart from communicative interaction with other human beings.

KARL-OTTO APEL

Karl-Otto Apel, a German philosopher, insisted that language and intersubjective agreement make meaningful ethical judgments possible. Apel held that the intersubjective community of investigators is the precondition for the possibility and validity of objectively valid ethics. Apel maintained, along with Immanuel Kant, the necessity for universal preconditions for the possibility and validity of ethics. Unlike Kant, however, he did not find these “transcendental” conditions in the consciousness of the solitary individual; following Peirce, Apel located them in the discursive ethical community.

Apel conceptualized this idea by utilizing a synthesis between transcendental idealism and historical materialism. From idealism, he postulated the normative and ideal presupposition of the “ideal communication community.” The ideal communication community functions as an imaginary hypothetical

community free from inequality and unjust constraints. From materialism, he derived the “real communication community” as a given historical society in which real conflict and inequality exist. The dialectical relationship existing between the ideal communication community and the real communication community is characterized as an antagonism between the ideal and the factual. Notwithstanding its antagonistic character, this dialectical relationship results in the conceptualization of the discursive community as the precondition for both the ethical community as a moral subject and, at the same time, the discursive community as the object of ethical action. In this manner, Apel avoids the extremes of subjectivism and objectivism. In Apel’s thought, ethics is made possible because of the search for mutual understanding that occurs intersubjectively between persons in conversation.

The heuristic model of the communication community functions in the same way as Wittgenstein’s concept of the language game. In either case, consensus functions as a regulative principle. Truth and knowledge arise from communicative action under rule-governed institutions. It is this communicative interaction that makes the objective validity of ethics possible.

Intervention

DEFINITION: Activity undertaken by a state that coercively interferes in the domestic affairs of another state

TYPE OF ETHICS: International relations

SIGNIFICANCE: Intervention may be motivated by national interest, humanitarian concern, or both. It is

often excused, or even mandated, when it seems primarily to be in the interests of the human rights of people being abused or neglected by their own government. Less apparently altruistic instances of intervention are often seen as examples of real-politik and therefore of questionable moral status.

Theoretically, no state has the right to interfere in the domestic affairs of another sovereign state. Such an act is a contradiction of the principles of sovereignty and therefore an attack on the very system on which the freedom of nations rests. Intervention comes in many forms: propaganda; espionage; discriminatory economic policies; and support or denial of support to governments or subversive movements in domestic crises, especially where such foreign support might prove to be decisive. The most notorious form, however, is military intervention.

It is not always easy to determine the morality of

Image not available

intervention, and where interventionist activities are concerned, morality may not always be the highest value. Instead, what matters most is the relationship of morality, power, and knowledge, which, when gainfully exploited, in its contemplative stage may be called wisdom and in its active phase may be called justice. Unfortunately, more often than not, this is not the case. During most of the Cold War, for example, intervention was undertaken on behalf of issues of national power far more often than because of poverty, tyranny, or exploitation. During that period, any action against the communist or imperialist threat, especially if it was successful, was considered by the interventionist power to be moral by definition, or else merely a problem of techniques.

Intrinsic good

DEFINITION: Value that something has in itself, as opposed to its value based on its usefulness or what it can bring about

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Intrinsic good or intrinsic value is a crucial component of many philosophical systems and theories of morality, which see it as the very basis of value. Other, more skeptical, philosophies see the concept of intrinsic good as an obfuscation of the true (relational or historical) nature of value and therefore believe they have an ethical obligation to attack those systems that employ it.

The concept of intrinsic good goes back to Aristotle's notion of "the good" as that for the sake of which one chooses all other things. The contrast is with extrinsic good, which is understood as something that is good only because it brings about something else that is intrinsically good. Standard candidates for intrinsic goods are pleasure and happiness; pluralist theories include such things as friendship and virtue. G. E. Moore introduced a useful test for intrinsic goodness and a theory about its nature. For example,

to see whether music is intrinsically good, Moore would have one imagine a universe with only music in it—and therefore with no listeners to enjoy the music—and consider whether the universe seems a better one than a universe without any music. If the universe with music in it does seem better, music is intrinsically valuable; if not, music is valuable only because of its effects, such as its effects on listeners. Moore also argued that intrinsic goodness is an objective, nonnatural property and that rightness can be defined in terms of it.

Intuitionist ethics

DEFINITION: Any of several ethical systems based, variously, in sensory perception, rational understanding, or considered judgment

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Intuitionist ethics seeks to justify or ground moral beliefs by demonstrating that they derive from a fundamental human faculty. The precise nature of that faculty, different in different versions of intuitionist ethics, will have profound implications for the theory and practice of moral judgment.

According to one version of intuitionist ethics, normal people can simply see the truth about at least some moral matters. In this view, the intuition that something is right or good is not just a hunch or a feeling. Instead, it is an immediate awareness, something like the awareness that three-sided plane figures have three angles. Thinking carefully about a particular act leads one simply to see that the act would be right. In this view, the judgment that this act would be right is self-evident—that is, knowable without reliance on further evidence. In a similar way, some intuitionists claim that some general moral principles are self-evident in the same way that mathematical axioms are self-evident.

The analogy with geometry and mathematics is, however, problematic. "Any three-sided plane figure

has three angles” is self-evident, but “Always tell the truth” is not self-evident. General moral principles, unlike geometric principles, have exceptions, and therefore they cannot be self-evident in the same way. In the case of particular moral judgments, one cannot be sure that there is no hidden aspect of the situation that will make the judgment incorrect. Thus, such particular moral judgments also lack the self-evidence of geometric principles.

Some intuitionists think of “seeing” as looking instead of as understanding. For them, moral intuitions are like perceptions of colors as opposed to apprehensions of axioms. One objection to this approach is that perceiving requires a sense organ, and it does not seem that people have a moral sense organ. It seems clear, however, that seeing moral qualities only requires some means, not necessarily anything like “a moral eye or a moral nose.”

Moral disagreement within societies, between societies, and across time periods presents a more serious problem for intuitionist ethics. How can one be sure that one is perceiving right and wrong if there is so much disagreement about them? Disagreement about what is red would raise serious questions about one’s power to detect color qualities, and the same seems true about the power to detect moral qualities.

Intuitionists may respond that some people have a faulty moral faculty. Such people may be biased or lack relevant experiences, such as knowing what it is like to be without enough food to eat. The idea is that, just as some people suffer from color blindness, some people suffer from moral blindness. Unlike the case of color blindness, there is no agreed-upon test for determining moral blindness. Intuitionists may emphasize the “intuitions” of “normal moral observers” or “moral experts” and discount the “intuitions” of everyone else. Then, however, the difficulty is to say what a moral expert is, without making a moral judgment that rests on intuition.

Also responding to the problem of moral disagreement, other intuitionists claim that there is not really that much disagreement. For example, one culture may leave older people to die in the cold while another culture cares for older people. Yet both cultures may be trying to do what they think is good for older people and merely have different factual beliefs about what that is. All the same, it seems that people may agree on all “the facts” of abortion and still disagree about whether the fetus has a right to life.

OBLIGATIONS

Some intuitionists may try to lessen moral disagreement by talking about *prima facie* obligations. A *prima facie* obligation to keep promises, for example, is an obligation to keep promises unless there is an overriding moral reason not to keep them. This approach does away with some disagreement, but disagreement remains, since different intuitionists have different lists of *prima facie* obligations.

If having an intuition is supposed to guarantee that one has determined the truth, then what are the criteria for determining that one has actually had an intuition? Disagreeing parties may be equally certain that they are right. If intuition is a “seeming to see,” something like a conviction, then how can it provide a solid foundation for moral judgments?

This appeal to intuition is not an appeal to one’s general beliefs, but instead an appeal to one’s considered beliefs, beliefs that one has arrived at after a process of rationally considering alternatives. These beliefs are not supposed to be self-evident; one checks them against one’s other beliefs and against the considered beliefs of others. Beliefs that pass this test become part of the basis for testing other beliefs.

This approach makes justification largely a matter of “coherence” among beliefs. If this approach can avoid a vitiating circularity, can it avoid a built-in bias in favor of traditional beliefs? Might not traditional prejudices survive the process of testing beliefs? In any case, the problem of disagreement remains, since two incompatible sets of beliefs may be equally coherent.

Invasion of privacy

DEFINITION: Exposure of one's personal life or information, especially by the media

TYPE OF ETHICS: Civil liberties

SIGNIFICANCE: Charges of invasion of privacy represent a clash between two fundamental civil liberties: the right to privacy and the right to freedom of the press. Generally speaking, the press is given more leeway to present the intimate details of the lives of public figures than those of private individuals, because the former are considered to have ceded some portion of their privacy rights voluntarily when they entered public life.

In 1890, two Boston lawyers, Samuel D. Warren and Louis D. Brandeis, published an article on the right to privacy in the *Harvard Law Review*. The article deplored the sensationalistic tactics used by the press at that time, which violated the average person's notions of privacy. Gradually, during the next century, such invasions of privacy were incorporated into an articulated concept in tort law. The earliest kind of privacy invasion was known as appropriation, the use of another's name or likeness for commercial purposes without that person's consent. Two other types of invasion of privacy—intrusion upon another person's seclusion and placing a person in a false light—developed later.

A last kind of invasion of privacy—the one to which Warren and Brandeis referred—is the publication of private information about a person. Today, if such information is newsworthy or is a matter of public record, the media may publish it. Since opinions differ regarding what is newsworthy, however, this type of invasion of privacy remains most vexing for citizens and media alike. Generally, though—supermarket tabloids notwithstanding—because the right

Iraq

IDENTIFICATION: Predominantly Arab Middle Eastern nation that has experienced an unusual amount of conflict and suffering

TYPE OF ETHICS: Modern history

SIGNIFICANCE: The modern history of Iraq has been afflicted by tyrannical leaders, abuses of human rights, religious and ethnic hostilities, power struggles among rival clans, and disastrous wars.

Situated in the northwest of the Persian Gulf, Iraq stands in the heart of western Asia. Except for a portion of the Shatt al-Arab (River of the Arabs), its national boundaries are generally arbitrary. A lack of common bonds for a national union has been one of the great problems of the country. Early in the twenty-first century, Iraq's proven oil reserves were surpassed only by those of Saudi Arabia. Until the disastrous war over Kuwait in 1991, which was followed by more than a decade of economic sanctions, the Iraqi population enjoyed a moderately high living standard.

ETHNIC AND RELIGIOUS CONFLICT

Almost 80 percent of Iraq's 22.6 million people are Arabs—people who speak the Arabic language and share a common Arab culture. The Kurds, the other major ethnic group, constitute about 17 percent of the population. The Kurds speak their own language, which is related to Persian, and most of them live in the mountainous regions of northern Iraq, next to Kurdish regions of Turkey and Iran. Having a strong sense of nationalist identity, they have long desired a separate country, to be called Kurdistan, an idea that the Iraqi government has long opposed. In

1988, the Iraq government used poison gas against Kurdish villages.

Small groups of other minorities are scattered throughout the country. Turkmen make up about 2 percent, while Iranians, Assyrians, Lurs, and Armenians each have less than 1 percent. Almost 3 percent of the people belong to various Christian churches. Before 1948, Iraq had about 150,000 Jews, but since then, forced emigration has reduced their numbers to about nine thousand. Except for Jews, small ethnic minorities have generally been tolerated so long as they have not opposed official government policies.

About 97 percent of Iraqis are Muslims—followers of the Islamic religion. Almost all Kurds and one third of the Arabs are Sunnī Muslims, who accept the orthodox Sunnī interpretations of the Qurʾān. The government has traditionally been controlled by

Sunnī Muslims. Approximately two-thirds of the Arabs are Shiʿites, who have different views of Islam and look to Ali as Muḥammad’s true successor. Located primarily in the country’s south, they have separatist tendencies. Their 1991 rebellion against the central government was brutally suppressed.

A VIOLENT POLITICAL CULTURE

Conquered by the Ottoman Turks in 1515, Iraq was part of the Ottoman Empire until 1917. Great Britain then administered the country as a League of Nations mandate until 1932. During the first year after independence, Iraq’s army massacred Assyrian Christians. A bloody *coup d’état* of 1936 added to political instability, and a series of eight military governments ruled the country until 1941, when the British returned in force. With Iraqi self-rule in 1945,

chaotic conditions allowed the Kurds to form a short-lived Kurdish Republic, which was brutally suppressed by the national army.

In the post-World War II years, Prime Minister Nuri al-Said shared power with the regent for the young king Faisal II. Iraqis fought in the Arab-Israeli War of 1948, which intensified anti-Zionist and anti-Western attitudes among the population. During the Suez Crisis of 1956, al-Said's refusal to condemn Great Britain and France infuriated Arab nationalists. Two years later, a group of left-wing military officers, led by General Abdul Karim Kassim, took over in a coup, killing both al-Said and the young king. The new regime executed scores of politicians and officers who had been connected with the monarchy. Democratic institutions were abolished. In 1961, attempts to suppress Kurdish nationalists led to a guerrilla war.

In 1963, a left-leaning group of military officers seized power in a coup, executing Kassim and his close associates. The new president, Colonel Abdul Salam Arif made an alliance with the Baath Party, a radical organization endorsing violence in pursuit of socialism, Arab nationalism, and anti-Western policies. In November, 1963, President Arif staged a successful anti-Baath coup. The next year, Baath members failed in an attempt to assassinate Arif, but in 1968, Baathist officers seized power in a violent coup.

IRAQ SINCE 1968

Between 1968 and 1979, Colonel Ahmad Hassan al-Bakr was president of Iraq as well as chairman of the Revolutionary Command Council. Real power, however, was firmly in the hands of his assistant, Saddam Hussein, who controlled the internal security apparatus. When Bakr resigned in 1979, probably for health reasons, Hussein was quickly installed as president. Hussein's first act was to purge the Baath Party of senior officers suspected of disloyalty, making it clear that opposition would not be tolerated. Most historians agree that Hussein's regime became one of the most violent and repressive in the modern history of the Middle East.

Hussein led his country into three destructive wars. In 1980, he ordered the invasion of Iran, apparently with the goal of annexing an oil-rich Iranian province where Arabs were in the majority. The destructive conflict lasted eight years. Two years later, Hussein's army occupied the oil-rich kingdom of Kuwait. In the Gulf War of 1991, a massive U.S.-led co-

alition forced the Iraqis to leave the small country. The United Nations passed numerous resolutions authorizing inspectors to determine whether Iraq was developing weapons of mass destruction (WMD). When Hussein failed fully to comply, a coalition of the United States, Britain, and a few other countries invaded Iraq and ended Hussein's regime. Observers debated about whether the coalition's preemptive war met the usual criteria of a just war.

Following Hussein's overthrow, coalition authorities appointed an Iraqi governing council, with representatives from the major religious and ethnic communities. The council was given the difficult task of producing a democratic constitution by the summer of 2004. Kurds wanted to gain independence, while Shi'ites and Sunnīs disagreed about how political leaders should be chosen. Numerous Iraqis bitterly resented the continued presence of foreign military forces, and some expressed their discontent with sniper attacks and terrorist bombings. Meanwhile, coalition inspectors failed to find any WMDs, the major reason given for intervention. Americans and British citizens became increasingly dissatisfied with the costs of the occupation.

Is/ought distinction

DEFINITION: Distinction drawn in moral philosophy between prescriptive (value) statements and descriptive (empirical) statements in neither being verifiable nor representing a definable body of knowledge

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The distinction between “is” statements and “ought” statements is crucial to ethics, since it differentiates between statements that can be true or false on the one hand and articulations of subjective unverifiable judgments on the other.

One of the oldest continuing debates in moral philosophy concerns the relationship of “prescriptive” statements (about what one *ought* to do) to “descriptive” statements (about what one *is* doing). Descriptive statements are defined as statements of fact that refer to events or properties that are obtained through the experiences of the senses and therefore are verifiable—that is, they can be categorized as true or false.

Since descriptive statements are empirical in nature, they are thought collectively to form a body of “scientific” knowledge. An example of such a statement is “The water is hot.” Both the subject and the predicate in this sentence can be verified; the liquid in question can be tested as to its composition, while its temperature can be measured and compared to accepted conventions of hot and cold. Once the sentence is analyzed, its truthfulness will either be affirmed or denied, but in either case, a concrete “fact” will have been established.

Prescriptive statements, however, do not always seem to proceed from the same empirical foundations, and it is not always possible to verify their truth or falsehood as one would verify that of a descriptive statement. Again, consider an example: “One ought never to cheat.” Here, no actual event is necessarily referred to; thus, there is nothing concrete to verify as either true or false. Instead, the statement seems to express an attitude about a possible course of action—in this case, to assert disapproval. The debate in moral philosophy, however, is whether such statements have any relation at all to empirical facts and thus form a body of “knowledge” similar to that of descriptive statements. About this there remains much disagreement.

THE DISTINCTION’S ORIGINS

The origin of the modern philosophical debate about the nature of prescriptive statements is traditionally ascribed to the eighteenth century British philosopher David Hume. In his *Treatise of Human Nature* (1740), Hume criticized previous philosophers who attempted to draw prescriptive conclusions from descriptive premises. Since for Hume the two types of statements have fundamentally different natures, he considered it impossible to derive the former from the latter. Statements of value, in other words, were not reducible to statements of fact.

Hume’s critique was challenged later in the eighteenth century by Immanuel Kant, who, in his *Fundamental Principles of the Metaphysics of Morals* (1785), attempted to avoid the trap of moral relativism that seemed to ensue from Hume’s position. While Kant agreed that statements of value could not be derived from statements of fact, prescriptive statements could nevertheless be verified if they were derived from a universal moral principle that could be shown to be self-evidently true. Kant’s categorical imperative (“I am never to act otherwise than so that I could also will that my maxim should become a universal law”) represented one attempt to frame such a universal moral principle and thus allow prescriptive statements in general to form a body of knowledge.

MODERN DEBATE

More recent attempts to either affirm or resolve the is/ought distinction have led to the formation of a number of schools of thought. In the main, those who make such attempts fall into two major groups: the cognitivists, who claim that prescriptive statements do form a recognizable body of knowledge, and the noncognitivists, who deny such a possibility. Cognitivists further subdivide into two separate schools: naturalists (such as Jeremy Bentham and R. B. Perry) believe that prescriptive statements are simply different forms of factual statements that are, like any scientific fact, empirically verifiable. Such verification may occur through analyzing those acts that happen in accord with particular prescriptive principles (Are such acts consistent with established ethical norms?) or by observing the consequences of those acts (Have they led to desirable results?). In either case, the naturalist asserts that such observation takes place on the level of the senses and thus value statements themselves are considered to be facts.

The nonnaturalists (such as David Ross and G. E. Moore) differ, seeing prescriptive statements as unique forms in themselves, which cannot be reduced to the level of scientific fact. Values may be considered to be true or false, but they must be verified not according to the observations of sense experience, but instead by direct appeal to moral intuition, to a universal value-principle, or to a set of properties that define intrinsic moral value. This appeal to universals has led to the nonnaturalist position's also being defined as intuitionism.

In addition, G. E. Moore, in his monumental work *Principia Ethica* (1903), framed a critique of the naturalist position based on what he termed the naturalistic fallacy. Moore claimed that naturalistic statements attempt to equate value properties with empirical properties as if statements about each conveyed the same kind of meaning. ("Gandhi is a good man" as being no different from "The ball is green"). Since it can be shown, said Moore, that such statements are not the same, naturalistic statements are inherently fallacious.

Noncognitivists (such as Charles Stevenson and A. J. Ayer) continued Moore's critique of naturalism but extended it to include all cognitivist theories in general. Both naturalism and nonnaturalism are thought by this group to be incorrect in claiming that prescriptive statements can in any way be proved to be true or false. Rather, prescriptive statements communicate a person's attitudes about a particular event, property, or course of action and attempt to convince others to agree. Since attitudes are not verifiable, they cannot be considered true or false, and, since attitudes are not intrinsic value-properties (as nonnaturalism asserts), there can be no such thing as a body of moral knowledge.

More recently, noncognitivism itself has come into question from a variety of directions. Philippa Foot has claimed that when one examines how one actually uses prescriptive statements, no "logical gap" exists between one's observation of facts and one's moral evaluation of them. Also, Mortimer Adler has proposed his own form of cognitivism by distinguishing between "natural desires" (which he calls "needs") and "acquired desires" (called "wants"). Since what one needs is by definition good for one, and since one cannot do the opposite and not desire what one needs, one may thus construct an imperative that is self-evidently true. Having done this, one

may then observe specific actions and measure them empirically according to one's established norm—a process that allows prescriptive statements to be verifiable and to form a body of knowledge after all.

Islamic ethics

DEFINITION: Ethics of the monotheistic religion that is the dominant faith in the Middle East and the religion of more than one billion adherents worldwide

DATE: Founded in seventh century C.E.

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Islam unites the spiritual and temporal, setting forth the ethical and moral principles that have become the precepts by which the world's Muslims live.

The Islamic faith centers around the Qurʾān (also spelled Koran), which Muslims consider the word of Allah as revealed in the seventh century to Muḥammad, an affluent seventh century Arabian merchant who become the religion's founder and only prophet,

through the archangel Gabriel. Muslims consider the ethical and behavioral precepts set forth in the Qurʾān to be the word of God (Allah) and, therefore, to be infallible.

Muslims are also guided by the Sunna and the *Ḥadīth*, collections of precepts and acts attributed to the Prophet Muḥammad and gathered after his death in 632 C.E. Based on oral traditions, the *Ḥadīth* and the Sunna provide temporal and spiritual guidance. They differ from the Qurʾān in being attributed to the Prophet, rather than to Allah, so they are not considered infallible and are subject to interpretation.

THE SPIRITUAL AND THE TEMPORAL

Muslims view life as a mere moment along the unimaginably long line of infinite time. Earthly existence is a prelude to life in the hereafter, the quality of which will be determined by the believers' adherence to the rules set forth in the Qurʾān and by their actions as dictated by this holy work. When the world comes to an end, a final judgment will occur. The obedient will be rewarded and the disobedient punished in grotesque ways. Those who die in defense of Islam are promised particularly lustrous afterlives.

The Qurʾān, quite remarkably to most non-Muslims, deals with such mundane matters as proper methods of cooking, bathing, brushing one's teeth, and defecating. However, while details of the temporal and corporeal aspects of everyday life are of great importance to Muslims, their importance never overshadows that of the spiritual.

The ethical codes of Islamic communities are clearly articulated. Most acts of Muslims fall into three categories: the morally acceptable, the morally neutral, and the morally unacceptable. Acts specifically forbidden by the Qurʾān include murder, cheating, sexual offenses, gambling, drinking liquor, and eating pork. All these prohibitions touch more on the temporal than on the spiritual. Infractions of these codes, such as theft, are severely punished on the second offense. While thieves may be lashed or incarcerated for their first offenses, the penalty they face for second offenses is having their right hands chopped off. Such penalties are rarely imposed in the most secular modern Islamic nations, such as Turkey, but in more traditional nations, they are practiced.

Followers of Islam need not shun earthly pleasures. However, they are commanded not to violate the moral and ethical codes necessary for their com-

munities to function smoothly. Polygamy is accepted by Islam, but adultery and homosexuality are not. Both offenses were still punishable by death in a number of Islamic countries in the early twenty-first century.

FIVE PILLARS OF ISLAM

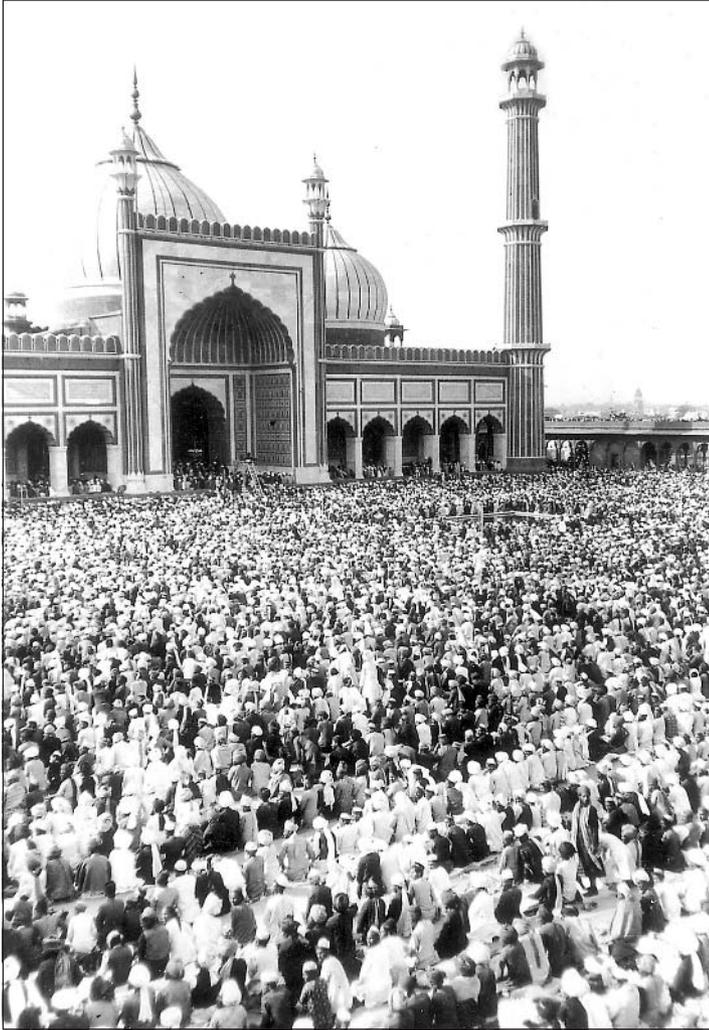

Islam is based upon five underlying precepts known as "pillars." The first and most important pillar is *shahadah*, accepting Allah as the one true god and Muḥammad as his Prophet. Indeed, the Arabic word *muslim* means one who submits. Unquestioning submission to the word of Allah and the precepts of Muḥammad are fundamental to accepting Islam.

The second pillar, *salah*, is closely tied to submission. It requires Muslims to pray five times at prescribed hours every day, prostrating themselves on prayer mats, with their heads bowed, and, facing toward the holy city of Mecca while praying. After praying, believers are to rise with their hands cupped behind their ears so that they might better hear the words of Allah. The washing of the head, forearms, hands, and feet frequently accompanies *salah* when it takes place within a mosque—a building devoted to Islamic worship.

Westerners may question the ethics of requiring such unquestioning adherence to any religious philosophy, but Islam demands total submission. In Muslim communities, a *muezzin*, or holy man, summons people to prayer, beginning in the early morning and continuing through the day until the final call to prayer at bedtime.

The third pillar is *zakah*, the giving of alms, initially a tax determined by Muslim communities based on specific assets. These alms were originally used to aid the poor, to help travelers and converts to Islam, and to buy freedom for slaves. In addition to *zakah*, Muslims practice *sadaqah*, or voluntary contribution. Islam has no moral strictures against the accumulation of wealth, but it both encourages and mandates sharing wealth with the less fortunate. The overlap between religion and politics is evident in this precept. Muslims are expected ethically to care about fellow human beings. The ethical question is not one of whether accumulating wealth is acceptable but how the wealth that is accumulated can best be used.

The fourth pillar of Islam is *sawm*, or fasting during the daylight hours through the entire month of Ramadan. Ritual fasting is viewed as an act of spiri-

Muslims gather for prayers before a mosque in India. Although India is a predominantly Hindu nation, it has more than 100 million Muslim citizens, who make it one of the largest Muslim nations in the world. (Library of Congress)

tual cleansing as well as an act of submission to the will of Allah. Some Muslim countries punish and even imprison people who do not observe *salah* and *sawm*, although strict interpretations of these precepts are less vigorously enforced in modern Islamic countries, largely because they pose ethical and legal questions about the interrelationship between religion and government. In some Muslim contexts, however, strict enforcement prevails.

Finally, there is the precept of the *hajj*, or the pilgrimage of Muslims to Mecca, the city in which

Muhammad received his revelations from Allah. All Muslims, with exception of those with severe disabilities, are expected to visit Mecca at least once during their lifetimes.

One might question the ethical validity of imposing these precepts and the strict set of rules that characterize Islam upon the diverse populations that accept the faith. The justification for this is the acceptance of the one underlying precept that colors significantly all the others: *shahadah*. After accepting this precept, no Muslim has a defensible justification for failing to yield to the will of Allah and for accepting the faith unconditionally.

ECONOMICS AND USURY

Muslims are not discouraged from engaging in profitable enterprises and from becoming rich. Muhammad, after all, was a rich merchant. Indeed, the richer that individual Muslims become, the more the Islamic community benefits from their affluence, collecting *zakah* to be put to fruitful uses. Islam considers the desire to make money a God-given desire, not unlike sexual desire, which is also, in Islamic eyes, God-given. However, Islam imposes implacable ethical codes upon either form of desire. Just as sexual desire must be controlled and not used to the detriment or exploitation of anyone, so is material desire expected to result in ethical acts such as charitable giving.

The one economic practice to which Islam is most stalwartly opposed on ethical grounds is usury—the lending of money at high rates of interest. The Qurʾān and the other holy books of Islam strictly prohibit usury. Before the rise of Islam in Arabia, it was not uncommon for Arabs to lend money at exorbitant rates of interest. If borrowers defaulted on loans, the amount of money or goods owed was doubled. These draconian lending practices led to the total economic destruction of many borrowers. Such practices are completely opposed to the ethical strictures of Islam.

WOMEN AND ISLAM

When Islam was established, the status of women in Arabia was low. Women were considered objects, mere chattels whose main purpose, beyond child bearing, was to serve the pleasure of men. Women had few rights, little protection, and virtually no independence. Under Islam, this situation changed. Muḥammad outlawed the casual, uncommitted relationships that were common between men and women at that time, replacing them with laws that articulated rules for both the polygamous marriages that Islam countenances and for divorce.

Although it may not seem so to modern Westerners, Muḥammad's codification of male-female relationships represented a major step forward for seventh century Arabian women, whose unethical treatment and vulnerability to moral violations such as rape and incest was inimical to Islamic ethics. Muḥammad decreed that women could own property and be able to inherit. These changes accorded women a previously unheard-of legal status. Ethically, women, who existed at the pleasure of men and who had been inconsequential members of society, were now accorded their rights as humans, even though they did not share equal social status with men.

Muslim women were governed by stringent rules of conduct and could be punished severely for transgressions, especially for sexual indiscretions. Those found guilty of adultery could be stoned to death, as often happened. Even at the beginning of the twenty-first century, women were still punished in this fashion in parts of Africa and in Saudi Arabia.

The *Ḥadith* require women to dress in loose clothing that masks their bodily contours. Muslim women in many Islamic societies are required to wear a *burqu'*, a floor-length head piece that covers the entire female body, with only a slit left open for the eyes. In Iran and other Islamic countries, women have been severely punished for not wearing the *burqu'* or for not covering their bodies sufficiently. Islamic women in many countries, however, have begun voicing serious objections to Islamic dress codes.

The prescriptions and proscriptions of the Qur'ān are designed to assure morality in Islamic societies, often by removing temptation. Men and women cannot intermingle freely in public. Men worship in the mosque, whereas women usually worship at home. If women are occasionally admitted into the mosque, they worship in rooms apart from those used by men.

In more developed Islamic countries, women are encouraged to seek higher education and to enter the professions. Coeducational facilities, however, do not exist. Islamic women are encouraged to study medicine because in most Islamic countries male physicians are legally forbidden to treat female patients. One may question the ethics of withholding from one gender the professional services of someone of another gender, but Muslims adhere strictly to the separation of the sexes.

JIHAD

After the terrorist attacks on the World Trade Center and the Pentagon on September 11, 2001, many Westerners became concerned with the Islamic notion of jihad, which is usually translated "holy war." However, attacks such as those, which were planned and executed by radical Islamic fundamentalists, have not been sanctioned by more centrist groups of Muslims.

A literal translation of the Arabic term *jihad* actually means something similar to "making an effort on the pathway of God." Most Muslims regard jihad as the efforts of individuals to act in ways that exemplify the demands of holy laws as they are outlined in Islam's holy books. Muslims strive through jihad to achieve ethical perfection on an individual basis. According to the precepts of Islam, an offensive jihad can be led only by someone on a level with Muḥammad, and most Muslims deny that any such person exists, although the Saudi leader of al-Qaeda, Osama bin Laden, apparently regarded himself as qualified to meet that mandate. Lacking a leader of Muḥammad's stature, Islam can engage only in a defensive jihad without violating the ethical precepts of the religion.

From time to time, some Islamic rulers have called their wars jihad, focusing their hostilities on people they identify as nonbelievers. Such leaders have generally represented the fringe elements of Islam and have been shunned by the vast central core of Muslims.

Isolationism

DEFINITION: Foreign policy or attitude toward foreign affairs designed to maximize a nation's autonomy and minimize obligations or entanglements by abstaining as much as possible from alliances and other international relations

TYPE OF ETHICS: International relations

SIGNIFICANCE: On a theoretical level, isolationism raises the question of the extent to which the well-being of people in other nations, including those suffering from human rights abuses or unjust wars, should be the concern of a given government. On a practical level, it may be unclear whether the effect of isolationism is to benefit or to harm a nation's own citizenry.

Taken together with such major concepts as neutrality and the Monroe Doctrine and such lesser ones as nonintervention, recognition of de facto governments, and equality of trade opportunity, isolationism was one element of a larger policy of U.S. independence on the international stage. George Washington's declaration of as "little political connections as possible" and Thomas Jefferson's admonition of "no entangling alliances" did not preclude a different course from being adopted when the United

States reached maturity. George Washington's Farewell Address constituted a foreign policy of independence, not one of isolationism. His primary concern was to keep the operations of the government immune from foreign intrigue and the decisions of the people free from alien domination.

Israeli-Palestinian conflict

IDENTIFICATION: Long-standing dispute about the right to occupy a small piece of land in the Middle East

DATE: First armed conflict began in 1948

TYPE OF ETHICS: Modern history

SIGNIFICANCE: After the founding of the state of Israel in 1948, the Israelis fought against Palestinians and neighboring Arab nations in five bloody and destructive wars. During the early twenty-first century, the ongoing conflict still presented a major threat to international peace.

After Palestine's Jewish people rebelled against Roman imperial rule in 70 C.E., most of them were forcibly expelled from their homes in the province of Judea, which was part of Palestine. Throughout the ensuing centuries, Jews dreamed of one day returning to the original homeland of their ancestors, which they called Zion. By the eighth century, however, Arabic-speaking Muslims were firmly entrenched throughout the entire region. In the late nineteenth century, Jews of Central and Eastern Europe, faced with growing European anti-Semitism, organized the Zionist movement, which called on Jews everywhere to return to Palestine. Most Zionists were idealists who believed that the then sparsely settled region had enough room for both Jews and Arabs to live together in peace.

THE FOUNDING OF MODERN ISRAEL

During the early decades of the twentieth century, waves of Jewish immigrants flowed into Israel. Arabs living in the area were alarmed to see them arrive, and periodically members of the two groups

fought each other. After World War II, revelations about the Jewish Holocaust in Europe produced great support for Zionism among Western Europeans and Americans. In November, 1947, a special commission of the United Nations (U.N.) called for the creation of separate Jewish and Arab states and proposed an international status for Jerusalem, with free access to persons of all religions. Jewish settlers at that time were willing to accept the borders proposed by the commission, but virtually all the Arabs in the Middle East adamantly opposed the notion of creating a Jewish state.

On May 14, 1948, Jewish leaders in Palestine declared the establishment of the independent state of

Israel. The declaration referred to the spiritual connection between the Jewish people and the land of Israel and provided a framework for a democratic system of government. It also promised religious freedom for members of all minority groups, called for peaceful relations with neighboring Arab countries, and recognized the right of all Jews to settle in Israel. Both the United States and the Soviet Union gave quick diplomatic recognition to the new state.

Meanwhile, Israel's Arab neighbors—Jordan, Egypt, Syria, Lebanon, and Iraq—quickly declared war and invaded Israel. The bitter fighting of this first Arab-Israeli war resulted in many thousands of deaths, including massacres such as one at Deir

Yassin. However, Israel prevailed and annexed one-third more land than had been provided for in the original U.N. partition plan. Truce agreements were finally signed in early 1949, but the Arab states still refused to recognize Israel's right to exist. Continued animosities later led to the Suez War of 1956, the Six-Day War of 1967, the Yom Kippur War of 1973, and Israel's invasion of Lebanon in 1982.

MORAL CLAIMS TO THE LAND

Israelis have cited several arguments to justify their right to live in Israel. Many conservative Jews base their claims on the Bible, which explicitly says that God has allocated the Promised Land to the Hebrew people, that is, the Jews. Liberal Jews, in contrast, have argued that they have purchased most of Israel's land, and that they will provide additional compensation for land to displaced Palestinians once a final settlement is made. Most Israelis further con-

tend that there are many Arab countries in which the Palestinians might live, but only one place in the world reserved for Jews.

Arab-speaking Palestinians believe that the state of Israel is founded on unjust aggression. They argue that their ancestors were living and working in Palestine for more than a thousand years, until Jewish invaders forcibly took over. They demand, moreover, the return of their land and homes, not monetary compensation. Many of them compare Zionists to the Christian crusaders of the Middle Ages, who were eventually expelled from Palestine.

One of the most controversial issues relates to why more than a half-million Palestinians became refugees in 1948-1949. The Israelis deny Palestinian assertions that the refugees were forced out of Israel. Rather, they argue that the refugees left of their own accord in order to make it easier for Israel's Arab enemies to kill Jews within Israel. Regardless of which

claims are true, by the end of the twentieth century, the number of Palestinian refugees had grown to about four million. Large numbers of them have been living in squalid camps, and many have joined extremist groups that advocate violence, including terrorism against civilians, as a means of repossessing their homeland.

THE DIFFICULT QUEST FOR PEACE

Scholars of the Israeli-Palestinian conflict generally agree that peace can be achieved only if both sides make painful concessions. While seeking a solution to the conflict in 1967, the U.N. Security Council passed Resolution 242, which called for Arab recognition of Israel's right to exist in exchange for Israel's withdrawal from territories occupied during the Six-Day War. The basic idea was described as "land for peace." The two antagonists, however, disagreed about whether the resolution meant "all" or "some" of the occupied land. Each side blamed the other for intransigence.

After 1967, moments of hopeful concessions were typically followed by periods of intensified violence. In the Camp David Accords of 1979, Egypt recognized Israel, while the latter promised eventually to accept limited autonomy for the Palestinians in the West Bank and Gaza regions. However, the Palestine Liberation Organization (PLO) continued to call for Israel's destruction, and Israel constructed increasing numbers of Jewish settlements in the West Bank. Hope reappeared when the Israeli government and the PLO in 1993 made secret agreements in Oslo, Norway, that envisioned peaceful coexistence and a gradual transition to an elected Palestinian government with authority over most of the West Bank and Gaza.

Extremists on both sides prevented full implementation of the Oslo agreements. Palestinian

groups, such as Hamas, began sponsoring a series of suicide bombers, who blew up crowded buses and stores. The Israeli government responded by destroying homes and assassinating radical leaders. In 2000, Israelis elected as prime minister Ariel Sharon, a former military commander with strong Zionist convictions. The Palestinian government demanded an end to new settlements, while Sharon refused to make any concessions until all acts of terrorism ended. Meanwhile, growing unemployment and despair encouraged angry young Palestinians to volunteer for suicide missions.

J

Jackson, Jesse

IDENTIFICATION: African American cleric and civil rights leader

BORN: October 8, 1941, Greenville, South Carolina

TYPE OF ETHICS: Civil rights

SIGNIFICANCE: A prominent civil rights spokesman and director of an organization dedicated to creating job opportunities, Jackson ran for president of the United States in 1984 and 1988, when he created controversies over racial and religious remarks that he made.

Jesse Jackson grew up in South Carolina during the era of rigid racial segregation. Because of his bitter experiences with racism and discrimination, he joined the Civil Rights movement and rose to become an assistant to Martin Luther King, Jr., in the Southern Christian Leadership Conference. The Civil Rights movement had a moral and ethical basis because of the historical mistreatment of southern blacks. After King's assassination in 1968, Jackson founded Operation PUSH, a Chicago-based organization whose goal was self-help and economic development. As a Christian minister, Jackson stressed moral values and often advocated boycotting businesses that engaged in discriminatory hiring and promoting practices. He regarded these matters as ethical issues, especially since employers practiced racial discrimination but wanted African American business.

In 1984 Jackson ran in the Democratic primaries for president of the United States. His appeal crossed racial lines and had a populist ring to it, reaching out to farmers, union workers, the working class, and the dispossessed in addition to the middle class. However, he created controversy for himself with remarks he made confidentially to a reporter, when he alluded to Jews as "Hymies" and

New York City as "Hymietown." The reporter published the remarks in his newspaper the next day. As a minister, Jackson came under severe criticism for ethical misconduct in making the statements and his failure to apologize immediately. His critics also wanted him to renounce Nation of Islam leader Louis Farrakhan, an ardent but controversial supporter of Jackson's presidential bid. Farrakhan himself called Judaism a "gutter religion." Jackson then faced an ethical dilemma because Farrakhan had provided personal protection for him during his 1984 political

campaign. When Jackson ran for president again in the 1988 Democratic primaries, he hired a Jew as his campaign manager, blunting criticisms that he was anti-Semitic.

In January, 2001, Jackson's morals and ethics were again tested after it was publicly revealed that he had fathered a baby out of wedlock and outside his marriage. This revelation appears to have done irreparable damage to his reputation as a Christian minister. Nevertheless, he continued to lead Operation PUSH after a vote of confidence from the board of directors, and he remained active in Chicago politics.

Jain ethics

DEFINITION: Religious tradition indigenous to India focusing on mystical insight leading to spiritual liberation and total nonviolence

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The central Jain principle of ahimsā, or nonviolence, became important to a number of later philosophies, among them Mohandas K.

Gandhi's philosophy of nonviolent political action.

The Jains constitute less than 1 percent of the population of modern India, but their modern and historical importance in the country far exceeds their numbers. The founder of the Jain faith, Vardhamānū Mahāvīra (called the *Jina*, or "conqueror") lived in what is now Bihar in north central India. He was roughly contemporaneous with the Buddha (both lived in the sixth century B.C.E.), and Jainism and Buddhism have many similarities. Central to Jainism is the principle of ahimsā, or nonviolence, which might be considered its primary contribution to ethics.

HISTORY AND CHARACTER OF JAINISM

It is probable that Jainism was a continuation of ancient aboriginal traditions of north-central India rather than a radical innovation of its "founder," Mahāvīra. The Jina himself is known as the twenty-fourth *tīrthaṅkara*, or "ford-maker" (that is, builder of a bridge between the mundane world and the world of the spirit). He was, however, responsible for organizing the Jaina saṅgha (community), which was notable for its inclusion of both men and women and its refusal to accept caste distinctions. Although Jainism was never a missionary religion per se, it spread from its homeland in Bihar along the trade routes and eventually acquired powerful converts such as the emperor Chandragupta Maurya.

Like Buddhism, Jainism was in some measure a populist response to the elite character of Vedic religion. It was preached not in Sanskrit, which few could understand, but in *prakrits*, or local dialects. Education, which was restricted to the few in Vedicism, was encouraged as a key antidote to the suffering caused by ignorance. Jains were therefore from the beginning a highly literate community, which they remain today.

In 79 C.E., the Jaina community split into two main sects, the *Digambara* ("sky-clad," or naked) and the *śvetāmbara* ("white-clad"). As well as differing in dress, the two groups differ in their definition of the Jaina canon, which is, given this tradition's emphasis on literacy, an extensive one. They also differ in the disciplines and austerities that they recommend; the *Digambara* is the more rigorous sect.

The Jaina conception of the universe basically emphasizes change rather than stasis and rejects the

personified deities of Vedicism (the system of faith ancestral to modern Hinduism). The central theological component of the Jaina system is the *jīva*, which can be roughly translated as “soul.” *Jīvas* are immortal, but they become entangled in worldly attachments that must be shed in order for them to escape the cycle of rebirth and attain *mokṣa* (“liberation”).

The attainment of liberation is a difficult task that is pursued most diligently by Jaina monks and nuns, who strive to be *nirgrantha*, or “free from bonds.” Abandonment of all property is the first prerequisite, accompanied by the taking of vows. During parts of the year, monks wander from place to place, begging for their food, meditating, and studying. Along with abstaining from causing injury to any life-form, monks and nuns commit to a life of chastity, honesty, and service. These are also the ideals to which laypersons of the Jaina community aspire.

JAINISM AS A WAY OF LIFE

All Jains try to cultivate the “three jewels” of “right faith,” “right knowledge,” and “right conduct.” Among the elements of Jainism most characteristic of the Jaina lifestyle is the principle of *ahiṃsā* (nonviolence). This is translated in everyday life into total vegetarianism, a dietary habit shared by other communities in India such as those of the high-caste Hindus and Buddhists. In addition to vegetarianism, however, the Jains’ characteristic concern for the protection of all life-forms is expressed in their support for veterinary hospitals, animal shelters, and means of livelihood that do not injure life. The Jaina community in India, which is unequivocally pacifistic in terms of military matters, influenced Mohandas K. Gandhi to develop his famous methods of nonviolent noncooperation.

Ahiṃsā as a principle stems from the notion that all life-forms contain *jīvas*, or souls, which are striving for liberation in their own unique ways. The path of an ant or a cow, for example, is different from the path of a human but equally valuable. This basically relativistic stance is expressed in such Jaina traditions as the use of brooms to sweep the path as one walks (to avoid stepping on small life-forms) and covering one’s mouth with a cloth (to avoid inhaling insects). Because of *ahiṃsā*, agricultural occupations are essentially closed to Jains, involving as they do turning the earth, which may kill worms and other creatures dwelling in the soil. The ultimate aim of the

Jains is to live lightly on the earth, doing as little harm as possible.

Jain communities are generally quite well-to-do and support temples that are among the finest monuments of the subcontinent. Their iconography concerns key figures from the history of the Jaina tradition and various mystic symbols and designs. There are no deities in the Hindu sense, but ritual offerings are made at various Jaina sites.

Twenty-first century Jains are found primarily in the states of Gujarat and Rajasthan in western India, where they tend to live in urban environments. Despite their small numbers, they are prominent in education, the media, business, and the professions.

James, William

IDENTIFICATION: American philosopher

BORN: January 11, 1842, New York, New York

DIED: August 26, 1910, Chocorua, New Hampshire

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The most famous American pragmatist, James put forward an ethics founded upon humanity’s freedom of choice. His most important works include *The Principles of Psychology* (1890), *The Varieties of Religious Experience: A Study in Human Nature* (1902), *Pragmatism: A New Name for Some Old Ways of Thinking* (1907), and *A Pluralistic Universe* (1909).

From 1873 to 1907, William James taught anatomy and physiology, psychology, and then philosophy at Harvard University. The first distinguished American psychologist, he won international recognition for his philosophy of “pragmatism” and “pluralism.” James believed that ethics rests on the free choice to be moral; that is, to see life as better lived within a moral framework. That conviction, of course, can never be proved or refuted by factual evidence. Even so, the choice empowers a person to make specific ethical decisions, in defense of which a person may gather reasons. Since each person is free to make choices, a moral philosophy must be constructed from the study of widespread ethical choices.

James thought that over the course of time, certain ethical principles had taken precedence over others. These principles could be used to construct a unified moral system. Although not appealing directly to Christian (or, more broadly, religious) teachings, James nevertheless made room for explicitly religious systems. On an individual level, James thought that ethics consisted of adjudicating the conflict between duty and inclination. His solution was that individuals should perform the duties that led to a more becoming life or made life worth living.

Japanese American internment

THE EVENT: Involuntary relocation of Japanese Americans and Japanese residents of the western United States to internment camps during World War II

DATE: 1942-1946

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Japanese Americans were interned en masse in concentration camp-style relocation centers, based strictly on their national origin without due process of law. Although upheld as legal by the U.S. Supreme Court, this wartime practice has since been the subject of extended moral debate and national embarrassment.

On December 7, 1941, the Japanese Empire made a surprise attack on the United States naval base at Pearl Harbor in Hawaii. This action led to a declaration of war by the United States against Japan the next day.

Before 1941, an anti-Orientalist movement existed on the West Coast of the United States. The attack on Pearl Harbor intensified this regional animosity and provided an opportunity to rid the region of this unwanted race. Suspicion ran high against the Japanese living in the United States. Many leaders were arrested, and many others endured personal attacks and violence. Both American-born (Nisei) and Japanese-born (Issei) people of Japanese descent were considered threats simply because of their national origin.

EXECUTIVE ORDER 9066

The California Joint Immigration Committee; the U.S. Army, represented by General John L. DeWitt; the Pacific congressional delegation; and other anti-Japanese organizations recommended that President Franklin D. Roosevelt evacuate the Japanese population. On February 19, 1942, Roosevelt responded with Executive Order 9066, which authorized the secretary of war, or any military commander designated by him, to establish military areas and exclude therefrom any and all persons. DeWitt, commander of the Western Defense Command, became the person responsible for the evacuation under the executive order. This was unfortunate because he was extremely prejudiced against the Japanese.

On March 2, 1942, DeWitt issued Public Proclamation Number One, which defined the West Coast exclusion zone. The western halves of Washington, Oregon, and California became Military Area Number One. All persons of Japanese ancestry living in that area would be relocated in the interest of military necessity. This left opponents of mass evacuation defenseless and brought no opposition from public or civilian leaders, who were forced to accept military authority. It also afforded those of Japanese ancestry a brief period of voluntary relocation. Only a few thousand took this opportunity to move, and they were faced with anti-Japanese feelings wherever they went.

The Wartime Civilian Control Authority (WCCA), a military organization, and the War Relocation Authority (WRA), a civilian agency created by executive order on March 18, 1942, were established to aid

Members of a Japanese American family sharing a barracks room at the Granada relocation center in southeastern Colorado. (National Archives)

in the movement of the evacuees. The WRA had the authority to provide for the relocation of evacuees in appropriate places and to provide for their needs and activities. Milton S. Eisenhower was the WRA's director for the first three months. Both he and his successor, Dillon S. Myer, attempted to find a just way to relocate the Japanese Americans, which won them gratitude from that community. Millions of dollars in property and belongings were lost, however, by the Japanese Americans who were forced to relocate.

After the failure of the voluntary relocation, Eisenhower realized that some form of detention on federally managed, army-guarded land was necessary. In making the decision on internment, the WRA faced the constitutional question of whether it had the legal authority to detain American citizens without bringing charges against them. The Fifth Amendment to the Constitution guaranteed every citizen the rights of life, liberty, and property with due process

of law. The WRA thought, however, that it was justified in forgoing this amendment during wartime as a necessity for national security. The court system supported the relocation argument by virtue of the words "war necessity." Although the United States was at war with Italy and Germany, only a few people of these nationalities were detained.

By late May, 1942, almost 112,000 Japanese Americans were in assembly centers. They were forced from their homes with only what they could carry with them. Assembly centers were hastily set up at fairgrounds, racetracks, and stadiums with barbed wire placed around them. The evacuees spent between six weeks and six months at these temporary centers, until the relocation camps were completed.

RELOCATION CENTERS

A total of 117,116 people were evacuated to assembly or relocation centers or came under some

phase of the evacuation program between March 2 and October 31 of 1942. This included 151 persons transferred from the Territory of Alaska to the custody of the WCCA and 504 babies who were born to mothers in assembly areas. Another 1,875 persons were sent from the Territory of Hawaii—1,118 to relocation centers and 757 to Justice Department internment camps. More than 70,000 were American citizens.

Life in the relocation centers was difficult at first. Many families were crowded into hastily erected barracks; living conditions were poor, and supplies were short. After the relocation authorities finally had the logistics worked out, conditions gradually improved. During 1943 and 1944, violence broke out and demonstrations were conducted in the camps to protest the treatment of the internees.

Early in 1943, the situation regarding the Japanese Americans lightened somewhat. Secretary of War Henry L. Stimson announced plans to form a Japanese American combat team made up of Nisei volunteers from the mainland and Hawaii. This unit served with distinction throughout the war. Director Myer wrote a letter to Stimson asking for an immediate relaxation in the West Coast Exclusion Zone, but Stimson rejected it. On March 20, 1943, Myer took the first step in decentralizing the relocation program by authorizing project directors to issue leave permits in cases in which leave clearance had previously been granted by the Washington office.

Finally, on December 17, 1944, the War Department announced the revocation of the West Coast mass exclusion orders of 1942, and the next day Myer announced that all relocation centers would be closed by June 30, 1946. On March 20, 1946, Tule Lake Segregation Center, the last of the WRA centers, was officially closed.

After the war, the government permitted the internees to file claims for losses during internment. The ceilings were low in relationship to the property losses and certainly did not cover the personal humiliation and suffering endured by the internees. In October, 1990, after many years of debate, U.S. Attorney General Dick Thornburgh presented the first reparation checks of \$20,000 to those interned during World War II. The government finally admitted that it had been wrong.

Jealousy

DEFINITION: Hostility toward rivalry or unfaithfulness and the predisposition to suspect rivalry or unfaithfulness; envy.

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Jealousy is often judged on aesthetic rather than explicitly moral grounds: It is deemed to be an unattractive emotion as much as or more than a strictly sinful one.

Jealousy begins at about the age of two and develops rapidly during the preschool years. An early form of jealousy is sibling rivalry, which consists of feelings of resentment toward a brother or sister. Sibling rivalry is typical between brothers and sisters in a family.

Sibling rivalry is typically higher in cases of same-sex siblings than in cases of opposite-sex siblings. It is also typically higher in cases of smaller age

differences; that is, sibling rivalry occurs more between siblings that are less than two years apart than it does between siblings that are more than three years apart. In the former case, the closeness in age probably heightens competition; siblings may prefer the same friends, the same toys, and the same activities. Sibling rivalry is also higher when the siblings have the same interests, and lower when they have different interests. In other words, sibling rivalry may be greater when two sisters are strongly inclined toward mathematics than when one is inclined toward mathematics and the other toward literature. Some sibling rivalry is typical in families, and it often is the first type of jealousy the child experiences.

Jealous feelings are typically caused by insecurity, such as when parents decrease the amount of warmth and attention they give the child and increase the number of prohibitions imposed on the child. Toddlers may show evidence of jealousy by doing such things as wedging themselves between mother and father as they are hugging, hitting a brother whom the mother just kissed, or asking "When are we taking the new baby back to the hospital?" These actions and comments reflect the small child's jealousy.

Parents can minimize the sting of jealousy and sibling rivalry by taking some specific steps. First, they can introduce firstborns early to their new role as "big sister" or "big brother." Telling the child beforehand that a new brother or sister is coming and involving the child in the pregnancy will lessen the impact of sibling rivalry. Second, parents can encourage and reward firstborns for helping in the care of the new baby. Although close supervision is necessary, even young children can be involved in the care of an infant. Third, parents can diminish jealousy and sibling rivalry by discussing the new baby as a person. Examples of helpful comments to a first child are, "She likes her bath, doesn't she?" and, "Look, he's calling you." Fourth, parents can diminish sibling rivalry and jealousy, and foster better relationships between siblings, by refraining from comparing children and, instead, recognizing and valuing each child as an individual. Thus, though some sibling rivalry may be inevitable, it can be increased or decreased by how parents handle the situation.

A later form of jealousy is sexual jealousy, which can occur in a marriage or a sexual relationship, chipping away at the foundations of trust and love that

hold the two people together. In relationships in which jealousy occurs, it is sometimes extremely difficult to resolve the problem, because explanations are turned away as untrue and even exacerbate the jealousy.

MONOGAMY AND JEALOUSY

In the United States, the single greatest reason for sexual jealousy is the commonly held standard of sexual exclusivity in monogamous relationships. Most jealousy centers on the belief that the other person is sexually interested in or involved with another person. Typically, one partner plays the role of the jealous one and the other plays the role of the accused.

Other forms of jealousy are nonsexual. Generally, when anything threatens to weaken the relationship bond, jealousy can occur. The result is often possessiveness, which can be either reassuring or suffocating. Feelings of jealousy make a relationship less rewarding and lower the individual's self-esteem.

Jealousy in a relationship can result in several different scenarios. In some cases, the jealousy becomes pervasive, and adults wind up fighting in all related and tangential areas. In other cases, the jealousy represents a more deeply embedded conflict: The partners are in effect denying the deeper conflict by emphasizing the jealousy. In still other cases, the jealousy may play a positive role in the relationship, serving to bring the partners closer together. The beneficial effects, however, are often short-lived.

Adults sometimes act to maximize jealousy in a relationship. They may play intentional games that are aimed at increasing their partners' jealousy. Their hidden agenda in this situation may be to increase their own feelings of security by causing their partners to feel less secure. When surveyed, about 54 percent of adults describe themselves as jealous. Highly jealous people are frequently dependent. They may also harbor feelings of inadequacy and be concerned about sexual exclusiveness.

Jealousy has been successfully treated with systematic desensitization, a technique that involves encouraging the person to relax deeply and then introducing scenarios that are slightly jealousy-provoking. Then, as the person becomes adept at relaxing in these situations, additional scenarios are introduced that are slightly more jealousy-provoking. This process continues until the person has no more

feelings of jealousy. This counter-conditioning process is based on the fact that it is impossible to be jealous and highly relaxed at the same time; the two feelings are mutually exclusive.

Jefferson, Thomas

IDENTIFICATION: American philosopher and politician

BORN: April 13, 1743, Shadwell, Goochland (now Albemarle) County, Virginia

DIED: July 4, 1826, Monticello, Albemarle County, Virginia

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: One of the Founders of the United States, Jefferson served as the nation's third president, wrote the Declaration of Independence, founded the University of Virginia, and worked both publicly and privately to increase and ensure civil rights, public education, religious liberty, and democratic government.

The oldest son of Peter Jefferson and Jane Randolph, Thomas Jefferson was born on the frontier of Vir-

ginia. He studied at the College of William and Mary and was admitted to the Virginia Bar, but he chose not to practice law. He inherited approximately 10,000 acres of land, which freed him from having to earn a living. Jefferson served as a Virginia legislator, delegate to the Continental Congress, author of the Declaration of Independence, governor of Virginia, and commissioner to France.

While governor, Jefferson championed freedom of religion and conscience, state-supported public education, and gradual emancipation. He suggested the principles, including the subsidization of public education and the prohibition of slavery, for the Northwest Ordinance, which organized the Northwest Territory. Upon Jefferson's return from France in 1789, George Washington appointed him secretary of state. Jefferson left the Washington administration and formed the opposition Democratic Republican Party during the administration of John Adams. Jefferson was elected president of the United States in 1800 and 1804. In 1803 he purchased the Louisiana Territory. A principal problem of his administrations was the defense of neutral rights on the seas during the Napoleonic Wars. He used the policy of economic coercion in that struggle.

Jesus Christ

IDENTIFICATION: Religious teacher

BORN: c. 6 B.C.E., Bethlehem, Judaea (now in Palestine)

DIED: 30 C.E., Jerusalem (now in Israel)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Jesus Christ was the originator of Christianity, which regards him as the son of God. He taught that love is the supreme value and that sin may be redeemed through sincere repentance.

Jesus taught ethics in the context of first century Judaism, which had both the (Old Testament) Scriptures and a long tradition of interpretation. He based

his teaching on Scripture and sometimes used basic principles of reason to refute opposing interpretations.

Jesus' method and message often clashed with those of other Jewish scholars, as when he violated the detailed commandments of their venerated tradition of scriptural interpretation in order to keep the spirit of the original scriptural commandment. For this he was condemned by many Pharisees, who were teacher-scholars. In one incident, Jesus taught that eliminating human suffering on the Sabbath did not violate the spirit of the command that Israel rest on that day (Matt. 12:10-13). He condemned those who scrupulously donated one-tenth of their property to the point of counting grains of spice yet overlooked the "weightier" matters of the law, such as justice, mercy, and faithfulness (Matt. 23:22). He also condemned as hypocritical teachers who allowed religious duty to cover violations of the spirit of the law, such as those who taught that property "dedicated" to God need not be used to care for one's parents (Mark 7:11-13).

JESUS' MORAL PRECEPTS

Jesus focused on attitudes as the sources of action: From the heart come sins such as theft, murder, and envy (Mark 7:21-22). Thus, murder is wrong, but so are anger and contempt. Adultery is wrong, but so is lust (Matt. 5:22, 28).

Jesus taught that love should dominate one's inward attitudes. Insofar as all morality can be summed up, it can be reduced to the command to love God and others. To Jesus, love was a commitment to the good of another regardless of that person's attitudes or actions toward one. It should extend even to one's enemies, since God loves even those who are evil. Doing to others what one would want them to do to one (Matt. 7:12), the "golden rule," requires service to others and excludes apathy and self-centeredness. The conviction that God actively loves people in this way can give believers courage and dispel anxiety (Matt. 8:26; 6:26, 30).

Jesus showed that a leader should exemplify this loving attitude by seeking to serve, not by trying to dominate or to gain wealth or fame. More than once he reproved the apostles who sought exalted positions, and he himself washed his disciples' feet as an example of humble service (John 13:5). He regarded his very life as a sacrifice for human sin that would al-

low righteousness to be graciously attributed to those who sought forgiveness from God. Humble confession and faith in God's gracious forgiveness provide access to divine mercy for moral failure.

A person who loves others and believes that God is loving can be free from concern about personal rights. The response to a slap on the cheek, a lawsuit, or the compulsion to carry another's load can be turning the other cheek, giving up more than the plaintiff asked for, and voluntarily carrying a load an extra distance (Matt. 5:38-42). After all, life is short, and someday everyone will be confronted with the absolute rule of God.

The rule of God creates paradoxes that defy conventional moral wisdom. The meek, not the assertive, will inherit the earth (Matt. 5:5). Those who try to exalt themselves will be humbled, whereas those who humble themselves will be exalted. Those who sacrifice for the good of others will find happiness themselves.

JESUS' WAY OF LIFE

Jesus motivated people with rewards, but not always the sort that would appeal to a selfish person. Those who do such things as love their enemies and lend expecting nothing in return will receive a "great reward" and will be true "sons of the Most High" (Luke 6:35). Jesus also said that people will generally give back what one gives them and more; "shaken down, pressed together, and running over" (Luke 6:38). Although this should motivate people to do good, they should be willing to "take up the cross," a symbol of complete renunciation of personal or worldly gain. The mature person acts out of pure love for others and a desire to emulate a morally pure and altruistic God.

Jesus voluntarily lived in poverty, but he did not condemn ownership. He advocated the compassionate use of private wealth: Those with means should be quick to share with those in need. Herein lies a profound difference between Jesus' teaching and various types of communism, which seek to eliminate private ownership as the solution to society's fundamental problems.

Jesus rejected insurrection as a means to effect change and was a disappointment to those who sought political or military deliverance for Israel. He did not confront the Roman methods of taxation or slavery, but in the ancient world he was radical re-

garding the treatment of women, as Paul Jewett shows in *Man as Male and Female* (1975). While living in a society that treated women little better than animals, he treated women with seriousness and dignity. He allowed them to follow his itinerant band and to serve tables, a function previously reserved for men. Domestic chores provided material for a number of parables. He confronted the double standard that allowed men but not women to divorce on a pretense; furthermore, he affirmed marriage as a lifelong commitment, breakable only in the case of serious sexual sin.

Jesus' ethics were moderate in that he advocated neither asceticism nor indulgence, neither legalism nor license. Yet he was passionate about righteousness and even chased officially sanctioned profiteers out of the Jerusalem temple with a hastily improvised scourge (John 2:15). He lived and taught devotion to God as expressed in a life of self-sacrificing love.

Jewish ethics

DEFINITION: Ethical traditions and systems of religious Judaism

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Jewish ethics was the first to define morality in the context of a covenant or sacred contract that is equally binding upon both humans and God, and therefore to see God as not only the source of morality but also as a subject of moral obligation. It is founded upon an understanding of moral law as something to be interpreted and debated rather than univocally pronounced and automatically followed.

Jewish ethics is based on the premise that the Jewish people are in a covenant relationship with God. This covenant demands that society be organized and personal lives be conducted in accordance with God's revelation. As a result, Jewish ethics has generally been understood to be a matter of *imitatio Dei* and to have as its characteristic form legal discourse. Thus, Jewish ethical literature moves between two poles. On one hand, it stresses adherence to a certain life-regimen as spelled out in Jewish law (*halachah*), while on the other, it calls for the cultivation through this lifestyle of character traits, attitudes, and intentions that help the individual to be more godlike.

Although the earliest literature of Rabbinic Judaism (from the first century through the seventh century) is devoted almost exclusively to developing Jewish law, the importance of proper attitude and intention is not ignored. The late Mishnaic book *Pirque Avot* ("Chapters of the Fathers"), edited in the third century, is a collection of moral aphorisms stressing the importance of honesty and selflessness in dealing with others and the need to act responsibly in the world.

These attitudes are given more formal recognition in the Talmuds (from the fifth century through the seventh century). Made up largely of real and hypothetical case law, the Talmudic literature not only illustrates how the letter of the law is to be understood and applied but also recognizes that there is a moral duty that goes beyond what the law requires. This extra-legal duty is referred to as *lifnim mishurat hadin* ("beyond the edge of the law"). In some instances (*Baba Metzia* 30b, for example), the Babylonian Talmud seems to regard such going beyond the

call of duty to be not merely supererogation but an expectation that rests on all Jews.

MIDDLE AGES

During the Middle Ages, Jewish ethics took three different forms: the further development of Jewish law, philosophical speculation on the nature of the moral life, and the cultivation of humility and other beneficial character traits. The first was largely a result of the practical application of received Jewish law to new situations. In this connection, rabbis from the eighth century on created a large literature devoted to identifying and understanding the principles and values that were to guide them in their legal deliberations. Despite the diversity of situations, certain common principles seem to emerge from the practical application of Rabbinic law: the overriding imperative to protect human life; the importance of avoiding even the appearance of idolatry;

and the values of sexual modesty, education, and child rearing.

Philosophical speculation on the nature of morality began in earnest among Jewish scholars with the rise of philosophical schools in the Islamic world. For the most part, Jewish philosophers from the ninth century on adopted the major philosophical principles and conclusions of Islamic scholars and applied them more or less directly to Judaism. Early writers such as Saadia Gaon in his *Book of Beliefs and Opinions* stressed that God's word as given in the Hebrew Scripture and interpreted by the rabbis is the only reliable source of truth.

Since God's law is fully known and since people have free will, Saadia argues, each individual bears full responsibility for acting in accord with God's word. Subsequent Judeo-Arabic philosophers, influenced by Arabic Neoplatonism, claimed that the true reward of the soul lay in contemplating the divine.

The wall is the holiest site in Judaism and many Jews believe in making pilgrimages to Jerusalem three times a year. (AP/Wide World Photos)

Adherence to Jewish law was the necessary first step in directing the soul toward a fuller apprehension of the divine. This line of thought reached its culmination in the Jewish neo-Aristotelians such as Moses ben Maimon (also known as Maimonides). In his *Eight Chapters*, Maimonides argues that actualizing the potential of the rational soul depends on proper discipline of the body and that such a discipline is precisely what is spelled out in the *halachah*.

Finally, pietistic writings attempted to instill in the readers moral sensitivity beyond mere obedience to the *halachah* and the contemplation of its principles. In some cases, these writings take the form of ethical wills, testimonies bequeathed to children by dying parents or relatives. These wills usually stress the importance of study, humility, and charity. In other cases, whole sects appeared that encouraged members to practice a life that was holier than that lived by the majority of the Jewish population. The Hasidai Ashkenaz of thirteenth century northern Germany is such a group. Its view of the moral life is spelled out in *Sefer Hasidim*. Similar ideas seemed to have influenced the Hasidic movement that sprang up in Eastern Europe during the mid-eighteenth century. Many early Hasidic stories presume that true virtue stems from the intention of the soul and at times may even run counter to the formal demands of *halachah*. The ethical writings of Hasidism have influenced such modern Jewish moral philosophers as Martin Buber, Abraham Joshua Heschel, and Elie Wiesel.

MODERN JUDAISM

In modern times, Jewish ethical speculation has again drawn heavily on the philosophical currents of the day. Modern Jewish movements (Orthodoxy, Conservative Judaism, and Reform Judaism), which have their roots in nineteenth century Germany, have been heavily influenced by the writings of Immanuel Kant. Modern Jewish thought has argued that simply following the letter of Jewish law out of habit is not sufficient. Instead, one must choose to abide by the *halachah* purely for its own sake or because it is one's duty to conform to God's will. More recently, Reform and Conservative rabbis in particular have struggled to identify the rational and universal ideals behind the *halachah* as a basis for approaching ethical dilemmas posed by new technologies.

Jihad

DEFINITION: Arabic term for a holy war fought in behalf of Islam as a religious duty

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: In the late twentieth century the jihad began gaining increased international attention as Muslim groups and individuals used arms to oppose Israel, the West, and even other Muslims.

Islam is an exclusivist religion, and its followers are obligated to protect its principles against adversaries and to broaden the religion's boundaries. Such efforts have drawn many communities into armed conflict. During the centuries of expansion after the founding of Islam in the seventh century, the new religion spread across North Africa, into Spain, Yugoslavia, and eastern and central Asia, and as far east as

Indonesia. While Islam's spread into Mesopotamia and Persia resulted in Muslim military control and many willing converts to the religion, its spread into India resulted in conflict. There Hinduism was put on the defensive, and Buddhism was all but obliterated.

In 732 Charles Martel thwarted Islam's drive into Western Europe at the Battle of Tours. More important, the Christian Crusades of the eleventh and twelfth centuries pitted European Christians against Muslims in Palestine, and resulted in continued Muslim hegemony there. In that struggle jihad became an ethical obligation, in effect, a sixth principle, or "pillar" of Islam. During the fall of the Byzantine Empire in 1453, the capital city, Constantinople, fell to Muslims and became the seat of the Ottoman Empire until that empire's own fall after World War I. During the subsequent spread of Western European colonial rule into the Middle East, Muslim lands came under the control of non-Muslim countries. Nevertheless, Muslim scholars concluded that unless Islam was prohibited jihad was not permissible.

In 1948, Middle Eastern Muslims opposed the creation of the modern state of Israel in what was then called Palestine. Their efforts to recapture Israel in the so-called Six-Day War in 1967 ended in an embarrassing defeat. Chief among their losses was control over Jerusalem, the site of the third holiest sanctuary in Islam. Muslim militants called faithful Muslims to jihad to regain control over the city and other land taken by Israel. Israel's supporters were then portrayed as suitable targets for jihad. Some Muslims hailed the terrorist attacks on the Pentagon and World Trade Center on September 11, 2001, as appropriate recompense for American actions hostile to Islam. The U.S.-led war in Iraq begun in 2003 simply fueled that fire for many Muslims.

Muslims have long warred against one another. One Muslim reaction to European colonialism was to attempt to copy Western powers by adopting technology and by establishing Western-type democratic states that tolerate all religions. In Iran that attempt met disaster in the overthrow of the government of the shah and establishment of a strict Muslim state governed according to the Qur'an. The Taliban established the same type of government in Afghanistan, and many observers thought that similar developments could occur in other Muslim countries.

Journalistic entrapment

DEFINITION: Use of an undercover investigation to lure subjects into compromising or illegal acts they would not otherwise commit

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: Reporters investigating wrongdoing may inadvertently or intentionally corrupt innocent people or cause the commission of crimes that would not otherwise have occurred.

Investigative journalism was propelled into prominence during the 1970's as a result of the Watergate scandal uncovered by *The Washington Post*, the leaking of the Pentagon Papers to *The New York Times*, and the general adversarial tone that characterized the relationship between government and the media throughout the Vietnam War. In subsequent years, technological advancements and the proliferation of broadcast shows that relied on videotape footage to document undercover findings swelled both the number and the scope of such investigations. Issues subject to such treatments have included home and commercial lending practices, nursing home care, governmental corruption, abortion practices, and military information confirmation.

The Federal Bureau of Investigation (FBI) and other law enforcement agencies frequently use un-

dercover operations to expose criminal wrongdoing. Their activities, unlike those in journalism, are subject to explicit guidelines and legal restrictions that help to establish the line between legitimate investigative work and coercing or abetting in the commission of a crime. For journalists, however, that line is largely one of interpretation because of the broad latitude and significant freedoms offered by the First Amendment. It is incumbent upon journalists, therefore, to wrestle with a number of ethical considerations, such as the morality of devising an enticement for illegal activity and the awareness that reporters themselves may become, if even indirectly, agents of wrongdoing.

Industry misgivings about the practice exist, as revealed in the Pulitzer Prize committee's reluctance to recognize stories that rely on undercover investigations because of their deceptive nature. The usage continues, however, because of the journalistic belief that news organizations have an overriding obligation to distribute information to a democratic society and a moral responsibility to consider society's needs, thereby providing the greatest good for the greatest number of people. This approach, with its emphasis on consequences, accepts the belief that the end justifies the means. Therefore, the media's "watchdog role" in preserving and protecting the public interest—a good and moral end—is justified in its aggressive pursuit of certain undercover investigations. Because the journalism profession also professes a strong commitment to accuracy and truthfulness, however, any use of deception must be carefully weighed.

INTEGRITY OF THE PRESS

Recognizing that integrity is its greatest asset, the press is especially vigilant in upholding standards that do not erode or detract from its credibility, including the use of deception. Because codes of ethics among the media are more advisory than mandatory, however, much of the decision is left to interpretation by individual journalists who adjudge the specifics of individual situations. The long-standing reliance on consequential reasoning has typically emphasized the social benefit derived from an undercover investigation. For example, a series entitled "Abortion Profiteers" by the *Chicago Sun-Times* in November, 1978, relied on information obtained by reporters who, obscuring their identity as journalists, went to

work for several outpatient abortion clinics where gross negligence as well as medical misconduct had been reported. The articles resulted in a number of new state laws regulating outpatient abortion clinics, the closing of two of the four clinics under investigation (one of them permanently), and the imprisonment of one doctor. Several other doctors left the state.

It was agreed by the editors and reporters involved that the overwhelming benefit to the community of such an investigation outweighed the price of the deception. Another case involving a different publication, however, reveals that a positive outcome is not the only measure in weighing the ethical considerations of going undercover. In 1988, *Newsday* conceived and planned—but did not execute—an undercover investigation designed to confirm the suspected practice of real estate "steering," a method of maintaining racially segregated neighborhoods by directing potential buyers only to those areas already populated by people of the same race. After a year of preliminary work, management decided that the operation was logistically untenable and that the same information could be obtained through other methods, such as interviews with buyers and real estate records. Anthony Marro, the editor at the time, also questioned the existence of probable cause, wondering if the appropriate level of presumed bad conduct merited the use of entrapment techniques.

The Society of Professional Journalists, whose code of ethics is widely invoked by individual journalists and news organizations, in 1993 introduced a new approach to ethical decision making that combined the long-used consequential reasoning with an effort to examine a number of other factors, such as the characteristics of the situation, as well as journalistic values, loyalties, and professional principles. In addition, the new code set forth a number of conditions, all of which must be met to justify deceptive information-gathering strategies:

1. The information sought must be of profound importance.
2. Other alternatives have been exhausted.
3. The reporter is willing to make public the deception.
4. Excellence has been pursued through full allocation of the news organization's resources.
5. The harm prevented by the deception outweighs the harm of the deception.

6. Conscious, thoughtful, moral, ethical, and professional deliberations have been made.

In addition, the revised code outlined specific rationalizations that do not meet ethical standards and may not be used to justify the use of deception. These include

1. Winning a prize.
2. Beating the competition.
3. Saving costs or time.
4. Others have “already done it.”
5. The subjects, themselves, are unethical.

Out of concern for their role as protectors of the public interest, journalists avoid concrete rules regarding the use of deception and undercover operations. They maintain the right to use such tactics ethically and morally on a situational basis when a greater good is served and when other methods have been exhausted.

Journalistic ethics

DEFINITION: Formal and informal professional codes of conduct governing the practice of journalism

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: Journalistic ethics seeks to balance the public’s right to know with the moral responsibility of individual journalists to be truthful, objective, and fair both in their reporting and in their work to uncover and develop information. Moreover, because the First Amendment dictates that the press be virtually unregulated by the government and legal system, there is a greater than average need for journalists to regulate themselves.

Unlike doctors and lawyers, journalists do not control who may practice in their field or police their own ranks; neither do they prescribe a body of knowledge with which those entering the field must be familiar. In this sense, journalists do not fit within the traditional definition of a “profession.” Nevertheless, responsible journalists—like members of these other professions—do adhere to a set of occupational principles, many of which are addressed in the ethical code (the “Code”) of Sigma Delta Chi, the Society of Professional Journalists.

RESPONSIBILITY AND FREEDOM OF THE PRESS

The first three sections of the professional code concern what many journalists regard as their occupational imperative: to observe a constitutional mandate to serve the public’s right to know. Such a right is not, in fact, explicitly stated in the Constitution and has been discounted by such eminent legal authorities as former Chief Justice Warren Burger. Other media critics point to abuses—such as invasion of privacy and interference with the right to a fair trial—stemming from overzealous pursuit of the journalistic mission. Still, courts have consistently upheld the media’s First Amendment rights, which are regarded as so central to the nation’s democratic principles that they can overcome—as they did during the 1971 “Pentagon Papers” case, *United States v. New York Times Company*—a countervailing concern as compelling as national security.

The Pentagon Papers case illustrates the code’s precept that “[journalists] will make constant effort to assure that the public’s business is conducted in public and that public records are open to public in-

spection.” Other, less august, journalistic exercises, such as traffic reports and celebrity gossip, illustrate not so much the public’s right to know as its need or desire to know. In such contexts, there is perhaps less justification for the kind of aggressive, sometimes invasive techniques employed by journalists.

ACCURACY, FAIRNESS, AND OBJECTIVITY

It would seem fundamental—and the professional code takes it for granted—that one of a journalist’s primary duties is to report truth rather than falsehoods. Yet the news business has always been plagued with so-called “yellow journalism,” which distorts or exaggerates facts in order to create sensationalism and attract consumers. In this sense, the blatant jingoism of William Randolph Hearst’s papers during the 1890’s is not unrelated to attempts on the part of modern television broadcasters to dramatize news through fictionalized “reenactments.” Public skepticism about television news rose to new levels during the 2004 U.S. Presidential campaign, when CBS News was accused of using falsified documents to cast doubt on President Bush’s service record in the National Guard during the 1970’s.

Another method by which journalists can take liberties with the truth is through misattribution or misquotation. Although the plaintiff in *Westmoreland v. Columbia Broadcasting System* (1984), General William C. Westmoreland, commander of United States troops in Vietnam during the late 1960’s, ultimately lost his libel action against CBS, the defendant clearly played fast and loose with the truth by deliberately misrepresenting a damaging cable regarding the deadly Tet offensive as Westmoreland’s. In 1990, however, the Supreme Court permitted psychoanalyst Jeffrey Masson to proceed with his lawsuit against *New Yorker* magazine writer Janet Malcolm because her allegedly purposeful misquotation of him (for example, that he intended to turn the Freud Archives into “a place of sex, women, fun”) could be libel.

Ironically, it was Malcolm herself, in her book about the relationship between convicted murderer Jeffrey MacDonald and his journalist/chronicler Joe McGinniss, who pinpointed one of the primary reasons that journalists sometimes violate the ethical imperative of fairness emphasized in the code: “The moral ambiguity of journalism lies not in its texts but in the relationships out of which they arise—relationships that are invariably and inescapably lopsided.”

Malcolm’s contention is that McGinniss insinuated himself into MacDonald’s confidence in order to obtain exclusive information and then betrayed him by writing a damning portrait of him. Seen in this light, MacDonald is just as culpable as the reporter who fails to protect the confidentiality of his sources. If this evaluation is accurate—and if Jeffrey Masson’s allegations about Malcolm are accurate—then clearly both McGinniss and Malcolm have violated the code’s tenet that “Journalists at all times will show respect for the dignity, privacy, rights and well-being of people encountered in the course of gathering and presenting the news.”

Just as MacDonald and Malcolm could be accused of not playing fair, they could also stand accused of bias, of failing to observe the journalistic objectivity that the code requires. They could, alternatively, be seen to be overcompensating for the intimate access they had to their respective subjects. The code states that “Journalists must be free of obligation to any interest other than the public’s right to know.” The most obvious interpretation of this precept is that journalists should not compromise their integrity by accepting payoffs. It can also be seen, however, to apply to situations such as McGinniss’s and Malcolm’s and to journalist-celebrities, who can themselves influence and even become the stories they cover.

Most ethical principles espoused in the code are simply restatements of common sense and courtesy. Because of the media’s ability to influence and shape society, however, it is of particular importance that purveyors of news take seriously not only their First Amendment rights but also their moral obligations.

Judicial conduct code

DEFINITION: Ethical rules adopted in most American jurisdictions to govern the conduct of judges

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: The Model Code of Judicial Conduct seeks to preserve the integrity and independence of judges by prohibiting them from being influ-

enced by family, social, political, or other relationships in the conduct of their official business.

Since the early twentieth century the American Bar Association (ABA) has attempted to develop guidelines for judicial conduct. The ABA adopted the Canons of Judicial Ethics in 1924 and the Model Code of Judicial Conduct in 1972. The ABA substantially amended this code in 1990, and a significant number of states adopted the amended code to regulate the conduct of judges in their jurisdictions.

In some cases the code requires that judges disqualify themselves from participation in cases in which their impartiality might reasonably be questioned. In addition, the code prohibits conduct that might otherwise be classified as private or personal when such conduct risks undermining the integrity of the judiciary. For example, judges are prohibited from belonging to organizations that practice inappropriate discrimination on the basis of race, sex, religion, or national origin. In general, the code requires that judges conduct their nonjudicial affairs in such a way as to minimize conflicts with their judicial obligations.

The Ethics of Socializing

Questions about the ethical conduct of judges in the United States reached the highest level in early 2003, when Supreme Court justice Antonin Scalia drew criticism for spending too much time socializing with power brokers and other high-level government officials. In the past, Supreme Court justices commonly acted as legal advisers to presidents. However, during the late twentieth century, greater sensitivity to the need for maintaining the separation of powers effectively ended that practice. Journalists, legal experts, and members of special interest groups all began questioning the propriety of justices becoming too friendly with people who might have important interests in cases that reach the Supreme Court. Justice Scalia was criticized especially strongly for spending too much time socialized with Vice President Dick Cheney. The Sierra Club was especially uneasy about Scalia's going on a hunting trip with Cheney only three weeks after the Supreme Court agreed to hear a case concerning Cheney's energy task force. It was believed that the negative attention that Scalia was drawing caused judges at all levels throughout the United States to review their own conduct.

Jung, Carl

IDENTIFICATION: Swiss psychologist

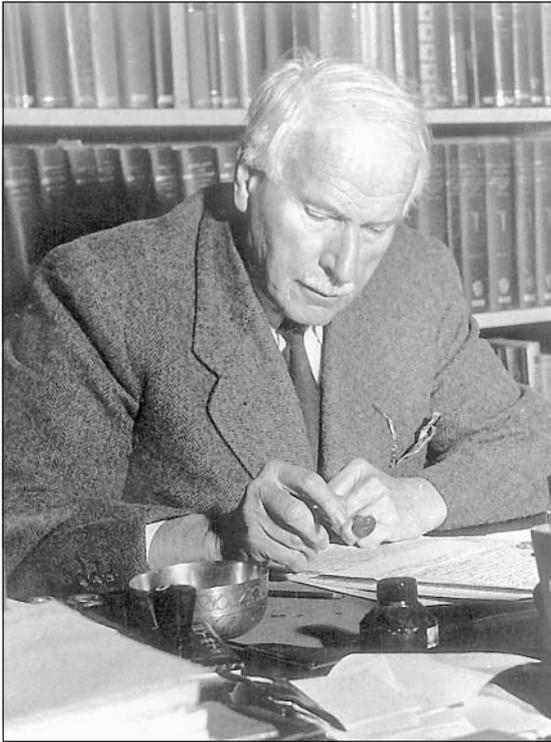

BORN: July 26, 1875, Kesswil, Switzerland

DIED: June 6, 1961, Küsnacht, Switzerland

TYPE OF ETHICS: Modern history

SIGNIFICANCE: The founder of analytical psychology, Jung approached ethical questions as medical problems concerning the mind. He believed mental health could be cultivated by bringing disturbing elements of the unconscious self to consciousness.

Jung studied medicine in Basel and psychiatry in Zurich. He collaborated for a time with Sigmund Freud but founded his own school of analytical psychology

Carl Jung. (Library of Congress)

in 1914. Jung's theory of the conscious personality, or ego, differentiates between the extroverted, or outgoing, personality, and the introverted, or inward-turning type. Both types of conscious personality are influenced by the unconscious self, which has two levels: the personal and the collective.

The personal unconscious includes knowledge that is too obvious to become conscious, together with repressed ideas and emotions that are too painful for conscious thought. The personal unconscious grows through individual experience, but the way it grows, Jung believed, is conditioned by the collective unconscious, which is common to all people.

The personal unconscious is found to include elements such as the old wise man and the earth mother, which appear, with variations, in dreams and myths all over the world. Jung called these elements archetypes and considered them inherited structures of the collective unconscious that condition the ways in which experience enters consciousness.

Jurisprudence

DEFINITION: Philosophy of law

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Jurisprudence is concerned with the nature and derivation of legal principles. It seeks both to understand why specific laws exist in specific forms, and to ascertain how they should be changed to better conform with a given social system or the requirements of justice.

Jurisprudence is the science of law; namely, that science that seeks to ascertain the principles on which legal rules are based, in order to not only classify those rules in their proper order and to show their relationships, but also to settle the manner in which new or doubtful cases should be brought under the appropriate rules. When a new or doubtful case arises out of two or more equally applicable rules, it is the function of jurisprudence to consider the ultimate effect if each rule were to be applied to an indefinite number of similar cases and to choose the rule that, when so applied, would produce the greatest advantage to the community.

Jurisprudence forms the basis for precedents, which provide the foundation for most judicial decision making, since most judges use the doctrine of *stare decisis* ("let the decision stand") to make future decisions based on precedents formed from past decisions. Jurisprudence, defined as the philosophy of law, deals with the legal reasoning behind the making of law and the decisions that judges make. Therefore, it has an overwhelming impact on society.

According to the nineteenth century English philosopher John Austin, there are two basic philosophies of jurisprudential reasoning, or patterns of jurisprudential thought. These philosophies of jurisprudential reasoning are analytical jurisprudence (known as positive law) and normative jurisprudence. Analytical jurisprudence studies the law as it actually is. It seeks to interpret, clarify, classify, and arrange in a legally systematic order actual legal concepts and doctrines. According to the analytical theory of jurisprudence, concepts of morality are totally distinct from one another. To legal positivists, such as Austin, the law is a matter of what is simply laid down, or posited, by the legislature, regardless of its moral status. A speed limit is an example of a positive law.

The other school, or pattern of jurisprudential thought, is normative jurisprudence, which concerns what the law should be. It subjects legal doctrines to moral evaluation and criticism in the name of social reform and justice. According to this theory, concepts of law and justice are equally related. For example, laws related to the constitutional principles that ban the use of cruel and unusual punishment, unreasonable searches and seizures, and denial of equal protection under the law, which cry out for moral interpretation, are more likely to be solved under the theory of normative jurisprudence than they are under the theory of analytical jurisprudence. One example of this can be found in *Brown v. Board of Education* (1954), which overturned the 1896 *Plessy v. Ferguson* decision.

The doctrine of *stare decisis* and the theory of analytical jurisprudence would have upheld the decision that the separate-but-equal theory of segregation was constitutional. Upon much criticism and examination of the moral and ethical issues involved in segregation, however, the U.S. Supreme Court overturned precedent, declaring that the U.S. Constitution is color-blind and that all U.S. citizens are entitled to equal protection before the law, regardless of the color of their skin. Some legal philosophers will say that moral, societal, and ethical evolution cried out for the overturning of the antiabortion laws of all fifty states, as was done in *Roe v. Wade*, an example of normative jurisprudence that gave women equal rights under the law. Normative jurisprudence is much more activist than is analytical jurisprudence, and judges who practice it create more law according to the needs of the particular case than do judges who adhere to the analytical philosophy of jurisprudence.

There are several other schools of jurisprudential thought that influence judges in their reasoning, from U.S. Supreme Court justices to county court judges. They are the natural law theory, the historical conception theory of law, the sociological conception school of jurisprudence, the realist conception theory of law, the economic conception theory of law, and the critical conception school of jurisprudence. The natural law theory states that law is ordained by nature. Higher principles exist independent of human experience. Natural law exists as an ideal condition that is either inherent in human nature or is derived from a divine source. Just as ethical standards tran-

scend legal standards, natural law transcends human notions of what is right and just.

The historical school of jurisprudence defines law as an embodiment of society's customs. Historical jurisprudence asserts that customs are the chief manifestation of the law and that law evolves with social development. Sociological conception jurisprudence defines law in terms of present human conduct. The law, according to sociological jurisprudence, is the sum of what the lawbooks permit and what human nature provides. A realist conception of justice is that the law is only what is actually enforced. For example, if a speed limit is 55 miles per hour, that is technically the law. If the police do not pull people over unless they are driving 65 miles per hour, however, then, to the legal realist, the law is not 55 miles per hour but 65 miles per hour.

The economic conception of law is that the U.S. Constitution is merely an economic document that was written to ensure citizens economic freedom from the government. Therefore, every decision must be looked at in the light of how a law or statute or judicial decree will affect the economic freedom of the citizens. The critical conception of jurisprudence is involved with literary criticism and is not as publicized or as frequently used in jurisprudential decision making as are the other types of jurisprudence.

All these forms of jurisprudential reasoning are used by every judge, but most judges have a particular pattern or philosophy that guides their decision making. The ethical dilemmas involved in jurisprudence involve determining which applications of which concepts of jurisprudence allow that judge to fulfill his or her moral and vocational responsibilities to society while defining the standards that the society's members must meet when interacting with one another.

Jury system

DEFINITION: Legal institution in which criminal or civil trials are decided by a group of citizens rather than judges or other professional court officers

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: The modern American jury system is founded in the notion that a person's peers are the best equipped to judge that person's actions, and that justice is best served when it is adjudicated by fellow citizens rather than imposed from above by an agent of the government.

Some hard historical data show how important a well-functioning jury system is to the encouraging of ethical behavior. The verdict in the famous Los Angeles, California, police brutality case involving the videotaped beating of black motorist Rodney King sparked an explosion of riots that lasted five days and set new records in terms of the number of casualties and the amount of damage; there were 60 dead, 2,383 injured, at least \$1 billion in damage to property, and at least 20,000 residents lost jobs as a result of the business closings that followed. Some people argue that the riots were a rebellion that was akin to the Boston Tea Party and that it was unethical neglect of the problems of the underclass in Los Angeles that provided the powder keg that was ignited by the spark of the jury's verdict. The tragic riots focused much more attention on these problems.

Law is often complex and abstract. The jury system serves to forestall the potential injustice of a large or remote government. A jury of one's peers, to which U.S. citizens are constitutionally entitled, often prevents the law from running roughshod over people in situations that could not have been foreseen

by the legislators who, often decades earlier, created the law. At the point of application of law, the jury can work justice in the particular case. Jury nullification is the jury's refusal to apply an unethical law. A jury can see people in court and adjust its views based on the equities it observes.

A major ethical issue surrounding the jury system is how representative of the larger community a jury should be. Many people believe that the verdict leading to the riots in the King case was the result of the facts that no African Americans were on that jury and that King was African American. During the *voir dire*, lawyers for each side have a limited power to prevent some people from serving on the jury without even showing why they may not serve. Lawyers have the right to remove any juror by showing cause (for example, that a juror is related to the accused). Lawyers use many psychological profiles involving stereotypes to remove potential jurors without cause. This may be unethical, because some discriminatory stereotypes are used in this process.

JURORS

Jurors are drawn from ordinary life. Therefore, the jury system is also a check and balance against unethical elitism in a democracy. This is why some states make jurors with extraordinary qualifications (such as a law degree) ineligible for jury duty. The jury system is used in both criminal prosecutions and civil suits. Usually, a unanimous verdict is needed to avoid a hung jury, but some states have allowed a nearly unanimous verdict to be decisive in some civil suits.

The jury system is part of an adversary system in which two sides clash and thereby, according to theory, provide the best picture of the whole truth by presenting both sides of the issue. Some countries use an inquisitorial system that uses judges or panels of authorities as investigators. The adversary system is often emotional and messy, but it provides a powerful incentive for each side to present its story. With this greater incentive comes a greater chance for the jury to hear the whole truth.

Just war theory

DEFINITION: Primarily Christian philosophy offering criteria for determining when it is just to wage war and how wars should be fought

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: Just war theory attempts to prevent and limit wars by providing universal guidelines for ethically correct ways to resolve conflicts between states.

Moral considerations in the conduct of war can be found in the earliest records of warfare. The first systematic attempt to set forth universal rules of warfare—based on natural law—was proposed by the Roman statesman Cicero during the first century B.C.E. During the fourth century C.E. the North African theologian St. Augustine agreed that morality was “written in the heart” and synthesized rational and biblical arguments for reconciling the evil of killing with the demands for peace and justice. The thirteenth century theologian St. Thomas Aquinas summarized the classic rationale for declaring war and articulated moral guidelines for conduct in war. Building upon this philosophical tradition, Hugo Grotius published the first comprehensive exposition of international law in 1625, providing the foundation for subsequent international agreements to limit warfare, such as the modern Geneva Conventions. By the early twenty-first century, the just war tradition had evolved into a theory resting on a few core principles.

Thomas Aquinas identified three reasons for justifying going to war. First, and most important, there must be a just cause. The principal idea here is that there are times when certain injustices, such as unprovoked attacks or human rights violations, are so egregious that to not go to war would be a greater evil. Second, only the proper authority—states, not individuals—can declare war. Third, just wars are waged only with right intentions, such as the desire for just peace or promoting a greater good.

Three other bases for a just war have been added to those articulated by Thomas Aquinas. First, in order not to waste lives recklessly, a war should have a reasonable chance of success. Second, the principle of proportionality should apply; it states that the

harm caused by war should not exceed the harm that provokes it. Finally, war should be a last resort, taken only when nonviolent means fail.

ACCEPTABLE CONDUCT IN WAR

The numerous guidelines for acceptable conduct in war can be grouped into two basic categories. The principle of discrimination specifies the legitimate targets of war and provides guidelines for the proper treatment of noncombatants and the defenseless. Pertinent to this principle, the “doctrine of double effect” states that killing civilians is excusable if military action against a genuine military target leads to unavoidable civilian loss—so-called “collateral damage”—and civilians themselves are not specifically targeted. The second major principle is a second kind of proportionality. The general idea here is to minimize destruction and suffering, especially by limiting the types of weapons used.

Just war theory holds that only wars fought for proper reasons and waged in the right way are just. Satisfying these criteria, however, is rarely clear-cut. Perhaps the best that just war theory can offer is to determine the degree to which any given war is just.

Justice

DEFINITION: Fundamental moral principle or ideal according to which each person should receive the treatment he or she deserves

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: A concept of justice or moral desert is arguably the foundation of ethical judgment, and it underpins all legal and social systems in which a punishment or reward is designed to fit the actions or character of the person receiving it.

Such words as fairness, equality, honesty, equity, integrity, and lawfulness, which are sometimes used as synonyms for justice, indicate the social order that is connoted by the term. In common speech, justice indicates both right relationships among people and a correct social norm—that is, one that establishes a course of expected conduct.

The roots of the modern Western view of justice can be traced to the Hebrew Bible, on one hand, and to Greek philosophy, on the other. Many social reformers, in particular, have been influenced by the Hebrew prophets. Thus, for example, the Martin Luther King, Jr., memorial in Montgomery, Alabama, is inscribed with the words of the eighth century B.C.E. prophet Amos: “. . . until justice rolls down like waters, and righteousness like a mighty stream” (Amos 5:24). In the Hebrew Bible, justice (*tsedaqah*) is a quality of God. God delights in it and wishes it for his people. The laws of God make clear his nature and his will. If the people do as he has commanded, then they too will be just. Thus, *tsedaqah* indicates a right relationship between the people and God. It indicates proper balance or right order. The fruits of justice are peace and abundance. The Hebrew prophets especially emphasized the social dimension of *tsedaqah* by claiming that a right relationship with God is possible only when people act justly toward one another. According to the prophet Amos, this meant that God would not revoke punishment from a society that allowed the righteous to be sold for silver and the poor to be trampled into the dust of the earth (Amos 2:6-7).

EARLY WESTERN PHILOSOPHERS

The oldest surviving Western writings that examine the nature of justice are those of the Greek philosopher Plato. Although Plato raised questions con-

cerning justice (*dikaio syne*) in several dialogues, his fullest treatment of the subject is found in the *Republic*. In that work, one of the characters, Thrasymachus, defines justice as the interest of the stronger—namely the ruling class—as expressed in society’s laws. As in the case of the Hebrew prophets, justice in this context indicates correct relationships among people. Since according to Thrasymachus the activity of rulers is governed by self-interest, however, and the obedience of the subjects is dictated by their weaker position, for him just subjects are those who obey the rulers of the state. Thus, Thrasymachus closely identifies justice with civil power, and since the rulers formulate the laws of the state, he also equates justice with civil lawfulness.

Socrates, the protagonist of the *Republic*, however, counters by claiming that justice is not only good for rulers but is also good “for its own sake.” He does this, first, by arguing that rulers do not always act in their own self-interest. According to Socrates, states exist precisely because people are not self-sufficient. In an ideal state, the rulers would be those who would act always for the good of the state, at all times putting its interests ahead of their own. The good unites the state, while the bad divides it. A good state, like a good person, contains the four cardinal virtues of wisdom, bravery, temperance, and justice. Justice, for Socrates, means that each person in the state performs his or her proper function. Thus, justice provides the right balance or harmony among the parts. To Socrates, the unjust person is dominated by the appetites and emotions, whereas the just person is controlled by reason. The unjust state would be governed by a despot; the just state would be ruled by a philosopher-king.

The views of justice advocated by Thrasymachus and Socrates have been represented many times in the history of Western philosophy. The positive law theory of justice holds that justice depends on authority, agreement, or convention. For example, the social contract advocated by Thomas Hobbes in *Leviathan* (1651) closely connects justice with civil law. Hobbes imagined life without laws to be akin to a war in which each person seeks his or her own advantage, “a war as if of every man against every man.” Out of their fear of anarchy and in order to preserve themselves, then, people agree in common to hand power over to the state, or Leviathan, which has coercive power and can enforce its laws. A just person, ac-

ording to Hobbes, is one who follows the laws of the state.

Like Socrates, John Locke held to a natural rights theory of justice. In *Concerning the True Original Extent and End of Civil Government*, he wrote that the law of nature taught that all people were equal and independent, and that “no one ought to harm another in his life, health, liberty or possessions.” It was the duty of the state to protect people’s natural rights. While Locke agreed with Hobbes in thinking that people willfully entered into a compact and thus formed the state, sovereignty, he thought, ultimately remained with the people. The purpose of the laws and the duty of rulers should be to represent and execute the will of the people. If the legislative or executive powers should betray their trust, they then should be counted as unjust and should be deposed.

One of the characters of the *Republic*, Glaucon, hints at but does not elaborate on a third view of justice; namely, that it is a social convention. According to this view, as developed by advocates such as David Hume and John Stuart Mill, justice is what promotes the welfare of society. It depends upon society, and it is a social product rather than a natural right. Justice is the basis of rights and laws, which are either just or unjust insofar as they promote the social good. Thus, this view of justice is sometimes called the social good theory of justice, and its proponents are perhaps most concerned with questions of how to perceive and identify the common good.

K

Kabbala

DEFINITION: Tradition of esoteric Jewish mysticism
TYPE OF ETHICS: Religious ethics
SIGNIFICANCE: The Kabbala, an occult formulation of the doctrines of the Jewish religion, is intended to supply a focus in contemplation, leading to a state of mystical awareness.

The Kabbala, an occult body of mystical teachings in the Jewish religion, focuses primarily on the notions of creation, revelation, and redemption. These teachings were usually surrounded by secrecy, and they were transmitted orally or in a highly veiled literature that proceeds by hints rather than by explicit declarations. The secrecy surrounding the Kabbala stems from the belief that its ideas were too subtle for the average mind. The Kabbalists, moreover, believed that their doctrines endowed certain individuals with mystical powers by which they might control nature itself. Those who sought to study the Kabbala were, therefore, screened to be certain that they would not invoke their powers too casually or for dishonorable ends. Only a chosen few in each generation were worthy of being the recipients of the wisdom of the Kabbala.

Sources of the Kabbala have been traced not only to the doctrines and literature of Judaism but also to a wide variety of cultures with which the Jewish people had come into contact in their dispersion. These influences include Persian, Neoplatonic, and neo-Pythagorean elements entering Judaism during the Hellenistic period. Christian and Gnostic themes were introduced somewhat later, as were borrowings from Muslim sectarianism following the emergence of Islam. This mixture of elements explains the difficulty that scholars have found in elucidating the Kabbala's sources. The Kabbala itself became one of the spiritual sources of the popular mysticism known as Hasidism, which flourished in the eighteenth and nineteenth centuries, especially in eastern Europe.

THE DOCTRINE OF CREATION

All Jewish mysticism has attempted to reinterpret the literal account of creation rendered in the book of Genesis. The mystics maintain that the account in Genesis does not sufficiently emphasize the transcendence of God. The reinterpretation has generally taken form as a demiurgic theory. In such a theory, God himself, who is boundless, infinite, and transcendent, did not perform the material act of creating the world. This was the work of a lesser spirit, or demiurge, who was brought into existence by God for this particular purpose. As the conception of God's transcendence developed, one demiurge seemed insufficient to express the sense of imposing distance between divinity and the material world. The remoteness of God from the world was intensified, therefore, by adding other intermediaries and thus forming a chain from God to matter in links of increasing materiality.

A second problem in the biblical account of creation, according to the Jewish mystics, concerns matter. If God is accepted as infinite, all must be contained within God. The question then arises, however, whether matter exists outside God. This issue was finally resolved by a theory that God, prior to creation, was actually infinite. To make room for creation, however, he voluntarily contracted or limited himself. Some excess of spiritual substance overflowed into the space from which God had removed himself, and this excess, or emanation, provided both the demiurgic intermediaries and the matter out of which the world was created. Because all substance is thus ultimately an overflowing of God's substance, Kabbala is a pantheistic doctrine (the doctrine or belief that God is not a personality, but that all laws, forces, and manifestations of the self-existing universe are God). The completed series of emanations also served the purpose of providing the route by which the human ascending spirit might reach the heights of divinity.

THE DOCTRINE OF REVELATION

After the first destruction of the Temple at Jerusalem, and particularly after its second destruction, the scriptures served as a focus for the religious devotion of the Jews. Their state no longer existed; their culture had been destroyed. All that remained was their belief in God and his word. If the Jewish religion were to endure, it seemed necessary that not only the content of revelation but also even its physical form should be considered inviolate and unchangeable. The level on which mystics interpreted revelation to serve their purpose was highly symbolical. To make this interpretation possible, the Kabbalists developed letter and number symbolism of great variety, complexity, and obscurity.

THE DOCTRINE OF REDEMPTION

The Kabbalists maintained and even intensified the traditional Jewish view of redemption. In the Kabbalistic view, salvation of the individual was of little significance. It entered only as a means to the greater end of the salvation of humankind. This would come about through the agency of a messiah and the Davidic line, who would lead the Jews in triumph to the Holy Land and inaugurate a reign of truth, justice, and mercy. The ideal of salvation is thus the establishment of an earthly paradise of human life, raised to its highest humanity. Other elements clouded this doctrine at various times in the history of mystical messianism. In general, however, the Kabbalistic view of redemption was an extreme form of traditional messianism. Attempts to calculate the exact date of the coming of the messiah were widespread. The coincidence of various calculations in fixing on dates close to each other inspired a wave of messianic movements.

Kant, Immanuel

IDENTIFICATION: German philosopher

BORN: April 22, 1724, Königsberg, Prussia (now Kaliningrad, Russia)

DIED: February 12, 1804, Königsberg, Prussia (now Kaliningrad, Russia)

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: In *Foundations of the Metaphysics of Morals* (*Grundlegung zur Metaphysik der Sitten*, 1785), *The Metaphysics of Morals* (1797), and especially the *Three Critiques* (1781-1790), Kant synthesized rationalism and empiricism into a single philosophical system that stood as the culmination of Enlightenment thought. He argued for the existence of a universal and objective moral law, the categorical imperative, which had the form of law as such and therefore transcended any individual human concern or value.

Late in his life, after his revolutionary work in epistemology, Kant first presented his mature moral philosophy in *Foundations of the Metaphysics of Morals*. Here, Kant developed his influential idea that human beings as rational agents are "autonomous," or have the capacity for moral self-government. For Kant, autonomy means that, as rational beings, people set their own standards of conduct, as distinct from the demands made by their desires, and are able to decide and act on these standards. On the basis of a complex argument, Kant concluded that autonomy is possible only if the will is guided by a supreme principle of morality that he called the "categorical imperative." Kant viewed this imperative as the product of reason

and as the basis for determining moral duties. He expressed it in three basic formulations.

THE FORMULA OF UNIVERSAL LAW

“Act only according to that maxim by which you can at the same time will that it should become a universal law.” Kant defined a maxim as a subjective principle on which a person intends to act, and a universal law as a principle that applies to everyone. Therefore, his formula of universal law demands that one act only on maxims that one can rationally will that everyone adopt. Kant provided the following example of how to use the formula: Suppose that a person must borrow money for a personal need and knows that he is unable to repay it. Is it morally permissible for him to act on the maxim of falsely promising to pay back a loan in order to get the loan? The formula tells that the person may act on the maxim if he can rationally will its universalization. The person cannot rationally will this because it would mean that people would no longer trust promises to repay loans, including his own. Kant added that the immorality of the maxim is clear in that the person really wants people to keep their promises so that he can be an exception to the rule for this one occasion.

THE FORMULA OF HUMANITY

“Act so that you treat humanity, whether in your own person or in that of another, always as an end and never as a means only.” For Kant, “humanity” refers to people’s uniquely human characteristics, their rational characteristics, including autonomy and the capacity to understand the world and to form and pursue life-plans. Thus, his formula of humanity demands that people always act so that they respect themselves and others as beings with a rational nature.

In *Foundations of the Metaphysics of Morals*, Kant used the formula of humanity to argue for a variety of duties to oneself and others. According to Kant, respect for rational nature in oneself implies that one ought not to destroy or deny one’s intellectual and moral capacities through suicide, drug abuse, lying, self-deception, or servility. It also implies that one must further one’s own rational nature by developing one’s natural talents and striving to be-

Immanuel Kant. (Library of Congress)

come virtuous. Respect for rational nature in others requires that one not harm them and that one uphold their individual liberty, but Kant discussed these duties as part of his legal and political philosophy. More exclusive ethical duties to others include the duty to contribute to the flourishing of rational nature in others through beneficence and the duty to refrain from arrogance, defamation, ridicule, and other activities that deny people’s humanity.

THE FORMULA OF THE REALM OF ENDS

“All maxims . . . ought to harmonize with a possible realm of ends.” This formula shows that the two previous formulas are interconnected. (Kant held them all to be equivalent, but this has not been widely accepted.) Kant described the realm of ends as a harmony between human beings, resulting from each acting only on maxims that can become universal laws. It is a harmony of ends in that its members, by acting only on universalizable maxims, act only on maxims that can meet everyone’s consent; thus,

they respect one another as rational self-determining agents, or ends in themselves. It is also a harmony of ends in that people will seek to further one another's individual ends.

MORAL VISION

Kant held that people must mirror the realm of ends in their moral choices and actions, and that it is humanity's duty to bring about this ideal. He viewed the French Revolution and the Enlightenment as steps in the right direction; argued for a worldwide league of democratic states as a further step toward the realm of ends; and claimed, moreover, that the religious institutions of his time must embrace the ideal, setting aside their historically evolved differences. Kant maintained that moral philosophy must not formulate new duties, but should only clarify the moral principle operative in "common moral reason" in order to help ordinary persons more adequately resist immoral desires. Kant's clarification went beyond these confines, however, and it ended with an inspiring moral vision of the realm of ends as the purpose of history, the kingdom of God on Earth, and the ultimate individual and collective vocation.

Kantian ethics

DEFINITION: Moral system put forward by, or modeled after that of, Immanuel Kant

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: Kantian ethics are concerned with the determination of an absolute and universal moral law and with the realization or modeling of an ideal society characterized by the mutual respect and harmonious coexistence of all moral agents.

The term "Kantian ethics" is commonly used to refer to the ethics of Immanuel Kant, as set forth in his *Foundations of the Metaphysics of Morals* and other moral writings of the 1780's and 1790's. The term is also frequently used to refer to later moral theories that are similar to Kant's ethics but contain modifications in response to its perceived shortcomings. Three important examples are the moral theories of Hermann Cohen, John Rawls, and Jürgen Habermas.

IMMANUEL KANT

The ultimate purpose of moral rules, Kant argued, is to make possible his ideal society, the "realm of ends," which has two main aspects: All its members respect one another as self-determining agents who pursue different individual ends, and they seek to promote one another's ends. Kant believed that this

moral ideal would evolve if everyone followed the fundamental principle of his ethics: the “categorical imperative.” This imperative demands that one act only on those personal policies of conduct (“maxims”) that one can rationally will to become universal laws or principles that guide everyone’s conduct. According to Kant, obedience to the categorical imperative implies respect for others as self-determining beings with different individual ends; in acting only on maxims that can become universal laws, one acts only on principles to which others can rationally consent, and thus one upholds their right to legislate their own moral rules and pursue their own individual ends.

Kant also argued that general obedience to the categorical imperative would bring about universal mutual promotion of individual ends (as the other aspect of the realm of ends) because the imperative prohibits refusing to assist others. The reason for this prohibition is that one cannot rationally will that everyone adopt a maxim of not assisting others in the pursuit of their individual ends, for in such a world one would lack the assistance of others as a means for realizing one’s own happiness.

Attempts to overcome the shortcomings of Kant’s ethics, while preserving its strengths, have led to such influential examples of Kantian ethics as the moral theories of Hermann Cohen, John Rawls, and Jürgen Habermas. The most significant shortcomings are the following: The categorical imperative does not offer a sufficient criterion for determining universal laws, Kant failed to provide an adequate justification of the categorical imperative, he described moral agents as isolated legislators of universal laws, and he failed to address satisfactorily how the realm of ends can be institutionalized.

HERMANN COHEN

During the later part of the nineteenth century, Kant’s philosophy regained in Germany the great influence it had had during his own lifetime. This resurgence is known as neo-Kantianism, and one of its most important representatives is Hermann Cohen, who transformed Kant’s ideal of the realm of ends into a democratic socialist ideal. Cohen held that human agents can only arrive at universal laws, or approximations thereof, if all people become decision makers or co-legislators in their institutions. Thus, Cohen argued that the realm of ends requires for its

realization not only political democracy, as Kant himself claimed, but also democracy in the workplace. Moreover, Cohen held that workplace democracy, in order to be effective, requires workers’ ownership of productive property. Cohen also maintained that these democratic socialist proposals were necessary for realizing the aspect of the realm of ends that all of its members promote one another’s individual ends.

JOHN RAWLS

A second main philosophical movement of renewed interest in Kant’s ethics and corresponding attempts to improve his ethics occurred during the 1970’s and 1980’s. The American philosopher John Rawls and the German philosopher Jürgen Habermas are the two major figures of this movement. Rawls’s primary concern is to argue for principles of justice that create a political society in accord with the realm of ends. More specifically, he argues for an extensive liberal welfare state based on the principles of justice that all persons must have equal political and civil liberties and that social and economic inequalities must be corrected to the greatest benefit of the least advantaged. Rawls holds that rational agents will opt for these principles of justice once their situation of choice, the “original position,” is made impartial by a “veil of ignorance” that makes them temporarily forget about all the specific facts concerning themselves and their society. Whether this innovative transformation of the categorical imperative—the veil forces one to opt for principles that are acceptable to all—justifies Rawls’s two principles of justice, and whether it can more generally be used to justify and explicate Kantian moral rules, are questions that have generated much debate.

JÜRGEN HABERMAS

The basic principle of the “discourse ethics” of Jürgen Habermas is a clear modification of the categorical imperative. The principle is that for a norm to be valid it must be accepted in a practical discussion by all those who are affected by the norm. The participants in the practical discourse must then also foresee the consequences of the general observance of the norm for the realization of the particular interests of each of them. This view that moral norms must be constructed by communities engaged in free practical discourse implies that the good society must be

fundamentally democratic; unlike Cohen and Rawls, however, Habermas has been somewhat vague and hesitant about the specific institutional ramifications of his Kantian ethics.

Karma

DEFINITION: Spiritual and ethical force generated by a person's actions

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: In Eastern religious traditions, karma is the motive force determining the transmigration of souls in successive incarnations: One's next life will be better or worse depending on the

good or evil of one's actions in this life. In modern Western culture, the term is used in a more general and secular sense to mean good luck or fortune earned through good deeds, or bad luck which is deserved as a result of malfeasance.

The word karma is a Sanskrit term meaning "action," "deed," or "work." By extension, it also came to mean the results of one's deeds and the law of retribution according to which one reaps what one sows.

The term karma does not appear in its extended sense in the oldest hymns of the Hindu scriptures. Nevertheless, the idea does appear that evil deeds have consequences that one would want to avoid. Furthermore, a person could obtain forgiveness from the god Varuṇa. The early hymns also taught continued personal existence beyond death, sometimes in an undifferentiated state, but sometimes with good men going to Heaven and others to a sort of hell.

In the Upaniṣads (composed roughly between the eighth and fifth centuries B.C.E.), Hindu speculation arrived at the conclusion that if one did not reap all that one had sown in this lifetime, one would inherit those uncompensated aftereffects in a future life. The cycle of rebirths came to be understood as the condition from which salvation was necessary. Furthermore, the law of karma was held to operate automatically; it was independent of the efforts of any god.

In its fully developed form, the law of karma is held to explain such phenomena as premature death (the result of misdeeds committed earlier in one's life or in a previous life), child prodigies (the child continues to develop skills already learned in a previous life), and differences in socioeconomic status (karma determines the caste into which one is born). In a moral universe, everything that happens to a person is earned; nothing is accidental or in any other way undeserved. In short, one determines one's own fate, in this and future lives.

Over time, Hindus developed several paths by which to escape the cycle of rebirth. The most important were enlightenment, work, love and devotion, and meditation, which also could be a method employed in other paths. The *Bhagavadgītā* (variously dated between the fifth and first centuries B.C.E.) dealt with the relationship between karma and one's caste duty. Simply put, it was the duty of each person to fulfill his or her role, even if the person found that role distasteful. Failure to do so would entangle one

more tightly in the cycle of rebirth. Actions undertaken out of a desire for reward would also lead to rebirth. Hence, the ideal was to perform one's duties to society without desiring to reap the benefits of one's actions. Such detached behavior would build up no karma, particularly if it were combined with other methods of salvation. Thus, one could escape from the cycle of rebirth.

KARMA IN BUDDHIST ETHICS

Buddhism retained from Hinduism the ideas of karma and reincarnation but denied the existence of a permanent soul that could be reincarnated. Instead, Theravāda Buddhists argued that everything in the phenomenal world was temporary, passing in and out of existence every instant. Furthermore, nothing originated from itself; rather, everything originated from something that had existed previously. This transitoriness was not random, however; discrete streams of karma held one's flashes of existence together in a continuum and separate from other streams of karma. An analogy often used by Buddhists was the passing of a flame from one candle to another. In that process, the second flame is neither identical to nor completely different from the first. Thus, a "person" could commit good or bad deeds and experience the rewards or punishments appropriate to each. Furthermore, over time a person could "use up" all acquired karma and pass into nirvana.

Buddhists were not oblivious to the logical difficulties implicit in this view. On one hand, if things passed completely out of existence before being replaced by others, it would appear that anything could cause anything, a conclusion that Buddhists denied. On the other hand, if something connected the flashes of existence, that something would at least resemble a permanent soul. Various Buddhist schools debated the nature of that resemblance, with several Mahāyānist thinkers returning to monistic thinking.

Buddhists generally hold that three factors regulate the acquiring of karma: the intention of the person committing an act; physical actions, including speech; and the abiding effects of the action. A person's karma may be changed by subsequent good deeds performed by the person or (in popular Buddhism) by someone else (for example, a monk or a Buddha) acting on that person's behalf.

KARMA IN JAIN ETHICS

Jainism held that the life force, or *jīva*, within a person is pure and intelligent but can be clouded by karma, which Jains (like some Hindu schools) understood as a subtle form of matter that attaches itself to the *jīva*. Virtuous acts color the *jīva* only slightly, while vices darken and weigh it down. Even the unintentional harming of a lower form of life results in the accumulation of karma. Hence, Jains are strict vegetarians and make every effort to avoid stepping on or breathing in even the tiniest insects. Release from rebirth is possible only if one ceases to acquire new karma and removes the karma already present by means of physical austerity and meditative concentration.

Keller, Helen

IDENTIFICATION: American social activist
 BORN: June 27, 1880, Tuscumbia, Alabama
 DIED: June 1, 1968, Westport, Connecticut
 TYPE OF ETHICS: Civil rights

SIGNIFICANCE: One of the most influential women of the twentieth century, Keller published many books and devoted her life to helping blind and deaf people.

At the age of eighteen months, Helen Keller suffered a severe illness that left her blind and deaf. She could not communicate with other people. When Helen was eight years old, her parents hired a teacher, Anne Sullivan, from the Perkins Institution for the Blind. Sullivan taught Helen a manual alphabet and finger-spelled the names of various objects. Within two years, Helen learned to read and write in braille. At age ten, Helen learned to speak by feeling the vibrations of Sullivan's vocal cords.

In 1890, Anne Sullivan accompanied Helen Keller to Radcliffe College. Four years later, Helen graduated cum laude and began writing essays on the rights of the disabled. She lectured worldwide and gained the support of famous people on improving the rights of people with disabilities. Her publications include *The Story of My Life* (1903), *The World I Live In* (1908), *Out of the Dark* (1913), *Helen Keller's Journal* (1938), and *Teacher: Anne Sullivan Macy* (1955). Helen Keller was an activist for the rights of people with disabilities until her death in 1968.

Kevorkian, Jack

IDENTIFICATION: American pathologist
 BORN: May 26, 1928, Pontiac, Michigan
 TYPE OF ETHICS: Bioethics
 SIGNIFICANCE: A medical doctor who has advocated the creation of a medical specialty ("obitriary") for suicide assistance, organ harvesting, and experimentation on the moribund, Kevorkian per-

sonally assisted in the suicide of scores of terminally ill patients. Media coverage of his actions and ideas galvanized public debate on the issue of physician-assisted suicide.

Jack Kevorkian's career-long focus on death—from trying to ascertain its onset in patients' eyes to trying to salvage some benefit from it—has alienated him from the medical establishment. Kevorkian advocated cadaver blood transfusions and lobbied along with death-row inmates for execution by lethal injection because it would be more merciful and would permit organ donation and experimentation under irreversible anesthesia. Kevorkian wrote various journal articles promoting his controversial ideas, but his objectives were repeatedly frustrated, and he turned his attention to patients who desired euthanasia.

No Regrets

In a telephone interview with a Pontiac, Michigan, reporter in April, 2004, Dr. Jack Kevorkian said, "There is no doubt that I expect to die in prison." Although he reaffirmed a promise that he had made earlier in affidavits, that he would assist in no more suicides if he were to be released, he expressed no regrets for what he had done or what had happened to him, saying, "I knew what I was doing."

In response to a letter-writing campaign to secure Kevorkian's early release, prosecutor David Gorcyca, who had led Oakland County's successful prosecution of Kevorkian in 1999, said that Kevorkian should be treated no differently than any other convicted prisoner. "He flouted the law and baited, no, begged me, on national TV to prosecute him. . . . Now he has to suffer the penalty."

Source: Detroit Free Press, April 11, 2004.

In 1989, Kevorkian developed a saline drip by means of which a severely disabled person could activate a lethal drug, and he marketed this machine on talk shows. Kevorkian later developed another "suicide machine" that used carbon monoxide, which he used after his medical license was revoked and he no longer had access to prescription drugs. On Novem-

Image not available

Jack Kevorkian with his "suicide machine." (AP/Wide World Photos)

ber 22, 1998, CBS's *60 Minutes* aired a video tape of Kevorkian injecting a patient named Thomas Youk with a lethal drug. The broadcast triggered renewed debate not only about the legality and morality of assisted suicide, but about journalistic ethics as well. Three days later, Kevorkian was arrested and charged with murder. He was convicted of second-degree murder in 1999 and sentenced to ten to twenty-five years in prison.

Kevorkian assisted in the deaths of at least 130 people. The media attention and controversy surrounding him throughout the 1990's made his name a household word. Besides questioning the propriety of assisted suicide, critics condemn Kevorkian's lack of medical experience with living patients; his brief relationships with the suicides; and the fact that many of the suicides were not terminally ill but merely in pain or afraid of advancing physical or mental disability, and possibly depressed. The number of people contacting him for assistance or openly endorsing his actions, however, demonstrates substantial dis-

satisfaction with available options for the terminally and chronically ill.

Kierkegaard, Søren

IDENTIFICATION: Danish philosopher and theologian

BORN: May 5, 1813, Copenhagen, Denmark

DIED: November 11, 1855, Copenhagen, Denmark

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Widely regarded as the founder of existentialism, Kierkegaard focused throughout his writings on the situation of the concrete individual who must choose how to live without the ben-

efit of objective criteria upon which to base that choice. His most famous works include *Either/Or: A Fragment of Life* (Enten-Eller, 1843), *Fear and Trembling* (Frygt og Bæven, 1843), and *Concluding Unscientific Postscript* (Afsluttende uvidenskabelig Efterskrift, 1846).

In a span of only thirteen years, from 1842 to 1855, Søren Kierkegaard authored a richly varied, challenging, and copious body of works. These include philosophical and theological treatises, novels, literary criticism, psychological investigations, social analysis, devotional literature, polemical pamphlets, and a literary autobiography. Despite the diverse character of his writings, many of the same themes and concerns run through all of them. In particular, Kierkegaard was concerned by what he saw as the growing tendency to discount the significance of the individual person's existence and to focus instead on large-scale social and historical phenomena. He regarded this trend as closely related to the tendency to overvalue knowledge and undervalue ethical endeavor.

PSEUDONYMOUS AUTHORSHIP

Most of the best-known of Kierkegaard's writings were published not under his own name but under those of his fictional creations. These were not mere pen names to keep secret Kierkegaard's role as author. Instead, Kierkegaard presented the main options for human existence by creating ideally consistent representatives of the "stages on life's way" and then letting them speak for themselves. That way, the reader does not simply learn about the various forms of existence as a removed observer. Rather, the reader imaginatively enters into the worlds of the various pseudonyms and gets a feel for what it is to exist as they exist.

Kierkegaard identifies three main forms, or stages, of existence: the aesthetic, the ethical, and the religious. His classic presentation of the aesthetic and ethical stages is his first major work, *Either/Or*. The first volume of this monumental book contains a variety of essays by an unknown aesthete who lives for pleasure, amusement, stimulation, and, above all, the avoidance of boredom. The volume ends on a dark note, with the copied pages of another aesthete describing the cynical seduction and abandonment of a young woman. The second volume, depicting ethical existence, consists of two very lengthy letters

from a lower-court judge and family man, Judge William, to the aesthete of volume I encouraging the aesthete to change his ways and adopt an ethical form of existence. By placing these two volumes before his readers, Kierkegaard sought to force a choice: either choose to live for pleasure, amusement, success, and so forth, or choose to devote yourself to doing the right thing and fulfilling your duties. The point is not simply to learn about these forms of existence but to choose which to live. By using pseudonyms and disappearing from the scene, Kierkegaard refuses to tell the reader which way he or she should choose.

Kierkegaard considerably complicates the issue of existential choice in subsequent pseudonymous works. In *Fear and Trembling*, the pseudonymous author, John of Silence, intensely examines the story of Abraham and Isaac from the book of Genesis. Abraham's readiness to sacrifice his son at the command of God shows the difference between ethical and religious existence, a difference that Judge William had effectively denied. Subsequent pseudonymous works, notably *Philosophical Fragments* (*Philosophiske Smuler*, 1844) and *Concluding Unscientific Postscript* by Johannes Climacus, distinguish between two types of religious existence: the immanent, in which the divine is believed to be within each person; and the transcendent, which views fallen humans as radically alienated from the divine and in need of divine assistance to gain salvation. Climacus identifies this latter form of religion as the Christian. While Climacus denies that he himself is a Christian, he is fascinated by Christianity and stresses the paradoxical nature of its central claims. He sharply criticizes modern philosophical and theological attempts to diminish that paradoxicality so as to assimilate Christianity to comfortable ways of thinking and being.

NON-PSEUDONYMOUS WRITINGS

At the last moment before its publication, Kierkegaard added a brief statement to the end of *Concluding Unscientific Postscript* admitting responsibility for the whole pseudonymous authorship and explaining his unusual form of writing. He expected at this point to stop writing and become a pastor, a position for which he was already fully trained. Instead, he commenced a second and distinctive career as an author. Most of the works in this "second authorship" were written under his own name and from an explicitly Christian point of view. In *Works of*

Love, he develops a Christian ethic that is grounded in Jesus' command to love one's neighbor.

By showing how radical this ethical demand is, Kierkegaard set the stage for an increasingly acrimonious confrontation with the Danish Lutheran Church. In the writings from the last years of his life, Kierkegaard asserted that the Danish church systematically diluted Christianity as part of an implicit deal with the social status quo: In return for good pay and high social status for pastors, "official Christianity" (which Kierkegaard referred to as "Christendom") legitimates the social order and avoids causing the sorts of disturbances occasioned by the radical demands of genuine Christianity. While Kierkegaard first stated these charges in books such as *Practice in Christianity*, he eventually addressed a broader audience by writing letters to the editor of a major Copenhagen newspaper and then producing a publication of his own, *The Instant*. Shortly after publishing the ninth issue of *The Instant* and at the height of his battle with the Danish Lutheran Church, Kierkegaard fell ill and was taken to a hospital, where he died some weeks later.

al-Kindī

IDENTIFICATION: Arab philosopher

BORN: c. 800, Kufa, south of Karbala, Iraq

DIED: 866, Baghdad, Iraq

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The first major Arab philosopher, Al-Kindī provided the first systematic philosophical expression of ethics and moral psychology in Arabic, and he was influential in Islamic and medieval European philosophy.

Al-Kindī, "the philosopher of the Arabs," argued that the soul is immaterial and is analogous to divine substance. The appetites and passions have their source in the material body and can lead a person into excessive love of physical pleasures. To avoid that development, the soul must be purified through the quest for truth and the rigorous study of philosophy. As the soul is thus further actualized, it can come to rule rationally over the lower faculties. If the virtuous soul has not been sufficiently purified here in the lower world, it will require further purification in the sphere of the moon and in those spheres beyond the moon before it is sufficiently cleansed to be able to partake in the intellectual apprehension of God (the bliss toward which all people should aim).

Al-Kindī drew upon the work of Neoplatonic and Pythagorean predecessors and, as is common for later Islamicate thinkers such as al-Fārābī, intermingled the metaphysics and moral psychology of both Plato and Aristotle. His work was important in medieval European attempts to understand Aristotle's *De Anima*.

King, Martin Luther, Jr.

IDENTIFICATION: American civil rights leader

BORN: January 15, 1929, Atlanta, Georgia

DIED: April 4, 1968, Memphis, Tennessee

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: As founding president of the Southern Christian Leadership Conference (SCLC), a post he held from 1957 until he died in 1968, King was the major American spokesperson for nonviolent social change and racial equality. He was recipient of the 1964 Nobel Peace Prize.

Influenced chiefly by the Indian liberator Mohandas K. Gandhi and the southern black evangelical tradition, King combined nonviolent activism and Christian theology in his ethic of social change. He maintained throughout his public career that he was not seeking to change only laws but also attitudes, so that people of all races and classes could live in the Beloved Community, a concept borrowed from social gospel advocate Walter Rauschenbusch.

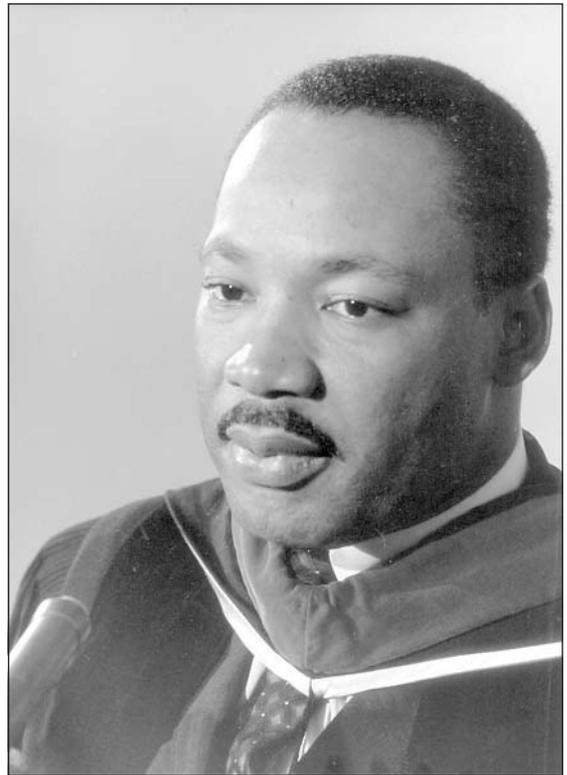

Central to King's philosophy was an ethic of love drawn largely from traditional Christian morality and combined with a strong reformist mission. King openly challenged the acquiescence of both blacks and whites. It was time for change, he believed, because the status quo was perpetuating wrong behavior that was harming all races, but meaningful change would come only by ethical means. "Returning hate for hate," he affirmed, "multiplies hate, adding deeper darkness to a night already devoid of stars. Darkness cannot drive out darkness; only love can do that."

THE LOVE ETHIC AND THE HIGHER LAW

By love, King meant more than a positive feeling. Drawing upon the rich linguistic heritage of the Greeks, he defined love not in terms of *eros* (romantic love) or even *philos* (brotherly love), but *agape*, a word used in the New Testament to mean unselfish, redemptive love. Like Gandhi, King believed that love is a potent force in human relations, capable of effecting reform without crushing the opponent. The real "enemy" in this view is not a group of people but a system that exploits both the oppressor and the oppressed. People should love their enemies, he said, because "love is the only force capable of transforming an enemy into a friend."

After years of studying the ideas of Rauschenbusch, Reinhold Niebuhr, Karl Marx, Gandhi, Jean-Paul Sartre, and others, King developed a synthesis of Christianity and Gandhian nonviolence that satisfied his longing for a method "that would eliminate social evil." He found in Gandhi's thought what he could not find elsewhere, and the result was a synthesis: "Christ furnished the spirit and the motivation and Gandhi furnished the method."

Ambiguities had to be resolved in real situations. One that King often faced was the question of breaking segregationist laws without appearing to oppose rule under law, a particularly frustrating issue in the Birmingham campaign of 1963. Jailed for defying a federal injunction, he was criticized by several local clergymen who characterized him as an outside agitator. Although he rarely responded to criticism, this time he felt compelled to answer in what is called his "Letter from a Birmingham Jail." Of all people, he felt, clergymen should most readily understand that his actions were consistent with the prophetic tradition of leaving one's home to carry God's message.

Martin Luther King, Jr. (Library of Congress)

He could not be an outsider, because “injustice anywhere is a threat to justice everywhere”; he was violating the injunction on the same grounds used in the thirteenth century by Saint Thomas Aquinas to denounce laws that were contrary to God’s higher law. “A just law is a man-made code that squares with the moral law or the law of God.” Ethics and the legal codes that enforce public morality were thus linked to the moral order of creation.

ELEMENTS OF NONVIOLENT ETHICS

The higher moral law was one of the four main components of King’s social ethics. The second, the principle of reconciliation, went beyond law to the level of community. To damage society permanently was contradictory, in his view. Just as God in Christian theology is a reconciler, so the social reformer must seek reconciliation. All sides in the confrontation must emerge with dignity and confidence that their interests will be protected in the new society.

Third, King believed that resistance by public officials or private citizens to social justice was only the surface manifestation of deeper evil. Reforms could not in themselves destroy that evil. For every pharaoh lying dead on the seashore—in a popular analogy to the Old Testament Exodus from Egypt—others will arise. The final victory over evil lies in the eschatological future. In that sense, King’s social ethic combined a vision of the final victory of good with the necessity of confronting specific societal flaws with confidence that even partial victories are important.

No ethical principle was more basic to King’s nonviolent ethics than was the concept of redemptive suffering. He knew that even the most limited gains in the Civil Rights movement would come with difficulty. Freedom would never be granted voluntarily. It had to be taken, and suffering would often result. Making frequent allusions in sermons and speeches to Christ’s suffering on the cross, King compared the nonviolent struggle against racism to the redemptive suffering of the Judeo-Christian tradition. Suffering in a righteous cause would expose evil to public consciousness, as Gandhi had done with British oppression in India, and offer an alternative model of behavior. “Recognizing the necessity for suffering,” wrote King, “I have tried to make of it a virtue.” This did not

mean that King invited martyrdom, but it did suggest an approach to morality that recognized the persistence of evil despite dedicated opposition.

King’s ethics demanded adherence to nonviolence based on the prophetic tradition. Although he was not primarily an original thinker, King infused nonviolent theory with a new intellectual integrity and created an effective grassroots movement to apply and test its viability in social reform efforts, international relations, and personal living. The nonviolent social ethics he articulated required discipline and the willingness to suffer for a good higher than that of one’s personal safety or comfort.

Knights of Labor

IDENTIFICATION: Universal national labor union working to promote social reform

DATE: Founded in December, 1869

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The Knights of Labor was the first national union to seek economic justice for unskilled labor by promoting a classless society in which each worker would also be an entrepreneur.

Established originally as a secret league, the Knights of Labor experienced tremendous growth when it became an open organization during the 1880's through the efforts of Terence Powderly, its grand master workman from 1879 to 1893. With the exception of professional workers, the Knights melded all labor, regardless of sex, race, creed, national origin, or skill level, into a single disciplined army that would check the power of concentrated wealth that, according to the Knights, was degrading labor.

The Knights of Labor believed that labor could regain its moral worth if it received a proper share of the wealth that it created and adequate leisure time to enjoy the blessings of a civilized society. The Knights sought to check the power of corporations through legislation to secure safe working conditions, equal pay for the sexes, an eight-hour day, a national banking system, public lands for settlers, weekly pay in full, the substitution of arbitration for strikes, and the abolition of contract labor and child labor. The Knights declined after 1886 when many skilled workers who desired less utopian reform joined the newly organized American Federation of Labor.

Kohlberg, Lawrence

IDENTIFICATION: American psychologist

BORN: October 25, 1927, Bronxville, New York

DIED: c. January 17, 1987, Boston, Massachusetts

TYPE OF ETHICS: Modern history

SIGNIFICANCE: In *Essays on Moral Development* (1981), Kohlberg put forward an influential theory of moral development based on the premise that morality is a cognitive ability that develops in stages. Application of Kohlberg's model has been controversial, because it lends itself to categorizing specific individuals or entire classes of people, such as women or the uneducated, as morally inferior to others based on the stage of development they are deemed to occupy.

While serving as professor of education and social psychology at Harvard University, Kohlberg refined his theory of moral development. He forced a rethinking of traditional ideas on moral development by asserting that one's maturity in moral decisions develops as one thinks about moral issues and decisions. With cognitive growth, moral reasoning appears, and moral reasoning allows children to gain control over their moral decision-making process. From approximately four years of age through adulthood, a person experiences six stages of development that are divided into three levels.

Because it is a cognitive developmental process, moral reasoning is taught using scenarios of moral dilemmas, causing students to justify the morality of their choices. Upon reaching cognitive maturity, a person will use reason to fashion an ethic of justice that is consistent with universal principles of justice and use it to satisfy the moral dilemma. For Kohlberg, moral judgment is the key ingredient in morality, taking precedence over other noncognitive factors. Some critics, notably Carol Gilligan, have challenged Kohlberg's system on the grounds that it seems to privilege values—such as detached, objective justice—more likely to be found in men, while it denigrates the moral values—such as caring and a desire to find solutions to moral problems that will benefit all parties—more commonly found in women in contemporary patriarchal society.

Kosovo

IDENTIFICATION: Province in southwestern Serbia

TYPE OF ETHICS: International relations

SIGNIFICANCE: In 1999, the North Atlantic Treaty Organization (NATO) conducted a massive bombing campaign against strategic targets throughout Serbia in order to force the Serbian government to stop its military operations against ethnic Albanians living in Kosovo.

During the 1990's, the province of Kosovo had a population of about two million people, of whom more than 90 percent were ethnic Albanians. Ethnic conflict between Serbs and Albanians in the province had roots deep in the past. After the Turkish Ottoman Empire conquered Serbia in the fifteenth century, its forces drove many Serbs out of the southwestern por-

tion of the country and allowed Albanians to settle there. After Kosovo won its independence from the Ottoman Empire early in the twentieth century, Serbia, with the support of the European powers, annexed it as a province. From 1918 into the twenty-first century, Serbia remained part of the federation of Yugoslavia.

With the fall of communism throughout Eastern Europe during the late 1980's and early 1990's, nationalistic Serbs demanded an end to Kosovo's autonomous status. Albanians, in contrast, called for either full independence or annexation to neighboring Albania. In 1989, the Serbian government, led by strongman Slobodan Milošević placed Kosovo under military rule and abolished its parliament. The province's Albanian leaders then declared independence and established an underground government. Meanwhile, the Yugoslav federation was breaking apart,

and by 1992 only two republics, Serbia and Montenegro, remained in the federation.

INTERVENTION TO STOP ETHNIC VIOLENCE

In 1995, thousands of Serb refugees from Croatia moved into Kosovo. Militant Albanian separatists formed the Kosovo Liberation Army (KLA) and began conducting guerrilla operations against Serb forces. In March, 1998, Milošević ordered a massive crackdown against Albanian separatists. By December, Serbian troops were destroying Albanian villages. During that year, more than 400,000 Albanians became refugees, most of them fleeing to Albania.

U.S. president Bill Clinton and many European leaders accused the Serbian government of practicing “ethnic cleansing.” In late 1998, Western leaders threatened Milošević with a campaign of air strikes unless his government would agree to a peaceful settlement. Milošević refused to make adequate concessions. On March 24, 1999, NATO forces began to

bomb bridges, roads, and additional targets of military value. Milošević responded with intensified attacks on Albanian villages, which in turn led to more bombings. On June 2, a special International Criminal Tribunal announced indictments of Milošević and four other Serbian officials for war crimes.

On June 3, Milošević finally agreed to negotiate an end to the fighting, and six days later, the two sides agreed to terms for a settlement. The next day, the United Nations Security Council authorized a fifty-thousand-man peacekeeping force to supervise the return of an estimated 780,000 Albanian and Serb refugees. However, ethnic fighting in Kosovo continued. Over the next several years, the KLA made revenge attacks against Serbs and other non-Albanians, creating new refugees. Although the NATO operation of 1999 had successfully stopped an instance of ethnic cleansing, it also demonstrated the inherent difficulties and frustrations associated with attempts by outsiders to end long-standing ethnic conflicts.

Ku Klux Klan

IDENTIFICATION: White supremacist organization dedicated to racial segregation and the subjugation of people of color and other minorities

DATE: Founded in 1866

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: Persistent conflicts over the Ku Klux Klan highlight the tension between the competing moral principles of freedom of speech and assembly on one hand and racial tolerance on the other.

Few ethicists celebrate or condone the activities of the Ku Klux Klan; there is, however, a legal debate about how best to control these activities without unduly infringing on individual freedom.

The Klan initially appeared toward the end of 1865 as a social club for former Confederate soldiers, who adopted the hooded sheet as their uniform. Members of the Klan wore masks to disguise their identity. The Klan gained notoriety during the Reconstruction period (1865-1877) for harassing recently freed African Americans who tried to exercise their newly won privilege of voting. Cross-burning on the property of the African Americans and their white Republican political allies was one form of harassment that the Klan practiced; whipping was another. By 1877, when conservative white Democrats had wrested control of southern state governments from the coalition of African Americans and white Republicans, Klan activity had subsided. By 1900, when African Americans had been effectively deprived of the right to vote in most southern states, the Klan had effectively disappeared as an organization; it had lost its reason for being.

THE SECOND KLAN

In 1915, a new national organization was formed, which took the name and the distinctive costume of the old Ku Klux Klan. The leadership of this new organization viewed Jews, Roman Catholics, and immigrants as posing a danger to America that was equal to, if not greater than, that presented by African Americans. Although the Klan in the South did take part in outrages against African Americans in the immediate post-World War I years, the principal targets of the Klan in the North and the Midwest were the Roman Catholic Church, Jews, and all immigrants from southern and eastern Europe. It also claimed to enforce the traditional small-town virtues of alcoholic abstinence and Victorian sexual morality against all deviants. During this time, the Klan received much backing from Protestant ministers. It spread rapidly for a while throughout the Midwest and the Northwest but went into a sharp decline after the leader of the Indiana Klan was convicted, in 1926, of the rape of a young white woman. During the Great Depression (1929-1941), what remained of the Klan was eclipsed in importance by various other hate groups.

THE THIRD KLAN AND THE HATE SPEECH VS. FREE SPEECH DEBATE

There was a revival of the Ku Klux Klan during the 1950's and 1960's in the South. This revival was sparked by the 1954 Supreme Court decision *Brown v. Board of Education*, which mandated racial integration of the schools, and by the African American drive for voting rights in Mississippi and Alabama during the early 1960's. Many police officials condoned or cooperated with the Klan. The Klan was implicated in the deaths of three civil rights workers in Mississippi in 1964, military officer Lemuel Penn in 1964, and white civil rights worker Viola Liuzzo in 1965. After 1954, three main Klan organizations were formed: the Knights of the Ku Klux Klan; the United Klans of America; and the Invisible Empire, Knights of the Ku Klux Klan.

Toward the end of the 1960's, Klan influence in the South began to wane. Vigorous prosecution of Klan crimes by the Federal Bureau of Investigation, under federal civil rights statutes, reduced its power. As African Americans, protected by federal registrars after the passage of the Voting Rights Act of 1965, more and more came to exercise their right to

vote, the once-common collusion between the Klan and local police became somewhat less frequent.

The Ku Klux Klan spread to the North during the 1970's and 1980's, as racial tensions spread across the country. The possibility that white males might lose jobs or promotions as a result of affirmative action policies was one Klan selling point. Klansmen practiced violence and intimidation, not only against African Americans but also, for a while, against post-1975 Indochinese refugee fishermen who had settled in the Gulf Coast states. Many Klansmen also opposed Mexican immigration; hostility to the Roman Catholic Church, however, was no longer emphasized.

FADING POPULARITY OF THE KLAN

During the 1980's, the reputation of the Ku Klux Klan was probably worse than it had ever been. The association of the Klan with acts of violence was one mark against it. Other elements that limited the spread of Klan ideas were the adoption by the Klan of anti-Semitism and the organization's close association with the neo-Nazi movement. Condemnation of the Klan appeared even in the pages of the conservative religious magazine *Christianity Today*; the author of the article was appalled not only by the Klan's hatred of African Americans but also by its insistence that Jesus Christ was not a Jew. The Klan and its rituals seemed more and more limited to the South, although hate groups with similar ideas did arise in the North. When ex-Klansman David Duke ran for the offices of Louisiana state legislator, senator from Louisiana, and governor of Louisiana, in 1989, 1990, and 1991, respectively, he soft-pedaled his past activity in the Klan; he won only the first election.

THE KLAN AND THE ISSUE OF FREE SPEECH

In June, 1990, two white youths in St. Paul, Minnesota, burned a cross at the home of an African American family that had moved into a previously all-white neighborhood; the city of St. Paul immediately passed a law banning cross-burning. In June, 1992, this law was overturned by the U.S. Supreme Court. In Georgia, a law banning the wearing of masks—a traditional practice among Klansmen—was struck down by the courts in May, 1990, as a violation of the Klan's right to free speech.

At that time, controversy erupted in the racially tense town of Kansas City, Missouri, when the Mis-

souri Knights of the Ku Klux Klan tried to broadcast a program on local cable television. Mayor Emmanuel Cleaver, an African American man, opposed this idea as likely to cause trouble; so did many other people in Kansas City. In June, 1988, the city passed a law that would have kept the Klan off cable television. In May, 1989, however, a federal district court ruled against the city. Despairing of a Supreme Court victory, the city eventually allowed the Klan the right to broadcast in Kansas City; the first episode of the Klan cable program was broadcast on April 3, 1990.

Among white liberals, the issue of whether the Klan should be allowed free speech proved to be divisive during the 1980's. Some urged that the white-sheeted hate group's right to propagate its views be curbed. Other liberals, such as Nat Hentoff, while by no means accepting Klan viewpoints, insisted that the First Amendment to the Constitution guaranteed the right to propagate even views that most people consider to be evil.

When Klan activity led to violence and intimidation, the courts during the 1980's sometimes assessed penalties against it. In Alabama, when an African American woman's young son was killed by Klansmen during the early 1980's, a white civil rights lawyer, Morris Dees, successfully sued the Alabama branch of the United Klans of America. The courts, by holding the organization responsible for the murder, effectively bankrupted the organization. In 1983, a court decision ordered the Klan to cease its harassment of Vietnamese refugee fishermen who plied their trade off the Gulf Coast of Texas.

Kūkai

IDENTIFICATION: Japanese Buddhist monk

BORN: Saeki Mao; July 27, 774, Byōbugaura, Sanuki Province, Japan

DIED: April 22, 835, Mt. Kōya, Japan

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Kūkai founded the Shingon school of Japanese Buddhism, teaching that there are ten

rungs on the ladder of spiritual development that leads to true Buddhahood.

Kūkai entered university studies in Confucian classics at age eighteen but converted to Buddhism and in 804 made a two-year trip to China to learn about esoteric Buddhism. Its “secrets,” which were transmitted from master to pupil, were available to anyone dedicated enough to master them. Kūkai subsumed all types of Buddhism under a ladder of ten spiritual rungs: the physical rung of food and sex; morality typical of lay Buddhism; deliverance from underworlds; realization that there is no soul; attainment of Theravādist disinterest; sharing the secret of liberation with others; meditation on the emptiness of things; seeing the true way of salvation; perceiving the Buddhahood of everything; and enlightenment.

Philosophically, Kūkai’s system was monistic, with the ultimate Buddha manifesting in the form of Mahāvairochana (Japanese, Dainichi), the Great Sun. Other Buddhas and bodhisattvas were emanations. A person uncovers his or her innate Buddhahood through meditating, repeating formulas, and performing hand gestures. Despite the esoteric nature of his rituals, Kūkai’s Buddhism appealed to the laity. Some Shingon adherents believe that he exists in the Heaven of the Satisfied, from which he will return with Maitreya, the future Buddha, and many people make pilgrimages to his tomb. After Kūkai’s death, the Japanese bestowed on him the title Kōbō Daishi (Great Teacher of Karma).

L

Labor-Management Relations Act

IDENTIFICATION: Federal law that attempted to check the power given to labor unions under the National Labor Relations Act of 1935 by specifying a set of unfair union practices

DATE: Became law on August 22, 1947

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The Labor-Management Relations Act sought to limit the power of labor partly to find a balance between labor interests and business interests and partly out of political fears that linked labor unions with communism.

After the passage of the National Labor Relations Act (Wagner Act) in 1935, manufacturers began a decade-long media blitz to convince the public and Congress of the evils of the new state of industrial relations. Manufacturers extolled the virtues of the free enterprise system and blamed the Wagner Act for allowing an unregulated growth of organized labor and producing the social and industrial unrest of post-World War II America. Probusiness Republicans turned the Democrats out of office in 1946 and promptly amended the Wagner Act, detailing six unfair labor practices and monitoring officials of labor organizations.

Changes in the law included outlawing the closed shop, prohibiting unions from participating in secondary strikes, allowing for an eighty-day injunction for emergency disputes, and requiring union officials to renounce any Communist Party affiliation or belief. This legislation provided a necessary balance between the interests of business and labor and proved the viability of the American system of government to keep its traditional economic institutions intact while meeting the current needs of all of its people.

Land mines

DEFINITION: Antipersonnel and antivehicle weapons buried below the surface of the ground that explode when disturbed

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: Difficult to detect and disarm, unexploded land mines can continue to pose threats to humans and animals for decades after military conflicts end.

During the twentieth century, victim-triggered land mines became increasingly popular with military strategists, partly because technological advances facilitated both the mass production and the ease of delivery of the weapons. A single aircraft pilot, for example, could create an extensive minefield by dropping thousands of land mines in one overhead pass, peppering fields, hills, and streambeds. Military strategists used antipersonnel mines to defend borders in regions where they lacked sufficient troops to provide human defenses, or to channel enemy troops into more strategic zones. In some cases, civilians themselves mined the lands around their homes to protect themselves from enemies intent on “ethnic cleansing.”

Long after a military conflict ends, the land mines that are laid down during the fighting retain the ability to detonate and kill. Local residents often do not know the locations or boundaries of nearby minefields. Sometimes, refugees returning to their homes must travel along paths containing hidden mines. Because land mines cannot discriminate between combatants and civilians, they often kill or injure more people engaged in ordinary pursuits—such as trekking home, farming, or foraging—than they have killed or injured during the conflicts in which they are deployed. Typically, an unwitting farmer or child steps on a mine and is badly injured; if no one hears the explosion, the victim may bleed to death before help arrives. Even if a victim survives an initial blast, a systemic infection from the mud and flesh driven

into the victim's body may prove fatal. Survivors need surgeons trained to amputate limbs, medicine to control their pain, prostheses to replace their missing limbs, and physical therapy to regain their physical functions. Civilians—especially children—living near minefields must be educated as to where it is unsafe to work or play.

After the Vietnam War, a groundswell of moral outrage against the use of land mines occurred, culminating in the Ottawa Treaty of 1999. That treaty prohibits the production, use, transfer, and stockpiling of antipersonnel mines. However, at the beginning of the twenty-first century, neither the United States, Russia, nor China had signed the document.

The primary virtue of an international ban is that antipersonnel land mines now belong to a category of unacceptable weapons. The stigma associated with

deploying such weapons means that their use is much less likely in the future. It also legitimizes requests for support of programs for land-mine victims and their families.

The loss of limbs and lives, the ruin of lands, and the social and economic disruption of entire communities are global problems. Humanitarians argue that military groups responsible for placement of the mines should be held accountable, since the indiscriminate, disproportionate, and persistent nature of antipersonnel mines violates international conventions regarding acceptable weapons. Accountability implies that reparations for damages should be paid. In general, governmental responses have been inadequate with respect to postconflict problems caused by land mines, especially in developing countries.

Language

DEFINITION: Any systematic means of communication or representation employing signs with conventionalized meanings

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The relationship of language to meaning and truth is a central concern for many philosophers, and the need to ground meaningful inquiry in a specific theory of language is no less pressing in ethics than in the other philosophical disciplines. Moreover, the rise of deconstruction and related disciplines has led many thinkers to endow the everyday use of language with a new and unprecedented level of ethical significance.

Mohammad Saber, an Afghan boy who lost both legs when he stepped on a land mine while collecting scraps of firewood for his family. According to a United Nations agency, as many as ten million land mines remained buried in Afghanistan during the late 1990's. (AP/Wide World Photos)

Since the modern division of ethics into normative ethics and metaethics, the latter study has concentrated almost exclusively on the meaning of ethical terminology, its nature, and the rules of its interrelationships. The concern of ethics with language is scarcely a modern phenomenon, and even in the dialogues of Plato, Socrates challenges his interlocutors with demands for precision in their use of terms such as good, just, right, piety, and virtue.

As modern metaethics analyzes contemporary language, there are vital divisions in ethical thought that depend entirely on particular approaches to ethical language. Moral (or ethical) realism maintains that ethical statements make truth claims and that ethical terms signify real properties and relationships. In addition, ethical information is seen as enjoying an objectivity that transcends culture, class, gender, and other categories.

Realism has suffered, however, under the criteria utilized by the school of logical positivism for verifiability, confirmation, and so forth in the twentieth century. In the wake of the decline of positivism, a renewed interest in moral realism has appeared, but serious problems remain regarding the relation of the moral to the nonmoral and regarding the explanatory role that moral propositions have in understanding the world. In regard to the latter, it is clearly the case that one can understand certain events and individuals in history better by understanding their morality, but it is not certain that one need know more than the empirical fact that those individuals simply believed in a particular moral code and acted upon it.

NONCOGNITIVISM

Noncognitivism has arisen as a way around imputing facticity and truth-value to moral statements. The three forms of noncognitivist ethics are emotivism, imperativism, and emoto-imperativism.

Emotivism constitutes a grouping of theories that are metaevaluative in nature. Throughout the full range of axiology (the study of values), those theories deny that moral, aesthetic, economic, or other sorts of evaluations convey information or are susceptible of truth-value analysis.

Emotivism portrays ethical statements as mere emotional utterances, in line with the attempt of logical positivism to eliminate truth claims from all nonempirical statements. Early emotivists included

philosophers such as A. J. Ayer, Charles L. Stevenson, John L. Austin, and, later, Paul Edwards and Margaret MacDonald.

R. M. Hare's theory of prescriptivism has been claimed by many thinkers, including C. L. Stevenson, to be a form of near-emotivism, although this analysis is in dispute.

Imperativism espouses the position that all ethical language is imperative in character. Obviously, much ethical language is overtly and undeniably imperative—for example, "Thou shalt not kill" or "Remember thou keep holy the Lord's Day." In imperativist theory, however, even ethical statements that have the outward form of factual claims are only disguised commands: "Murder is evil" equates to "Do not commit murder," and "Theft is blameworthy" amounts to "Don't steal." Furthermore, because they are commands, they have no informational import and are not susceptible of any truth-claims, since a command can never be true or false.

Since there was no inherent contradiction between the emotivistic and the imperativistic interpretations, a third school evolved that combined both theories into a single supertheory. Emoto-imperativism maintains that any ethical utterance is actually an emotional response, a command, or both simultaneously. Thus, "murder is immoral" can be rendered as "Murder—ugh!," "Do not murder," or "Murder—ugh!—do not commit it."

On the cognitive side of the debate, ethical naturalism interpreted ethical language in terms of nonmoral empirical meanings. A clear example of ethical naturalism is Thomas Hobbes's assertion that to say that a thing is good has the simple meaning that the speaker likes that thing. As one of several alternative theories, one might hold "good" to mean that which would be desired for its own sake by any normal person with knowledge and experience of it, as Jeremy Bentham asserted.

G. E. Moore's discovery of the naturalistic fallacy has been seen by many as fatally undermining ethical naturalism, and that is certainly the case if there is any attempt in the particular ethical theory to imply a conjunction of the specific empirical content of the good and the notion that the good is "that which one ought to do." Without this prescriptive linkage, however, the naturalistic fallacy leaves ethical naturalism unscathed.

INTUITIONISM

Intuitionism has a long history in ethics, dating back at least to the moral philosophy of Lord Shaftesbury, but in modern ethical thought, it has especially been viewed as a possible solution to the metaethical enigmas surrounding ethical language.

The heart of intuitionism holds that ethical statements can be justified without being derived from other types of statements. This noninferential justification of moral judgments has often led intuitionists to call them “self-evident,” but in any case, the clear import of modern intuitionism has been to avoid many of the epistemological pitfalls that have beset other theories of ethical language. Some intuitionists have gone so far as to assert a faculty of moral intuition as a source for all ethical judgments.

Despite the concern of ancient and medieval ethical philosophy with precision of language, it is modern philosophy that has made language one of the central concerns of ethics. Undoubtedly, David Hume’s is/ought problem has been the source of much of this concern.

“Hume’s Law”—the rule that one cannot deduce a prescriptive conclusion from descriptive premises—had the necessary effect of radically cleaving the empirical sphere of facts from the sphere of values. This radical divorcement of is and ought forced a search for new meanings in ethical language, together with the search for an epistemology of ethics that confines ethical terminology within the parameters of general philosophy of language, logic, and truth theory.

Laozi

IDENTIFICATION: Chinese philosopher

BORN: 604 B.C.E., Quren, State of Chu, China

DIED: Sixth century B.C.E., place unknown

TYPE OF ETHICS: Classical history

SIGNIFICANCE: One of the three principal teachers of what later became known as Daoism, and supposed author of the *Dao De Jing*, Laozi (“Old Master Lao,” or Lao Tze in Wade-Giles) is commonly considered to be the founder of the Daoist religion. Daoism calls on its adherents to achieve order in society and harmony in personal life by withdrawing from society, ceasing to strive, and seeking contentment without worldly fame.

Basic facts about the life of Laozi are difficult to verify. Although he is traditionally believed to have lived in the sixth century B.C.E., the earliest information regarding his life and work is found in the works of a Chinese historian of the second century B.C.E. According to this source, Laozi was a native of a small village in the south of China in a state then called Chu, which corresponds roughly to the modern-day region of eastern Henan.

It is said that Laozi served as an official historian to the royal house of Zhou and became well known for his versatile learning. He has been associated with the Li clan, a family whose existence is historical fact, but it seems that this connection was created

during the Han Dynasty, several centuries after Laozi supposedly lived. At this time, the Li clan decided to adopt him as their ancestor, a practice that was common among noble families who wished to relate themselves to heroes of China's past. Some scholars contend that Laozi is a wholly fictitious person, posited by later generations of his followers who wished to ascribe various writings of Daoism to a single source.

DAO DE JING

The document attributed to Laozi, the *Dao De Jing*, or the *Way and Its Power*, is the oldest text of the Chinese mystical tradition. Known also as the *Laozi* after its alleged author, it is a short text of about five thousand Chinese characters. The work is probably not as old as tradition holds it to be. It was most likely compiled from various aphorisms that emerged during China's Warring States period, around 250 B.C.E. Scholars dispute whether it is the product of a single mind or simply a collection of adages drawn from several ancient sources. The *Dao De Jing* can be read in various ways: as a philosophical handbook on how to live prudently in the world, as a discourse on the ways of politics, as a treatise on military strategy, and as a religious tract. Chinese scholars have written hundreds of commentaries on it. A body of popular belief and religious ritual emerged from it that continues to be practiced as one of the major religions of China today.

Laozi believed that genuine knowledge of and insight into the nature of things could be obtained only through mystic intuition. He maintained that all things were composed of two opposite aspects, a kind of unity of contradiction, and much of his teaching inverted the generally assumed order of things. He said, for example, that "the softest thing in the universe overcomes the hardest" and that "seeing the small is insight, yielding to force is strength."

POPULAR DAOISM

The debate about Laozi's life derives from the context in which Daoist thinking gained popularity. The fourth and third centuries B.C.E., a period of anxiety caused by social disturbance and upheaval in China, fostered conditions that were particularly favorable to the development of philosophical and religious reflection. Some people saw Confucianism as the answer to the chaos. This school of thought main-

tained that social harmony derived from the fulfillment of mutual responsibilities in a clearly defined hierarchical system. Others believed that Legalism, which promoted meticulously enforced and stringent laws, was the solution for disorder.

Both of these philosophies were rejected by the Daoists. They argued that the salvation of both individuals and society could not be attained by rigorous loyalty to social codes or laws, but rather by pursuing retirement from the world as a means of mastering it. The aim, they taught, was to preserve and increase one's vital energy by recourse to various disciplines, including contemplation of the Way (Dao) as well as proper diet, breathing, and exercise. This did not exclude work, for the *Dao De Jing* assumes that work is necessary. Rather, work was to be done without rivalry, so that desire, competition, and those motivations that produce conflict would be avoided.

LEGACY OF LAOZI

Later Daoists ascribed a religious connotation to the mystical aspects of the original doctrine of Daoism. The impersonal and infinite force beneath nature became transformed into individual finite human souls, which, after death, became powerful spirits. Many important Chinese gods (of rain, fire, medicine, agriculture, and the kitchen) arose in the Daoist school. The popular Daoism of later times increasingly emphasized magical aspects that typically became attractive when daily life seemed hopelessly difficult. Particularly drawn to this form of Daoist thinking were Chinese peasants who lived on a narrow economic margin where hard work and skill were not always sufficient to guarantee even survival. As a consequence, the average person began to associate Daoism with the world of spirits who had to be placated and appeased. Increasingly, Daoists were expected to select lucky days for such important events as funerals and weddings. A fear of death emerged. This debasement of Daoism in its popular form departs significantly from the teachings of such early philosophical Daoists as Laozi.

Law

DEFINITION: Body of rules enacted by a recognized authority that governs the conduct of the members of a given society, culture, or religion

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: There is no necessary or logical correspondence between secular law and morality, but most societies strive to a greater or lesser extent to craft their laws in such a way as to create such a correspondence. The perception that a law is unjust or immoral may be grounds to disobey that law. The laws of a given religion are generally speaking beyond question by adherents of that religion, although they may be open to interpretation.

Law is that which is laid down, ordained, or established. It is a body of rules of action prescribed by a controlling legal authority and having binding legal force. It is a written code of rules that must be obeyed by citizens, or those citizens will be subject to sanctions or legal consequences. Law is a solemn expression of the will of the supreme power of the state. Law is different from ethics. Ethics have been defined by former Supreme Court Justice Potter Stewart as "knowing the difference between what you have a right to do and what is the right thing to do."

Ethics involve following not only the letter of the law but also its spirit. Ethics are not codified in books. They are that which is moral. Ethics deal not only with conduct but also with motives and character.

Ethics constitute a higher standard than that of law; law dictates the minimum standards of behavior required of a person by society, whereas ethics go beyond what is required. Law comes from principles of morality; morality does not descend from law. Morality is that which pertains to character; it governs conduct not by legislative action or by force but by conscience and a desire to adhere to general principles of right conduct. Morality is a strict belief or conviction in the mind that is independent of legal proof or positive law. Law is essential to preserve society; ethics and morality are essential to sustain it at a higher level.

ETHICS, LAW, AND MORALITY

Ethics are concerned with human values. Often, these values are reflected in jurisprudence and in laws. Legal theory has always concerned itself with morality. Two legal philosophers who wrote a great deal concerning the relationship between law and ethics were Saint Thomas Aquinas, who founded the natural law theory of jurisprudence, and John Austin, who helped establish legal positivism. There are two very different views of law, but both men stressed that law is subject to criticism from a moral point of view, and both believed that there are standards by which it may be properly judged.

Thomas Aquinas, in his *Treatise on Law*, says that "Law is nothing else than an ordinance of reason for the common good, promulgated by him who has the care of the community." He views law as something that is established for the good of all. Austin, however, sees the law as a social element that can be used for good or bad, and that can be exploited as a power tool by those in authority. Austin appears to be more realistic in his assessment of the possibility of the use of law by some to suppress others, since history has demonstrated that law is capable of doing good but has great capacity for evil. It can settle disputes and provide security, and it can lead to and enforce slavery. Law does not necessarily serve the common good and is not necessarily designed to do so. Austin recognizes that law can be good, if it is just and is derived from the laws of nature, as opposed to the laws that are framed by humankind. He says, "unjust hu-

man laws are a perversion of the ideal of law, which is given by right reason and the law of nature.”

Thomas Aquinas taught that human laws are just when they serve the common good. Laws that distribute burdens fairly, show no disrespect for God, and do not exceed the lawmaker’s authority are good laws. When laws fail to satisfy these conditions, however, they are unjust. Then, according to Thomas Aquinas, they do not “bind in conscience.” One is morally bound to obey just laws but not unjust laws. Unjust laws should be obeyed only when circumstances warrant it or “in order to avoid scandal or disturbance.” Human law does not automatically merit respect, and its legitimate claim to obedience depends on moral and ethical considerations that are independent of human law.

THE MORAL BASIS OF LAW

The role of law in enforcing morality is another ethical dilemma in the relationship between law and ethics. Conduct, the immorality of which involves serious rights violations (such as rape and murder), is obviously a proper object of state regulation and laws. The real conflict between law and ethics, however, involves state regulation of conduct that is not unjust or harmful in the sense of committing serious rights violations, but instead is regarded as immoral by the public, such as laws that prohibit sodomy between private consenting adults or laws criminalizing cohabitation. Should the mere fact that the majority of society’s members and their elected representatives view such conduct as immoral serve as sufficient ground for making such conduct against the law?

Democratic societies such as the United States are supposed to allow the majority to have its way. Sometimes, however, liberty-maximizing societies will not be pure democracies and will place severe limits on the will of the majority in order to protect the rights of the individual, as does the Bill of Rights of the U.S. Constitution. Thus, a full moral discussion of the legitimacy of using the law to regulate private behavior that is judged to be immoral by a majority of citizens will mandate, at the very least, a moral theory of justified state coercion, and a moral theory of basic rights will be accorded to citizens in a just society. John Stuart Mill, in his treatise *On Liberty*, claims that the only purpose that justifies a society in coercing any of its members is to prevent harm to others.

Law has an interaction with moral opinion. Laws governing sexual conduct and drug usage confront the ethical issues head-on. What are the rights of the individual in relationship to society? What rights may the collective social body claim to the individual? When people form a society, how are the respective rights of both the individual and society at large to be structured? The general consensus is that both the individual and the society at large have rights that each must recognize, yet what those rights are and what boundaries restrict their invocation are matters of continuing struggle.

The struggle expresses itself in a number of ways, the most significant of which is the conflict between the individual conscience and the law. Should morality be legislated and enforced by law? When law and conscience conflict, which one should be obeyed? Laws seem to originate from moral convictions. Since it is morally wrong to take someone else’s life without justification, murder is illegal. It is by no means clear, however, that all moral convictions of a society, even those of a majority in a democracy, should be enforced by judicial sanctions. Should moral opposition to prostitution and abortion, for example, result in laws prohibiting such activity?

Which moral convictions should be incorporated into the legal code? Who decides which moral convictions are allowed to be incorporated into law: judges, the people, or both? Should the law concern itself with traditionally private immorality (such as homosexual acts) unless the behavior is offensive to public order and decency or exposes to the ordinary citizen something that is offensive or injurious? Is an established code of morality essential to preserving social order, even at the expense of private acts? Should individual liberty and personal choice be limited simply by the moral feelings and convictions of others?

PRINCIPLES OF LAW AND ETHICS

Many great legal philosophers have debated these ideas. H. L. A. Hart, professor of jurisprudence at Oxford University, in 1959 published a detailed view of his theory of the relationship of law and morality in his treatise *Law, Liberty, and Morality*, in which he concluded that there was almost no legitimacy in making certain conduct illegal or criminal unless the conduct was harmful to others. The immorality of an

action was not sufficient to make it illegal. Hart believed that “there must be a realm of private morality and immorality which is not the law’s business.”

Several principles are often used in the legal enforcement of morality as justification for limiting the freedom of individuals. There are the “harm” principles, which state, as did John Stuart Mill, that behavior should be prohibited only if it harms someone. There is the “offense” principle, which states that behavior should be coercively prohibited if it is publicly offensive to others, and there is the “principle of legal moralism,” which holds that behavior should be punished simply because it is immoral. This perception that it is the responsibility of the law to enforce morality is used to justify the regulation of sexual and reproductive conduct, such as homosexuality and abortion. Joel Feinberg, in his essay “Hard Cases for the Harm Principle” (1973), holds that in order to characterize the kind of behavior that society is justified in controlling, the harm principle must be supplemented with a carefully drafted version of the offense principle.

There is a conflict between the individual conscience and the law. If one person believes that abortions are always morally wrong, but the law permits abortions under any circumstance, should that person attempt to prohibit women from obtaining legally permissible abortions? When the conscience and the law conflict, which takes priority? Conscience is an individual’s convictions regarding what actions are right and wrong, morally good or bad. When a person’s moral convictions lead him or her to object to abortion, or to a particular military position taken by the country, that person is also opposed to legal sanctions of abortion or that military position. A law is a rule of conduct prescribed by a properly constituted governing authority, enforced by sanctions, and justified by a mandate to legislate for the public benefit. A law is a rule of conduct that is “on the books.”

Given these principles of conscience and law, a fundamental question arises. When a person is morally convinced that he or she ought to do one thing, yet a legally constituted authority directs otherwise, what is that person to do when the two courses of action are at odds with each other?

People faced with these choices can obey the law; follow their consciences and suffer the legal consequences because they conflict with the law; or follow neither of the previous choices, thus choosing to obey

the law or follow personal conscience as the particular circumstances require. The third alternative seems to require specifying principles in terms of which the decision is made in any given instance to obey the law or follow one’s conscience.

Another set of moral questions about the law is derived from the realization that law is not only a set of rules used to govern society but also a profession. Lawyers, people trained in the law who give legal advice and assistance in legal matters, have certain responsibilities as advocates that may at least appear to conflict with larger responsibilities as a whole. For example, if a defense lawyer makes the best defense for his client and obtains freedom for him, even when he is both guilty and a danger to society, the ethical question is whether this is morally justifiable. As the defendant’s advocate, the lawyer must work for the client’s best interests. As a citizen, however, does the lawyer not owe the best interests of society concern and attention as well? Some people would argue that it is the job of the adversary system to aim at justice and the common good, and that the lawyer’s job is merely to play a part in the system, aiming not at justice but rather at vigorous advocacy of the side to which the lawyer has been assigned. Is this a valid moral defense or simply a retreat from social responsibility?

CONCEPTS OF JURISPRUDENCE

Several different philosophies guide the rule of law as interpreted by the judiciary system, as opposed to the laws that are created by legislatures and elected officials. These are the patterns of jurisprudence, or legal reasoning, which create legal standards of behavior that are as important as the statutes themselves, because they set precedents for others to follow in the enforcement of the law.

There are legal philosophers who are deeply skeptical of both doctrinal analysis and moral evaluation of the law, who see those approaches to law as so infected by prejudices in the status quo as to make them little more than covert political activity. These writers often follow the lead of “legal realism,” which can be defined as the idea that law is simply a prediction of what the courts will decide, and suggest bringing such advocacy into the open and accepting an overtly political conception of the courts and the law, law being simply the exercise of power. The jurisprudential movement known as the “economic analysis of law,”

which encourages judges to decide cases in such a way as to ensure that economic freedom and wealth are protected and expanded, is a free-market version of the realist philosophy.

“Critical legal study,” which advocates interpreting the law in ways that will assist the disadvantaged and exploited, is a socialist version of the same perspective. None of these versions, however, can exist without moral values and moral theory, because it is impossible to justify the importance of caring about whether a person has been exploited or oppressed unless moral values and moral theory have been imposed. After all, exploitation is simply a kind of unjust treatment. Thus, it appears that normative jurisprudence, the moral evaluation of law and the legal profession, will have important tasks to perform as long as human beings seek to regulate their conduct through the use of law.

Normative jurisprudence deals with the appraisal of law and the moral issues that law generates. Human law can be made and changed by deliberate decisions. What direction should those decisions take? Law claims the authority to lay down rules and enforce them. Are its claims warranted? Can people legitimately refuse to comply? Things are done in the name of the law that are not normally justifiable; people interfere in other people’s lives, depriving them of goods, liberty, even life itself. How, if at all, can these practices be defended?

“Analytical jurisprudence” is the form of jurisprudence that questions the fundamental nature of law. What is law? How is it part of a system? How can a decision be made according to the law when the law is unclear? How is the law like or unlike moral standards? Analytical and normative questions concerning law are closely related.

LAW AND MORALITY

The law speaks of rights and responsibilities; duties and obligations; fairness, justice, and justification: Does this mean that the law inevitably contains or satisfies moral standards? Ideas about the essential nature of law have emphasized either its connections with or its separation from morality: Which view is right? Law is a social fact. Laws are commands. By its very nature, however, law is connected with morality. There are legal obligations that are moral obligations, but not all moral obligations are legal obligations, and the constant ethical struggle and changes

in the law represent attempts to determine which obligations should be legal obligations and should be sanctioned by law enforcement and the courts. Are there proper limits to the reach of the law? Are there areas of human conduct that are, in principle, properly beyond legal sanction? Is there a point at which it is correct to say that, notwithstanding the morality and the social preferences and spiritual values and the sensibilities of the public, the suppression of certain actions by law is not the business of the government and must be left up to each individual to determine what is moral and ethical conduct?

From time to time, the facts of a particular legal case raise issues that force people to go beyond precedent, beyond statute, and even beyond the task of constitutional interpretation. The facts of a case may take one to that area where law and philosophy intersect, where one finds lawyers thinking like philosophers and philosophers reasoning like lawyers. As the ethical issues and underlying principles that form American law and jurisprudence evolve, it becomes ever clearer that these cases play a very important role in what American society is to be and what values and standards of conduct it will set for its citizens. In trying to answer such difficult questions, the profession of law and the discipline of philosophy have much to offer each other as they combine to form and reflect the ethical, legal, and economic standards of American society.

Lawyer for the situation

DEFINITION: Lawyer representing multiple parties engaged in a joint endeavor or seeking an amicable settlement who is not partisan for any of those parties

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Advocacy of a counsel for the situation, rather than a counsel for a given party thereto, represents one side in an ongoing debate over the scope of ethically proper relationships between lawyers and clients.

During the 1916 confirmation hearings on Louis D. Brandeis's nomination to the Supreme Court, opponents alleged that Brandeis was an unscrupulous lawyer who was unfit for the high court. Another Boston lawyer, Sherman Whipple, testified about his 1907 conversation with Brandeis on a bankruptcy matter in

which the bankrupt party believed that Brandeis had favored his creditors. Brandeis informed Whipple that he had not represented the bankrupt party personally but had agreed to act fairly and equitably in everyone's interests. Asked whom he represented, Brandeis had replied that he "was counsel for the situation."

In contrast, the prevailing ethical model of a partisan advocate acting zealously and with absolute loyalty to a single client frowns upon a lawyer with divided loyalties, since no one "may serve two masters." Proponents, such as Yale law professor Geoffrey C. Hazard, Jr., argue that a lawyer for the situation can often act more efficiently, with less acrimony, and with a greater insight than is possible with separate representation. Lawyers often represent family members and business associates with largely harmonious interests when relations among them are cooperative rather than adversarial. Although tensions remain, the concept's official recognition has increased since it was publicized in 1916. The 1983 Model Rules of Professional Conduct recognize that a lawyer may "act as intermediary between clients" under strict limitations.

Laziness

DEFINITION: Disinclination toward physical or mental exertion

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The deadly sin of sloth is a species of laziness connoting disinclination to do the will of God or work toward salvation. Laziness more generally may have moral consequences if it is a persistent character trait, but it may also name a passing mood, in which case it is generally thought to be morally neutral.

Acedia ("sloth") was one of the seven deadly sins of medieval ethical tracts, which were termed deadly not because they were necessarily mortal, or unforgivable, but because they were deemed singularly attractive. *Acedia* is a lack of diligence in the love of

God, which may in turn lead to a lack of diligence in performing good works and an inclination toward inactivity.

The idea that idleness is inherently sinful is a post-Reformation one that is tied to the notion that economic prosperity is a sign that a person is one of God's elect. The popular moral literature of the eighteenth and nineteenth centuries is exemplified by William Hogarth's industrious apprentice, who marries the boss's daughter, and the idle apprentice, who is hanged at Tyburn.

The concept of laziness as a character defect is almost absent from early twenty-first century ethical thought; lazy behavior is viewed as the product of physical or mental illness. Disinclination toward exertion frequently accompanies depression, a complex of physiological and mental symptoms triggered by the perception that the situation is hopeless and effort will not change it. To the extent that it avoids futile effort, such inactivity is biologically adaptive.

Attitudes toward inactivity vary widely from culture to culture. The Western attitude that effort expended toward accumulating goods in excess of what is needed for survival is virtuous is far from universal, and the contempt of nineteenth century Europeans for "lazy, shiftless natives" reflects a narrow moral outlook. Avoidance of effort within a social context is damaging in a cooperative enterprise (such as marriage), however, because it deprives others of the fruits of their labors, and is generally censured.

Leadership

DEFINITION: Responsibility for making decisions that direct the actions of others

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Persons in positions of leadership have special responsibilities to behave ethically, both because their actions may have important consequences for the lives of others, and because they are expected to adhere to higher standards than those whom they lead.

There has always been a concern in society regarding leadership and ethics. Perhaps this is due to the recognition of the importance between the two concepts if society is to improve and bring about a certain amount of justice to individuals. Failure in an attempt to develop ethical forms of leadership may have disastrous consequences throughout the world. Individuals, countries, and future generations might suffer immeasurably as a result of leaders who avoid ethical issue. One need only look at the havoc brought throughout the world as a result of authoritarian political leaders of the twentieth century who showed little or no concern for the concept of ethical behavior.

The early twenty-first century has seen many examples of unethical behavior within the American business world that have contributed to public loss of confidence in the national economic system. The negative ramifications of this loss of confidence were felt by investors throughout the world. However, one can also find examples of beneficial results of other leaders who obviously were motivated by ethics. It is thus evident that ethics plays an important role in society. Attempting to practice ethical conduct obviously has its rewards, but unethical conduct has its faults.

IMPORTANCE OF LEADERSHIP

The ties between leadership and ethics are important for a number of reasons. For example leaders are often evaluated on the basis of their perceived ethical judgments. A simple lack of ethics therefore could result in poor evaluations by the leaders' followers. Ethics are also important because of the expectations that followers have of their leaders. Ethical behavior is something that leaders must understand as an unwritten requirement for their positions of authority. To enter into leadership positions without such an expectation contradicts an inherent requirement of the position. A lack of ethical behavior on the part of leaders may bring about negative effects on society, such as mistrust in organizations or general mistrust of a particular culture. This mistrust could also affect other parts of the organization or other entities with which it has contact over time.

Although it is generally hoped that all individuals in American society behave ethically, society expects higher standards of behavior from its leaders than it does from their followers. This is true for several reasons. For example, leaders within the public arena

take oaths of office, pledging faithfully to obey and execute the law. Also, the actions of leaders, both public and private, typically affect larger numbers of people than the actions of ordinary people. When leaders engage in unethical conduct, they may hurt much larger numbers of people than nonleaders can hurt. Finally, leaders are usually expected to set examples for those who are led by them.

Laudatory though ethical behavior is, it does not come without costs. There may be a political cost. For example, judges who dismiss criminal cases because of the improper conduct of the police may not be reelected when citizens in their communities next have the opportunity to vote for judicial offices. There also may be financial costs, including possible loss of jobs. Such losses might negatively affect not only the politician, but also the politician's family. There may also be personal costs in the form of social ostracism by former friends as well as one's neighbors.

Leaders are also often faced with moral dilemmas when they face difficult public issues. This often comes about when they realize that even though their actions may be legal, they may be considered by some to be unethical. For example, abortion or artificial birth control may be viewed as unethical by a certain prominent religious group in this country. Nevertheless, both types of activity are legal in the United States. No matter what the political leader does about these activities, some group will be opposed to the particular public action.

A number of characteristics associated with leaders may affect their image as ethical. For example, a perception of honesty in a leader would tend to enhance that person's favorable image. In addition, a leader who works for the betterment of the majority, yet adequately protects individual minority rights, may also be perceived as ethical. Finally, leaders whose efforts result in improved societies without enriching the leaders might be considered ethical.

Potential future leaders may be made aware of the importance of ethical issues by a number of sources. For example, they should realize what happens to leaders who do not measure up to accepted ethical codes. Any ethical failings that result in leaders being dismissed from office should make other leaders understand what might happen to them if they behave similarly. Leaders can also be informed about attitudes toward particular activities in terms of their relationship to ethical conduct as a result of public

opinion surveys. How one's behavior is projected in the media may also serve a guide to better ethical behavior.

League of Nations

IDENTIFICATION: Council of world powers created to promote international cooperation, peace, and security

DATES: Began formal operations January 10, 1920; officially dissolved April 18, 1946

TYPE OF ETHICS: International relations

SIGNIFICANCE: The League of Nations was the first organization of its kind in modern history. Its effort to prevent war failed, but the experience of the league in the interwar period provided important lessons for the world's major governments in creating the United Nations as a successor organization.

The idea of a league of nations gained currency during World War I in large part because of the enormous human losses caused by the war and the belief of many leaders that only an international organization could prevent the recurrence of such a terrible cataclysm. Woodrow Wilson is credited with promoting the idea of the league, because of the call in his Fourteen Points for the creation of "a general association of nations." There were others, how-

However, despite Wilson's championing of the League, the United States never joined the international organization. (AP/Wide World Photos)

ever, whose influence generated support for an international association of peace-loving states, notably President William H. Taft in the United States, Sir Edward Grey and Lord Robert Cecil in Great Britain, and Field Marshall J. C. Smuts in South Africa. In several allied and neutral countries during World War I, organizations were formed to enlist support for a postwar world organization. Nevertheless, special credit does belong to Wilson because of his leadership at the Paris Peace Conference in 1919 in drafting the Covenant of the League of Nations. The League covenant was incorporated into the Treaty of Versailles, which was adopted at Paris in 1919.

The central purpose of the league was to promote international peace and security. It sought to achieve this end by means of a variety of techniques, of which the most notable was a system for the peaceful settlement of disputes between states and for taking col-

lective action against those nations that committed aggressive war. Other important objectives of the league were economic and social cooperation, disarmament, and national self-determination.

ORGANIZATION OF THE LEAGUE

There were three principal organs of the league: an assembly in which each member was represented; a council that was to be composed of representatives of the United States, Great Britain, France, Italy, and Japan as permanent members plus four others elected by the General Assembly; and a permanent Secretariat headed by a Secretary General. The assembly met annually beginning in September. Assembly decisions required a unanimous vote, thus giving every member a veto. In practice, members who disagreed with the majority often abstained, permitting many decisions to be taken by consensus. During the life of

the league, sixty-three states were members, seventeen members withdrew from the assembly, and one, the Soviet Union, was expelled.

Because the United States declined to join the league, it never joined the council. The number of elected members was increased first to six and later to nine. The council generally met four times a year. While the scope of discussion in the assembly encompassed any issue of international affairs, the council confined its discussion to political problems. Decisions in the council required a unanimous vote, though if the subject was a dispute that was likely to lead to conflict, the parties in contention could not participate in the vote.

The principal purpose of the league was to resolve disputes between states and keep the peace. This responsibility was spelled out in Articles 10 to 17 of the covenant, which embodied what has become known as the idea of collective security. According to Article 10, each member undertook "to respect and preserve as against external aggression the territorial integrity and existing political independence of all Members of the League." Members were to settle their disputes peacefully, and under the provision of Article 16, league members were committed to join in common action against any state that went to war without observing the procedures for peaceful settlement specified in the covenant. Economic sanctions were to be the principal, though not necessarily exclusive, form of sanctions used to bring an aggressor state to heel.

LEGACY OF THE LEAGUE

Although the league is remembered primarily for its political activities, it also made major contributions of a social, scientific, economic, and humanitarian nature. These include work in controlling drug trafficking, protection of women, child welfare, abolition of slavery, and support for refugees. In the political realm, the league is considered to have been a failure, as indicated by the outbreak of World War II less than two decades after World War I.

In fact, the political contributions of the league were significant. Some of its major successes came during the 1920's: settlement of the Swedish-Finnish dispute over the Aland Islands, settlement of the Polish-German frontier dispute in Upper Silesia, and prevention of war between Greece and Bulgaria in 1925. Germany's entrance into the league in 1926

was an important step in the reconstruction of Europe. That step was linked to the signing of treaties known as the Locarno Pact, which guaranteed the inviolability of the Franco-German frontier and the demilitarization of the Rhineland.

The league's political accomplishments were, however, outweighed by its failures, particularly during the 1930's. A major blow to the league's prestige resulted from its inability to act against Japan when that country invaded Manchuria in September, 1931. The Lytton Commission, created by the League Council, determined that Japan was guilty of aggression. The only consequence of the league's investigation was Japan's withdrawal from the organization. The league's first major test of collective security was a failure.

Even more fateful for the league were the half-hearted economic sanctions imposed upon Italy to stop Benito Mussolini's invasion of Ethiopia in 1935. Because oil was not included in the embargo, the sanctions failed to stop the Italian dictator, and in July the assembly abandoned the sanctions. This blow to League prestige proved to be fatal. Within the next three years, Nazi Germany embarked upon a campaign of aggression that the league was powerless to stop. The Rhineland was remilitarized in violation of the Versailles Treaty (1936), Austria was annexed (1938), Czechoslovakia was occupied (1938-1939), and Poland was invaded (1939). The expulsion of the Soviet Union for its war against Finland was the league's last action, but that action reflected the organization's impotence rather than its efficacy.

FAILURE

Several explanations have been advanced to account for the political failure of the League of Nations. The first was the absence of the United States as a member. Without American involvement, economic and military sanctions were very difficult to institute. Second, the decision-making rules of the league made it difficult for the organization to take strong and decisive measures. Third, there were legal loopholes in the covenant that permitted members to evade their responsibilities. Fourth, the league lacked teeth; that is, it did not have military forces at its disposal to use against an aggressor. Fifth, the great powers that dominated the league were unwilling to subordinate their national interests to their commitments under the covenant.

Students of international organization are still divided in their general evaluation of the league: Did it fail because it was too weak or did it attempt to accomplish more than was possible in a world of sovereign states? Whatever the answer, there was enough faith in the principles of the league to make a second effort. The United Nations was organized in such a way as to overcome what many believed to be the flaws of the league. The Security Council of the United Nations has enforcement power that the League of Nations never possessed.

League of Women Voters

IDENTIFICATION: American voter education and advocacy organization

DATE: Founded in 1920

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: The League of Women Voters was founded on the principle that democratic government requires political responsibility on the part of its citizenry. It therefore encourages all mem-

bers of the public to become as informed and politically active as possible.

The League of Women Voters is a direct descendant of the women's suffrage movement. At its jubilee convention in 1919, the National American Women's Suffrage Association, which was the leading women's suffrage organization, voted to dissolve itself because of the final ratification of the Nineteenth Amendment and to form a new body to be known as the League of Women Voters. The amendment enfranchised women in all federal elections. Ratification was completed in 1920, and the league was formally launched at a convention in Chicago.

Although many of the league's organizational principles and bylaws were not clear at that point, the new organization was based on several principles that have been maintained throughout its history. The purpose of the league was to educate the public in general and women in particular regarding public issues by preparing and distributing information and encouraging political participation. Until 1946, the center of the league's internal organization lay in relatively autonomous state associations similar to those that had been so successful during the struggle for women's suffrage. There was considerable disunity. In 1946, the league reorganized itself into a membership association of individuals rather than a federation of state associations. By 1992, it had some 125,000 members in 1,350 chapters all over the United States.

The major thrust of the league's activities continues to be voter education. At the local level, league chapters study issues, distribute information, and sponsor "candidates' nights" at which local political candidates appear and discuss the issues and their candidacies. At the national level, the League of Women Voters has been very active in arranging presidential campaign debates and in attempting to establish debating rules that enhance the quality and educational value of the discussion. The league, although nonpartisan, has never shied away from taking positions on national issues; for example, the league supported American foreign aid during the 1940's and 1950's, and the recognition of China during the 1960's. The league continues to be a force for the rational study of public issues and for moderation in politics.

Legal ethics

DEFINITION: Standards of moral and professional behavior governing members of the legal professions

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: American legal ethics evolved with the growth of the country, resulting finally in the American Bar Association's 1983 Model Rules of Professional Conduct.

Ethics are a mixture of honesty, decency, manners, and etiquette. They are not rules or laws imposed by others; rather, they are personal, internal mechanisms arrived at through self-evaluation and self-knowledge. Legal ethics are also internal individual beliefs. In the narrowest sense, legal ethics concern professional conduct. More broadly, they encompass the moral lives of lawyers and their behavior toward clients, courts, and colleagues. Legal ethics are fraught with the potential for conflict, as members of the legal profession can find themselves with conflicting loyalties.

Lawyers are taught that loyalty to a client should be foremost; personal interests and the interests of others should be relegated to second place. Lawyers should counsel their clients on the best way to use the law to their advantage and, if necessary, how to escape or mitigate its effect. Conflict often arises between the public trust a lawyer owes as an officer of the court and the loyalty owed the client. A lawyer may have to make a decision whether to report a client's improper behavior to the court and put public trust first or to counsel the client to cease and put the client first. In some cases, conscientiously and loyally representing a client may lead to civil disobedience or to the public impression that a lawyer is unethical and unprincipled.

ETHICS AND COMMON LAW

In addition to being personal, legal ethics derive from discussion and meeting with other members of the legal profession and agreement as to what is expected and accepted behavior. This tradition is found

in English common law. King Edward I of England decreed in 1292 that the Court of Common Pleas was to choose lawyers and students to take part in court business and that these individuals were to live together under the supervision of the court. Also in the thirteenth century, the Inns of Court were established. True inns, they became places for people studying and practicing the law to live and work together under the supervision of judges. From this community, through discussion, came a set of professional mores guiding those engaged in the law and setting certain ethical behaviors and standards. American law and ethics followed the English pattern for a time.

As the United States expanded westward, however, and as the nation's commercial enterprises diversified, new types of knowledge and expertise were needed. This knowledge had to come from experience rather than from books or from the court itself. At the same time, the tradition of spending evenings with colleagues at the end of a day in court—a time for discussing mutually accepted rules and self-government—was becoming a thing of the past. Because there was less internal pressure to be faithful to established legal principles, ethical problems began to arise more frequently, and there was a growing movement urging the state to begin regulating the practice of law. Yet the rapidly increasing complexity of American law made it obvious to many observers that those who knew the legal system best—the lawyers themselves—would have to be the ones to develop new ethical guidelines or rules of professional conduct. In 1836, one of the first extensive considerations of American legal ethics was published by University of Maryland professor David Hoffman. His *Fifty Resolutions in Regard to Professional Ethics* dealt with etiquette and ethics and attempted to discourage behavior that would reflect badly on the legal profession.

WRITTEN RULES

Pennsylvania judge George Sharswood's written lectures on professional deportment, *The Aims and Duties of the Profession of the Law* (1854), noted the differences between professional and personal ethics and served as the basis for the Code of Professional Ethics, enacted by the Alabama state bar in 1887. Alabama's was the first state bar to enact such a code. The American Bar Association's Canons of Professional Ethics, also drawing heavily on Sharswood,

were promulgated in 1908. By 1920 the canons had been adopted by all but thirteen of the state bar associations, although not without modification.

The canons were detailed, dealing with the positive obligations of a lawyer, such as the duty to represent the poor and indigent. They were largely hortatory in nature, intended as professional rules rather than public laws. By 1969 the original thirty-two canons had grown to forty-seven, supported by more than fourteen hundred interpreting opinions, often lacking coherence and consistency.

The American Bar Association (ABA) recognized the shortcomings of the canons. It sought rules that would exhort lawyers to uphold the highest standards of justice upon which the country's legal system was based, that would weed out those whose standards could damage the reputation of all, and that would provide standards for new lawyers. The Code of Professional Responsibility was therefore adopted, amended as needed, by all state bar associations except California, which adopted its own similar rules. The code had three parts: canons, expressing standards of professional conduct; ethical considerations, setting aspirational objectives toward which all should strive; and disciplinary rules, setting the minimum standards of conduct to avoid disciplinary action. Supreme Court decisions in the 1970's that addressed legal advertising and fees, as well as continuing problems with the ethical considerations, necessitated a new document.

In 1983 the American Bar Association produced the final version of the Model Rules of Professional Conduct. By the early 1990's most state bar associations had adopted the model rules, sometimes with substantial revision. The model rules focus more on mandatory guidelines for the legal profession than on moral considerations.

Bar association grievance committees have the ability to investigate complaints and, if necessary, refer the complaint to the court for further action. Disbarment may be recommended if a lawyer is found untrustworthy to advise and act for clients or if the lawyer's conduct reflects on the dignity and reputation of the court and the legal profession. Disciplinary codes cannot replace ethics and personal ethical behavior. They can only make it difficult for those guilty of unethical behavior to continue in the practice of law.

Leibniz, Gottfried Wilhelm

IDENTIFICATION: German philosopher

BORN: July 1, 1646, Leipzig, Saxony (now in Germany)

DIED: November 14, 1716, Hanover (now in Germany)

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: A leading Protestant philosopher of the Enlightenment, Leibniz attempted, in such works as *Theodicy: Essays on the Goodness of God, the Freedom of Man, and the Origin of Evil*

(*Essais de Théodicée sur la bonté de Dieu, la liberté de l'homme et l'origine du mal*, 1710) and *New Essays Concerning Human Understanding* (*Nouveaux essais sur l'entendement humain*, written 1704; published 1765), to reconcile faith and reason.

A “universal genius”—mathematician, scientist, diplomat, historian, ecumenist, and philosopher—Leibniz was “the pathfinder of the German Enlightenment.” For the last forty years of his life, he worked for the House of Hanover, principally as the royal librarian. A devout Lutheran, Leibniz, in an age of increasing determinism and materialism, strove to envision a worldview that was rational, hopeful, and spiritual. Reality for Leibniz was composed of an infinite number of individual spiritual substances (“monads,” from the Greek word meaning “one”), arranged in an ascending order of consciousness from nearly nothing to God (“the Supreme Monad”). Created by God, this is “the best of all possible worlds,” since in it an infinite being chose to honor the limitations of finitude. So-called evils (material, mental, or moral) contribute to the ultimate good of the universe. This intelligent and benevolent world is rational, and all things in it exhibit a pre-established harmony, or “unity.” Such a universe invites ethical action that is both personal and social, both thoughtful and charitable.

Lemkin, Raphael

IDENTIFICATION: Polish legal scholar and political activist

BORN: June 24, 1900, Bezwodne, Russian Empire (now in Belarus)

DIED: August 28, 1959, New York, New York

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Lemkin is credited with coining the word “genocide”; his vigorous efforts to have genocide recognized as a crime under international law facilitated the passage of the United Nations Convention on the Prevention and Punishment of the Crime of Genocide in 1948.

Raphael Lemkin began formulating his legal theories about the annihilation of national, religious, and racial groups when he was a law student in post-World War I Poland. Sensitized to organized mass persecution as a young Jewish child in Imperial Russia, he developed an intellectual interest in government-condoned killing as a university student, when he learned that there was no legal basis for prosecuting the perpetrators of the 1915 massacre of Armenians in Turkey. Lemkin’s formal support for the codification of laws against acts of mass killing began in 1933 when he unsuccessfully urged adoption of an international treaty that was to punish acts of mass killing, at a meeting of the Legal Council of the League of Nations in Madrid, Spain.

Lemkin spent the ensuing years in private legal practice and was forced to flee Poland in 1939, when Germany invaded the country. After immigrating to the United States, Lemkin taught at several universities and served as a legal expert for the U.S. War Department. Profoundly influenced by the cruelty of the Nazi wartime policies in occupied Europe, Lemkin continued to write and solidify his ideas on the codification of punishment for crimes against humanity. He also served as a legal consultant to the chief U.S. prosecutor at the Nuremberg Trials.

Lemkin defined the word “genocide,” which combines the Greek word *genos* (race) and the Latin *cide* (killing), as a deliberate destruction of a racial, ethnic, religious, or political group. He first used the word in his 1944 book, *Axis Rule in Occupied Europe*.

Lenin, Vladimir Ilich

IDENTIFICATION: Russian political leader

BORN: Vladimir Ilich Ulyanov; April 22, 1870, Simbirsk, Russia

DIED: January 21, 1924, Gorki, Soviet Union

TYPE OF ETHICS: Modern history

SIGNIFICANCE: One of the most influential political figures of the twentieth century, Lenin founded the Soviet Union, creating a national government based on the theories of Karl Marx and setting an example for others to do likewise.

V. I. Ulyanov Lenin was one of the most influential political leaders of modern history. His significance was both theoretical and practical. His two more significant theoretical contributions revolved around his theory of imperialism and his conception of the Communist Party. His practical contribution was as the maker and sustainer of one of the great revolutions of modern history.

LENINISM IN THEORY

Lenin's theory of "imperialism, the highest stage of capitalism," attempted to address the principal problem confronting Marxism during the last years of the nineteenth century and the early years of the twentieth century. Simply put, the advanced industrial powers appeared to have avoided many of the debilitating contradictions that Marx had predicted would cause the final crisis in the fourth stage in his theory of the historical process—capitalism. Marx believed that the anticipated crisis of capitalism would inevitably trigger a worker revolution, thereby advancing history to its fifth and culminating stage of history—socialism. Conversely, however, without the crisis of capitalism, there could be no revolution.

Drawing upon the thought of several other European Marxist and English liberal theorists, Lenin posited that the advanced industrial economies had temporarily avoided the contradictions central to Marxist theory by expanding their economies to engulf the entire globe. In doing so, the capitalists had been able to secure cheap labor and raw materials, as well as markets for products and outlets for surplus capital. This process had allowed the capitalists to derive "superprofits," which had, in turn, been partly used to bribe the workers in the advanced industrial countries and thereby postpone the inevitable crisis and revolution. Lenin referred to this expansion of the industrial economies to a global scale as "imperialism."

Lenin went on to maintain, however, that imperialism could not last in perpetuity but would inevitably be overcome by its own contradictions and give way to socialism as Marx had originally predicted. In

the broadest sense, Lenin argued that once the industrial economies had expanded to engulf the entire world, the contradictions that Marx had anticipated would eventually be activated. Monopolies and states would violently compete for global domination, with weaker competitors being driven from the field. Lenin further theorized that the imperial states would fight wars for the distribution of colonies and semicolonies, conflicts that would devastate both winners and losers.

Ultimately, the decline in superprofits and the costly international conflicts would force the capital-

Vladimir Ilich Lenin. (Library of Congress)

ists to withdraw first some, and eventually all, of the material and political concessions made earlier to the workers in the advanced industrial countries. This, combined with the suffering caused by the imperialist wars, would yield a dramatic increase in societal tension. Thus, the final crisis of capitalism would emerge, resulting in the eventual but inevitable overthrow of capitalism by the workers of the industrial states and the entry into history's culminating stage of socialism.

Lenin's other principal theoretical contribution to the Marxist movement was his conception of the Communist Party and its role as an agent to advance the historical process. Marx had expressed optimism that the workers of the advanced industrial countries would acquire both the impetus and organizational skills necessary to make the proletariat revolution merely by experiencing the deteriorating socioeconomic conditions within mature capitalist systems. Lenin, however, disagreed. He acknowledged that the workers would be aware of their increasingly miserable conditions and would, periodically and spontaneously, rise in revolt against their oppressors. Lenin maintained, however, that this nonrational impulse to revolt was not, in itself, motivated or guided by any understanding of the historical significance of the action.

For Lenin, only the "conscious" individuals in society, those who had studied the flow of history as interpreted by Marx and his successors, could understand where their particular society had been and currently was in the flow of history. Only these conscious people were capable of understanding where society was inevitably going and, perhaps most important, assessing the current revolutionary tasks confronting their society as it traversed the road of history. On this basis Lenin defined the Communist Party as composed of those individuals who had gained "consciousness" and were prepared to dedicate their lives on a full-time basis to promoting the revolution and advancing the historical process.

Lenin charged the party with the task of preparing for the moment when the impulse for a spontaneous outburst by the masses against local conditions fully ripened. When that outburst finally occurred, the party would seize the leadership of the revolt and channel it into action that would meaningfully advance the historical process. In short, the party alone was incapable of successfully making a revolution,

while the masses alone, without guidance from the party, would similarly be incapable of taking historically meaningful action. Together, however, the masses, led by the party, would be the agents of history.

PLANNING COMMUNISM

Based upon these considerations, Lenin posited two missions for the party. The long-range mission was to educate the masses so that they might eventually acquire consciousness. Until that long-term goal was achieved, the immediate task of the party was to lead the masses. Since only the party knew what was appropriate policy and proper action for the unconscious masses, the party had a responsibility to guide or, if necessary, coerce the masses into proper action. Thus, although the means to move the masses along lines determined to be appropriate by the party might be manipulative, ruthless, or cruel, in Lenin's eyes, the party knew what was ultimately in the best interests of society. In short, for Lenin, the goal of future societal fulfillment via entry into the stage of socialism justified whatever means were deemed necessary to advance society in that direction.

Finally, since Lenin conceived of the party as being critical to historically significant action, he felt that the party's decision-making process must not be paralyzed by internal division and indecisiveness. To avoid that danger, Lenin argued that the party must employ the decision-making principle of "democratic-centralism." Lenin believed that all party members shared a common commitment to advancing the historical process under the leadership of the party. Thus, Lenin maintained that, with respect to specific policy questions confronting the party, the members of the party should be free to exchange opinions frankly prior to a decision having been made. Once a final decision was made by the party leadership, however, Lenin required all party members to defer to their common commitment to the party as the instrument of history, unreservedly accept that decision, and enthusiastically work toward its implementation. Any further dissent regarding the announced decision would constitute a breach of party discipline. Henceforth, discussion could center only on the manner in which the decision would be implemented.

While Lenin hoped that the principle of democratic-centralism would unite diversity of opinion and freedom of expression with resolute, united action, in

fact, the principle was fraught with difficulties. In reality, any decision and its manner of implementation are much more closely intertwined than the principle of democratic-centralism allowed. Moreover, while in principle the party rules provided for the democratic election of its leadership, in reality leadership recruitment into the party hierarchy soon came to be based upon co-option by the incumbents. Overall, in practice, the democratic element of democratic-centralism yielded to the centralizing component.

Finally, connecting his conception of the party with his theory of imperialism, Lenin came to believe that it would be easier to start a revolution in the less industrially developed countries than in the advanced capitalist states, although he believed that the revolutionary momentum would be more difficult to sustain in these countries. This conclusion would shape Lenin's views regarding the nature and timing of the revolutionary process in Russia.

LENINISM IN PRACTICE

Armed with these theoretical concepts, Lenin made his practical contribution to history—as the maker of the Bolshevik Revolution and the founder of the Soviet Union. In Lenin's eyes, World War I, the first of the anticipated imperialist wars, offered a unique opportunity to advance the historical process internationally. He believed that if the Russian proletariat could seize power, that act would have profound consequences for the entire international system. He argued that Russia was a semicolony, exploited by the advanced industrial powers. Thus, a successful Russian proletariat takeover would disrupt the entire global economy upon which imperialism was based. Moreover, a successful revolution in Russia would signal the overthrow of what many in Europe regarded as the system's most reactionary state.

Finally, in the largest sense, a successful takeover by Russian workers would provide a heroic example for the workers of the advanced industrial economies to emulate. In short, a revolution in Russia, even a democratic one, would serve as the "spark" that would ignite the pyres of revolution in the advanced industrial countries and yield a quantum leap in the historical process. Based upon these considerations, Lenin moved decisively to capitalize upon the revolutionary situation in Russia in 1917; in the autumn, he employed the party to seize power on behalf of the Russian workers.

It soon became obvious that the proletariat of the developed industrial countries would fail to advance history by following the Russian example, overthrowing the existing capitalist order, and resolutely moving toward the final Marxist stage of socialism. Prior to taking power, Lenin had suggested that under these circumstances the Russian workers should launch a revolutionary war designed to liberate the European workers from their capitalist overlords. After taking power, however, Lenin realistically recognized that the new Soviet state lacked the resources to launch such a war of liberation. Moreover, to do so would jeopardize the revolutionary gains that had already been made. Therefore, Lenin decided that the foremost priority for the new Soviet regime would be to protect the revolutionary gains already made in Russia; only insofar as those gains would not be jeopardized would the Soviet Union attempt to spread revolution abroad.

Within Russia itself, however, retaining power was far from certain. The new Soviet regime was immediately confronted by a series of challenges emanating from both within and outside Soviet-controlled territory. Externally, the Soviets were threatened by counterrevolutionaries, national separatists, and the troops of foreign powers. Internally, a variety of noncommunist elements challenged the authority of the Communist Party of the Soviet Union (CPSU).

WAR COMMUNISM

To defeat these challenges, Lenin launched what became known as the period of War Communism. Between 1918 and 1921, he orchestrated a series of campaigns at various levels that were designed to suppress ruthlessly all internal challenges to the monopoly rule of the CPSU, while simultaneously increasingly centralizing the party itself at the expense of interparty democracy. Similarly, Lenin aggressively mobilized Russia's economic resources, although at the expense of such early policies as worker control over industry. Finally, Lenin oversaw the formation of the Red Army and, under his overall leadership, that instrument was used to crush the counterrevolutionaries and national separatists. In the eyes of many party members, however, many of the measures taken during the period of War Communism constituted an abandonment of the ideals of the revolution and were justifiable only as temporary expedi-

ents necessary to retain communist control in Russia. Finally, by late 1920, it appeared that the enemies of the Soviet regime had been routed and that the CPSU had successfully retained power.

Organized elements within the party now began to emerge, calling themselves by such names as the Workers Opposition and the Democratic Centralists, arguing that with the passage of the initial period of threat to the revolution, the party could now turn its attention to realizing the ideals of the revolution, ideals that had been compromised during the period of War Communism. Indeed, the issue of the future of the party and the revolution came to a head at the Tenth CPSU Congress in 1921. Here, Lenin not only successfully defeated the platforms presented by the party dissenters but also resolutely moved to drive them from the party hierarchy and permanently ban factionalism from the party.

CRUSHING OPPOSITION

Fatefully for the future of the CPSU, Lenin opted to sustain and intensify the bureaucratic, centralized, and authoritarian character that the party had increasingly assumed during the period of War Communism. Moreover, he intensified the campaign to crush any opposition to the CPSU monopoly rule over the Soviet Union. Finally, under Lenin's leadership, the party continued its relentless campaign to penetrate and exercise control over all elements of Soviet society. Thus, although with the inauguration of the New Economic Policy in 1921 the regime retreated from some of the extreme economic measures taken during the period of War Communism, the foundations and character of the Soviet sociopolitical, totalitarian system were firmly established by Lenin and his lieutenants.

Although, in his final months of life, Lenin may have had some regrets concerning the direction that the Soviet Union and the CPSU had taken under his leadership, everything that Lenin did during these formative years was consistent with the theoretical approach that he had formulated prior to the takeover in 1917. The ends—the advancement of the historical process—justified any means utilized in pursuit of that goal. Lenin's goal had been to make and consolidate a revolution in Russia led exclusively by the Communist Party. With enormous determination and ruthlessness, Lenin had succeeded in attaining his objective.

Leopold, Aldo

IDENTIFICATION: American scientist and writer

BORN: January 11, 1887, Burlington, Iowa

DIED: April 21, 1948, near Baraboo, Sauk County, Wisconsin

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Leopold was responsible for the establishment of the first U.S. Wilderness Area. His *A Sand County Almanac* (1949) put forward the "Land Ethic," which placed humanity within, rather than in charge of, the ecosystem.

Aldo Leopold's boyhood was dominated by sports and natural history. After completing one year of postgraduate work in forestry at Yale, Leopold spent fifteen years with the U.S. Forest Service in Arizona and New Mexico. There, he developed the idea of preserving large, ecologically undisturbed areas for ecological preservation; in 1924, he precipitated the establishment of the first U.S. forest Wilderness Area in the Gila National Forest of New Mexico. In 1933, he became professor of wildlife management at the

University of Wisconsin. In 1934 he became a member of the federal Special Committee on Wildlife Restoration. He was a founder of the Wilderness Society in 1935.

Leopold made a family project of restoring the ecosystem to its original condition on an abandoned farm he had purchased near Baraboo, Wisconsin. His posthumous publication relating to this experience, *A Sand County Almanac*, has become an environmentalist classic, and the farm has become a research center, the Leopold Reserve. Four of Leopold's five children became prominent, environmentally oriented scientists. Three of them, Starker, Luna, and Estella, became members of the National Academy of Sciences. His son Carl became an established research scientist, and his daughter Nina became director of the Leopold Reserve.

Leviathan

IDENTIFICATION: Book by Thomas Hobbes (1588-1679)

DATE: Published in 1651

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: *Leviathan* is a rational, systematic study and justification of natural rights, sovereignty, and state absolutism. In it, Hobbes claimed logically to deduce a theory of ethics and politics from scientific and mathematically verifiable facts about human nature.

The moral language utilized by Hobbes in his *Leviathan* was expressed by the precise vocabulary of geometry, empirical science, and physics. The mathematical and scientific study of politics adopted by Hobbes did not incorporate a value-free or ethically neutral perspective. Hobbes's political ethical theory was grounded in a causal-mechanical and materialistic metaphysical theory. Hobbes's mechanistic scientific model was explanatory of all existence, since the universe consisted of interconnected matter in mo-

tion. This complex political theory and set of ethical arguments were deduced from Hobbes's pessimistic interpretation of human nature in the context of an original, or primitive, condition.

It was in this highly unstable, anarchic, and violent state of nature that individuals competitively pursued their self-interests. Hobbes depicted with bleak realism "the life of man solitary, poor, nasty, brutish, and short." The political ethics in *Leviathan* were justified primarily by the natural human egoistic motivation of fear of violent death, and secondarily by the passions for power and material possessions. Therefore, self-preservation was the most fundamental natural right and was the central reason for individuals to leave the state of nature and enter into commonwealths.

Hobbes's articulation of the normative egalitarian principle of universal natural rights was expressed in conjunction with his radical rejection of the principle of the divine right of kings. Hobbes's rejection of moral objectivism was articulated in conjunction with his moral relativism, which claimed that the diverse corporeal natures of individuals were explanatory of the multiplicity of value judgments. Moral judgments were identified by a particular individual's appetites and aversions, or mechanical movements toward or away from material objects. There was no *summum bonum*, or universal absolute common good, although the common evil to be avoided was violent death.

Hobbes expressed a political theory of authority that was justified by means of scientific, rational, and logical arguments, in lieu of traditional theories of political legitimacy based upon convention, theology, or the divine right of kings. Citizens of Hobbes's prescribed commonwealth were bound by a social contract or by the superior power of the sovereign to obey all the government's commands, regardless of the moral content of such commands or the intention of the sovereign. Hobbes's core assumption of the natural insecurity of human life was linked to his prescription of an absolute monarchy or a highly centralized parliamentary body as the most desirable form of government.

Levinas, Emmanuel

IDENTIFICATION: Philosopher and Jewish adult educator

BORN: January 12, 1906, Kaunas, Lithuania

DIED: December 25, 1995, Paris, France

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Levinas argued that ethics is the basis of philosophy, and that responsibility to others is the basis of ethics.

Emmanuel Levinas found most philosophers of his day overly occupied with trying to articulate the ultimate nature of “Being”—the reality that lies beyond everyday life. In his view, philosophers should focus instead on the most important concern of everyday life: How people should relate to one another. He himself asked such questions as how can a person respond to the suffering of others, which other people deserve one’s response, and how can one balance one’s responses to different people in ways that achieve justice.

For Levinas, ethics rests on the absolute responsibility that each person has to respond to the face of the Other. In *Time and the Other* (1987) Levinas argued that humans are social beings. They know themselves through their responses to others, not through their relationships with Being or with ultimate reality. In *Totality and Infinity: An Exercise on Exteriority* (1969), he argue that one does not need to know who people “really” are in order to respond to them. In fact, he wrote that it is impossible fully to know another person, even one’s own spouse or children. The best anyone can do is to reach out toward others and grow as others continue to surprise one.

Levinas’s ethical writings for educated Jewish readers reflect his World War II experiences. In *Difficult Freedom: Essays on Judaism* (2d ed. 1976), he describes a stray dog in the German camp in which he was imprisoned. The dog was in a sense more human than his guards, for it responded to the prisoners as if they were human beings. Elsewhere, Levinas argued that he was within his rights not to forgive philosopher Martin Heidegger for his Nazi Party affiliation, because of the great crimes perpetrated by the Nazi party during the Holocaust.

Libel

DEFINITION: Defamation of a person or group by means of writing or visual images

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: To be libelous, defamatory material must generally be both malicious and untrue, and it must be shown to cause actual harm. It must therefore be deemed to be morally indefensible in order to be legally prosecutable. In the United States, libel is one of the few classes of speech not protected by the First Amendment.

Libel is often confused with slander, which is oral defamation rather than written or visual defamation. One’s good reputation is usually among one’s most valuable possessions. Since libel, by definition, damages the reputation of another, it does serious harm and thus is clearly unethical.

Criminal libel is the malicious publishing of durable defamation. In common law and under most modern criminal statutes, criminal libel is a misdemeanor (an infraction usually punishable by a year or less in prison) rather than a felony (a more serious infraction punishable by more than a year in prison). Libel is also a tort, a noncontractual and noncriminal wrongdoing. Libel is thus grounds for a civil lawsuit in which one may seek to recover money to compensate for the damage that the libel has caused to one’s reputation. Truth, however, is a defense against libel, and even if the damage is caused by a false claim, if the damaged person is a public figure, then one must show malice (intent to harm) or a reckless disregard for the truth in order to prove libel. Honest mistakes do not constitute libel against public figures. Civil lawsuits against libel and punishment for criminal libel are both limited by the First Amendment of the Constitution. This was the upshot of the landmark Supreme Court

case *New York Times Co. v. Sullivan* (1964) and its progeny. This landmark case was designed to preserve the vigor and variety of public debate in a democracy, balancing democracy against serious harms to reputations in order to avoid a chilling effect on the exercise of the constitutional right of free speech.

Liberalism

DEFINITION: Philosophy holding that human liberty is of paramount importance and rejecting the notion that set values should control the conduct of one whose conduct affects no one else

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: The impact of liberalism on ethics has been profound. According to this philosophy, ethics is a means of resolving disputes created by competing individual goals, protecting one's ability to choose one's own values, rather than serving as a standard that espouses one set of values over another.

In 1869, the British political philosopher John Stuart Mill wrote an essay entitled "On Liberty," which many have come to regard as one of the primary sources of liberalistic thought. In that essay, Mill wrote that the only freedom deserving of the name is that of pursuing one's own good in one's own way, so long as one does not attempt to deprive others of their pursuits. In the nineteenth century England in which Mill lived, there was a struggle between increasing religious strictness and the rebellion that accompanied that strictness. Mill believed that society should not impose its values on anyone, because it is in society's best interest to preserve personal liberty. This belief was based on the theory that individuals who have the freedom to be spontaneous and follow their own desires will naturally form a progressive and happy society.

THE IDEAL OF INDIVIDUAL SOVEREIGNTY

Liberalism seeks to protect the ability of individuals to live according to their own judgments. It is neu-

tral with regard to the content of those judgments, resting on the notion that a self-governed life is good in and of itself. Thus, normative ethics in a liberal society are geared to improving the individual and resolving the disputes caused by competing desires, while at the same time maximizing individual freedom.

Moral standards prescribing what is right and wrong are inconsistent with liberalism in its purest sense, as they interfere with the ability of individuals to explore and develop their own beliefs. Accordingly, the concept of normative ethics, those prescribing good habits and duties, necessarily gives way to a sort of situational ethics. Individuals must have the freedom to decide when their conduct harms others, or the very ideal of individual sovereignty is compromised.

CLASSICAL VS. MODERN LIBERALISM

In its early stages, liberalism was associated with a laissez-faire approach to government. This was largely because government was generally viewed as an oppressor of the individual. The form of liberalism promoting this pro-individualist theory of government is sometimes called classical liberalism. In its modern form, however, liberalism is more commonly associated with increased government involvement in societal matters. It promotes the imposition of societal mechanisms that foster both social and economic equality, with the aim of giving the individual meaningful life choices. This change in liberal philosophy is sometimes known as the Great Switch.

Some philosophers have difficulty reconciling modern liberalism with the premise of classical liberalism. For example, societal laws concerning equal treatment, compulsory education, and publicly supported social welfare programs require an interventionist state and thus interfere, to at least some extent, with individual liberty. However, such laws are seen by liberal thinkers as a necessary means to achieve the end of individual sovereignty. In other words, unless individuals are given equal opportunities, only the privileged can maximize the benefits of individual sovereignty.

LIBERALISM AND ETHICS

According to liberalistic thought, the overarching ethical principle is that of individual freedom. Thus,

the only ethical model that is consistent with this principle is one that does not impose any particular value system. Whereas traditional ethics often praise selfless acts and condemn those motivated alone by self-interest, liberal thinkers believe that the natural selfish desires of human beings will ultimately lead to progress and happiness for all of society's members. The question thus becomes whether any principles that do not presuppose any particular vision of the good life can be found.

Philosopher Ayn Rand advocated what she called "rational" self-interest. Under this approach, the individual must adopt certain character traits, or virtues, that help one develop a rational approach to making judgments about one's own life. For example, virtues such as integrity—consistently acting in accordance with one's beliefs—and honesty ensure a rational approach to self-governance. Thus, ethics that provide for development of the self ensure that the principle of individual sovereignty has the desired result on society as a whole. In other words, ethical obligations are generally owed to the self rather than to others. The major ethical dilemma posed by liberalism is the development of a principle by which conflicting individual conduct can be resolved.

Libertarianism

DEFINITION: Political movement advocating absolute personal liberty and the severe limitation or elimination of government

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Libertarianism treats individual autonomy as the highest good. As a result, libertarians are commonly on the left wing in terms of civil rights and on the right wing in matters of economics and public policy.

The libertarian movement consists of a diverse group of individuals who are united in the view that any social or political institution is wrong if it interferes with individuals' control over their own lives. Libertarians defend property rights, the free-market economy, and the full range of civil freedoms, including the rights to abortion, freedom of speech and the press, sexual freedom, and the use of drugs and alcohol.

Libertarianism should be placed on the political spectrum in contrast to conservatism, modern liberalism, and totalitarianism. Conservatives are generally in favor of more economic freedoms but fewer civil freedoms; conservatives typically favor anti-abortion, antidrug, antisodomy, and some censorship laws. Modern liberals are generally in favor of more civil freedoms but fewer economic freedoms; modern liberals typically favor compulsory wealth-redistribution schemes and increased regulation of business. Totalitarians reject liberty in the economic and civil realms. In contrast to these three major political movements, libertarians claim to advocate both civil and economic liberty consistently.

HISTORY

Libertarian theory has roots in the history of modern political and economic thought. It draws on ele-

ments of the classical liberal tradition in politics, as exemplified in such thinkers as John Locke. Some libertarians emphasize classical liberalism's contractarian tradition, while others emphasize its natural rights tradition. Modern philosophers Robert Nozick and John Hospers are representative of these positions. Libertarianism also draws upon the anarchist tradition of the nineteenth century. Murray Rothbard, usually acknowledged as the founder of modern libertarianism, is a major representative of this tradition.

In economics, libertarianism has drawn inspiration from the "Austrian" school of economics, most notably from the work of Ludwig von Mises and Nobel laureate F. A. Hayek, and from the "Chicago" school of economics, most notably from the work of Nobel laureates Milton Friedman and James Buchanan.

JUSTIFICATIONS FOR LIBERTY

Libertarians disagree among themselves about how to justify the claim that liberty is the fundamental social value. Some believe that political liberty is an axiom: The value of liberty is self-evident and therefore not in need of justification. Most libertarians, however, offer arguments for liberty.

The most common argument starts with the premise that values are subjective. No individual's values are more right than any other's. The only universal points that can be made about values is that individuals have them, and in order to pursue their values, individuals need to be free of coercion by other individuals. Consequently, the only universal social principle is that the initiation of the use of force by one individual against another is wrong.

Other libertarians justify liberty via social contract arguments. Supposing a Hobbesian or Lockean state of nature, contractarians argue that rational individuals with conflicting interests would agree upon a set of legal constraints that would limit each individual's liberties only to the extent necessary to leave all other individuals at liberty. Therefore, rational individuals would voluntarily contract to institutionalize in their society the broad principle that the initiation of force is wrong.

A third group of libertarians justifies liberty by first arguing for universal and objective moral principles. Appealing to Aristotelian self-realization teleology, Lockean natural rights, or Kantian duties to

treat others as ends in themselves, such libertarians derive the conclusions that using force against individuals is immoral and, accordingly, that only political liberty is compatible with their broader moral framework.

As much as these proposed justifications of liberty differ, all libertarians reach the same conclusion: Individuals must be left free to do what they wish with their own lives and property.

ROLE OF THE STATE

Libertarians also disagree among themselves about the extent of the role of the state in promoting liberty. The state is a coercive institution, and states have regularly used their coercive power to violate individuals' liberties through arbitrary laws, the sanctioning of various forms of slavery, compulsory taxation, compulsory military drafts, and so on. Reacting to these facts, libertarians fall into two major groups. One group, the anarchists, argues that the state is an inherently evil institution that should be abolished. The other major group, the "minarchists," allows that the state can play a limited role in promoting liberty.

Minarchist libertarians are divided into two subgroups. Some minarchists agree with the anarchists that the state is an evil, but unlike the anarchists they believe it to be a necessary evil: The state can be valuable in protecting the liberties of some individuals, but this value must be balanced against the inevitable abuses of the state's coercive power to violate individuals' liberties.

Other minarchists argue that the state is an inherently good institution, as long as its coercive power is constitutionally limited to defensive purposes and these limits are enforced strictly. In either case, minarchist libertarians agree that the state's functions should not extend beyond basic police, military, and judicial functions, and that these functions should be funded through voluntary mechanisms, not compulsory taxation. Anarchist libertarians reject any role for the state and argue that even the minarchist state functions can and should be supplied by private, voluntary protection agencies.

In the political realm, however, libertarians agree that they can set aside foundational disputes about the justification of liberty and the scope of the state in order to work together for a goal on which they do agree: the reduction of the current scope of the state.

Library Bill of Rights

IDENTIFICATION: Document of the American Library Association that sets forth policies on intellectual freedom meant to be followed by all U.S. libraries

DATE: Adopted on June 18, 1948

TYPE OF ETHICS: Arts and censorship

SIGNIFICANCE: The Library Bill of Rights is designed to protect the rights of all citizens to free and equal access to information and creative expression. Some provisions of the document may be controversial, especially the insistence (reaffirmed in 1996) that people of all ages should have access to the same materials.

The original text of the Library Bill of Rights was drawn up by Forrest Spaulding. It was adopted for the

American Library Association (ALA) at the ALA Council in San Francisco. Subsequently, the ALA Committee on Intellectual Freedom was established to recommend any steps necessary to protect the rights of library users in accordance with the Bill of Rights of the United States and the Library Bill of Rights. Through discussion and approved emendation by members of the ALA Committee on Intellectual Freedom and by the membership of the ALA, the document was adopted on June 18, 1948, and amended in 1961 and 1980.

The six basic policies that make up the Library Bill of Rights are summarized as follows: (1) library materials should be chosen for the interest and enlightenment of all people in the community; (2) libraries should provide materials that represent all points of view on issues and concerns; (3) censorship should be challenged; (4) libraries should cooperate with those concerned with resisting the abridgement of free expression and free access to ideas; (5) rights of individuals to use libraries should not be denied based on “origin, age, background, or views”; and (6) meeting rooms of libraries should be available to community groups regardless of the beliefs and affiliations of their members.

Life, meaning of

DEFINITION: Notion that human experience as such has a purpose, significance, or value which explains or grounds it, and which could provide guidance as to how one ought to live one’s life

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: If life were determined either to have or to lack a definite and comprehensible meaning, that determination would have profound consequences for all of ethical theory and practice.

Albert Camus’s *The Myth of Sisyphus* (1942) opens with this claim: “There is but one truly serious philosophical problem, and that is suicide.” According to

Camus, judging whether life is worth living represents the most basic of all philosophical problems. Questions about the meaning of one's life are by no means confined to philosophers. Indeed, wondering why one is here and whether anything will come from what one is doing are familiar and pervasive activities. Ethicists offer a variety of responses ranging from the religious ("God provides a meaning for life and everything else"), to the existentialist ("I can give my life meaning"), to the nihilist ("There is no ultimate meaning to life or anything").

MEANING OF THE QUESTION

As with many philosophical inquiries, it is worthwhile to clarify the meaning of the question being asked: "What is the meaning of life?" It is easy to imagine such a question being asked by a severely depressed individual seeking psychological counseling or guidance, but this is not the context for the philosopher's concern.

The philosopher (or any reflective individual) comes to inquire about the meaning of life as a natural consequence of being self-conscious and rational. As people mature, they learn to make observations, generalize, offer explanations and predictions, and so on. Being rational means looking for explanations in terms of rules, principles, and theories, which are established by reason and by empirical methodologies. Being self-conscious involves awareness of one's rationality. Once one becomes aware of one's own rational nature and outlook, it is tempting to turn that rational outlook inward and seek an answer to the question "Why am I here?" in much the same way that one seeks an answer to the question "Why is that mountain here?" Another way of expressing the philosopher's question, then, is as follows: "Why am I self-conscious? What is the purpose of my self-awareness?"

This interpretation of the question about the meaning of life can be represented as "What is the meaning of my life?" Other questions about the meaning of life could focus on all life, or all animal life, or selected groups of human life, or all intelligent life, and so on. The philosophical question about the meaning of life, however, focuses on the meaning of an individual human life.

The reflective inquirer recognizes this principle: When one is wondering about the meaning of life, the most one can legitimately wonder about is the mean-

ing of one's own life. One is not in a position to know the meaning of another person's life or to place a value on another's life.

TRANSCENDENTAL RESPONSES

There are two sorts of responses to the question about the meaning of an individual's life. One sort of response seeks an answer in something transcendental, or beyond this world. By far the most prevalent views of this sort are religious, and they are too numerous and varied to review here. Some nonreligious, mystical views about the meaning of life also invoke a transcendental and nonrational reality.

Transcendental explanations are not satisfying to skeptics, who ask for direct and obvious evidence of nonevident realities. The transcendental view that the meaning of an individual life (along with the sense of the whole universe) must lie outside the universe is subject to Ludwig Wittgenstein's criticism in *Tractatus Logico-Philosophicus* (1921) that things that are claimed by their very nature to be beyond the experiences of this world are among the things about which we are incapable of clear and meaningful discourse: "What we cannot speak about we must pass over in silence."

There are responses to the question about the meaning of life that do not ultimately rely on appeals to transcendental realities. In addition, there are a variety of types of nontranscendental responses. For example, positivists argue that the meaning of life is a question without an answer, because potential answers are not subject to independent verification or refutation; as a consequence, the meaning of life must remain a permanent mystery. Hedonists argue that the meaning of life is determined by the pleasures enjoyed in this life. Nihilists argue that there are no enduring values of any kind, no sense to anything, including one's own life; they often cite the prevalence of natural disasters, wars, and pettiness as evidence supporting their own view. While these responses differ widely, they share a common emphasis on the evidence of this world as that which determines what, if any, meaning attaches to life.

The most prevalent philosophical view of this type traces its history from Socrates in ancient Greece to Jean-Paul Sartre and other modern existentialists. What existentialists have in common is an emphasis on the actions of an individual in this world as the primary determinant of the meaning of that individ-

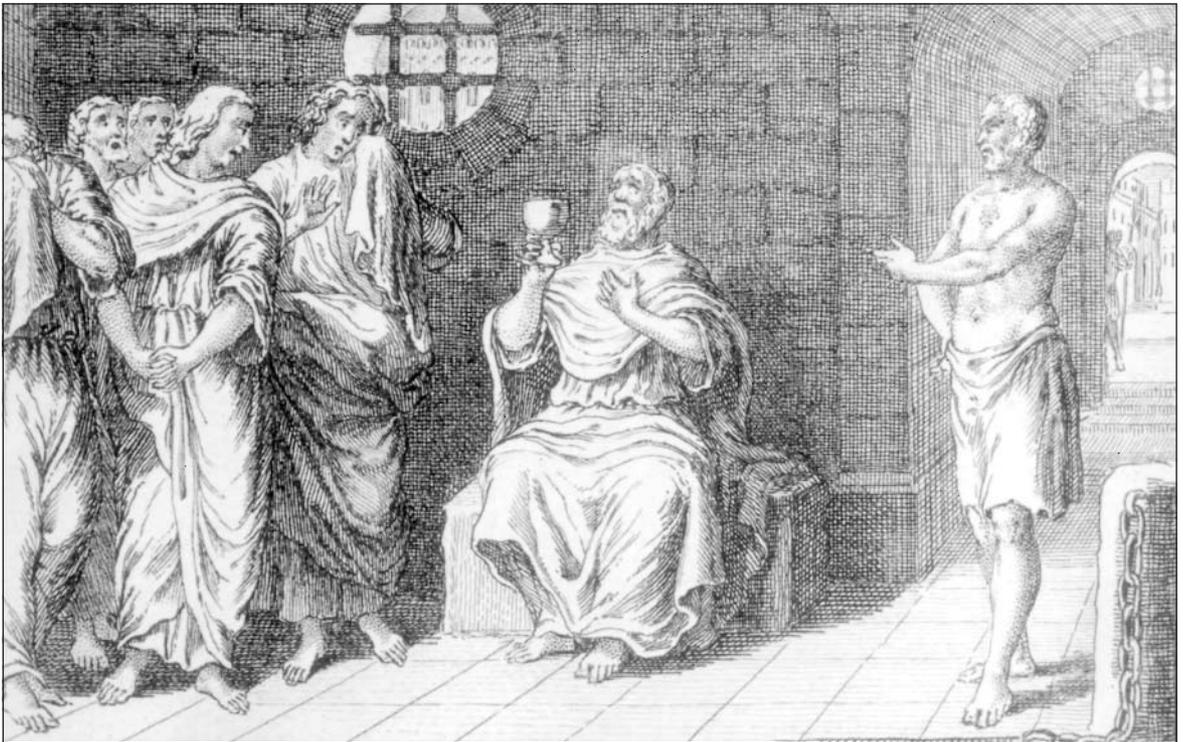

ual's life. Existentialists generally believe that how one lives one's life shows what one thinks of oneself. Because existentialists emphasize individual choices and human actions, their views are categorized as generally nontranscendental, although many existentialists accept the existence of transcendental realities.

THE EXAMPLE OF SOCRATES

The life of Socrates is often cited as an early example of existentialism. Most of what is commonly believed about the life and death of Socrates can be traced to four Platonic dialogues: *Euthyphro*, *Apology*, *Crito*, and *Phaedo* (for example, see Romano Guardini's *The Death of Socrates*, 1970). In the *Euthyphro*, Socrates is shown inquiring into the nature of piety. The situation is that the elder Socrates meets the youth Euthyphro at the city courthouse. Socrates is there to respond to charges of impiety and corruption of youth. Euthyphro, who is there to file questionable murder charges against his father, claims to understand the true nature of piety. Socrates'

subsequent examination of Euthyphro's exaggerated claim is filled with irony and can be viewed as illustrating the character of Socrates as well as the general nature of Socratic inquiry. Socrates shows each of Euthyphro's definitions of piety to be deficient or confused, yet Euthyphro persists in his naïve belief that whatever is pleasing to the gods is holy and presumably proceeds to press charges against his father.

The *Apology* recounts the trial of Socrates. More of Socrates' irony and sharp wit are revealed, as Socrates mocks his politically powerful accusers while offering carefully reasoned defenses against each of the charges. Socrates is found guilty by a narrow majority of the 500 judges and is offered the opportunity to suggest an alternative to the death penalty proposed by the accusers. Socrates facetiously considers a series of alternative penalties, ranging from public support for his inquiries to a very minor fine, taking the opportunity once again to ridicule accusers and judges. Socrates is sentenced to death and takes the opportunity to make a final speech in which he re-

Engraving of Socrates taking hemlock by the eighteenth century French artist Louis Pierre Boitard. (Library of Congress)

peats his faith in the divine voice that warns him of exaggerations and other wrongs, imagines an after-life filled with interrogations of ancient heroes, and asks his friends to punish his sons if they claim to know things that they do not know.

The *Crito* depicts Socrates' brief stay in jail awaiting execution. Socrates refuses opportunities to escape as inconsistent with his beliefs and continues to make philosophical inquiries about the nature of justice and other issues. The death scene is depicted in the *Phaedo*. On the day that Socrates is given the poison hemlock, he is visited by a group of friends, and they discuss the meaning of life and death. Socrates' dying words to his friend Crito were: "I owe a debt to Asclepius [the Greek god of healing]; do not forget to pay it."

The Socrates that emerges from these dialogues is an individual entirely dedicated to a search for truth (especially with regard to ethical matters), determined to expose popular views as exaggerated and confused, capable of great irony and insight, and subject to the divine guidance of an inner voice. Socrates clearly reflects the basic existentialist outlook in the *Crito*: What one does shows what kind of person one is. Socrates is not the kind of person who acts against his beliefs and breaks the laws. The existentialist credo found in Socrates can be stated as follows: One's life shows what one thinks of oneself. Socrates urges people to think highly of themselves.

THE PROBLEM OF SOCRATES

Socrates presents challenges to traditional views about justice, piety, and goodness but offers no positive account of his own about these ethical concerns other than the example of his own life. Yet Socrates' life is essentially unique—Socrates hears and obeys a divine inner voice. Socrates cannot say, "Be like me; get an inner voice." Socrates can give no account of his divine voice, and even he regards the fact that he hears this voice as mysterious.

In Friedrich Nietzsche's *Twilight of the Idols* (1889), another problem with Socrates is elaborated. On most ethical matters Socrates remained an inquiring skeptic, yet with regard to the value of life, Socrates became dogmatic, as best reflected in his dying judgment that life is worthless: "To live—that means to be sick a long time; I owe a debt to Asclepius, the savior." Nietzsche argues that the value of life can be estimated or judged neither by the living, for they

constitute an interested and biased party, nor by the dead, because they are not talking. Therefore, Nietzsche argues, the problem of determining the meaning of life is a problem of will, not one of reason.

THE EXISTENTIALIST VIEW

The existentialist view is that each individual is responsible for beliefs held and actions selected, including whether to regard Socrates as a heroic seeker of truth, an eccentric teacher, or a corrupter of youth. Jean-Paul Sartre's *Existentialism* (1946) presents a clear explication of the fundamental tenets of existentialism, including the following: human existence precedes essence; subjectivity must be the starting point of any inquiry; some freedom of action exists; and in choosing who one becomes as an individual, one is choosing how to regard humanity. Part of the human condition is the predicament of choice—choosing one's emerging character. Sartre's existentialism carries a two-sided message: One has freedom and a burden of choice with regard to the kind of person one chooses to become. Sartre's advice is not unlike that of Socrates: Think highly of yourself. Of course, the existentialist leaves the specific interpretation of the word "highly" in the phrase "think highly" to the individual.

A recurrent theme in existentialist writings is that individuals can give meaning to their lives. While it is not possible to state precisely the particular meaning of an individual's life, it is possible to suggest what meaning an individual gave to life by an elaborate tale or story, as found in novels, for example. Indeed, the novels of Jean-Paul Sartre and Albert Camus are often cited as examples of existentialist literature, as are the works of Fyodor Dostoevski and Leo Tolstoy.

This existentialist notion that certain things (such as how one values life) show themselves or make themselves manifest is consistent with the positivist critique of ethical language as meaningless. Ludwig Wittgenstein's *Tractatus Logico-Philosophicus* makes this distinction explicit: there are things that cannot be put into words, these things make themselves manifest, and an example of something that makes itself manifest is "There are laws of nature" (ironically put in words).

The results of positivist attacks on ethical language include an eruption of all kinds of artistic endeavors meant to illustrate existentialist notions about enduring the human condition, choosing in the

face of an absurd existence, accepting the responsibilities of choice, and so on. As a consequence, there now exists a substantial body of existentialist literature, philosophy, and art, which makes this area of philosophical inquiry unique in its multidisciplinary approach to the question of what it means to be a person. The appeal of an existentialist outlook is partly the focus on one's entire life rather than on a specific aspect of life such as one's physical attributes or intellectual abilities.

Existentialists typically place great emphasis on human choice and action, shifting the focus of the question about the meaning of life from reason to will. Existentialists would accept the usefulness of high-sounding ethical pronouncements (such as "The unexamined life is not worth living" or "To thine own self be true") but would argue that how one chooses to live in accordance with those and other maxims is the crucial issue—not the maxims themselves.

An existentialist ethical view might be encapsulated in words such as these: Become a voice that comforts and encourages, a hand that guides and assists, an eye that sees and reflects, a face that does not turn away, a person whose life shows what a person can become. Ultimately, however, it is not the words that matter. What matters is the comforting, encouraging, guiding, assisting, and so on.

In summary, there are two basic ways to understand questions about the meaning of life. One can think of the meaning of life in terms of what God can make it or in terms of what one can make it oneself.

Life and death

DEFINITION: Presence or withdrawal of the ineffable motive force that differentiates animate from inanimate matter

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Decisions regarding life and death are usually thought to be the most important and most difficult of all ethical issues. Specific definitions of life and death may determine the parameters of one's legal, ethical, economic, and personal obligations.

Since humans do the defining, all life is defined from the standpoint of human life. Definitions of life reflect the complexity of human life and the various cultural contexts within which the definitions are sought. Definitions of life and death therefore symbolize the concerns of the individuals seeking a definition as well as the culture that supports their search.

Definitions of life and death not only manifest the values and concerns of individuals and society but also determine who lives in that society. If a definition of death, for example, focuses on the irreversible loss of consciousness, then those who have irreversibly lost consciousness are no longer part of that human society because they are no longer considered human. If a definition of human life makes the possession of human DNA equal to being human, then every organism with human DNA is part of that human society.

Definitions also focus on one aspect of human existence rather than another. The word "death," for example, may refer to dying, the death event, or the time after the moment of death. People who say, "I am afraid of death" usually mean that they fear dying. Others, who say they look forward to death, usually mean an afterlife. Today, many people use "death" as it is used in this article to refer to the point at which a living entity changes from a living to a nonliving state.

The focus of modern Western society is on the biological nature of life and death; therefore, its ethical concern is with the biological aspects of life and death. This concern will be the focus of this article.

DEFINING LIFE AND DEATH

No society can exist without explicit or implicit definitions of life and death. People must know when

someone is dead. Without such knowledge, wills could not be probated, burial could not take place, leadership positions in business and politics could not be clearly defined, and life-support systems could not be removed. Without clear definitions of human life and death, one would consider a thing (a cadaver) to be a human person. To treat things as human is not only an intellectual error but also an ethical one.

Western society has had, and still has in many situations, both implicit and explicit definitions of life and death. A person who steps off a curb and is run over by a truck is alive when he or she steps off the curb and dead afterward. One can point to a living person before the event and a corpse after the event. One "knows" both life and death in this situation. Since people need official recognition of what they know intuitively, common law developed a definition of death. In common law, death as the cessation of life is determined by "a total stoppage of the circulation of the blood." People's intuitive judgment and society's legal definition were adequate until modern technologies altered the ability to extend life.

In modern industrial societies, acute death, such as occurs in a truck accident, does not happen often. Most people die slowly, die old, and balance on the edge of death for a long time. The end of life today more properly may be described as "living-dying," because it is an extensive period of time during which individuals know that they will die and usually act differently in the light of this knowledge. This "living-dying" phase of life results in experiences and relationships that never have been dealt with in cultures that do not possess the technological ability to produce such a phase of life. This phase is not present when one is run over by a truck: one moment one is alive, the next one is dead.

Things are different today not only for those in the "living-dying" phase of their life but also for those who are "patients"—those who are ill but will probably get better. A significant number of patients will recover only if they receive a living human organ to replace one of their dead ones. The ability to transplant organs such as the heart, liver, and lungs leads modern society to deal with life and death in a different way. This ability produces a culture whose new definitions of death challenge the human view of life and ultimately determine who is human and who is not.

REDEFINING LIFE AND DEATH

Since death is basically the cessation of life, a definition of death is also a definition of life. If one examines the corpse of an individual run over by a truck, one might notice that, although the person is dead, some parts of her or him are still alive. The heart may be beating and thus may be alive. The hair, fingernails, and many cells are also alive. If someone who was unaware of the person's death examined these human parts, that person would not know whether they came from a live human or a dead human. It could be said, therefore, that human death is a process in which it takes a long time for everything human to die. Yet society treats human death as an event. The laws and customs surrounding dying and death seek to mark a point before which the person is alive and after which the person is dead. Obviously, something more than cellular death is needed to indicate when a person is dead.

A medical doctor declares a person dead based on certain criteria. Modern criteria are the result of centuries of experience. A doctor who declares someone dead is saying that experience has shown that when certain criteria are fulfilled, this dead human will never again be a living human.

Commonsense observations that the person was dead in the truck accident are officially confirmed by someone who has the authority to do so, and after that confirmation has been made, people begin to then treat the corpse in a different way.

For most of human history, commonsense observation was the only way to tell the difference between life and death. Part of that observation involved determining whether the person was breathing or not and whether his or her blood was flowing. The breath and the flow of blood were considered the criteria for life and death. Blood and breath, or spirit, are still central to many cultures' views of life. Commonsense observation told people that when their breath was gone, their life was gone. Common sense also demonstrated that if one lost a large quantity of blood, one's breathing stopped and one was dead. Certainly, human life was not only blood and breath, but without blood and breath one was not human.

The history of science has also been the history of challenging commonsense observations. The discovery of the human circulatory system and the invention of the stethoscope were challenges to commonsense observation. The discovery of the way in which

the blood circulates demonstrated that when the heart stops pumping, there is effectively no blood; when the lungs stop functioning, there is no more breath. Commonsense observations were augmented by new scientific discoveries and inventions that showed that the previous criteria were ways of knowing that certain essential organs were dead. These criteria now were linked with certain places of death, such as the heart and/or lungs. People now believed that once these organs were dead, a corpse would never again be human.

Commonsense observation might lead one to believe that the lungs and the heart are not moving, whereas a stethoscope might indicate that they are. One no longer had to use a mirror held to a person's nose to know whether breathing had stopped; one did not have to see the loss of blood to know that the heart had stopped. The heart could stop for other reasons and still be dead. One could hear whether it was making noise and was alive. One could listen to the lungs to hear whether there was breath; if not, the person was considered dead. With the advent of the stethoscope, technology began to augment, and sometimes contradict, commonsense observations.

DEATH AND MODERN TECHNOLOGY

Modern technologies continue to augment and to defy commonsense observations, but the sequence of determining a death is the same: Certain criteria indicate that part of the human is dead; experience has shown that once these criteria are fulfilled, that person will never be alive again.

Because humans developed the ability to keep the heart and lungs alive, former commonsense observations about death were challenged. Many investigators were led to conclude that if the brain were dead, the human would never again be alive. Since for most of human history the life of the organs was identical with the life of the human organism, the challenge of developing new criteria included determining new definitions of death, such as those that focused on the brain.

The meaning and definition of life were always concerns for philosophers and theologians. Scientists usually viewed these definitions as too abstract for scientific investigation because they could not be quantified and subjected to experimentation. To many biologists, it made no difference whether they were operating on a human heart or a pig's heart. A

muscle was a muscle. A primary model for many scientists working with human anatomy is that of the machine. They speak of human parts in the same way that a mechanic would speak of automobile parts. The realization that these parts form a conscious, willing, and loving machine is of little consequence to scientists using this model. This model's implicit definition of life seems to be that human life is equal to the efficient operation of the parts, which is indicated by the flow of blood and breath. Death occurs when there is an irreversible stopping of blood and breath; that is, when one of the parts no longer functions, the machine is dead.

When one views the human being from a perspective other than that of the machine model, one arrives at different definitions. Robert Veatch, in *Death, Dying, and the Biological Revolution* (1989), provides an excellent summary of two modern definitions.

OTHER DEFINITIONS

One definition is that death is the irreversible loss of the capacity for bodily integration and social interaction. Death occurs when the entire brain is dead. The criteria for determining that the brain is dead are that there are no spontaneous movements, breathing, or reflexes and that such unreceptivity and lack of response are confirmed by a flat electroencephalogram. These same criteria might be met by someone who was suffering from hypothermia or who was taking a central nervous system depressant, so these possibilities must be ruled out before death is determined. It could be that a person whose heart and lungs were functioning with the aid of machines would be declared dead using this definition. For those accustomed to linking death with the circulation of vital body fluids, to remove the person from the machine would necessitate the ethical decisions associated with euthanasia. For those who accept this definition of death, however, to continue to treat the person as if he or she were alive would be unethical.

Another definition of death is that death is the irreversible loss of consciousness or the capacity for social interaction. Notice that the capacity for bodily integration does not have to be irreversible according to this definition. If one's neocortex is dead, one has lost consciousness and cannot communicate with others. The easiest way to determine whether this is the case is with an electroencephalogram. Common sense is certainly challenged here, because a person

in the living-dying phase of life could be breathing without a machine and still be considered dead.

In both of these definitions, human life is understood to be more than mere biological functions. The first definition assumes that both the biological function of spontaneous blood and breath circulation are necessary to be human, as is an ability to interact with others. If these are not present, then human life is absent. The second definition goes further; it says that consciousness and social function are uniquely human. If both are absent, then human life is absent.

The initial commonsense definition led to legal definitions of death. The new definitions also led to legal definitions. The common law definition was gradually redefined with the advent of the new technologies and discoveries. The most famous definition for legal purposes was that of the President's Commission for the Study of Ethical Problems in Medicine and Biomedical and Behavioral Research. The commission rejected the vague general definitions mentioned above for a more specific and biological definition, suggesting that the following definition be used in laws throughout the country: "An individual who has sustained either (1) irreversible cessation of circulatory and respiratory functions, or (2) irreversible cessation of all functions of the entire brain, including the brain's stem, is dead."

REFINING DEFINITIONS OF LIFE AND DEATH

Definitions reflect the questions of persons and societies. These modern definitions reflect the concerns of the modern age: rational analysis and reductionism for the purpose of technological control. Other cultures have defined human life and death in terms of other concerns. Many times, the human life known and analyzed by the five senses was seen as limited in the face of something that transcended ordinary life. The sensual reality might be the spirit, or breath, but this sensual reality was a manifestation of a deeper reality that connected human beings with their past, present, and future. It has been called soul and *atman*. Many terms from many cultures attempt to define life and death. Modern arguments about definitions of life and death in Western culture are arguments about who human beings are and what they will become. Old views of life and death are no longer valid. Commonsense observation is insufficient. New views are still to be discovered. Modern definitions do not match human experience. Inevitably,

there will be confusion as people search for definitions that reflect their experience and improve the quality of life in the face of its inevitable end.

CONFUSION AS A HOPEFUL SIGN

Modern popular literature uses four phrases that reflect definitional confusion: brain death, heart death, right to life, and right to death. The first two phrases reflect the difficulty experienced by many people who attempt to understand definitions of life and death. The last two phrases reflect attempts to argue for definitions within the political arena. Most people understand life and death not with the formal definitions stated here but within the parameters of “television-speak”; many decisions concerning social policy are made not by professionals but by the political process. These two phrases reflect the two major social constraints to definitions of life and death: the demand for simplicity in a very complex affair, and the unwillingness to change ideas about a very personal reality.

Modern Western society communicates through the media. The media need short and simple phrases to describe something. Such phrases show how one must think in using this technology.

To use the phrases “brain death” and “heart death” as many reporters do is to suggest that there are two different kinds of death. This is inaccurate. A person is either dead or alive. To say that someone is “heart dead” is to refer to common, primitive definitions of death. To say that a person is “brain dead” indicates that the brain comes into the judgment about death—nothing more. The use of “heart death” and “brain death” to refer to the death of the person also gives the impression that a human being is identified with the heart and/or brain. Such an identification implicitly supports a materialistic view of the person that is not accepted by many philosophers.

The supporters of the “right to life” and those of the “right to die” use modern “rights” language to argue about life and death. They know what they do not want society to do. Right-to-life supporters do not want human life maximized in such a way that large groups of people who are defective, or perhaps lack full consciousness, will find themselves defined out of the human race. Right-to-die supporters do not want human life minimized in such a way that if any of a person’s organs is alive, society would be obliged to sustain that person’s life. Rights mean obligations.

Right-to-life supporters say that society is obliged to sustain human life under any circumstances. Right-to-die supporters say that society is obliged to allow an individual to choose a particular mode of death rather than experience a slow death of various organs. Most arguments about rights to life and death deal with the issue of euthanasia rather than the issue of definitions of death. The euthanasia issue concerns whether one may ethically hasten the death of someone in the living-dying phase of life. Definitions of death seek to determine whether a person is dead. These are two different issues.

Confusion and argument about definitions of life and death indicate that Western culture is undergoing significant change. They indicate that people are aware of the change that is taking place, thinking about it, and offering arguments for one side or the other. Being aware of these definitions means being aware of what arguments are offered and taking one’s place in the conversation, not the confusion.

Lifeboat ethics

DEFINITION: Concept that likens the ethical principles of living on Earth with those of sharing an overcrowded lifeboat

DATE: Concept developed during the 1970's

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Lifeboat ethics is a neo-Malthusian response to human population growth, overpopulation, and hunger that advocates the denial of food aid to starving peoples.

Garrett Hardin, who first articulated the concept of lifeboat ethics during the 1970's, employed three metaphors to explain the idea. First, he described he relatively few truly affluent nations as living in well-stocked lifeboats, while the much more numerous poor nations' populations continuously fall out of their own overcrowded lifeboats, while hoping to board affluent lifeboats. As in real overcrowded lifeboats, Hardin argues that it is suicidal to help the poor, even if a lifeboat has extra room, as the affluent have a primary obligation to provide for their own future generations.

Hardin's second metaphor is the tragedy of the commons, a term used historically for shared pasturelands using for grazing livestock. Open to all livestock raisers, commons lands invited overuse and consequent destruction. Hardin sees modern immigration—which moves poor people to food—and the World Food Bank—which moves food to the poor—as forms of commons lands. The former accelerates environmental destruction in affluent countries, while the latter leads to exhaustion of the environment.

Hardin's third metaphor is what he calls the ratchet

effect. When population increases in poor countries lead to crises, the humanitarian food aid that pours into the countries spurs further population increases, setting up vicious cycles. Food aid thus ultimately contributes to enormous population crashes and untold suffering. Hardin's conclusion challenges altruistic practices and employs a utilitarian approach: Withholding food aid will prevent massive global starvation and suffering in the future.

ASSESSMENT

Lifeboat ethics requires a careful assessment of the premises and facts. Hardin assumes that Earth's human population is close to the planet's biological carrying capacity. However, no one actually knows what that capacity really is. World population has historically risen geometrically without the massive starvation that Hardin's theory should expect. Moreover, starvation may have political or economic causes, as it is often occurs in countries involved in wars or beset by irresponsible governments.

The degradation of arable land, overfishing, and global climate change present real threats to the future of the ability of the earth to feed its increasing human population. Moreover, some argue that food aid reinforces governmental irresponsibility in poor nations. Among the countertheories is the cornucopian argument of Julian Simon, which suggests that technological innovations will keep up with population increases, forestalling a crash. Sharing modern technology, and not merely giving food, could become a moral obligation of the affluent.

Ethical responses to lifeboat ethics include the problem of distributive justice, a much discussed difficulty with utilitarianism. While Hardin believes that survival overrides justice, Peter Singer argues that affluent nations have an obligation to ameliorate world suffering. Singer and others also argue that eating meat—which is generally done mostly by the affluent—is unethical, as well as inefficient, as the food given to livestock could be better used to feed the hungry poor. Others treat food aid as supererogatory, an optional as opposed to an obligatory action.

Lifestyles

DEFINITION: Typical behavior patterns or modes of living of specific individuals, groups, or cultures

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Lifestyle choices reflect the fundamental values of the people making them, but the term “lifestyle” is most commonly applied only to unusual or distinctive values and choices. The lifestyle of the mainstream can become invisible in its ubiquity.

Everyone, either consciously or unconsciously, subscribes to some set of values and beliefs. A lifestyle is a person’s active expression of his or her values and beliefs. People tend to inherit the lifestyles of those who are important to them and then individualize those lifestyles. Lifestyles are learned by experience.

Lifestyles may be divided into two significant sets. The first set consists of Eastern and Western lifestyles, which are based on the beliefs and values of two different parts of the world. The second set consists of the modern, conservative, liberal, and fundamentalist lifestyles, which are based on various ways in which people respond to modern life. An understanding of these lifestyles allows one to understand those values and beliefs that condition one’s ethical choices. Many commentators would be quick to add that the world is moving into a postmodern age, which will generate significant change. Such significant change is always accompanied by an increase in the number of alternative lifestyles that are available in a given area. Alternative lifestyles offer people new ways of life and challenge the way of life of the majority in a given area. Alternative lifestyles

should not be mistaken for fads, which last only for a short time, such as a year or two. Alternative lifestyles usually exist for at least a generation before they die out or become the lifestyle of the majority.

EASTERN AND WESTERN LIFESTYLES

Eastern lifestyles are represented by the religions or philosophies of Hinduism, Buddhism, Daoism, Confucianism, and Shintōism. These lifestyles are very much oriented toward nature and tend to view time as a series of recurrent cycles. They also tend to de-emphasize the will of the individual and the role of choice. Western lifestyles are represented by the related religions of Judaism, Christianity, and Islam. Western lifestyles tend to emphasize history and time, believing that the world began at a specific point in time. Western thought is generally dualistic (right or wrong, yes or no), whereas Eastern thought is generally unified (right and wrong, yes and no). Western thought also tends to emphasize choice and the will of the individual.

In the middle of the seventeenth century, new ideas initiated a new set of beliefs and values that can be called “the modern.” In this case, modern does not mean contemporary. The modern lifestyle affirms most of the beliefs and values of the Western lifestyle. It adds to the Western lifestyle, however, the belief that the mind (reason) is the only instrument that should be used to examine and evaluate the nature of reality. This view constitutes a rejection of the roles of the supernatural and of religious traditions in providing models for behavior and belief. In the modern view, one should analyze how other people act and determine what nature requires. Only if actions are consistent with natural requirements should they become behavioral norms. As the sciences that grew out of modern thought developed, the importance of universal objective norms was minimized; more emphasis was placed on the pluralism of norms and, therefore, ways of living.

The liberal lifestyle accommodated itself to pluralism. The ideas of progress and rationality were central to this lifestyle. Life was viewed as an adventure that, because of the sciences, would continually improve. It was thought that the discoveries of the sciences should be used to improve the quality of life and to develop new behavioral norms.

The conservative lifestyle, however, did not wish to operate on the basis of the ideas of progress, plural-

ism, and scientific rationality. Instead, conservatism reflected a lifestyle that emphasized hierarchy, order, tradition, and religion. The old was held to be more important than the new. The most important values and beliefs were those that had been inherited from religion.

The fundamentalist lifestyle is based upon the religion (Eastern or Western) within which it is practiced. The Christian fundamentalist lifestyle generally reflects many of the beliefs of the modern in its belief in the literal truth of the Bible and the conviction that the end of the world will come soon. Christian fundamentalism rejects the modern's view of the supernatural by holding to the belief that God regularly intervenes in the world. Some other forms of fundamentalism—Islamic fundamentalism, for example—can be thought of more accurately as reflecting a conservative lifestyle. Although many people view fundamentalism in general as a violent lifestyle that rejects democracy and seeks to reorganize society on the basis of religion, that is not always the case. Each form of fundamentalism must be examined in its own religious, cultural, and national context.

ALTERNATIVE LIFESTYLES

Alternative lifestyles are united in that they respond to the lifestyles that dominate the cultures in which they occur. Each alternative lifestyle rejects all or part of these dominant lifestyles and promotes a different set of beliefs and behavioral norms.

Limited war

DEFINITION: Combat undertaken by a government that deliberately limits the extent of its military action against its enemy

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: Limited war theory attempts to apply ethical considerations of justice and fairness in the political-military arena.

A government's limitations in war may be expressed in terms of the power and types of weapons it uses, the geographical areas that it targets for attack, the specific segments of the enemy's military structure it targets, the techniques that it employs to minimize harm to noncombatants, its reluctance to seek help from its allies, or how long it will pursue its objectives. In addition to the traditional legitimizations of war as a means of self-defense and a method of defending the public good, many countries have come to perceive a moral obligation to respond to blatant violations of human rights, especially in the light of the various genocidal events of the last century. However, such a "nobility of cause" makes it even more morally pressing to avoid excessive destruction and human casualties. This limitation is usually decided out of ethical considerations such as the inequality of the military capacity of the combatants.

The just war theory, which is closely allied to limited war theory, was designed to determine when a war is morally justifiable (*jus ad bellum*) and what limitations should be placed on the ways in which wars are waged (*jus in bello*). The criterion pertaining to *jus in bello* is commonly called proportionality—the insistence that the estimated collateral destruction inflicted and the costs (in lives and materials) must be proportional to the anticipated good that will result from the military engagement. Many ethicists and religious leaders have pointed out that in the modern nuclear age, in which weapons of mass destruction threaten to obliterate much of the planet,

the limitation of proportionality is essential in any military engagement.

Proportionality also includes the shielding of non-combatants from harm, ensuring that they can never be considered targets of attack. When the United States began to invade Iraq in 2003, the American leaders delineated eight specific objectives. In the light of these objectives and the American assertion that its military action was a war of liberation and not one of conquest, great efforts were made to avoid targeting the Iraqi infrastructure, since it would be vital in postwar rebuilding. The so-called American “shock and awe” air campaign, unsurpassed in its focus and magnitude, was highly successful in keeping the number of civilian casualties low and damage to the Iraqi infrastructure minimal.

One of the clearest examples of limited war in modern history was the Falkland Islands War of early 1982, in which Great Britain resisted Argentina’s unilateral seizure of the islands. During that war, which last only seventy-two days, Britain limited its military response to the region immediately around the islands themselves and never even hinted that it might attack the Argentine mainland, although it had the force to do so. The British thus limited the duration of the conflict, its geographical focus, and the weapons that it used.

Lincoln, Abraham

IDENTIFICATION: President of the United States during the Civil War

BORN: February 12, 1809, near Hodgenville, Kentucky

DIED: April 15, 1865, Washington, D.C.

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Lincoln led the American people in an effective political response to the ethical problems posed by slavery.

Slavery was the major moral issue affecting American politics in the early and mid-nineteenth century. Although Lincoln grew up in areas of Indiana and Illinois in which most people were friendly to slavery and hostile to African Americans, Lincoln himself said that he always opposed the institution. He insisted, however, that opponents of slavery had to accept the fact that the U.S. Constitution protected slavery in states where it already existed. In 1837, as a member of the Illinois legislature, Lincoln voted against a motion condemning abolitionist societies and placed on record his condemnation of slavery as morally offensive. To preserve his political future in abolitionist-hating Illinois, he also stated that he rejected demands for the immediate end of slavery because the institution was constitutionally protected.

Lincoln opposed expansion of slavery, hoping that confining it to existing areas would eventually lead to its extinction. When serving as a congressman during the Mexican War, he voted for the Wilmot Proviso that would exclude slavery from any territory acquired from Mexico. The Kansas-Nebraska Act of 1850, which opened new areas to slavery, infuriated Lincoln, who proceeded to lead antislavery Illinois Whigs into the newly forming Republican Party.

While debating Stephen A. Douglas during his campaign for an Illinois senatorial seat in 1858, Lincoln rejected leaving decisions on slavery to residents of the territories, arguing that doing so would treat slavery and liberty as equally acceptable. He insisted that slavery was morally wrong and that black

people were human beings having the right not to be enslaved. Citing the Declaration of Independence, Lincoln mocked Douglas for interpreting it to read that all men were created equal except Negroes.

As president, Lincoln showed continual growth in his understanding of how an antislavery position could be effective within the American political system. During the months preceding his inauguration, he reaffirmed his objection to slavery's expansion, rejecting the proposed Crittenden Compromise in Congress that would have guaranteed Southerners the right to export slavery to all land south of the Missouri Compromise line. When the slave states that remained with the Union during the Civil War rejected his proposal to emancipate slaves and compensate their owners, Lincoln strongly supported passage of the Thirteenth Amendment abolishing slavery throughout the country. Using his war powers, President Lincoln issued the Emancipation Proclamation, freeing slaves in territories rebelling against the Union.

While he was growing up in racist Illinois, Lincoln originally doubted the ability of African Americans to become fully functioning citizens, but in 1865, shortly before his death, he denounced the Unionist legislature in Louisiana for refusing to extend the suffrage to black soldiers who had fought for the Union.

Lobbying

DEFINITION: Organized efforts by individuals and members of groups to influence public officials—particularly legislators—to pursue their own political agendas

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Lobbying is a fundamental and constitutionally protected democratic political right that may influence the content and direction of public policy. It is ethically controversial because of the inequalities in the resources that lobbying forces bring to the process in their attempts to influence government decision making.

Found most predominantly in democratic societies, lobbying is a political activity in which individuals or groups make direct appeals to officials in the legislative and executive branches of government to support legislation and regulations favoring their own interests. The process takes its name from the lobbies of buildings, such as the federal government's Capitol rotunda, in which the "lobbyists" traditionally gather in their attempts to get the attention of the legislators passing through the buildings.

CONSTITUTIONAL PROTECTION

Within the United States, lobbying is protected under the First Amendment's guarantee that citizens have the right to "petition their government." As a constitutionally protected right, lobbying is difficult to regulate and would be impossible to abolish without a constitutional amendment directly and explicitly forbidding such activity.

Lobbying activity is also supported by such other First Amendment guarantees as freedom of speech, freedom of the press, and the right to assemble. Freedom of speech allows lobbyists to voice their opinions on policy to politicians. Freedom of the press allows lobbying organizations to produce printed materials to distribute to the media, politicians, or the general public. Freedom of assembly permits lobbying organizations to gather their members in protest, or support, of public policies.

Despite its constitutional protections and importance in democratic society, lobbying has not been without controversy. Lobbying is about the pursuit and exercise of political influence. Many people, especially those who see themselves as marginalized within the system, have advocated regulating lobbying in order to achieve a more equitable balance of power within the lobbying environment and to prevent corruption.

At the national level, attempts to regulate lobbying have never gone further than the Federal Regulation of Lobbying Act of 1946. That simple piece of

legislation stipulated that anyone paid to serve as a lobbyist must register with the clerk of Congress. The law itself is weak, however, because it requires only those who call themselves “lobbyists” to register. People who do the same things that lobbyists do but call themselves something else—such as lawyers or public relations specialists—do not need to register under the law. Indeed, the great majority of people engaged in lobbying do not register. However, for legal regulation of lobbying to go any further would invite constitutional challenges. In the early twenty-first century, there was no indication that the American system of lobbying would change in the near future, if ever.

ETHICAL IMPLICATIONS

As a form of political activity, lobbying is not, in and of itself, unethical. In fact, one could argue that to lobby is an important exercise of one’s constitutional rights. However, ethical dimensions of lobbying may enter into its practice in several ways.

The tools used by lobbyists can be ethical or unethical. For example, money or other gifts may be offered to influence politicians. During the nineteenth century, lobbyists frequently offered scarcely concealed bribes. Through the twentieth century and into the twenty-first, otherwise legal campaign contributions used in tandem with lobbying efforts have been seen by many to exert corrupting and unethical influences. “Buying votes” is the term often used when connecting lobbying and campaign contributions.

In lobbying, the timely and persuasive dissemination of information is critical. Therefore, the use of knowingly false or misleading information may be unethical. Under the intense pressure of pursuing political goals, some of which may have extreme consequences, lobbying organizations may be tempted to disseminate information that inflates the merits of their cases. This would clearly be unethical, and a high price in loss of credibility may be paid by such organizations. Credibility and a good reputation are invaluable assets to lobbyists. With credibility comes respect on the part of listener, as respected lobbyists are more likely to be believed, trusted, and rewarded.

Some critics of lobbying are bothered by the inherent social inequalities found in its practice. Lobbying requires time, education, and money. Organizations that represent the poor, children, or other marginalized groups can face severe disadvantages

against competing lobbying forces that may be much better funded.

Finally, conflicts of interest may arise. Politicians may be lobbied by organizations in which they have vested interests. For example, a politician may own stock in a lobbying corporation. That situation presents a conflict of interest that may lead to an inherently unethical action on the politician’s part. Many states have laws designed to reduce this problem, but their effects have been mixed. In some states, such as Texas, incumbent state senators are permitted to serve outside clients as lobbyists and lobby their own colleagues. Because of the possibilities for conflicts of interest that such practices may create, similar behavior was outlawed at the national level during the nineteenth century.

Lobotomy

DEFINITION: Destruction of tissue in the frontal lobes of the brain, or severing of the connection between those lobes and the rest of the brain

DATE: First performed on human patients in 1935

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: The use of lobotomy to treat mental disorders raises ethical questions as to the relative

cost and benefits of the procedure, the possibility of destroying a personality, and the adequacy of the evidence supporting the technique. In the popular imagination and judgment, lobotomy has come to stand for all forms of psychosurgery.

The lobotomy is based on the biomedical model of mental illness, which posits that mental disorders are caused by abnormalities in brain structure. If this is the case, surgically treating the brain should cure the disorder. The field that does so is called psychosurgery.

The antecedent of the lobotomy was the prefrontal leukotomy, which was invented by the Portuguese neurosurgeon António Egas Moniz in 1935. In this procedure, a surgical device called a leukotome was inserted through a hole into the frontal lobe and rotated, destroying whatever nerve tissue it contacted. The prefrontal leukotomy was replaced by the prefrontal lobotomy, which was developed by the American neurosurgeons Walter Freeman and James Watts in 1937. The limitation of the prefrontal leukotomy was that it did not permit precise determination of the area to be cut. In the prefrontal lobotomy, larger holes were drilled into both sides of the skull, after which a leukotome was inserted and precisely moved in a sweeping motion through the frontal lobe.

The prefrontal lobotomy was in turn replaced by the transorbital lobotomy, which was developed by Freeman in 1948. A knife was inserted through the top of the eye socket into the brain and then swung back and forth. This procedure was quick and efficient and could be performed as an office procedure.

The inspiration for these surgical procedures came from data presented by Carlyle Jacobsen that showed a marked change in the level of emotionality of a chimpanzee following destruction of a large part of the frontal lobe of the cerebral cortex. Formerly, the chimpanzee was highly emotional and obstinate. After the operation, the animal appeared calm and cooperative. Egas Moniz believed that this technique could be used on humans to relieve anxiety and other hyperemotional states. Egas Moniz claimed great success in alleviating extreme states of emotionality, and his work aroused worldwide interest, excitement, and practice. Psychosurgical techniques were seen as quick and effective methods for alleviating certain common mental disorders that could not be

treated effectively and rapidly by other means, and as providing a partial solution to the problem of overcrowding in mental hospitals.

From 1936 to 1978, about 35,000 psychosurgical operations were performed in America, with perhaps double that number worldwide. Egas Moniz was awarded the Nobel Prize for Physiology or Medicine in 1949 in recognition of his work. The Nobel citation states: "Frontal leukotomy, despite certain limitations of the operative method, must be considered one of the most important discoveries ever made in psychiatric therapy, because through its use a great number of suffering people and total invalids have been socially rehabilitated."

ETHICAL ISSUES

Contrast Egas Moniz's Nobel citation, however, with David L. Rosenhan and Martin E. P. Seligman's assessment of the lobotomy in their 1989 textbook *Abnormal Psychology*: "Moreover, there is the danger that physicians and patients may become overzealous in their search for a quick neurological cure . . . the disastrous history of frontal lobotomies . . . should serve as a warning."

In fact, Rosenhan and Seligman were correct and the Nobel Prize citation was wrong. The leukotomies and lobotomies were a disaster. Their sorry history is rife with ethical violations involving their rationale and the evidence that was used to justify their use on humans.

Within three months of hearing Jacobsen's account, Egas Moniz performed leukotomies. He did so despite the lack of clear evidence from animal experimentation to justify the procedure. Egas Moniz conducted no animal experimentation himself; in addition, his reading of the scientific literature to support his beliefs was spotty and selective, and he ignored contradictory evidence. Furthermore, there was a large animal and human literature that clearly demonstrated a range of serious side effects and deficits produced by lesions to the frontal lobe, such as apathy, retarded movement, loss of initiative, and mutism. With no supporting evidence, Egas Moniz insisted that these side effects were only temporary, when in fact they could be permanent. Egas Moniz's initial report on twenty patients claimed a cure for seven, lessening of symptoms in six, and no clear effect in the rest. An impartial review of these cases concluded, however, that only one of the twenty

cases provided enough information to make a judgment.

There is also the question of whether it is ethical to destroy brain tissue as a means of treating cognition and action. Proponents of psychosurgery argue that newer techniques avoid the frontal lobes, the procedure is based upon a good understanding of how the nervous system functions, side effects are minimal, its use is much more strictly monitored and regulated, and it is undertaken only as a treatment of last resort.

Opponents of psychosurgery, however, argue that it is an ethically and morally unacceptable procedure of dubious value for several reasons. First, there are surprisingly few ethical or legal guidelines regulating psychosurgery. Second, psychosurgery has been used to treat a wide variety of disorders, such as schizophrenia, depression, obsessive-compulsive disorder, acute anxiety, anorexia nervosa, attention deficit disorder, uncontrollable rage or aggression, substance abuse and addictions, homosexual pedophilia, and intractable pain. Psychosurgery is performed with the belief that the specific locations in the nervous system that are associated with the above disorders are known and that surgically altering them will in turn alter the particular behavior. Opponents of psychosurgery argue, first, that such knowledge does not in fact exist and that the assumption that these behaviors are tied to specific locations in the brain has not been proved. Second, opponents argue, careful examination of the literature reveals psychosurgery to be an unpredictable, hit-or-miss procedure. Third, the destruction of brain tissue cannot be reversed, and undesirable side effects, which also cannot be reversed, are unavoidable.

Locke, John

IDENTIFICATION: English philosopher

BORN: August 29, 1632, Wrington, Somerset, England

DIED: October 28, 1704, Oates, Essex, England

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: The author of *An Essay Concerning Human Understanding* (1690) and *Two Treatises of Government* (1690), Locke was one of the most influential of all Enlightenment political theorists. He is credited with creating the fundamental ideas which later formed the basis of the American Declaration of Independence and the U.S. Constitution. In the realms of philosophy of mind and ethics, Locke's blending of empiricism and theism was equally influential.

Locke is known for his political writings (the *Two Treatises of Government* are the basis for the principles used in the American and British constitutions) and for his epistemology, which is the central focus of *An Essay Concerning Human Understanding*. He never wrote a work devoted specifically to ethics, but he did develop a fairly clear stand on the nature of ethics. His *An Essay Concerning Human Understanding* is the most important of his works in terms of his ethical views, but *Two Treatises, Some Thoughts Concerning Education* (1693), and *The Reasonableness of Christianity* (1695) also contain some of his ideas on the subject.

Locke came from the non-Anglican Protestant community in England, learning as a child the virtues of Calvinist simplicity but little of the harsh, judgmental aspect of that sect. He was educated at Oxford University, but he moved away from the then-fashionable Scholasticism and, under the influence of Robert Boyle, began to study practical science. He

chose medicine as his specialty and worked with the famous Thomas Sydenham. He never took his degree or practiced medicine (the former was not required for the latter at that time), but the influence of his training would remain with him.

After completing a diplomatic mission in 1665, Locke returned to Oxford and immersed himself in the writings of René Descartes. Two years later, the earl of Shaftesbury, a school friend, invited Locke to become his personal physician and live with him. Locke proved to be as much secretary as doctor, helping his patron with such projects as the Constitution for the Carolinas. He was also elected a fellow of the Royal Society.

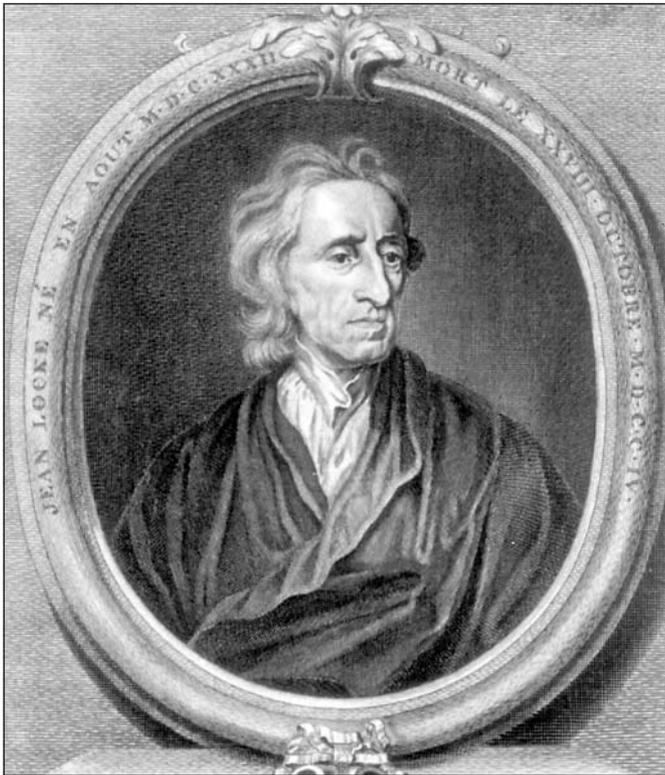

In 1675, Locke began a long visit to France both for his health and to expand his study of Descartes. He returned home in 1679 only to face political problems when his patron, Shaftesbury, was accused of treason. Although he was acquitted, Shaftesbury fled to Holland in 1681, and Locke, who had held some minor government posts under Shaftesbury's influence, found it best to follow his example. After

Monmouth's Rebellion (1685), Locke was branded a traitor, and the English government demanded his extradition. The Dutch paid little attention to the matter, however, and Locke still lived quietly, continuing work on what was to be *An Essay Concerning Human Understanding*. He returned home after the Glorious Revolution of 1688 and increasingly divided his time between London, where he served as a commissioner of appeals, and Oates, the Essex home of his friends Sir Francis and Lady Masham. It was in this comfortable, supportive home that Locke, during the 1690's, was at his most prolific, though his *Essay* and *Two Treatises* had been in development for years.

ETHICAL VIEWS

Like Thomas Hobbes and some other philosophers, Locke defined good as that which gives, or is conducive to, pleasure. His is a very individualistic view, for it allows no room for altruistic pleasure. He also asserted that there were no inborn attitudes, including ethical principles. As an empiricist, Locke, whom most students know for his assertion that the mind is at birth a *tabula rasa*, or blank slate, on which experience writes, logically concluded that ethical principles must be learned. He also asserted that such ethical principles were as logical and scientific as mathematics, but he was never able to prove his case.

Unlike most strict empiricists, however, Locke was also a theist. The natural laws of ethics, he asserted, could be learned deductively and hence applied to all human beings. They also came to people as revelation. Thus, natural law and divine law were the same. The importance of the former was that it was accessible to all, not only to mystics and those who believed in their pronouncements of God's messages. Theism also influenced Locke's ethics in another way. When he had to consider why an individual would follow ethical principles, especially when another course of action might seem more conducive to his or her pleasure, Locke fell back on the fear of ultimate punishment. Whatever the potential for short-term pleasure, failure to observe the laws of ethics would result in long-term suffering.

John Locke. (Library of Congress)

IMPLICATIONS FOR ETHICAL CONDUCT

Despite the inconsistencies that other philosophers have pointed out in his ethical views, Locke's ideas have been consistently popular. This seems to be because, for most people, inconsistent beliefs are common, and Locke's positions are much like those of a typical modern Western person. Modernism has produced liberal Christianity, in which the believer is encouraged to select those principles that seem to fit his or her observations of life and produce happiness. While not exactly Locke's view, the view of liberal Christianity is close enough to encourage a continuing interest in his writings. Students are more likely to start reading his work because of his importance in political philosophy and epistemology than because of his ethics, but as they discover his ethical views and find them congenial, they will keep them in the public view.

Lotteries

DEFINITION: Government-run operations involving chance selections in which people buy numbered tickets, and cash awards are granted based on numbers being drawn by lot

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Once almost universally rejected as ethically unacceptable, lotteries and other forms of state-supported gambling have become major sources of revenue for U.S. states reluctant to raise taxes; they have also created new ethical challenges for governments.

Until the late twentieth century, a widespread American ethos rejected state support for any form of gambling. Objections were based mainly on Protestant Christian beliefs, which held that gambling itself was morally wrong. Political jurisdictions with majorities or substantial minorities of Roman Catholic voters tended to be more tolerant of some forms of gambling. Forms of gambling based on contests depending partly on skill—such as betting on horse racing—generally had better chances of public acceptance. By contrast, lotteries and casino gambling—which depend on pure luck—were slower to gain acceptance. Even without an absolutist moral stance, the dominant American attitude still rejected state-supported gambling out of a fear that such support would give a stamp of approval to an unwise or savory practice.

By the last third of the twentieth century, Americans were becoming more tolerant of gambling. While casino gambling had long been associated almost exclusively with the state of Nevada, other states became willing to experiment with it to add new sources of tax revenue. The state of New Hampshire started its lottery in 1964. Lotteries then spread slowly to other states, but the trend gained speed as states found they were facing revenue losses as they competed with states with lotteries.

Lotteries could be acceptable only when an absolute moral standard condemning gambling was replaced by a standard closer to utilitarianism. Challenges to the utilitarian ethical arguments as a proper moral mode of argument are well known, especially for those who attack utilitarianism on absolutist religious grounds, but they lead to only one kind of ethical debate. Other debates occur even within utili-

The winners of the largest lottery prize to that date, they received a lump-sum payment of \$104.3 million. Had they opted for annual payments instead, they would have collected \$7.7 million per year for twenty-five years, for a total of \$192.5 million. (AP/Wide World Photos)

tarianism, particularly when state sponsorship is an alternative to taxation.

Proponents of state-sponsored gambling argue that the propensity to gamble is so widespread that it will flourish without state sponsorship, as it has historically, even in the face of rigorous state prohibition. Given this fact, proponents argue that the state should at least cash in on a practice that will continue in any event. Gambling may even be seen as a boon providing funds for education or other welfare activities that cannot be provided given a public reluctance to raise taxes. This argument is strengthened any time

a non-lottery state faces competition from neighboring lottery states.

ARGUMENTS AGAINST LOTTERIES

Opponents challenge state-sponsored gambling on grounds of hidden social costs as individuals, especially with low incomes, gamble away money that should properly be used to care for their dependents. For those low-income individuals succumbing to a gambling addiction, the state may be encouraging the impoverishment of families, especially poor families with children. Gambling may even be associated with other social problems, such as alcoholism and drug addiction. By supporting gambling, the state may seem to encourage other maladies. Above all, by supporting gambling, the state may promote get-rich-quick attitudes that contribute to eroding the work and savings ethics badly needed in any society. Opponents clearly see state-sponsored gambling as having deleterious social consequences.

Opponents bolster their arguments with statistics tending to show that the welfare cost of treating the victims may outweigh the revenue gain. Such statistics require complicated calculations and are frequently challenged by gambling’s proponents, who have continued to argue that the urge to gamble is so widespread that gambling will occur whether the state sponsors it or not.

These ethical arguments frequently lead to another debate over the size of government. Opponents of large govern-

ments tend to argue that governments are more likely to be kept small if they must receive all their revenue from taxes. Because lotteries provide additional, nontax, revenue, they thus may encourage overly large governments.

Lottery revenues are not guaranteed and may fall after the novelty interest in lotteries wears off or if excessive numbers of states begin to use lotteries. If the enlarged government’s programs become seen as entitlements, then those programs may be difficult to eliminate—or even trim—after lottery revenues subside. Taxes may then have to be raised to support the

programs. Since states often rely on regressive taxes, the tax burden on low-income individuals may be even more severe as they are caught in a scissors-like situation in which their taxes go up as their state benefits go down.

For all these reasons, ethical debates over lotteries and other forms of state-sponsored gambling are likely to continue to dominate public discussion over lotteries.

Love

DEFINITION: Attraction, attachment, or devotion to another person; affection

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Love may be seen to raise issues of, or even create, moral responsibilities between individuals. For some ethical systems, notably Christianity, love in itself is a morally admirable and possibly obligatory act.

Philosophers have treated a number of issues connected with love: the nature and value of romantic love, the distinction between *agape* and *eros*, the motivation of those who love, self-love, friendship, the possibility of altruistic love, and the nature of caring, compassion, benevolence, and sympathy.

ROMANTIC LOVE

Most philosophers have been critical of romantic love. Stendhal claims that in passion-love, lovers “find” perfections in their beloved that are not really there. José Ortega y Gasset believes that in love the lover’s attention becomes fixed solely on the beloved. All else that formerly absorbed the lover is eliminated from consciousness; therefore, the rest of the world does not exist for the lover. Ernest Becker, in *The Denial of Death* (1974), claims that romantic love is but another example of the basic human drive for heroism. Each person in a love relation endows the other with godlike qualities so that each can feel cosmically justified. In *The Second Sex* (1949), Simone de Beauvoir criticizes “orthodox patriarchal romantic ideology,” in which a woman is to find her identity and value solely in her beloved’s superiority and independence. Romantic love, she writes, makes a woman servile and devoid of self-respect; the woman is “pitiful, insecure, dependent, and powerless through her loving.”

Not all philosophers, however, have been so negative about romantic love. Robert Solomon states that love is an ordinary but spectacular emotion. Ethel Spector Person argues that though romantic love can be harmful, it can also be enriching. It can liberate people from old habits, give them hope, move them to enlarge their possibilities, and incite them to transcend their self-centered concerns.

AGAPE AND EROS

The classic description of *eros*-love is contained in Plato’s dialogue *Symposium*. Plato characterizes love as a desire for pure beauty. One does not love others because of their beautiful qualities but because they are instances of, and point to, “the Beautiful itself.” Moreover, those who love pure beauty do so in order to satisfy a self-directed desire—the desire to know beauty, not just for the moment, but forever. The receiving character of this love, which it has in common with sexual love, has been contrasted with the giving character of *agape* love. *Agape* love is said

to bestow worth on its object instead of being derived from its object's worth, and it is said to exclude self-love, unlike *eros*, which is essentially self-love. From this it is inferred by some that only divine love is agapic, because only it is nonacquisitive and entirely other-directed; others, however, assert that some human love is agapic.

A number of questions arise about these descriptions of *agape* and *eros*. Are the two as mutually exclusive as they are sometimes claimed to be? Is all human love erotic? Is *agape* always a better love than *eros*? Is the element of self-sacrifice in *agape* love appropriate to women's experience, which is said by some twentieth century feminists to contain too little self-regard; too much self-surrender, especially toward men; and insufficient concern for self-development?

DUTY AND EMOTION

Should people love because they desire to be loving or because they believe that it is their duty to do so? Immanuel Kant and Søren Kierkegaard side with the latter alternative on the grounds that desire and emotion are capricious—they change easily, and people have little control over them. Moreover, Kant said, for any action to have moral worth, including a loving one, it must be motivated by a sense of duty. Other philosophers, including many twentieth century feminists, side with the first alternative. Desire and emotion are not so capricious as Kant and Kierkegaard thought, and the feature of love that gives it moral worth is its emotion—the acceptance felt by a beloved or the sympathy felt by a sufferer. Some writers characterize the duty approach as masculine because it conceives love as rational and impersonal, and the emotion approach as feminine because of its appeal to feeling and connectedness.

CARING

There is a rich philosophical literature that describes the nature of caring and similar phenomena. Caring is said to involve receptivity, which is depicted as “feeling with” the one who is cared for. The carer is attentive to the other, absorbed in the other, and aware of the other's thoughts, feelings, and facial expressions. Sensitivity to the cared for's situation is present; so also is a sense of “we-ness.” For some, the essence of caring is the attitude of wanting to help the cared-for grow. For others, the essence of caring is

the sense of being present with the other. Distinctions are drawn between caring and other states with which it is sometimes confused, such as being submerged in the other without the awareness that the other is a separate person.

THE POSSIBILITY OF ALTRUISTIC LOVE

For psychological, social, and religious reasons, some people have wondered whether other-directed love is possible. Imagination may make one think one loves when in fact one does not, emotionally distant parents may produce children who are unable to connect, competitive capitalism may make people feel alienated from one another, an emphasis on sexuality may make people strive for nothing but sexual satisfaction, and sin may make people irremediably self-centered. In *Being and Nothingness* (1943), French philosopher Jean-Paul Sartre asserts that separateness and opposition are at the core of human relations, including love. Love is impossible, he says, because both the one who loves and the one who is loved are trying to get something from the other, and neither is able to do so. Sartre graphically portrays these ideas in his well-known play *No Exit*. Others believe that separateness can be overcome by certain sorts of “interpersonal oneness,” such as Martin Buber's I-Thou relation, and that the obstacles to love can be met with a social or religious transformation.

Loyalty

DEFINITION: Dedication or commitment to a person, cause, country, or ideal

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Loyalty is generally seen as a virtue regardless of its content, but it can also be judged to be misplaced or misguided, in which case it can be more ethically ambiguous.

In the Old Testament, God's first commandment to Moses on Mount Sinai requires the uncompromising loyalty of the Israelites: "I am the Lord thy God, which have brought thee out of the land of Egypt, out of the house of bondage. Thou shalt have no other gods before me." Thus, loyalty to God becomes the paramount duty of Judaism and, subsequently, Christianity, in which it is reaffirmed by Jesus: "Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy mind." Jesus also acknowledges earthly loyalties, however, requiring one to "render therefore unto Caesar the things which are Caesar's" and to "love thy neighbor as thyself."

Loyalty was the essence of the ancient Greek *eusebia*, or "piety," meaning devotion to the gods but encompassing devotion to parents, friends, country, and anything else worthy of respect and veneration. Loyalty as such is specifically discussed by neither Plato nor Aristotle, even though both philosophers devote much attention to other virtues, defining them and subjecting them to exacting philosophical scru-

tiny. Yet *eusebia* was important not only to them but to all Greeks, constituting the heart of Greek citizenship. The greatest example of Greek loyalty was Socrates, who refused to repudiate his beloved Athens even when its laws punished him unjustly, just as he refused to repudiate philosophy, which he believed was the only means of leading Athenians to the moral truth that would restore the city's integrity. Choosing death at the hands of the state for refusing to give up philosophy, he preserved his loyalty to both.

Aristotle likewise attests the importance of loyalty in the *Nicomachean Ethics*: "It is also true that the virtuous man's conduct is often guided by the interests of his friends and of his country, and that he will if necessary lay down his life in their behalf." He also considers the problem of conflicting loyalties:

A . . . problem is set by such questions as, whether one should in all things give the preference to one's father and obey him . . . and similarly whether one should . . . show gratitude to a benefactor or oblige a friend, if one cannot do both. . . . That we should not make the same return to everyone, nor give a father the preference in everything . . . is plain enough; but since we ought to render different things to parents, brothers, comrades, and benefactors, we ought to render to each class what is appropriate and becoming.

For Aristotle, specific loyalties are rooted in one's relationships with others, and the obligations attendant upon these loyalties are determined by the nature of these relationships.

Loyalty as piety is preserved in the Roman *pietas*, encompassing reverence for the gods and those to whom natural relationships bind one—family, countrymen, and all of humankind. "Natural" loyalties, springing from kinship to fellow humans, entail "natural duties" that are consonant with these loyalties. Since such kinships are part of the natural order, any violation of these duties transgresses natural moral law. *Pietas* reflects the Stoic belief in a cosmopolitan loyalty to all people by virtue of natural human kinship and obligation to God.

In the Middle Ages, loyalty was exemplified in the "fealty" owed by a vassal to his lord and by the lord to his king. Also included in the concept of fealty

was the reciprocal obligation of the king to his subjects. The desire to depose rulers who violated this obligation led to the distinction between loyalty to the *office* of the king and loyalty to the *person* of the king. The Magna Carta constituted a statement that loyalty to the office did not require loyalty to the person; conversely, disloyalty to the person did not signify disloyalty to the office.

MODERN VIEWS

The transition to the modern world, which engendered a new political entity, the “nation-state,” resulted in loyalty’s becoming a predominantly political virtue, from which sprang both the fanatical, nationalistic loyalty of fascism and communism and the pluralistic loyalties of democracy. Despite attempts to transcend national loyalties through organizations such as the United Nations, loyalty in the modern sense is associated with both benign patriotism and radical nationalism, in which loyalty is often interpreted as a call to military aggression. Even in democratic countries, national loyalty is often considered the highest political virtue. The Alien and Sedition Acts of 1798 and the Sedition Act of 1918 were attempts by the U.S. Congress to mandate loyalty by outlawing all publications that were considered defamatory or seditious. Uncertainty about the national loyalty of some Americans led to the internment of Japanese Americans during World War II and to the “blacklisting” of people suspected of subversive activities during the McCarthy era, from 1950 to 1954.

Among philosophers, only Josiah Royce has given loyalty sustained critical scrutiny. Royce’s dismay at “that ancient and disastrous association” between loyalty and war prompted him to write *The Philosophy of Loyalty* (1908), in which he defines loyalty as “the willing and practical and thoroughgoing devotion of a person to a cause.” The cause to which one declares loyalty becomes the plan for one’s life, which, combined with the personal gratification of serving this cause, makes life meaningful. Lest loyalty be construed as being consistent with devotion to an evil cause, Royce stipulates that genuine loyalty respects the loyalties of others and forbids actions that destroy them or prevent their being acted upon. Royce refers to respect for the loyalties of others as “loyalty to loyalty.”

Loyalty oaths

DEFINITION: Formal and solemn pledges to support and defend a country, government, or leader

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: In the United States positive oaths (or affirmations) of future loyalty are obligatory in numerous situations, despite widespread beliefs that such requirements infringe upon individual freedom and contradict the principles of liberty they are ostensibly designed to protect.

Throughout recorded history, governments and leaders have utilized loyalty oaths as a means of consolidating power and punishing nonconformists. In England, after the Protestant Reformation, such oaths had the effect of restricting the legal rights of Roman Catholics and other religious dissidents. In colonial America, citizens were typically required to take

oaths to support and defend the commonwealth. Some oaths included the additional responsibility pledge to report political dissidents to the government. During the American Revolution, the Continental Congress and individual state legislatures mandated that citizens pledge allegiance to the U.S. government. Loyalists and Quakers refusing to make this pledge were punished with exile and confiscation of property.

THE IDEA OF LOYALTY

Unconditional loyalty to governments, regardless of the morality of the governments' actions, has often resulted in great evil. The most obvious example occurred in Nazi Germany under Adolf Hitler. On the other hand, democratic societies appear to benefit from a patriotism that is checked by a critical spirit and sound ethical convictions. In his classic work *A Philosophy of Loyalty* (1908), Josiah Royce argued that loyalty to good causes is the most basic of virtues. Recognizing the evils of intolerance and fanaticism, however, Royce insisted that individuals should have the freedom to choose their own objects of loyalty without coercion. His philosophy envisioned the desirability of a pluralistic society that promotes reasonable patriotism while tolerating a broad diversity of dissident voices.

In the Anglo-American tradition, loyalty oaths were based on an invocation to God as a witness to truth. In common law, therefore, the oaths of atheists were considered invalid. However, as culture became increasingly secular, individuals were given the option of making simple affirmations of loyalty without reference to any religious beliefs. Only a small minority of citizens objects to making nonreligious affirmations of general loyalty to their country. However, members of some law-abiding groups, including the Jehovah's Witnesses, refuse on religious grounds to affirm allegiance to any secular government.

ETHICAL ARGUMENTS

Critics of mandatory loyalty oaths, such as Benjamin Franklin and Supreme Court justice Hugo L. Black, commonly argue that such oaths are pernicious because of their chilling effect on the free expression of unorthodox ideas, their tendency to engender divisions of opinion, and their susceptibility to abuse. Almost everyone admits that the oaths

themselves do not restrain subversive actions because disloyal persons are apt to lie about their true intentions. Moreover, to punish those guilty of treasonable and other illegal behavior, it is not necessary to require oaths.

Proponents nevertheless believe that loyalty oaths have the positive function of encouraging a healthy spirit of patriotism and national unity. They further observe that loyalty oaths used in the United States after the 1960's have not included pledges to support particular policies or political ideas. Proponents of the oaths thus find it difficult to understand why good citizens would not gladly proclaim loyalty to a democratic country that allows peaceful means to change laws and policies.

CONSTITUTIONALLY APPROVED MANDATES

The U.S. Constitution requires the president, members of Congress and state legislatures, and all executive and judicial officers to pledge by oath or affirmation to support it. Following this model, Congress has mandated that members of the armed forces, naturalized citizens, and employees in sensitive governmental positions must also pledge or affirm their allegiance to the United States. Most jurists interpret these requirements to be consistent with the First Amendment's guarantees of freedom of religion, speech, and association.

In *Cole v. Richardson* (1972), the U.S. Supreme Court upheld legislation requiring positive oaths or affirmations of loyalty so long as they are not unduly vague and do not infringe on constitutional freedoms. The Court's decision allowed oaths to include a pledge to oppose the forceful overthrow of the government. However, a minority of the justices who voted on that case argued that requiring such a pledge was unconstitutional because it might be interpreted in ways that restrict freedom of speech and association. The majority, however, found the pledge acceptable, because the Constitution does not guarantee any right to advocate or endorse the overthrow of the government by violence or other illegal means.

The Supreme Court does not permit public schools to require children to pledge their allegiance to flag and country. In contrast, *Cole* upheld the constitutionality of requiring adults to pledge loyalty as a condition of public employment. However, in 1994 a federal appeals court ruled that these requirements violated the Restoration of Religious Freedom Act of

1993, because the government could not show that loyalty oaths served a compelling objective. However, the decision was based on a federal statute that later lapsed and became unenforceable, which means that courts in the future may not utilize that decision as a precedent.

UNCONSTITUTIONAL MANDATES

Jurists distinguish between positive oaths to support one's country and negative oaths to refrain from particular acts and associations. One variant of negative oaths, called "test oaths," makes reference to the past rather than the future. After the Civil War, for instance, Congress and state legislatures required public officials and lawyers to swear oaths pledging that they had never supported the Confederacy. Such oaths were required for holding public office and for working in certain professions. In the *Test Oath Cases* (1867), the Supreme Court found that such retroactive test oaths were unconstitutional because they imposed legislative punishments for acts not illegal when performed.

Because of fears of communism after World War II, most U.S. states required teachers and other public employees to sign loyalty oaths that included pledges of nonassociation with the Communist Party or another subversive organization. In 1949, thirty-one professors of the University of California were fired for refusing to take one such oath. During the 1960's, however, the Supreme Court held that almost all requirements for negative oaths were unconstitutional. In one of its most notable decisions, *Keyishian v. Board of Regents* (1967), the Court recognized the importance of academic freedom in higher education and proscribed loyalty statutes that unduly restrict teachers' speech in their classrooms.

Luck and chance

DEFINITION: Unpredictable and uncontrollable events and forces that may shape events favorably or unfavorably

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: If the unpredictable, uncontrollable forces that shape events can affect the ethical status of people who experience it, then this type of luck is called moral luck.

Ordinary luck is a concept familiar to nearly everyone. The role that luck plays within the realm of ethics can best be illustrated by a hypothetical contrast:

Bert is normally a careful driver and rarely backs his car out of his driveway without first looking. One morning, however, he is distracted by something that he hears on the radio and backs out without looking. As a result, he fails to see a small child running across his driveway, and his car strikes and kills the child.

Carol is another careful driver who rarely backs out of her driveway without looking. One morning she, too, is distracted by something she hears on the radio, and she backs out without looking. However, no child is running across her driveway, and nothing bad happens as a result of her momentary carelessness.

Those who believe moral luck is present in these examples would affirm that, other things being equal, Bert is more to blame morally for backing out of his driveway without looking than is Carol for doing exactly the same thing. Those who hold this position

would appeal to the ways these facts would be treated in a court of law. While there would be harsh penalties for Bert, Carol's penalties would be relatively mild. To the extent that the law is based upon considerations of ethics, moral luck seems defensible.

Not everyone is convinced that moral luck is possible. Some philosophers are convinced that unpredictable forces can never affect a person's moral or ethical status. An example is the great German philosopher Immanuel Kant. One who shares Kant's point of view would react to the example by holding that both Bert and Carol are to blame for backing out without looking, as nothing about their states of mind or actions is relevantly different. Carol may happen to be lucky that no child runs across her driveway, but opponents of moral luck would see nothing morally significant in this fact. If Bert is to be judged harshly for what he does, there is no reason to judge Carol any less harshly. They both act in identical ways, and their acts grew out of identical motives.

In many ways people's lives are affected by chance. Some philosophers have pointed out that a person's very existence is a matter of luck. The reason is that many people die without producing offspring. However, every time a new human being comes into existence, it means that not one of that person's thousands of ancestors died without producing offspring, a statistical fact that is incredibly improbable.

The ethical character of each human being has been shaped by parents and other early influences. The extent to which these have been positive moral influences is likewise a matter of luck, as is the extent to which people have been spared from temptations to engage in wrongdoing.

Lust

DEFINITION: Intense sexual desire, or, by extension, a nonsexual desire that resembles sexual desire in its intensity

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: LUST may be defined as excessive desire which is not held in check by reason, or which otherwise defeats the sovereignty of the individual. By that definition, lust is, traditionally, one of the seven deadly sins.

Injunctions against lust, in the sense of sexual activity outside marriage (also called "lechery" in the Middle Ages), figure prominently in the Old and New Testaments of the Bible. The Jewish tradition emphasizes the harmfulness of lust in its disruption of a family-centered social structure. It presents marriage as being handed down to humankind from the time of Adam and Eve, and being further reinforced by the Ten Commandments of Moses and other divine revelation. The New Testament, while suggesting that more individual freedom of choice and forgiveness of repentant transgressors is permitted, assumes that the sexual behavioral norms of Jewish tradition are still very much in effect. The letters of the apostle Paul set the stage for a Christian tradition that makes sexual abstinence a good in itself. This finds parallels in the monastic movements of many of the world's religions.

From a societal standpoint, "lust" is a term of opprobrium for sexual activity that disrupts the social structure—above all, extramarital sex. For the individual, however, sexual behavior may be perceived as "lust" if it is performed without love and respect, even within the confines of marriage. All such loveless sex has been designated as a form of "lust"—hence, one of the seven deadly sins—from the early Middle Ages onward. In a modern context, "lust" in this sense is replaced by such terms as "using" one's sexual partner and "sexual harassment."

Luther, Martin

IDENTIFICATION: German Protestant reformer

BORN: November 10, 1483, Eisleben, Saxony (now in Germany)

DIED: February 18, 1546, Eisleben, Saxony (now in Germany)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Perhaps the most significant figure in the second millennium of Christianity, Luther initiated the Protestant Reformation by criticizing what he saw as corrupt and inappropriate practices of the Roman Catholic Church.

Only in modern Christian ethics is an artificial line drawn between religious doctrine and its practical application—Luther himself recognized no such boundary. His career as a reformer was imbued with the notion of ethics as an outgrowth of Christian faith, as it was with the faith that made ethics both possible and valid. Indeed, one could say that Luther's reforming activity was first occasioned by ethical concerns, since it was corrupt practice on the part of the Roman church that first led him to consider the possibility of corrupt doctrine. The preaching of indulgences in German churches in order to raise funds for papal building projects and for the purchasing of German bishoprics, along with traffic in relics and hastily recited masses for the dead, seemed to Luther to be symptoms of a larger spiritual decay—a decay that he was convinced would swiftly be reversed if those in authority knew of its existence. It was only when the authorities refused to alter these practices that Luther began to realize that a more fundamental change was needed, after which his career as a reformer started to take shape.

JUSTIFICATION BY FAITH

At the same time, Luther was undergoing a spiritual crisis of his own that would have a profound effect on his ethical thought. The medieval Church taught that, while salvation was to be obtained through Christ, the individual Christian could assist his or her own cause through participation in the sacraments of the church. Luther's time as an Augustinian monk was largely spent in such acts, but with no sense of spiritual relief. It was only when he began a study of the Scriptures—in particular, the Epistles to the Romans and the Galatians—in preparation for his

teaching at the University of Wittenberg that he came upon the doctrine that would free him from his spiritual trials and start a theological revolution: "The just shall live by faith" (Rom. 1:17). It became Luther's contention that salvation could not be gained by any human effort but was solely a gift of God. All that was required to be "justified" was faith, which was itself a gift of God. Nothing else mattered, since nothing else was effective.

At the same time, Luther was not willing to give up good works, but it was clear that his ethics would have to occupy a new place in his system. This problem was worked out in several of his early works, including "Treatise on Good Works" and "On Christian Liberty," both written in 1520. The gist of Luther's maturing ethic is best summarized in a sentence from "On Christian Liberty": "Good works do not make a man good, but a good man does good works." Following the biblical writings of Paul and James, Luther asserted that Christian faith had to be enacted, both out of gratitude for what God had done for the believer and so that God could continue His perfecting work. It was Luther, anticipating John Wesley, who first suggested a doctrine of "sanctification." Furthermore, Luther's doctrine of the "priesthood of all believers" declared that all Christians were responsible for doing good works, not only the members of the clergy and the cloister, who were called to lives of "higher righteousness."

LIVING FOR OTHERS

What works should the justified Christian do? Luther's definition of ethical behavior was, like his doctrine, taken directly from biblical models. The redeemed believer was to give no thought to his or her own needs, which had already been fulfilled through faith, but was to give himself or herself up wholly for the benefit of others, in the same way that Jesus Christ himself took no thought of his own interests, giving himself wholly for humankind. Although Luther's ethic contained practical elements—he recommended marriage and the public education of youth—at bottom it was primarily existential: "I will give myself as a Christ to my neighbor, just as Christ offered himself to me." The nature of ethical behavior was to be seen in self-sacrifice, through which Christ would be revealed in acts of service, as he had been revealed in the ultimate service of the cross.

SECULAR AUTHORITY

Luther did make specific ethical prescriptions that had to do with the nature of secular authority. As with everything else, Luther's politics were based on his doctrine: God has ordained two spheres of authority, or two "kingdoms"—one internal and moral, over which the Church was to have authority; and the other external, to be ruled by the "sword." Both were divinely ordained, the latter on the basis of Paul's dictum that everyone was to be subject to secular authority (Rom. 13:1).

With this belief as his starting point, Luther remonstrated with both rulers and their subjects. Rulers, he said, were not to stray outside their ordained boundaries into religious and moral legislation but were to concentrate on restraining, convicting, and punishing sinful behavior in their own sphere. That this was necessary was occasioned, Luther believed, by the fact that, although truly justified Christians had no need of such authority, most Christians were not yet in so spiritual a state but were still enslaved by sin, and thus were prone to disobedience and chaos. Rulers were needed to maintain order.

Subjects were to obey their rulers in all things. (Luther included in this injunction justified Christians, who ought to remain obedient for the sake of their weaker neighbors.) The difficulty arose when rulers became corrupt: Was there any point at which despotic rulers could be legally resisted? Luther's answer was a cautious and provisional yes, since the ultimate authority over both "kingdoms" was God, and no ruler could compel his subjects to disobey God in their obedience to the ruler. Again, Luther's foundation was biblical: "We must obey God rather than men" (Acts 5:29). Luther's insistence on the divine foundation of secular rule, however, led him to counsel obedience even to corrupt rulers so long as there was any doubt about the proper response. It was on this basis that Luther opposed the Peasants' Revolt of 1525, even though he affirmed the legitimacy of the peasants' grievances. Such opposition, while consistent with his overall ethic, cost him much support among his early followers.

One reason why Luther consistently opposed the overthrow of secular authority by oppressed subjects was that he was convinced that God himself would end the rule of any authority that was mired in corruption, as he had in biblical times. Thus, Luther's political ethic, like the rest of his thought, was grounded in

his personal confidence that God would ultimately set all things right, since nothing lay outside his power.

Lying

DEFINITION: Making a false statement with the intention of misleading another person

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Lying is most often judged along a spectrum, from bearing false witness against another person, prohibited by the Ten Commandments, to telling "little white lies," which is often deemed to be harmless and therefore permissible.

Although there is little sustained philosophical or religious discussion of the issue of lying and its consequences for society, there is some embryonic discussion of the ethics of lying, particularly in connection with the issues of truth and sin.

Influenced by Manichaeic beliefs that pitted

good against evil and truth against lies, Saint Augustine provided Catholic orthodoxy with the judgment that lying jeopardizes one's relationship with God, because God is truth and all lying is a form of blasphemy. Although Augustine holds that the teaching of false doctrine is the worst type of lying, he was opposed to lying in all its forms.

A great scholar in the fields of law, the classics, theology, and history, Hugo Grotius was arrested for his anti-Calvinist views on tolerance and politics. Sentenced to life in prison, he arranged a clever escape and fled to France and Sweden, where he proceeded to write his most famous legal work, *On the Law of War and Peace* (1625). His confrontation with Dutch Protestant internecine battles and the ruse he used in making his escape from jail may have led him to modify his theological opinions about lying. He argued eruditely that lying was permissible when directed toward children, the insane, thieves, and unrighteous persons, as well as when it was done for the public good.

Immanuel Kant's reliance on pure reason obviated any appeal to emotional or pragmatic reasons to excuse lying. Kant argued that a lie always harms humankind because it "vitiates the source of law itself." This deontological view does not excuse any form of lie even in a life-threatening situation.

CONTEMPORARY VIEWS OF LYING: SISSELA BOK

The 1979 work *Lying: Moral Choice in Public and Private Life* by Sissela Bok is the first major, systematic philosophical study of the ethics of lying. Bok's contribution to the debate is her superb, detailed intellectual discussion of the taxonomy of lying. She analyzes "white lies," false excuses, inauthentic justifications, lies in a crisis, lies to liars, lies to enemies, lies for the public good, lies to protect peers and clients, deceptive social science research, lies to the sick and dying, and the effects of lying on both the liar and the person who is deceived.

Reflecting the contemporary lack of any single authority, Bok marshals new categories of lying and analyzes them with an eclectic set of criticisms. She defines lying not as a sin or as an untruth but as "a false statement made to another person with the intention to mislead." Bok emphasizes the consequences of lying: The deceived person becomes distrustful of the liar and, by extension, the society that allows lies to be disseminated without any barriers.

The liar loses both self-respect and a sense of reality as he or she continues to become absorbed in a system of transmitting lies to retain power or authority. From this point of view, lying harms not only the individual but also the community.

Bok partially shifts the responsibility for exposing and correcting the problems of lying from the individual to society. After all, she argues, how can an individual change the whole structure of a medical, legal, or business system that values sales, bottom-line income, and success more than it does honesty? How can an individual change misleading advertising, deceptive social science research, deceitful pharmaceutical claims, and fallacious government reports and regulations? These fraudulent activities contribute to the destruction of moral values, the loss of respect for authority, and the proliferation of individual despair in the pursuit of justice.

Bok is not an absolutist: She finds that there may be a need for certain types of lying. Like Grotius, she believes that one may lie to a terrorist or a criminal, or lie in other life-threatening circumstances. Lying to protect the innocent is not Bok's only exemption. She also allows provisionally for certain white lies. Lying to protect someone's feelings or to avoid a painful situation can be justified, but only as a last resort. One must always look at the overall context. Will one white lie lead to many more, cumulatively creating more distrust in and harm for the one who is deceived?

Bok has extended the significance of lying to all personal relations. She has also warned of the danger of the pressure to lie that derives from such institutions as the government and from such professions as the law, medicine, and business. She has called for the discussion of ethical standards in all institutions, and especially in the field of medicine. To see the act of lying as an authentic issue—separate from its relationship to sin or the individual's responsibility—is a major accomplishment. Bok concludes that without the active support of society and its institutions to correct the problem of lying, the individual will not be able to overcome the need and the temptation to lie.

Lynching

DEFINITION: Unlawful killing of a person by a mob, usually by hanging

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Lynching became a common form of racial violence in the American South, especially in the wake of the U.S. Civil War. Defenders claimed that lynching was used to protect the virtue of white women. In reality, however, it was used to keep African Americans in fear for their lives.

The term “lynching” comes from Captain William Lynch, a captain in the Virginia militia during the American Revolution. Lynch and his men sought to rid Pittsylvania County of Loyalists, Americans who supported the British during the war, and subjected them to trials before a hastily assembled court. Lynch said that the tribunal was justified because no other legal authority existed in the county, so citizens had the right to create their own system of justice and carry out its punishments. The court was said to practice “lynch law,” and by the 1830’s, that term was applied to instances in which mobs took the law into

their own hands without waiting for legal authorization.

Lynching was common on America’s western frontier during the nineteenth century, but no statistics are available concerning how many people were killed by this form of mob action. After the end of the Civil War and the abolition of slavery in 1865, lynching was most common in the southern United States, where it became a frequent occurrence, especially between 1882 and 1930. During that period, a total of 4,761 lynchings took place in the United States, 90 percent of them in the states of the Old Confederacy. Of the victims, 3,386 (71 percent) were African American and 1,375 (29 percent) were white. Half of these killings were carried out with the help of local police, and in 90 percent of the other cases, local legal and judicial authorities gave their approval. No member of any lynch mob was ever arrested or punished for participating in these crimes.

RATIONALES FOR LYNCHING

Defenders of lynching—and these included most southern white political, business, and community leaders—argued that fear of such deadly violence alone prevented African American men from raping white women. Ben Tillman defended lynching and announced that, although he was governor of South Carolina, he would still “lead a mob to lynch a man who had ravished a white woman. I justify lynching for rape, and before almighty God, I am not ashamed of it.” Lynching from this perspective was ethically justified because it protected the purity and honor of a physically weak population, white women, from the violent attacks of sex-crazed fiends, African American men.

This rationale has come to be seen in recent years as a cultural denial of a deeper truth. Fear of white women being raped by African American men was used to obscure or displace attention from the fact that it was actually white men who had an established, institutionally sanctioned history of raping African American women in the South. Slave owners had routinely raped their slaves. In only 23 percent of southern lynchings was the victim even accused of rape.

More lynchings, 28 percent, happened because of minor infractions of social customs, such as a black man’s simply talking to a white girl or whistling at her from across the street, than because of violent

Richard Wright on the Emotional Impact of Lynching

Richard Wright, the author of *Native Son* (1940) and *Black Boy* (1945), observed that lynch mobs could strike anywhere, anytime, and for any reason. Lynching was part of a reign of terror imposed by the white majority to keep African Americans subjugated. “The things that influenced my conduct as a Negro,” Wright wrote about violence against African Americans, “did not have to happen to me directly. I needed but to hear of them to feel their full effects in the deepest layers of my consciousness.”

sexual crimes attributed to the victim. Therefore, it appears that lynch law was used more as a way of maintaining white supremacy than as a way of punishing criminals. The real purpose of lynching was to maintain white supremacy by making all African Americans aware of the terrible penalty that could be imposed upon them for breaking the southern code of racial ethics.

ANTILYNCHING LEGISLATIVE EFFORTS

A campaign to end lynching by declaring it a federal crime instead of a state crime began in 1930. Two groups, both composed of white southerners—the Association of Southern White Women for the Prevention of Lynching and the Atlanta-based Commission on Interracial Cooperation—called upon the Congress of the United States to pass an antilynching bill. Both organizations believed that through education and public pressure, a majority could be found to give the Federal Bureau of Investigation jurisdiction over cases in which local authorities had failed to protect victims of mob violence. Thirty people had been lynched that year, and a particularly brutal incident in Sherman, Texas, in which a retarded African American youth was slowly burned to death changed the hearts of enough congressmen and senators for the bill to win passage. However, though the House of Representatives approved the measure, the Senate did not. Instead, Senator Thomas Heflin of Alabama led a successful filibuster against the bill. Heflin made his position quite clear: “Whenever a Negro crosses this dead line between the white and Negro

racess and lays his black hand on a white woman he deserves to die.”

Southern white leaders raised the constitutional issue of states’ rights. States had always been responsible for enforcing criminal laws, and these leaders believed that that power should not be reduced. Raising any crime to a federal level would only lead to the creation of an all-powerful national police force that could threaten the freedoms of Americans everywhere. Arguments favoring local control helped to defeat later attempts to outlaw lynching through federal law, while masking the racially motivated intentions of its defenders.

That race and not constitutional issues lay behind opposition to antilynching legislation was demonstrated by events that occurred during the debate on lynching legislation in Congress in 1935. The horrible lynching of Claude Neal in Florida, in which a white mob cut off the victim’s fingers and toes and forced him to eat his own flesh before mutilating his body with a hot poker and hanging it from a tree, received national attention. Still, the Senate did not act; southerners killed the bill with a six-day filibuster. One opponent denounced the legislation for promoting federal interference in local affairs, while another defended the lynchers because Neal had allegedly raped his white girlfriend, though she denied it, and “the virtue of white women must be defended, at any cost.” Not even a separate bill calling for a national committee to research the problem of lynching survived the Senate debate.

Lynchings were significantly reduced by the late 1930’s to an average of fifteen per year, and by the 1940’s, such mob-inspired murders had almost disappeared. Yet during the 1950’s, two black men were killed in Mississippi for violating the southern racial code. Fourteen-year-old Emmett Till was brutally killed apparently simply because he had talked to a white woman. The last officially recognized lynching happened in Mississippi in 1959, when Mack Charles Parker was hanged by a mob for allegedly raping a white girl. Apparently, no recorded lynchings have taken place since then, though a young African American, chosen at random, was mutilated and murdered by the Ku Klux Klan in Mobile, Alabama, in 1981. The decline in lynching is attributed to increased press coverage and public awareness of the crime, plus progress in federal protection of civil rights.

ETHICAL PRINCIPLES

The ethics of lynching was summarized in a long speech by Senator Allan J. Ellender of Louisiana in January of 1938. Again a horrible incident—a case in which two African Americans had been blowtorched to death by a Texas mob—had led to the introduction of an antilynching bill in Washington. Ellender led the fight against the bill and celebrated the South's long battle to subjugate blacks in which "lynch law" played a prominent part. "It was costly: it was bitter, but oh, how sweet the victory."

M

McCarthy, Joseph R.

IDENTIFICATION: U.S. senator best remembered for leading communist witch hunts during the 1950's

BORN: November 14, 1908, Grand Chute, near Appleton, Wisconsin

DIED: May 2, 1957, Bethesda, Maryland

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: While chairing a Senate committee investigating alleged communist agents in the federal government, McCarthy gained notoriety for his tactics of attacking witnesses and making unsubstantiated allegations; his name became synonymous with unethical behavior.

Republican senator Joseph R. McCarthy of Wisconsin sought to rid the nation of what he saw was communist infiltration of the administrations of both Harry S. Truman and Dwight D. Eisenhower. He also sought to uncover what he saw was a communist takeover of such major cultural institutions as the motion picture industry. He saw the nation as being threatened by sinister communist agitators quietly seeking to undermine American values by secretly gaining control of key national institutions.

McCarthy's use of the phrase "card-carrying member of the Communist Party" publicly raised ethical concerns about both the objects of his attacks and the nature of his tactics themselves. On one hand, McCarthy's allegations made citizens worry about the possibly unethical behavior of the leaders of key American institutions. On the other hand, his failure to substantiate any of his allegations ultimately ignited charges that he was wantonly destroying the lives and careers of innocent people in order to further his political career.

McCarthy's primary targets were initially many of the architects of the New Deal who had been in public service during the administrations of Franklin D. Roosevelt and Harry S. Truman. He singled out for

criticism successive secretaries of state in those administrations—George C. Marshall and Dean Acheson. Thanks, in part, to the publicity he gained from making these charges, McCarthy won reelection to the Senate in 1952.

McCarthy next launched attacks against officials in the newly installed Eisenhower administration. McCarthy's notoriety crested in the fall of 1953 when he began investigating alleged communist infiltration of the ranks of U.S. Army officers and civilian leaders. During televised month-long hearings the following spring, McCarthy appeared before the nation primarily as a bullying interrogator of witnesses. These investigations, which quickly became known as the Army-McCarthy hearings, swayed public opinion against him and led to a growing public distrust of his numerous unproven allegations.

The following fall, possibly due in part to a voter backlash against McCarthy and his tactics, the Republicans did poorly in the off-year elections and lost control of the Senate. With the change in party control of the Senate, McCarthy was forced to relinquish chairmanship of his investigating committee. His public career hit bottom on December 2, 1954, when the Senate, by a 67-22 vote, censured him for behavior "contrary to Senate traditions."

McCarthy's tactics of bullying interrogation coupled with unsubstantiated allegations left a legacy of unethical behavior in public life. Hence, for one to be branded with the label "McCarthyism" or for using "McCarthy tactics" is to be charged with engaging in unethical persecution of another person.

Machiavelli, Niccolò

IDENTIFICATION: Italian political theorist

BORN: May 3, 1469, Florence (now in Italy)

DIED: June 21, 1527, Florence (now in Italy)

TYPE OF ETHICS: Renaissance and Restoration history

SIGNIFICANCE: One of the first early modern thinkers to distinguish between private and public morality, Machiavelli sought in *The Prince* (*Il principe*, 1532) to provide rulers with guidelines for attaining and maintaining authority. “Machiavellianism” has come to mean the belief that power is the ultimate good, or even the only good, and that any method for obtaining it is justified.

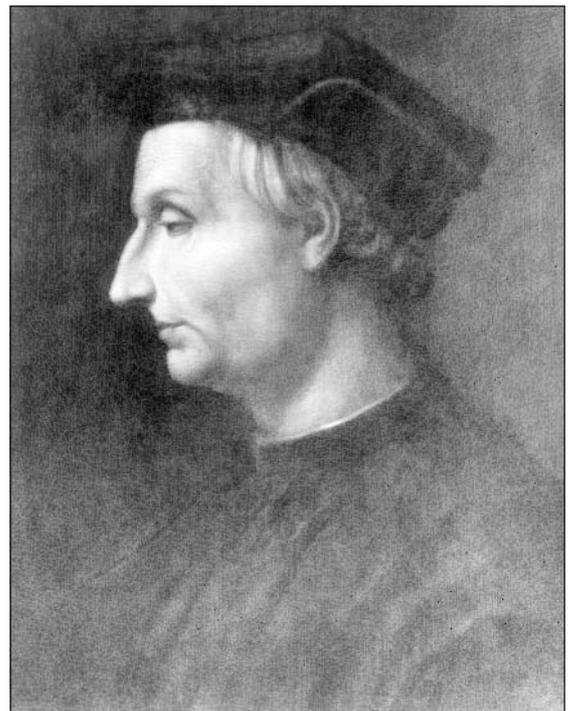

The ideas of Niccolò Machiavelli have been associated with the darker side of politics. To be Machiavellian has for centuries meant to be willing to do anything in the quest for power. Machiavelli has been viewed as a political devil, advising leaders to embrace the arts of treachery, force, and cruelty in order to be successful. These notions derive almost wholly from his work *The Prince*, and although they have persisted, they are exaggerations of the substance of Machiavelli’s ideas. Machiavelli also wrote plays, poetry, and histories. His most expansive work was *Discourses on the First Ten Books of Titus Livius* (1636). In it, the breadth of Machiavelli’s political thinking may be seen, and especially his high regard for republican government.

HISTORY

For good or ill, it was *The Prince* that, as Count Carlo Sforza said, “made Machiavelli famous and infamous.” Although it is unfair to say that Machiavelli

was a preacher of treachery and evil, there is some truth in these perceptions of Machiavellian ethics. Moreover, there is an inheritance from Machiavelli’s ideas that has deeply influenced political thinking into the modern era. Because of this influence of *The Prince*, it must be the focus of any discussion of Machiavellian ethics.

Machiavelli grew up in the Florence of Lorenzo de Medici. He was disheartened by his city’s decline following the French invasion of 1494. During the period of the Republic (1494-1512), Machiavelli, as second chancellor, was intimately involved with diplomatic relations involving France, Germany, the papacy, and other Italian states. When the Medici retook the city in 1512, Machiavelli was tried for treason and exiled to San Casciano. While he was in exile, he devoted his life to writing, yet he sought a return to public life. Around 1513, Machiavelli wrote *The Prince* and dedicated it to Lorenzo di Medici. Although they had been enemies in the past, Machiavelli hoped that Lorenzo would be impressed by the work and employ his skilled advice. Machiavelli’s work went unnoticed in his lifetime, but the succinct power of *The Prince*, a condensation of

Niccolò Machiavelli. (Library of Congress)

Excerpt from Machiavelli's *The Prince*

From this circumstance, an argument arises: Whether it is better to be loved rather than feared, or the opposite. The answer is that one would like to be both one and the other; but since they are difficult to combine, it is more secure to be feared than loved, when one of the two must be surrendered. For it may be said of men in general that they are ingrates, fickle, deceivers, evaders of danger, desirous of gain. So long as you are doing good for any of them they are all yours, offering you their blood, goods, lives, children, when any real necessity for doing so is remote, but turning away when such need draws near, as I have remarked. The prince who relies wholly on their words, and takes no other precautions, will come to ruin. Friendships gained at a price and not founded on greatness and nobility of soul, are indeed purchased but never possessed; and in times of need cannot be drawn upon.

Machiavelli's thought regarding rulership, outlasted both its purpose and the Medici.

THE PRINCE

If it has been unfair to say that *The Prince* and its interpretations accurately portray the depth of Machiavelli's thinking, it is equally fair to say that he meant every word of what he wrote. In *The Prince*, Machiavelli states that he will not speak of republics, for here he has a single purpose. *The Prince* discusses how principalities are won, held, and lost. It is a primer that tells how a single ruler may gain and maintain power. Machiavelli emphasized how power is garnered in a corrupt and dangerous political environment such as the one that existed in Renaissance Italy. In such treacherous times, a prince required special skills to control the state. This, the purpose of *The Prince*, accounts for the work's narrow focus and tone. The book stresses the need for rulers to develop clear objectives and pursue them vigorously and boldly. They must be willing to resort to illicit behavior in the interest of self-survival. Although Machiavelli does affirm certain principles (for example, avoid dependence on others, establish a citizen mili-

tia), he advises princes to be flexible in carrying out their policies.

MACHIAVELLI'S IDEAS

Machiavelli's attention to the mechanics of government in *The Prince* made political and military affairs paramount. He separated these from religious, moral, or social considerations, except as these might be politically expedient. The purpose of the state is to preserve power, and the one criterion of evaluation is success. Machiavelli was indifferent regarding whether a policy was brutal or treacherous, but he was aware that such qualities might affect the success of policy. Hence, Machiavelli preferred that policy be perceived as honorable and fair, but he emphasized that one should never risk failure for moral considerations.

In *The Prince*, Machiavelli openly discussed the advantages of skillful immorality. He was not immoral; instead, he advised princes to embrace political amorality, which encouraged virtuous behavior among subjects but accepted a rulership that transcended morality. This double standard for rulers and subjects is a hallmark of Machiavellian ethics. Machiavelli never advised cruelty for its own sake, but attempted political objectivity. This unabashed objectivity did not make him a devil, but he did exaggerate the quest for power and confuse the objectives of politics with the game itself.

PRINCIPLES

Machiavelli's ideas were precursors to many modern political attitudes. He addressed human nature, rulership, the character of the state, and the role of popular government. His observations about skillful policy were based on the assumption that the primary human motivations are selfish and egoistic. Machiavelli assumed that government derives from human weakness and the need to control the conflict that grows out of human self-interest. People are naturally aggressive, and the role of the state is to provide security.

This perspective on human nature led Machiavelli to emphasize the role of lawgiver and ruler. He argued that moral and civic virtues grow out of law and government; they are not inherent in human nature. The ruler represents the law and implements morals but is above morality. For this reason, the ruler must be both a "lion and a fox." When necessary, a ruler

must disguise the real intent of policy by controlling outward appearances. At other times, a ruler will have no recourse but to use brute force. Force must be used discreetly and effectively, but the ruler cannot flinch when the preservation of the state is at stake. Machiavelli argued that a ruler should be both loved and feared but stated that it is difficult to have it both ways. Thus, if one cannot be both loved and feared, it is better to be feared than to be loved. The ruler must have the virtues of strength and vision, and the flexibility to adapt to the whims of fortune.

Machiavelli was a national patriot, and he defined the state in terms of a personal identification of the citizens with the state. This idea accounts for Machiavelli's preference for popular government, whenever practical. He disliked noble classes because they were divisive and because noble class interests often clashed with those of the state. Machiavelli disdained the use of mercenary armies and encouraged a standing army of citizens who were willing to die for their country. Machiavelli believed that the goal of the state was to preserve national integrity and property, and he suggested that no state can survive without popular support.

Machiavelli was a realist, a skeptic, a patriot, a populist, and an adviser to tyrants, and his vision profoundly influenced political thinking. Even the meaning of the state as a sovereign institution appears to have originated with him. Unfortunately, Machiavellian ethics makes power the primary goal of politics, while moral, economic, and social forces are only factors to be controlled in the power game.

MacIntyre, Alasdair

IDENTIFICATION: Scottish moral philosopher

BORN: January 12, 1929, Glasgow, Scotland

TYPE OF ETHICS: Modern history

SIGNIFICANCE: One of the most significant moral philosophers of the second half of the twentieth century, MacIntyre wrote *After Virtue* (1981) in an attempt to summarize the history of Western moral thinking to date, to explain the quandaries of the modern moral landscape, and to synthesize a new approach to ethical theory that will address and resolve those quandaries.

In *After Virtue*, Alasdair MacIntyre analyzes theories of morality with regard to culture and states that virtue is found within the community, in its *ethos*, or character, and not in the individual alone. He argues that the Enlightenment abandoned the belief in a divine origin of morality and overemphasized the individual. This leads, says MacIntyre, to a breakdown of the triad of ethics: "man-as-he-happens-to-be," "man-as-he-would-be-if-he-realized-himself," and a divine system of rules to be followed. Such grounding of morality in human nature can produce moral relativism. MacIntyre is looking for a balance between the utilitarian concept of morality as usefulness and the relativism of different social norms. This question of the individual and the society is addressed in MacIntyre's book *A Short History of Ethics* (1966), in which he asserts that morality emerges out of human history rather than out of human nature.

This conception places ethical decisions beyond the limits of individuals. MacIntyre believes that valid moral principles reflect what rational people would accept collectively as good for the individual, regardless of the individual's place in society.

Mādhyamaka

DEFINITION: School of thought in Buddhism based on moderation

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Mādhyamaka Buddhism teaches that all worldly thought and beliefs are ultimately contradictory, and that the true path to nirvana entails recognition that the truth transcends anything that can be thought rationally or put into words.

Mādhyamaka is a school of thought within Buddhism that derives from the notion of “one who follows the middle way.” It was begun by the scholar and theologian Nāgārjuna, who lived during the period from 150 to 250 C.E. in India, and it is one of four central Buddhist schools. Mādhyamaka Buddhism spread throughout eastern Asia and is known by various other names, including *sanronshu* in Japan, *sanlun zong* in China, and *dbu-ma-pa* in Tibet.

HISTORY

Born in southern India in the second century, Nāgārjuna was the author of several philosophical treatises. His central contribution was the idea of *śūnyatā*, or “emptiness,” meaning the recognition that everything in this world, including human beings, is devoid of reality. His argument contradicted other contemporary philosophies of India, which looked on things as having substance in and of themselves. Nāgārjuna proposed that everything is defined or given meaning in terms of everything else. He called this contextualization of reality *pratītyasamutpāda*, or “interdependent co-arising.” Recognition of the illusoriness of human perceptions of reality and the mutual dependency of things in the

world is a first step toward true understanding, wrote Nāgārjuna and his major disciple Āryadeva.

In the so-called Middle Period of Mādhyamaka, eight Indian scholars wrote commentaries on the work of Nāgārjuna. During this period, Mādhyamaka split into two schools, the Prāsaṅgika and the Svātantrika. This distinction was primarily based on different logical and rhetorical methods for establishing the truths of Mādhyamaka Buddhism.

During the Later Period, scholars integrated aspects of other schools of thought in Indian Buddhism into Mādhyamaka. Mādhyamaka thought also spread to Tibet, China, and Japan, and more commentaries and treatises were written by scholars in those areas.

PHILOSOPHY

Although there are many complexities in the arguments presented by various thinkers within Mādhyamaka Buddhism, some general trends stand out. Primary among these is the recognition that reality is one and whole, and the human perception of separable “things” in the world is based on artificially cutting up that single reality through rationality and language. Nothing actually exists in and of itself, and attachment to the notion of the reality of self and world is a basic source of human suffering. Nonattachment to the illusory notions of self and world is liberation, or nirvana.

The meditative techniques emphasized in the Chan (Zen) tradition in China and Japan are focused on releasing the individual from the suffering that comes from attachment to atomized, hence false, conceptions of self and world. They seek to bring perception beyond the constraining rationalism of language, which is delusory in its fragmentation of reality.

ETHICS

One might suppose that rejecting the reality of perceived things and selves in the world and declaring everything “empty” of meaning could lead to a moral nihilism in which no action is any more meaningful or better than any other action. This was not, however, the interpretation of at least some of the key thinkers in Mādhyamaka Buddhism. Nāgārjuna recognized that although everything was devoid of reality on an ultimate or philosophical level, on a pragmatic level people have no choice but to live fully in the world, however faultily defined it may be. Nāgārjuna believed the ideal to be that of the *bodhi-*

sattva, or “enlightened being,” who lives in the world and pursues a moral path but is aware of the ultimate insubstantiality of mundane reality.

The “Middle Way” of *Mādhyamaka* is a path of moderation between rejecting the world as illusion and accepting the world as fully real and substantive. One tentatively accepts reality as it is, creating meaning through moral action, while realizing all the time that there is no ultimate grounding behind the reality in which one lives. The Japanese sage Dōgen, founder of the Sōtō school of Zen Buddhism, said, “Before Enlightenment, carrying firewood. After Enlightenment, carrying firewood.” The point is that one pursues daily activities in the world, but one’s perception of them, one’s mind, has changed. Although Dōgen is not properly considered part of *Mādhyamaka* Buddhism, this popular insight identifies clearly the position of the *Mādhyamaka* Buddhist with regard to action and philosophy.

Magna Carta

IDENTIFICATION: Grant of rights and privileges conceded by King John to English barons

DATE: Signed on June 15, 1215

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: The Magna Carta dealt with the grievances of feudal lords, but succeeding ages have used its language as a guarantee of the rights of all British citizens to freedom under the law and judgment by peers.

The Magna Carta, or Great Charter, is an English document that granted privileges and liberties that were to become the cornerstones of English constitutional government. It became a symbol of resistance to oppression, and many future generations looked upon it to formulate protection against their own threatened liberties. Earlier kings of England had issued charters and granted concessions to their barons. The difference between those charters and the Magna Carta was that the former were granted by the kings whereas the Magna Carta was demanded by the barons under threat of civil war.

The English kings before John were Norman and Angevin rulers who centralized the government, demanded increased taxation, and expanded feudal and judicial systems as a means of political control. Consequently, when John succeeded his brother Richard I in 1199, he was able to exploit his subjects. John was unskilled in waging war, and when he lost all of his continental possessions except Aquitaine to Philip II of France, his barons sought redress of their wrongs.

John had demanded military service or large amounts of money in lieu of it, sold offices, favored friends, arbitrarily increased taxes, and shown little respect for feudal law, breaking it when it suited him. King John also took the Church’s possessions and was excommunicated by Pope Innocent III in 1209. It was 1213 when John finally sought peace with the Church. In 1214, John returned from France in total defeat. His barons met with him and refused to serve

him or pay for not serving in the military. The barons began to prepare for war against John, if he did not confirm their liberties.

THE BARONS' REVOLT

In May of 1215, the barons formally renounced their allegiance to the king. John made concessions to the Church and granted London the freedom to elect its own mayor, hoping to gain support. John offered arbitration, but the barons refused. John finally agreed to grant the laws and liberties that the barons had demanded. They agreed to meet on June 15, at a place called Runnymede.

The barons came with a prepared list of demands, the Articles of the Barons. After the king had agreed to the terms, they were reduced to the form of a charter. King John finally affixed his royal seal to them on June 15, 1215. It was the custom to affix a seal instead of signature to royal documents.

The original charter was not carefully organized. It was later divided into sixty-three parts. These clauses can be divided into several groups, each dealing with specific issues.

The first of these groups concerns the Church, stating that it is to be free. The King must not interfere in the matters and offices of the Church. Two more groups deal with feudal law pertaining to those holding land directly from the crown, tariff reliefs, and those who are subtenants. A particularly large group deals with law and justice. No man was to be imprisoned without lawful judgment of his peers or by the law of the land.

Another group of clauses relates to towns, trade, and free movement for merchants. The conduct of royal officials is the subject of other clauses, while still others deal with the administration of the royal forest. Immediate issues were also mentioned, such as the recalling of foreign mercenaries, the returning of lands that had been seized unlawfully, and King John's compliance with the charter. If he failed to live up to his agreement, the council of twenty-five barons had the power to wage war against him.

REVISIONS AND ADDITIONS

Although King John swore an oath to abide by the terms of the Magna Carta, he had Pope Innocent III annul it on August 24, 1215, on the ground that it had been enacted by force. Civil war followed. King John died in November, 1216, and was succeeded by his

nine-year-old son, Henry III. The advisers of young Henry accepted the reforms of the Magna Carta in good faith. Reissues of the charter were granted in 1216, 1217, and 1225. The charter had been accepted by the government, to be used for guidance. Certain provisions, however, were omitted from the reissues. In 1216, the restraints and demands made against King John did not need to be retained. John's granting of freedom of elections in the Church was ignored, even though the declaration that the Church "should be free" remained. Also absent was the provision for a review of the king's performance by the twenty-five barons.

The 1217 Charter added provisions for suppressing the anarchy that was still prevalent in several districts, amended a few details of the original Charter that had proved to be defective or objectionable, and addressed new problems that had surfaced since the first charter. The final revision of the Magna Carta, which was made in 1225, contained only slight variations from the 1217 version.

The reissue of the Magna Carta in 1225 took the place that it still retains among the fundamental laws of England. It is this version that is always cited in editions of the statutes, courts of law, Parliament, and classical law books.

The Magna Carta is viewed as the cornerstone of the English Constitution. Before the close of the Middle Ages, it had been confirmed thirty-eight times. Edward I, with his confirmation in 1297, placed the Magna Carta on the statute books, and it remains there today. The declaration that statutes that are contrary to the Magna Carta are null and void carries a similarity to the language of the U.S. Constitution. The principle that no person shall be deprived of life, liberty, or property without due process of law was not merely a bargain between a king and barons. It was meant for free people in every age.

Maimonides, Moses

IDENTIFICATION: Jewish philosopher

BORN: Moses ben Maimon; March 30, 1135, Córdoba (now in Spain)

DIED: December 13, 1204, Cairo, Egypt

TYPE OF ETHICS: Medieval history

SIGNIFICANCE: The most influential Jewish thinker of the Middle Ages, Maimonides wrote extensively on philosophy, science, and medicine. Although he wrote no works on ethics per se, ethical issues permeate all of his philosophical writings, notably *Mishneh Torah* (1185) and *Guide of the Perplexed* (1190).

Maimonides, who was certainly the greatest intellectual figure to arise from the Sephardic (Iberian) Jewish tradition, was one of the most respected and influential Jewish thinkers in all of history. He is known chiefly for his commentaries on Jewish law and the origins of ethical behavior, but he also wrote works on general philosophy, medicine, and astronomy. His writings sparked controversy, but he came to be regarded as preeminent among Jewish philosophers and (by some) as the spiritual descendant of the biblical lawgiver Moses.

HIS LIFE

Maimonides was born in 1135 in Córdoba, in Islamic Spain. His family was wealthy, his father a notable intellectual and judge in a rabbinical court. Recognizing his son's brilliance, Maimonides' father personally tutored him in Jewish law. Maimonides was born at the end of the "golden age" of Jewish

Spain, a time of relative religious tolerance when the richness of Islamic thought intersected with Jewish and Christian traditions, drawing also on newly rediscovered Greek and Latin texts.

When Maimonides was about thirteen, the relative peace and tolerance in Spain ended abruptly with the ascendancy of the Almohad Islamic sect, whose fanaticism included the forced conversion of Jews to Islam. Maimonides' family was forced to flee Córdoba, settling in 1160 in the Moroccan city of Fez—which, as the center of the Almohad movement, was an odd choice.

In 1165, life in Fez became intolerable, so Maimonides' family moved first to Palestine and finally to Egypt. There, Maimonides' father died and Moses joined his brother David in the jewelry trade. When his brother died in a shipwreck, Maimonides supported himself as a physician, quickly rising to prominence as physician to the sultan, Saladin, and his vizier, al-Afdal. Thereafter, he practiced medicine, lectured to medical colleagues at a Cairo hospital, served as spiritual adviser to the local Jewish community, and wrote extensively on medicine, astronomy, and philosophy. He married late in life; fathered a son, Abraham (who also became a notable scholar); and died in 1204. It is likely that his varied life of surviving religious persecution, engaging in international commerce, and practicing medicine added a dimension of common sense and practicality to Maimonides' philosophical writings, enhancing his ability to communicate with a wide audience.

MISHNEH TORAH

Maimonides did not write books on ethics, as such, but wrote extensively on Jewish law, in which the distinction between law and ethics is unimportant. Probably his most significant legal work was the *Mishneh Torah*, which was completed in 1185 in Egypt and was written in Hebrew, unlike his other important writings, which were in Arabic. It consists of fourteen books and is widely regarded as among the most splendid and significant works of Jewish literature. The book attempts a systematic compilation of all Jewish law; rather than dwelling on points of contention or scholarly refinements, however, it tries to go to the heart of the issues, presenting the law in a clear and practical fashion.

Maimonides believed that the law was closely connected to logic, a prejudice that produced clarity

in his presentation. The influence of Aristotle, which was very much a factor in Jewish intellectual activity at that time, was everywhere apparent. Perhaps it was the Greek influence that enabled Maimonides to go beyond the conservatism of contemporary Talmudic scholarship and to place his own distinctive imprint on his work.

The section of the work dealing with “character traits” deals explicitly with ethical matters and shows the clearest Aristotelian focus. It is based on the notion that right actions are congruent with good character and the idea of a God-like mean. Thus, in matters of ethics, the wise man emulates the deity in following the mean course: that course of action that avoids all extremes that might reflect humanity’s natural inclinations. The nobility of character that makes such action possible also dictates a lack of interference with others and renders an orderly society possible. This general precept leads in a natural way to a number of secondary conclusions, including the importance of speaking kindly, of paying attention to one’s own health, and even of suppressing truth to the extent that it may inflict injury on others.

GUIDE OF THE PERPLEXED

Unquestionably the best-known of Maimonides’ writings, the *Guide*, completed in 1190, was also his last important work. Written in Arabic, it was translated into Hebrew and Latin. It attempted a synthesis of Hebrew religion and classical philosophy, an attempt that evidently succeeded, judging from the work’s enormous authority in subsequent Jewish (and Christian) religious thought, and from the fact that it was immediately assailed by some contemporaries as heretical. The perplexity in the title refers to inconsistencies or tensions between the rabbinical and the classical philosophical traditions. The intended audience was, presumably, urbane Jewish intellectuals (who were literate in Arabic). The purpose of the work is clearly theoretical, but, interestingly, the portions dealing with ethical matters can operate on a distinctly practical level. Thus, the purpose of the law is the health of both body and soul, the health of the soul is a question of character, and good character is associated with right actions. Right actions, as discussed earlier, proceed from adherence to the mean and from the exercise of kindness.

Malcolm X

IDENTIFICATION: American religious leader and social activist

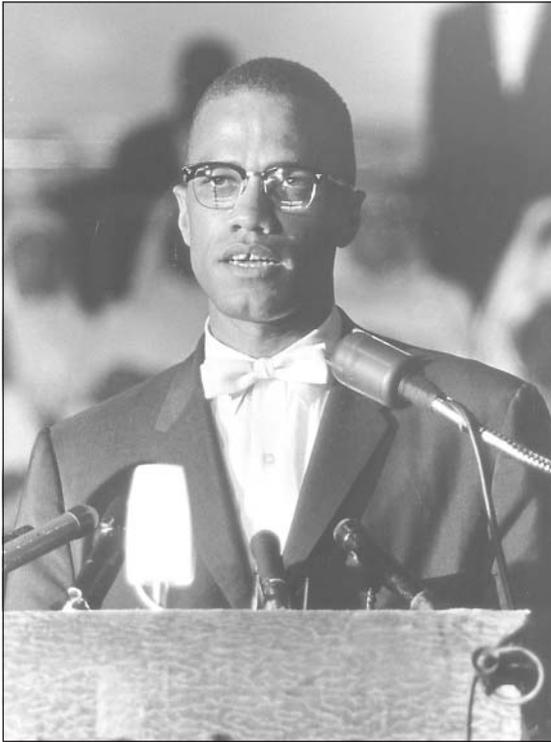

BORN: Malcolm Little; May 19, 1925, Omaha, Nebraska

DIED: February 21, 1965, New York, New York

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Malcolm X advocated employing “any means necessary” to bring about a world of human rights and universal brotherhood based on truth, equality, righteousness, peace, justice, and freedom. One of the most important figures of the Civil Rights and Black Power movements, Malcolm X inspired many militant activists and helped to spark important debates over the relative merits of violent and nonviolent protest.

Appalled at the racial discrimination that was widely practiced in predominantly Christian America, Malcolm X chastised Christianity as unethically enslaving African Americans through its teaching that the oppressed should focus on Heaven, where they will

Malcolm X. (Library of Congress)

reap rewards and their wrongs will be righted, instead of doing something about their deprivation here on Earth. He taught that Islam could bring about true brotherhood because of the “color-blindness” of Muslims.

Distancing himself from the “turn-the-other-cheek” philosophy of Christianity, Malcolm advocated the “fair exchange” of an “eye for an eye, a tooth for a tooth, a head for a head, and a life for a life,” if that was what it took to obtain human rights for African Americans and to create an egalitarian society of true human brotherhood. Just as love should be reciprocated, so should enmity. He believed that violent confrontation was necessary to defend the weak (women and children) against the strong (the Ku Klux Klan) but saw it as ethically wrong to form an African American Ku Klux Klan, since it “threatens the brotherhood of man.” He was convinced that confrontation based on moral tactics succeeds only when the system one is dealing with is moral. In 1964, he formed Muslim Mosque, Incorporated, to give a spiritual basis to the correcting of the vices that destroy the moral fiber of society, and founded the

Organization of Afro-American Unity, a nonreligious, nonsectarian group intended to unite African Americans in the goal of attaining human rights.

Malthus, Thomas

IDENTIFICATION: English economist

BORN: February 13, 1766, the Rookery, near Dorking, Surrey, England

DIED: December 23, 1834, Claverton, Bath, England

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: Responding to the demand for revision of England’s Poor Laws, Malthus advocated limitations on human reproduction in *An Essay on the Principle of Population, as It Affects the Future Improvement of Society* (1798). His *Principles of Political Economy* (1820) encouraged private and public spending as a palliative for a lagging economy, thereby anticipating the 1930’s economic system of John Maynard Keynes.

Contrary to the philosophers Jean-Jacques Rousseau and William Godwin, who professed the inherent goodness and perfectibility of humanity, Malthus argued that poverty could not be abolished, because of the inevitability of population growth consistently exceeding the food supply. While population grew geometrically, according to Malthus, resources grew arithmetically. Thus, population increases always would be checked by famine, disease, and war. Practical application of Malthusian theory occurred in the renovation of English Poor Laws. Believing that poverty was encouraged by the old system, which allowed people to live in their homes with community aid, thereby encouraging them to have many children, Malthus advocated workhouses in which the poor would be forced to live and work in conditions sufficiently bad to keep out all but the most desperate. Because of steadily rising food production rates brought about by increasingly sophisticated agricultural techniques, Malthusian predictions of

food shortages—on an international scale—have failed to manifest. Yet mounting ecological devastation—frequently caused by exploitative agricultural practices—the poor distribution of food, and unprecedented, unchecked population growth in the twentieth century, as well as predicted population growth in the twenty-first century, will undoubtedly result in a Malthusian ceiling.

Mandela, Nelson

IDENTIFICATION: South African social activist and statesman

BORN: July 18, 1918, Mvezo, Umtata district, Transkei, South Africa

TYPE OF ETHICS: Human rights

SIGNIFICANCE: After emerging with dignity from nearly three decades of political imprisonment, Mandela helped end South Africa's oppressive apartheid system and became the nation's first fully democratically elected president.

Before Nelson Mandela was sentenced to life imprisonment during the early 1960's, his struggle for freedom for black people in the Republic of South Africa led him first as a member of the African National Congress to advocate nonviolent acts of civil disobedience. However, after the Sharpeville massacre in 1960, in which South African police killed 69 peaceful demonstrators and wounded another 178, Mandela persuaded the African National Congress (ANC) to change its tactics to include acts of violent sabotage because peaceful protest had proven ineffective against overwhelming governmental force. Following a government raid on the headquarters

of Umkhonto We Sizewa (Spear of the People), the military arm of the ANC that Mandela cofounded, the five-year jail term he was serving for leaving the country without permission and for inciting workers to strike was changed to life imprisonment.

IMPRISONMENT

During the years he was imprisoned, Mandela spent many hours at hard labor. Nevertheless, he managed to be of help to many of his fellow prisoners. However, his time in solitude was especially valuable because it gave him opportunities to read, meditate, and write. The hours he spent alone in his cell deepened and clarified his thinking about his cause and contributed to making him South Africa's most important African nationalist leader.

International concern for Mandela's situation grew steadily and was accompanied by pressure for his release and for an end to apartheid. Some countries

imposed painful economic sanctions against South Africa. The government responded several times during the 1970's and 1980's by offering Mandela his freedom—but only on the condition that he renounce his principles and tactics. He refused all such offers and told President P. W. Botha that only a truly free man could agree to such an arrangement.

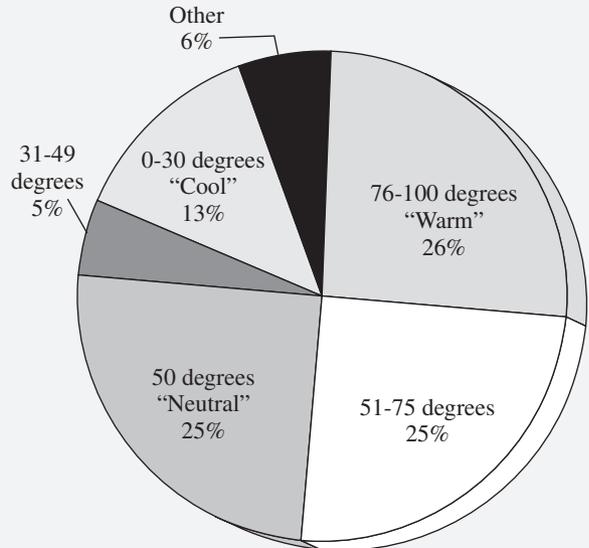

In view of the mounting economic consequences of international sanctions against South Africa, Botha's successor, President Frederik W. de Klerk, arranged a series of secret meetings with Mandela to work out a mutually acceptable solution to the problem of making a transition from apartheid to a free and democratic society. Success came in 1990, when sanctions were lifted against the ANC, which promised to avoid violence, and Mandela was released from prison. For their achievement, Mandela and de Klerk shared the Nobel Peace Prize.

When South Africa held its first universal free elections in 1994, the ANC won in a landslide and the new parliament elected Mandela president of the country. Mandela's prompt call for reconciliation after taking office and his determination to ensure fairness for all the nation's people helped make the radical transition peaceful. However, the challenges that he faced were enormous: to extend the benefits previously enjoyed only by a minority of South Africa's population to its deprived majority. This meant great changes in every aspect of South African life: provisions for such basic necessities as housing, food, and water; education of children and adults; amendments and corrections in laws and methods of transferring land ownership; transformations in health care; and expanded electric power and telephone service. In addition, the growing acquired immunodeficiency syndrome (AIDS) epidemic, unemployment, waste and corruption within the government, and the need to reconstruct South African business and industry required close attention.

Not all these problems were solved during Mandela's four-year term as president. Nevertheless, Mandela presided over a comparatively united country in which progress was made on all fronts. He continued his concern for peace and justice not just at home but wherever in the world human rights were

American Feelings Toward Mandela

After Nelson Mandela completed his term as president of South Africa in 1998, the Chicago Council on Foreign Relations asked a cross-section of Americans to express their feelings about him on a thermometer scale.

Source: Roper Center for Public Opinion Research. Figures reflect responses of 1,507 adults surveyed in the fall of 1998.

threatened. He helped mediate Indonesia's dispute with its East Timor independence movement and Libya's resolution of its responsibility for the 1988 terrorist downing of a Pan Am jetliner over Lockerbie, Scotland. He also helped Iran, Syria, Jordan, Israel, Palestine, and the United States in several attempts to make a durable peace in the Middle East.

RETIREMENT

After Mandela retired from the presidency in 1999, he continued to work for children's welfare through two foundations he created. He also went on missions to bring peace and reconciliation to various parts of the world and spoke out on issues about which he felt strongly. For example, in 2002 and 2003, he condemned American military intervention in Iraq as a threat to world peace. In 2003 he also sponsored a large-scale rock concert that featured world-famous performers who donated their time to raise money to combat AIDS in Africa.

Because of Mandela's achievements as a revolutionary, his courageous work in transforming South Africa into a free and democratic country, and his wisdom, integrity, and moral stature as a champion of world peace and justice, many people have ranked him among the most important statesmen of the twentieth century.

Manhattan Project

IDENTIFICATION: Research and development program established by the U.S. War Department to create a superexplosive utilizing the process of nuclear fission

DATE: Established in June, 1942

TYPE OF ETHICS: Scientific ethics

SIGNIFICANCE: The Manhattan Project created the first atom bombs and the only such bombs ever to

Image not available

Workers at the Trinity test site in New Mexico prepare to raise the first prototype atom bomb to the top of a one-hundred-foot tower for detonation on July 16, 1945. (AP/Wide World Photos)

be used against human targets. The morality both of creating and of employing those weapons has been a matter of debate ever since.

In 1939, physicists in the United States learned of Nazi Germany's attempts to develop a fission bomb of unprecedented power and alerted President Franklin D. Roosevelt to the situation in a letter written by Albert Einstein. Given the brutality of the Nazis, the ramifications of such a weapon were frightening. On December 6, 1941, the president directed the Office of Scientific Research and Development to investigate the possibility of producing a nuclear weapon. The head of the office, Vannevar Bush, reported back in early 1942 that it probably would be possible to produce sufficient fissionable uranium or plutonium to power such a weapon. Accomplishing that task was by far the greatest obstacle to building an atom bomb.

In strict secrecy, in June of 1942, the Army Corps of Engineers established the Manhattan Engineer District, a unit devoted to building the bomb. On September 17, then-colonel Leslie R. Groves was appointed to head the entire effort (plan and organization), which by this time was called simply the Manhattan Project. Groves was promoted to general shortly thereafter. Physicist J. Robert Oppenheimer directed the scientific group that was responsible for actually designing the weapon.

By 1944, the Project was spending one billion dollars per year—a situation that some people believed was out of control. Project scientists detonated a prototype bomb in New Mexico on July 16, 1945, producing an energy yield that was beyond their expectations. Two more bombs were readied and dropped in early August, and Japan surrendered soon after. At the time, only some contributing scientists protested the use of the atom bomb against a live target. Qualms were dispelled by the thought that Germany and Japan would have used it if they had developed it. As the effects of the new weapon became more fully appreciated, however, many began to feel remorse.

Manichaeism

DEFINITION: Proselytizing, gnostic, universal religion

DATE: Founded around 240 C.E.

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Most famous as a species of absolute dualism, Manichaeism espoused a belief in the ability of the human soul to redeem itself and transcend the corruption of worldly matter.

Manichaeism was founded and organized by the Persian Mani, who was born on April 12, 216 C.E., in the province of Babylon (modern Iraq). Drawing on evidence such as the Turfan texts, discovered in Chinese Turkestan in 1904 and 1905, which contain portions of Mani's "bible," the Mani Codex, and on Manichaean literature, scholars accept the tradition that Mani's mother was a noble and that Mani was artistic, well educated, and multilingual. His father was an Elkesaite, a member of a Jewish-Christian religious movement that practiced baptism, purifications, and food taboos, all of which the mature Mani rejected. At the ages of twelve and twenty-four, Mani reported visions of a heavenly twin that persuaded him to abandon the Elkesaites and to proclaim his own doctrine publicly.

THE SPREAD OF MANICHAEANISM

Expelled by the Elkesaites and persecuted by the Persian regime, Mani fled for a time to India. In either March, 242, or April, 243, however, the Persian emperor Shapur I recalled Mani, sanctioned his religious views, and permitted him to preach throughout Persia. Having gathered a handful of converts, including his father, Mani thereafter rapidly won adherents within Shapur's realm before his rivals, in cooperation with a new emperor, imprisoned and martyred him in 277.

Manichaean missionaries, even before Mani's death, had begun spreading their religion into Egypt and the Roman colonies of North Africa (where the young Augustine of Hippo was a convert), as well as across Central Asia. In Persia's eastern provinces, in fact, Manichaeans thrived until the tenth century, when their enemies drove them eastward into Samarkand, Turkestan. There, when the Uighur Turks conquered eastern Turkestan, Manichaeism became the official religion until that area, in turn, was decimated by the Mongols in the thirteenth century.

Meanwhile, during the fourth century, Manichaean influences in the West had reached their peak in Sicily, southern Gaul (France), and Spain.

Manichaeans subsequently penetrated China in 696 and, despite persecutions during the ninth century, their doctrines persisted there, clandestinely, for another five hundred years. In medieval Europe, in large part because of the hostile fifth century writings of Augustine, “manichaean” was a pejorative term applied by Christian theologians to heretical sects such as the Paulicians, the Cathars, the Bogomils, and the Albigensians, whose dualism or gnosticism resembled Manichaeism. In sum, for roughly a thousand years and across much of the Northern Hemisphere, Manichaean beliefs and ethical practices won many converts and were exposed to the scrutiny of learned people and their governments.

MANICHAEAN BELIEFS AND ETHICS

Mani acknowledged that his religion was ecumenical, or all-encompassing, by design, and he openly drew upon a variety of philosophical and religious beliefs, including Judaism, Zoroastrianism, Greek philosophy, Chaldean astrology, Buddhism, Daoism, and Christianity.

Mani’s primary objective was the salvation of men’s souls (women were excluded as unredeemably corrupt) through personal acquisition of deeply experienced special knowledge, or *gnosis* (Greek for “wisdom”). For Manichees there were, at creation, two separate worlds. One world was paradisaical, suffused by the light of God, goodness, and beauty. In the present, however, humans lived in another world, a world of darkness, or evil, whose matter, although containing some mixtures of light, was corrupted almost totally. Human beings themselves were corrupt products of the mating of demons amid evil’s partial triumph over light.

That some of God’s light remained mingled in the battle between light and evil and that it could still be discovered in man nevertheless offered Manichaeans hope of salvation. An elite—the elect or *perfecti*—therefore could be saved if they carefully, at times painfully, lived their lives in search of the light within them. Finding light, they also discerned the nature of reality and of the past, present, and future of the universe. Their souls were destined for the kingdom of light. Manichees whose vows were incomplete—hearers—were destined for reincarnation.

Manichaeism demonstrated an attractive tolerance for other faiths. Jesus, Buddha, Zarathustra, and Laozi, for example, were important figures from whom Manichees believed Mani was descended or reincarnated. Their writings or sayings formed parts of Manichaean liturgies and literature. Strict and benevolent personal and social behavior were stressed, particularly among the five classes of Manichaean clergy. Prayer was expected four times a day. Taxes were levied to support temples and clergymen. Monogamy was prescribed. Violence, including suicide, was denounced. Fasting was expected once a week and for thirty days at the spring equinox. Believing that humans ate living entities, including plants and fruits, for whom tears were in order, Manichees were supposed to be strict vegetarians.

ETHICAL IMPLICATIONS

Manichaeism, in a harsh world of savagely conflicting regimes and faiths, was a religion of hope and redemption, the key to which was gaining inner wisdom. With a well-ordered clergy, temple observances, rites, and strict rituals, it provided a culturally rich and secure framework for hopeful, benign, and tolerant living that deplored violence and avoided warfare.

Manifest destiny

DEFINITION: Political doctrine holding that the entire North American continent was intended by God or Providence to become the territory of the United States

DATE: Term coined in 1845

TYPE OF ETHICS: International relations

SIGNIFICANCE: The doctrine of manifest destiny was referred to most explicitly in congressional debates of 1845 and 1846, but it shaped U.S. foreign and domestic policy throughout the nineteenth century.

The notion of manifest destiny has come to be associated with the policy espoused by President James Monroe in the Monroe Doctrine, but the phrase itself was coined later, by John L. O'Sullivan in the July-August 1845 issue of *United States Magazine and Democratic Review*. During that year, the merits of expansionist policies were the subject of debate, as the United States attempted to lay claim to the territories of Oregon and Texas.

Proponents of manifest destiny such as O'Sullivan held that the United States had a moral right, and indeed a religious obligation, to occupy and develop these lands. Opponents saw this attitude not only as heretical but also as potentially self-destructive, since it was possible for the still young nation to annex more territory than it could control and defend. Later historians, aware of the full extent of the genocide of Native Americans perpetrated in the name of manifest destiny, have raised more direct questions about the ethical effects of the doctrine.

Whatever its moral status, however, the conviction that the United States was destined to possess North America largely became reality during the nineteenth century. French claims to North America vanished with the Louisiana Purchase of 1803. Spanish claims received settlement in the Adams-Onís Transcontinental Treaty of 1819, after which Spain's lands contiguous to the United States came under the control of an independent Mexico. Russia's claim to Oregon Country was withdrawn as part of an 1824 Russian-American agreement. British claims to Oregon Country disappeared in a treaty signed in 1846. In addition, by 1848, Mexico's claims to Texas, New Mexico, and California were no more.

Mapplethorpe, Robert

IDENTIFICATION: American photographer

BORN: November 4, 1946, New York, New York

DIED: March 9, 1989, Boston, Massachusetts

TYPE OF ETHICS: Arts and censorship

SIGNIFICANCE: Mapplethorpe was an important and controversial artist whose work has been exhibited in museums and galleries worldwide. He was one of a small group of photographers and performance artists at the center of battles in the United States over censorship and public funding for the arts during the late 1980's and early 1990's.

The work of the late photographer Robert Mapplethorpe, who frequently depicted homoerotic and sado-masochistic subjects, excited controversy throughout his career. With a slick and sophisticated style, Mapplethorpe often juxtaposed underground, subculture matter with classical composition. A 1989 exhibition of Mapplethorpe's photographs in Washington, D.C., which was partly funded by a grant from the National Endowment for the Arts, provoked a conservative campaign to halt government subsidies for what some considered to be "obscene" works.

After an emotional debate, Congress enacted restrictions on National Endowment for the Arts grants that did not fully satisfy either side, although they were milder than many in the art world had feared they would be. Meanwhile, a Mapplethorpe exhibition at the Cincinnati Contemporary Art Center led to the first trial of an art museum and its director on obscenity charges. Against the odds, the defendants were acquitted by a jury that decided that Mapplethorpe's photographs were the work of a serious artist.

Marcus Aurelius

IDENTIFICATION: Roman emperor

BORN: Marcus Annius Verus; April 26, 121, Rome

DIED: March 17, 180, Sirmium, Pannonia (now in Serbia) or Vindobona (now Vienna, Austria)

TYPE OF ETHICS: Classical history

SIGNIFICANCE: Marcus Aurelius is remembered as much for his Stoic philosophy, recorded in the *Meditations* (c. 171-180), as for his rule of the Roman Empire. His personal honor and nobility are perhaps best attested to by the fact that, in a time and place notorious for utterly ruthless imperial politics, he insisted on honoring a perceived commitment to his adoptive brother to share the throne. The brothers became the first fully equal joint emperors in the history of the empire.

While ruling the Roman Empire during its greatest period, Marcus Aurelius practiced a simple, even austere personal lifestyle based on a sincere belief in Stoic philosophy, which emphasized the overwhelming importance of spiritual and intellectual values over physical or material pleasures. Noted publicly for his restraint, modesty, and nobility, Marcus Aurelius devoted many of his private hours to writing his *Meditations*, which contained the essence of his version of Stoic ethics. The core of his ethical beliefs may be summed up in a few basic rules: forgive others for their wrongs; be aware of the harm done to people by their own bad actions; avoid judging others; be conscious of your own faults; consider that you cannot know the inner thoughts of others; avoid anger, for life is brief; anger and grief can be worse than actual physical harm; and kindness and friendship are best for all. Although these rules are hardly revolutionary in theory, they assumed and retain importance because they were held by a Roman emperor.

Marketing

DEFINITION: Promotion, sale, and distribution of commodities

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Marketing in modern society entails identifying potential consumers, persuading them to purchase one's products, and designing, modifying, manufacturing, or providing those products with the target market in mind. All these practices require ethical decisions to be made, about everything from invasions of privacy to honesty in advertising to fairness in pricing.

Various personal, societal, and environmental factors have led to an increased awareness of ethics in business practices. Frequently, this awareness is focused on marketing activities. Continual publicity about businesses involved with unethical marketing practices such as price fixing, unsafe products, and deceptive advertising has led many people to believe that marketing is the area of business in which most ethical misconduct takes place.

MARKETING AND ETHICS

Broadly speaking, "ethics" implies the establishment of a system of conduct that is recognized as correct moral behavior; it concerns deciphering the parameters of right and wrong to assist in making a decision to do what is morally right. "Marketing eth-

Marketers' Code of Ethics

The American Marketing Association's code of ethics requires members to accept responsibility for their actions by making sure that their decisions, recommendations and actions serve their customers, organizations, and society. The professional conduct of marketers is to be guided by the basic rule of ethics not knowingly to do harm, adherence to relevant laws and regulations, accurate representation of their qualifications, and practice of the association's code of ethics.

The code itself lays down specific guidelines under the headings of honesty and fairness, rights and duties of parties in the marketing exchange process, product development and management; promotions; distribution; pricing; and marketing research.

The full text of the code can be found at www.marketingpower.com/live/content175.php

ics” is the application of ethical evaluation to marketing strategies and tactics. It involves making judgments about what is morally right and wrong for marketing organizations and their employees in their roles as marketers.

The American Marketing Association (AMA) is the major international association of marketers. It has developed a code of ethics that provides guidelines for ethical marketing practices. Marketers who violate the tenets of the AMA code risk losing their membership in this prestigious and influential association.

Marketing is involved with a variety of ethical areas. Although promotional matters are often in the limelight, other ethical areas deserving attention relate to marketing research, product development and management, distribution, and pricing.

The area of marketing that seems to receive most scrutiny with respect to ethical issues is promotion. Because advertising, personal selling, and other promotional activities are the primary methods for communicating product and service information, promotion has the greatest visibility and generally has the reputation of being one of the most damaging areas of marketing. Misleading and deceptive advertising, false and questionable sales tactics, the bribing of purchase agents with “gifts” in return for purchase orders, and the creation of advertising messages that exploit children or other vulnerable groups are some examples of ethical abuses in promotional strategy.

MARKETING RESEARCH, DEVELOPMENT, AND MANAGEMENT

Marketing research can aid management in understanding customers, in competing, and in distribution and pricing activities. At times, however, it has been criticized on ethical grounds because of its questionable intelligence-gathering techniques; its alleged invasion of the personal privacy of consumers; and its use of deception, misrepresentation, and coercion in dealing with research participants and respondents.

Potential ethical problems in the product area that marketing professionals can face involve product quality, product design and safety, packaging, branding, environmental impact of product and packaging, and planned obsolescence. Some marketers have utilized misleading, deceptive, and unethical practices in their production or packaging practices by making unsubstantiated and misleading claims about their products or by packaging in a way that appeals

to health-conscious or environmentally concerned shoppers. Ethical behavior involves using safe and ethical product development techniques, providing a product quality that meets customers’ product specifications, using brand names that honestly communicate about the product, and using packaging that realistically portrays product sizes and contents.

Planned obsolescence represents an ongoing ethical question for marketers. Consumers are critical of it for contributing to material wear, style changes, and functional product changes. They believe that it increases resource shortages, waste, and environmental pollution. Marketers, on the other hand, say that planned obsolescence is responsive to consumer demand and is necessary to maintain sales and employment.

DISTRIBUTION AND PRICING

Many of the potential ethical problems in distribution are covered by laws such as those contained in the Robinson-Patman Act. Nevertheless, distribution involves some ethical issues that merit scrutiny. Deciding the appropriate degree of control and exclusivity between manufacturers and franchised dealers, weighing the impact of serving unsatisfied market segments where the profit potential is slight (for example, opening retail stores in low-income areas), and establishing lower standards in export markets than are allowed in domestic markets are examples of some distribution cases that have significant ethical implications.

Since pricing is probably the most regulated aspect of a firm’s marketing strategy, virtually anything that is unethical in pricing is also illegal. Some of the primary ethical issues of pricing are price discrimination, horizontal/vertical price fixing, predatory pricing, price gouging, and various misleading price tactics such as “bait-and-switch” pricing, nonunit pricing, and inflating prices to allow for sale markdowns.

SOCIAL RESPONSIBILITY

It seems tenable to suggest that the areas of marketing ethics and social responsibility should be seen as concomitant. If marketing is authentically concerned with meeting consumer needs and concerns, it should also entail carefully evaluating how decisions impact and affect consumer expectations and quality of life.

Bait-and-Switch Techniques

Bait-and-switch advertising is the practice of advertising a product or service that the seller knows will not be reasonably available when consumers respond to the ad. When a consumer expresses a desire to buy the advertised product, the seller explains that it is not available for some reason—perhaps it has sold out—then apologizes and offers another product, one that has a higher price or a higher profit margin. After going to the trouble of seeking out advertised products, customers are often willing to accept alternatives, even if they are more expensive, particularly if the sellers are good at making the alternatives appear to be good deals.

Used car dealers are notorious for bait-and-switch techniques. A common ploy for a dealer is advertising a single vehicle at a bargain price that brings in many potential buyers. If the advertised vehicle actually exists, it is likely to be sold quickly, allowing the dealer to say, in all honesty, that the lot has sold all its advertised vehicles and then turn the customers' attention to more expensive vehicles. If the advertised vehicle does *not* exist, the dealer may say exactly the same thing, with the same results. In either case, the practice is unethical and may even be illegal.

Marketing activities can have significant societal and environmental ramifications. The rise of ecological consciousness among consumers gives social responsibility increasing stature. Consumers now are very concerned about whether the products or services they buy cause air or water pollution, landfill expansion, or depletion of natural resources. Recognizing this increased ecological concern of consumers, many companies are reevaluating the ways in which they produce and package their products and are considering the alteration of other areas of their marketing mix.

Marriage

DEFINITION: Formalized union, traditionally of members of the opposite sex, governed by the customs of a specific society

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Marriage is commonly both a religious sacrament and a social institution with economic, educational, and other functions crucial to the maintenance of modern societies. Thus, the institution and anyone entering into it are enmeshed in an extensive network of moral functions, rights, and obligations.

In Western societies steeped in the Judeo-Christian tradition, marriages are monogamous, conjoining one member of each sex, but there are also polygamous cultures in which one male marries more than

one wife (polygyny) or one female marries more than one husband (polyandry). Whatever its form, marriage provides a sanctioned context for mating and initializes the basic family unit.

PATRIARCHAL HERITAGE

In Western societies, there is a strong patristic heritage that still influences marital laws and customs. Even in ancient cultures with no roots in Judaism there was a deeply ingrained, patriarchal bias. For example, in pre-Christian Rome, fathers had supreme authority, including the right to dispose of the property and even the lives of their wives and children.

In many ancient societies, including that of Rome, marriage involved tradition rather than law *per se*. Marriages were arranged by family patriarchs, particularly in cultures with stratified classes based on birthright and inheritance. Marriages of convenience were prevalent and often involved the endogamous union of close relatives to preserve social rank and family property. The emphasis in such marriages was on the bride's social rank, dowry, childbearing potential, and domestic management skills. As a result, male infidelity, even when officially condemned, was widely practiced; under an infamous double standard, however, no such sexual freedom was granted to wives. Moreover, vestiges of Roman law and custom geared to male primacy have remained in Western law, going unchallenged until the twentieth century.

RELIGIOUS AND CIVIL SANCTIONS

During the Middle Ages, the Roman Catholic Church became the principal agent of change in those geographic areas formerly under Roman domination. Basing its arguments on scriptural prohibitions against sex outside marriage, the Church sought to modify the rules of courtship and marriage and vigorously condemned both fornication and adultery. The Church gave marriage a sacramental status and, technically, made it binding for life.

The Church also kept records of marriages, births, baptisms, and deaths until civil records were instituted, making all but baptismal and confirmation records redundant. Strongly influenced by the Church, criminal and civil law reflected both Christian ideology and its collateral Roman legacy. Civil codes made it extremely difficult to obtain divorces in secu-

lar courts, while criminal laws exacted harsh penalties for adultery.

In most Western countries, it has become possible to marry outside the purview of any church, in a civil ceremony that is legally binding but precludes any religious sanctions. Those who marry in a religious ceremony must obtain civil authorization, however, and the service itself must conform to law. In the United States, marriage is treated as a legal contract, but it differs from normal contractual agreements in that it cannot be dissolved without judicial arbitration. Although laws have gradually been liberalized to make divorce easier to obtain, the legal right to divorce may be inhibited by conflicting religious doctrines that, for many people, take precedence over legal rights.

RELATIONSHIP TO THE FAMILY

Because marriage was traditionally undertaken to provide generational continuity in name, blood, and property, it cannot be separated from the concept of family. Prior to the modern industrial and technological revolutions, in a more sparsely populated, less mobile world, many families took the form of extended families, in which the family patriarch held both dominion and roof over not only his children but also his grandchildren and even his great-grandchildren. The nuclear family, consisting only of parents and their immediate children, eventually displaced the extended family as the norm in the more industrialized areas of the world.

The concept of marriage has also undergone modification. Beginning with the suffrage movement, women sought to achieve many rights and prerogatives that both tradition and law granted exclusively to men. Vigorously advanced was the idea of marriage as an equal partnership, with all rights equitably shared by husband and wife. Most laws governing such matters as property and the custody of children now reflect the principle of joint ownership and responsibility.

MODERN PROBLEMS

The emancipation of women has raised new moral and legal issues that are yet to be resolved. An example is the notion of conjugal rape, an idea that is alien to much conventional thinking about marriage. Legal redress in cases of spouse abuse has been difficult because law enforcement agencies still tend

to view marriage problems as private matters. The battered wife, though not exclusively a new phenomenon, is relatively new to public awareness.

Closely linked to the concept of procreation, marriage has traditionally sanctioned only heterosexual unions, but even that principle has been challenged by gays who wish to benefit from some of the legal guarantees extended to married couples and families. They have worked to redefine marriage legally to include the contractual mating of couples of the same sex with all the rights of heterosexual couples, including child adoption. Opposition to this goal, based on religious and moral grounds, remains strong.

Marshall Plan

IDENTIFICATION: Program that transferred economic resources from the United States to Europe in order to restore European economies to prosperity

DATES: Proposed 1947; in effect 1948-1951

TYPE OF ETHICS: International relations

SIGNIFICANCE: The best-known example of foreign aid, the Marshall Plan advanced the principle that relieving economic distress promotes a peaceful world order.

The Marshall Plan, proposed in the spring of 1947 by General George C. Marshall, the American secretary of state, was intended to provide substantial economic aid to war-ravaged Europe. In order to prevent widespread economic collapse, the plan proposed to restore European economies to their prewar levels of production. Enacted by the Congress under the Truman administration, the plan provided more than \$12 billion in economic aid to eleven Western European nations from 1948 to 1951. The amount equaled approximately 1.2 percent of the U.S. gross national product during each year of aid.

Essentially designed as government-to-government aid, the plan required each nation to formulate a list of needs and prescriptions for addressing them. Nations within the Soviet sphere of influence, unwilling to divulge their economic needs, quickly withdrew from consideration. After national programs had been approved, American aid, in the form of manufactured goods, machines, and raw materials, began to flow into the nations of Europe. American advisers supervised the program throughout to ensure that inflation did not destroy the gains. By 1951, the plan had succeeded in its goal of raising levels of productivity to prewar levels. The Marshall Plan brought benefits to both Europe and America by improving the economies on both sides of the Atlantic. It also laid the groundwork for future international cooperation in both commercial and military affairs.

Marx, Karl

IDENTIFICATION: German political philosopher

BORN: May 5, 1818, Trier, Prussia (now in Germany)

DIED: March 14, 1883, London, England

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: The author of *Capital: A Critique of Political Economy* (*Das Kapital*, 3 volumes, 1867, 1885, 1894) and coauthor, with Friedrich Engels, of *The Communist Manifesto* (*Manifest der Kommunistischen Partei*, 1848), Karl Marx was perhaps the single most influential thinker of the nineteenth century. His theories of economics and of history formed the basis for revolutionary movements and socialist and communist governments during that century and the next. It has been said that, with the dissolution of the Soviet Union in 1989, historians were divided into two camps: those who believe that Marx's model of government failed, and those who believe that it was never attempted.

Karl Marx occupies a pivotal place in the history of the international socialist movement. A passionately committed revolutionary theorist and activist, he worked tirelessly to bring about the overthrow of capitalism and believed that he had discovered the historical laws that would inevitably produce its collapse. As an integral part of his philosophical system, he developed a materialistically based theory of ethics in which the prevailing moral principles of any historical period were seen as reflections of the underlying economic process and the interests and aspirations of the dominant social class. In presenting this view, he posed the question of capitalism's moral legitimacy more sharply than did any other philosopher of the nineteenth and twentieth centuries, and he offered a powerful alternative vision of a socialist society in which social classes would be abolished and all poverty and suffering would end.

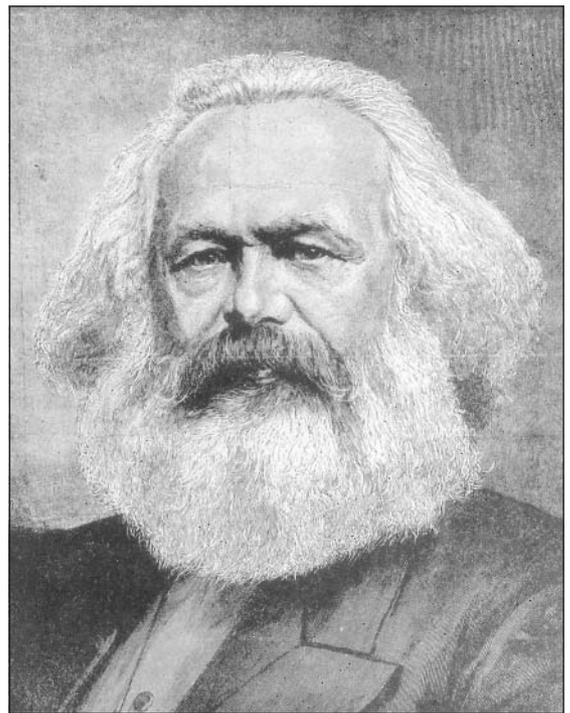

HISTORICAL MATERIALISM

At the center of Marx's system lies his philosophy of dialectical materialism. His views on historical evolution, economics, society, and the theory of ethics all grow directly out of his materialist conception of the world. For Marx, it was not ideas that were the primary determinants of history, but material—

particularly economic—facts. In the social world, in particular, the consciousness of human beings was determined by the conditions of their material existence and by the values and norms associated with the prevailing mode of economic production of the time.

All of history, Marx believed, moved through six distinct historical stages: primitive communism, the ancient slave state, feudalism, capitalism, socialism, and, ultimately, communism. At each stage in the process of historical development, the economic system created within it two antagonistic social classes, whose struggle for control of the productive property of the society was continuous and was reflected in their political and ethical ideas. In this struggle, the views of the dominant class—under feudalism, the landowning aristocracy, and under capitalism, the industrial bourgeoisie—tended to predominate. As Marx put it in *German Ideology* (1846): “The ideas of the ruling class are in every epoch the ruling ideas, i.e., the class which is the ruling *material* force of society is at the same time its ruling *intellectual* force.”

Thus, for Marx, all ethical ideals—no matter how cleverly disguised—were class based and had their

Karl Marx. (Library of Congress)

origin in the conflicts generated by the underlying social and economic system. They were, in a real sense, ideological weapons used by the dominant and contending classes in their struggle for political hegemony, and thus were an ineluctable part of the class struggle itself. That struggle, Marx believed, was always resolved by revolution, and it unfolded naturally according to historical laws that were independent of the individual's will.

REJECTION OF MORAL ABSOLUTISM

The materialist foundations of Marx's philosophy led logically to a categorical rejection of abstract moral idealism. To Marx, universal ethical principles such as those proposed by Immanuel Kant or by the Christian church were pure historical fictions. All ethical perspectives, he contended, were influenced by material interests and rooted in the economic conditions of a specific time and place. Abstract moral concepts such as "liberty," "equality," and "justice" were, in his view, illusions. Each social class tended to define such concepts in terms of its own historical experience, seeking to shape them in order to satisfy its ongoing material needs.

During the capitalist stage of development, for example, the bourgeoisie, the primary purchaser of labor in the society, and the working class, the seller of labor, naturally came to see such concepts as "liberty" and "equality" differently. This difference in perspective was based not on abstract moral reasoning but on contrasting positions of the classes in the productive process and the underlying economic relations of the age. In presenting their material demands, both classes made claims to absolute moral authority. No common moral ground in the class struggle existed, and the ultimate arbiter was always physical force.

Marx's belief that all morality was class morality took on a particular poignancy with regard to religion. The Church, he argued, like the state, was an institution that was dominated by the ruling class of any historical period. Therefore, it tended to espouse moral values that strengthened that class's political and social position. Specifically, the Church's promotion of the ideal of personal humility, scriptures against violence, and concentration on the afterlife were designed to teach the worker to be submissive to authority and to look to the next world for the ultimate reward. Religion, as Marx put it acidly, was "the

opiate of the masses," and its destruction was an important step toward freeing the working class from the intellectual domination of the bourgeoisie.

WORKING-CLASS MORALITY

The vehemence with which Marx rejected the idea of universal ethical principles was accompanied by an equally disdainful attitude toward the more extreme forms of moral relativism. Since history, he argued, inevitably moved to materially "higher" and thus more potentially liberating stages, the ethical values of the ruling class of any historical period were inherently superior—in a developmental sense—to those of the ruling group that preceded it. Thus, the ethics of the bourgeoisie were "objectively" more progressive than those of the aristocracy and the slave-owning class before it, and those of the working class were the most liberating of all. Indeed, of all the classes that had appeared throughout history, the working class alone possessed a truly revolutionary morality. This was because its demands for human equality, an equitable distribution of property, and economic as well as political democracy grew directly out of its own material needs. It was this profoundly moral vision of the working class as a social carrier for a genuinely liberated society—even more than the purportedly scientific character of his historical analysis—that would account for much of Marx's influence after his death.

Marxism

DEFINITION: Set of theories and practices espoused by, or associated with, Karl Marx, including historical materialism, the elimination of private property, and a commitment to bringing about a classless society

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Classical Marxism was a revolutionary philosophy founded in a commitment to universal equality and justice. The actual governments that have come into being espousing Marxist principles, however, have often deviated from those ideals to such an extreme that the very meaning of the term has become a subject of significant controversy.

Implicit in Marxism is a unique variety of ethics that combines traditional theories of “might makes right” with the belief that under communism the wrongs of past injustices will be righted. Marxism as a theory has two distinct parts: Marx’s interpretation of society as he perceived it and his image of society in the future. Marx can also be understood on two levels: as an economic theorist and as a moral theorist. He is more widely regarded, however, as an economic theorist with little regard for anything but economic justice. Some scholars of the last century have analyzed Marx as a moral theorist whose earlier writings in particular reflect values that are moral and perhaps

even religious, although not in a traditional sense. These values were implicit in his theories of history and the revolutionary process.

Marx, in his early works, often spoke of the worker’s alienation from society because of the division of labor and private property, which left the worker with little to show for his endeavors. Marx did not think that the situation could be corrected by invoking abstract theories of ethics and justice, since he believed that in every era ethics and values are imposed by the “ruling class.” For example, Marx argued that in the Middle Ages, the feudal landowners who controlled the livelihood of others also set the norms of society. He believed that in the nineteenth century, capitalists (the bourgeoisie) controlled the means of production and therefore the political and social system. As part of their power, they set the standards of right and wrong. Although Marx criticized the ethical standards of his era, he accepted that the bourgeoisie had the right to set those standards.

ECONOMIC FORCES IN HISTORY

Marx believed that it was important to understand the economic forces that propel the evolution of history. His theory of historical materialism rejected traditional idealism and substituted for it a materialist interpretation, which defined the progression of history as the history of class struggle. Marx also predicted a fundamental revolution that would end class struggle and alienation in society.

Marx described a class struggle between the capitalists (the ruling class) and the proletariat (the workers) in his own era. The former controlled the means of production and therefore dominated society. The proletariat worked for the bourgeoisie in conditions of exploitation and hardship and were alienated from the products of their labor. Marx was concerned about the long hours the proletariat worked and low wages they received, about child labor, and about other social problems that were prevalent during the early stages of European capitalism, but he did not believe that those problems could be remedied.

Marx predicted that societal conditions would gradually worsen, as fewer and fewer people remained in the ruling class and more and more people joined the ranks of the proletariat. Eventually, Marx predicted, the proletariat would be so large and their conditions so terrible that they would rise up in spontaneous rebellion against the bourgeoisie. This revo-

lution, born out of the dialectic and contradictions of history, would eventually provide the keys to ending exploitation. In the short run, the victorious proletariat would organize the dictatorship of the proletariat and begin to right the wrongs of history by removing privileges from the bourgeoisie—foremost among them, private property.

In the transitional era of the dictatorship of the proletariat, however, bourgeois values would still prevail. There would be a transitional period of undetermined length. Only in mature postcapitalist society, which Marx called communism, would people embrace new values and ethics, shed traditional acquisitiveness, and work for the good of society. Eventually, classes would disappear and a classless society would emerge in which people would work according to their abilities and receive compensation according to their needs. In the new society, people would no longer be alienated from their work and from society.

MARX'S ETHICS

Marx's theories of ethics were closely tied to his economic theories. He did not develop theories of ethics that were separate from his perception of economic reality. At the same time, the idea of transcending alienation and establishing new norms for society revealed an underlying idealism that was inconsistent with his conceptions of materialism.

Marx worked closely with Friedrich Engels from 1845 until his death. Their most famous publication, *The Communist Manifesto* (1848), contains guidelines for social norms and values that were to be followed after the proletarian revolution. Engels continued their work after Marx's death (1883). Engels's later writings on social issues, such as the family, and personal relations contain ethical overtones. In particular, Engels's writings on the family give evidence of the applications of the division of labor and "class struggle" within the family itself.

Although Marx would have bristled at the suggestion that he was an ethical thinker, an ethical undertone to his theory of history can be seen in his prediction that the injustices of the class struggle would be corrected on Earth, not in a distant heaven, when the revolutionary process led to the eventual emergence of communism.

Maximal vs. minimal ethics

DEFINITION: Distinction between the least one must do to avoid transgression and the most one can do to accomplish good

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Minimal ethics are generally passive, since they involve one's obligations to refrain

from evil acts, while maximal ethics require positive action to make either oneself or the world better conform with one's values and ideals.

The tension between maximal and minimal ethics arises in the attempt to relate what people *can* do to what they *ought* to do. How far and in what way should what is possible govern what is required?

WHO IS MY NEIGHBOR?

When ethical theories examine duties to others, tensions quickly emerge between consideration of what is owed to others and consideration of the effect upon one's own interests or well-being. The Christian scriptures highlight these tensions in such stories as that of Jesus' telling the young man to sell everything and give it to the poor (Mark 10) or telling the lawyer to imitate the Good Samaritan who risked everything to help a man who fell among thieves (Luke 10).

In the field of medical ethics, Tom L. Beauchamp and James F. Childress argue in *Principles of Bio-medical Ethics* that a physician is "not morally obligated to emulate the Good Samaritan but rather to be what Judith Thomson calls 'a minimally decent Samaritan.'" They characterize the tension between maximal and minimal ethics in their discussion of the distinction between the duty of nonmaleficence ("do no harm") and the duty of beneficence ("do good"). "[T]he importance of the distinction is evident. The obligation of nonmaleficence is more independent of roles and relations, allows less discretion, and, in general, requires a higher level of risk assumption than the obligation of beneficence, which requires positive actions."

Some ethical theories simply make "do no harm" the duty and leave "doing good" to individual decision making. Other theories attempt to determine how far a person might be required to venture into doing good. Philosophers usually appeal to what it is "reasonable" to require, but no satisfactory agreement has been reached concerning how to define responsibilities that go beyond the minimum. Peter Singer, for example, in discussing duties to victims of famine, has argued that "if it is in our power to prevent something bad from happening, without thereby sacrificing anything of comparable moral importance, we ought, morally, to do it." Many people, however, believe that his principle is unreasonably

demanding. Michael Slote argues against Singer that it is not morally wrong to fail to prevent something bad from happening to someone else if preventing the evil "would seriously interfere with one's basic life style or with the fulfillment of one's basic life plans—as long as the life style or plans themselves involve no wrongs of commission."

In *Christian Faith, Health, and Medical Practice*, Hessel Bouma and others have provided a survey, from a religious perspective, of reasons that attempt to locate the source and motivation of a whole range of duties from the minimal to the maximal:

[Picture ethical duties] on a spectrum, with minimal, legally enforceable ones at one end of the spectrum and, at the other end, those requiring heroic sacrifice for the sake of another's well-being. In the middle will be responsibilities such as truthfulness and civility that are morally mandated but not legally enforceable. . . . [A]t one end the state's sword power (its right and duty to use coercion, including its power to tax) provides added motivation, whereas at the other end the power of gratitude and the inspiring stories of good Samaritans and shepherds who lay down their lives for their sheep must be sufficient incentives.

BE ALL YOU CAN BE

Maximal vs. minimal ethics concerns more than the tension between duties to others and care for one's own interests. The tension between the minimal and the maximal can arise in the attempt to delineate the excellences that characterize a well-lived life. Immanuel Kant, for example, argued that people have a duty to develop their talents. How far does that duty extend? Is a modest cultivation of a particular talent sufficient? How much is enough? In *Beyond Good and Evil*, Nietzsche urges a maximal standard of human development in the application of purifying discipline to the "creature" in humanity in order to bring the "creator" element to greater perfection: "The discipline of suffering, of *great* suffering—do you not know that only *this* discipline has created all enhancements of man so far?"

CLASSIFYING THE MAXIMAL

Many ethical theories classify acts as forbidden, required, or simply permissible. In "Saints and

Heroes,” J. Urmson argued that a further class of acts should be identified and that the old Christian concept of supererogation should be employed for this classification. Supererogatory acts, according to Urmson, are those that are not required by duty but go beyond duty in a way that merely permissible acts do not.

Urmson’s arguments have led many people to agree that ethical theories should have a place for maximal expectations that are recommended but not required. His critics, however, question whether ethical theories can or should try to define a point at which one says, “We have done enough; everything else is beyond duty.” They worry that the attempt to make a precise definition of what is strictly required leads theories to be narrow and legalistic in their account of human duties. They prefer an approach in which a “reasonable” account of how maximal duties are required can be given.

Mean/ends distinction

DEFINITION: Ethical distinction drawn between the goal being achieved and the method employed to achieve it

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The distinction between means and ends is the basis for hypothetical imperatives, which have the form “You should do *x* in order to accomplish *y*.” Categorical imperatives presuppose that means and ends are one and the same: “You should always do *x*.”

Theories of ethics vary widely in their philosophical perspectives. Nowhere is this chasm more broad than between the strict legalistic rules set forth by Kantian ethicists and the subjective interpretations favored by situationists. Immanuel Kant, as the father of the categorical imperative, believed that moral actions must hold up universally and unconditionally. Situational ethics, however, as developed by the consequential school, maintains that circumstances alter cases. Actions have no meaning or value in and of themselves; they become meaningful only in the light of the purpose they serve.

Situationists believe that any act—in fact, the same act—can be right or wrong, according to the situation. Such flexibility in moral reasoning lays the foundation for the popular maxim that the end justifies the means. Although unstated, the essential meaning of this philosophy is better represented by the clarification that a good end justifies a bad means. A good end achieved through good means needs no justification; a bad end, regardless of the quality of the means, deserves none.

The emphasis, then, is on the outcome, making the means/end distinction a favorite of consequential ethicists who argue that the moral act is the one that achieves the greatest good for the greatest number. With this reasoning, it is easy to extend the principle that an immoral act is justified if it is the vehicle by

which a greater good is accomplished—telling a lie, for example, in order to save a life. Another school of thought, however, that of the situationists, places the rationale for this maxim not on the relative merits of the means and the end, but on the circumstances that define each individual situation.

Situationists believe that good and evil are not intrinsic properties belonging to a given act but are instead attributes that develop their character within the context in which the act occurs. The man who denies his financial problems as he provides comforting reassurance to his dying mother, for example, is acting in a compassionate and commendable way, not an immoral and deceitful one. The same subjectivity can be applied to other acts, too, including those conventionally considered good, such as self-sacrifice and philanthropy, and evil, such as thievery and murder. That the unscrupulous exploits of Robin Hood are hailed as heroic deeds by all but his villainous victims demonstrates the popularity of this notion. If acts are not intrinsically good or bad, then they must derive their merits from some other source. That source is the purpose that they serve or the intended outcome toward which they have been employed. Therefore, it is the end, and only the end, that justifies the means.

DEONTOLOGICAL VIEWS

Although strict deontologists believe that such a subjective philosophy foreshadows nothing short of moral anarchy, the means/end distinction has long been employed. Indeed, even the Bible contains numerous instances in which valued outcomes are achieved through violent or destructive means, such as the flooding of the earth in order to restore goodness, an action that is inconsistent with modern Judeo-Christian moral prescriptions. Despite the fears of legalistic ethicists, however, the means/end argument, when properly applied, is a stiff and rigorous test of ethical principles, demanding a careful examination of four individual elements: the end, the motive for desiring this end, the means by which the end will be accomplished, and, in true consequential fashion, the foreseeable consequences.

It is important to note that all consequences must be weighed, not only the intended ones. For example, the parent who successfully funds the family vacation by trimming household expenses must consider not only the financial effects of a debt-free summer

sojourn but also the physical and psychological effects of lowered nutritional standards and clothing stretched beyond its normal wearability. In addition, responsible implementation of the means/end distinction recognizes that because means are seen not only as benign tools used to negotiate an outcome but also as ingredients that lend their attributes and characteristics to the creation of the outcome, they must be carefully selected, fitting, and appropriate to the hoped-for end. The following list offers specific questions to help address these issues.

1. Is the end really good? Does it simply appear to be good because of its desirability? Real good is commonly recognized as that which contributes to the achievement of full human potential.

2. Is it probable that the means will achieve the end? Utilitarian ethicists refer to this concept as maximizing expected utility.

3. Is the same good possible to achieve using other means? Is the bad means simply the easiest? Combined with the question above, the lower the expectation that the means will achieve the expected result, the greater is the obligation to seek alternative means.

4. Is the good end clearly and overwhelmingly greater than the bad means that will be used to attain it?

5. Will the use of a bad means in order to achieve a good end withstand the test of publicity? Will others agree with the decision reached in the question above?

Although the means/end distinction provides a useful tool as well as a popular philosophy for weighing ethical choices, it is not without its handicaps. A primary shortcoming, consistent with all consequential theories, is the lack of precision with which outcomes can be predicted. Therefore, the distinction is a more accurate measure of moral correctness in hindsight rather than in the development of situations. Despite this weakness, however, the means/end argument remains a strong and practical one. Its simple and obvious logic offers an understandable formula by which to weigh and resolve challenging ethical questions.

Media ownership

IDENTIFICATION: Owners and executive officers of print and broadcast media, such as newspapers, magazines, radio and television stations, and broadcast networks

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: Ownership of multiple media outlets by single individuals or companies raises serious ethical concerns about the availability and fairness of news.

Media ownership raises a number of interesting ethical questions. Of particular important are questions relating to whether owners of the media conduct their operations in a fashion that is objective, comprehensive, and ultimately in the best interest of the general public. When large numbers of media outlets are concentrated in the hands of a few owners, especially when the outlets are of various kinds of media, then these ethical questions become particularly acute. Such situations periodically occur in Western society.

During the late nineteenth century, sizable numbers of newspapers in both the United States and Great Britain became concentrated in the hands of a few individuals, known in the United States as “press magnates” and in Britain as “press barons.” By the 1880’s, the American publisher Joseph Pulitzer—after whom Pulitzer Prizes are named—had assembled a number of newspapers under his control; these included the *New York World*. Meanwhile, his great ri-

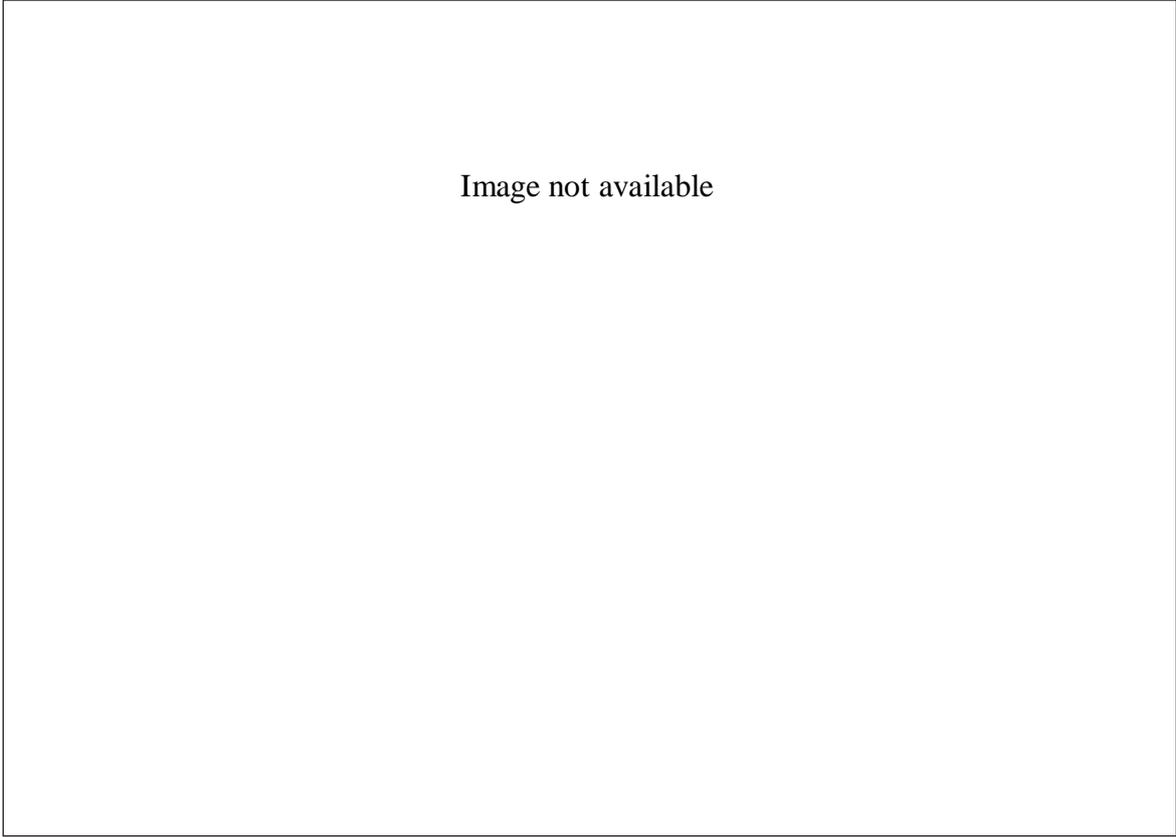

val, William Randolph Hearst, took over the *San Francisco Examiner* from his father in 1887 and in 1895 bought the *New York Morning Journal*. The following year, Hearst established the *New York Evening Journal*.

Low priced, easy to read, and filled with eye-catching sensational stories, the Pulitzer and Hearst papers soon had large circulations and enormous influence on public affairs—influence that Pulitzer and Hearst, in particular, were not shy about using. Perhaps the most striking example of their influence occurred during the Spanish-American War of 1898, which was actively pushed by the two newspaper chains, especially by the Hearst papers. At one point, before war had been declared, the famous artist Frederic Remington asked if he could return from his assignment as a war illustrator in Havana, since war between Spain and the United States appeared to be unlikely. Hearst is reported to have responded, “You provide the pictures and I’ll furnish the war.” Whether that story is literally true or not, Hearst’s famous riposte accurately symbolized the considerable powers of media ownership and its ethical dilemmas.

At the same time that Pulitzer and Hearst were battling for media dominance in the United States, two brothers named Harmsworth were gathering a media empire in Great Britain. Better known as Lords Northcliffe and Rothermere, the brothers came to own a sizable portion of the British press, including the famous *Times of London* as well as such high-circulation papers as the *Daily Mail*, *Daily Mirror*, *Weekly/Sunday Dispatch*, *London Evening News*, and *Glasgow Evening News*. They also owned the magazine group Amalgamated Press. Although such acquisitions, the Harmsworths became the dominant media power in the United Kingdom, and Lord Northcliffe in particular was recognized as highly influential. In 1917, during the crisis of World War I, another press baron, Lord Beaverbook, was appointed minister of information by the British government, thus making him officially responsible for wartime propaganda both at home and, increasingly important, in neutral countries such as the United States. After this, there could be little doubt about the power of media ownership and control.

MODERN MEDIA CONSOLIDATION

The question of media consolidation in the hands of a relatively few individuals or corporations arose

A large rectangular box with a thin black border, centered on the page. Inside the box, the text "Image not available" is centered in a black serif font.

Members of an organization called Code Pink march outside a Los Angeles radio station in May, 2003, to call attention to an impending Federal Communications Commission hearing on a proposal to deregulate media ownership which would allow large companies to increase their control over radio, television, and newspaper communications. (AP/Wide World Photos)

again toward the end of the twentieth century, as a handful of key players came to dominate the international media market. In addition to owning traditional newspapers, these new press barons also owned varieties of other media, most notably book publishing companies; film, radio, and television outlets; and new media channels, such as sites on the World Wide Web. They also introduced new forms of media, such as twenty-four-hour all-news networks, which operated in cooperation with their other holdings. Never before in history had such a variety of media been collected and controlled by so relatively few persons or companies.

Chief among these players were giant media corporations such as AOL-Time Warner, which was created by a merger early in 2000 and which operated Cable News Network, or CNN; Rupert Murdoch's

News Corporation, which started in Australia and spread throughout the world and which started Fox Television as a challenge to CNN and the existing big three networks; and Fininvest, an Italian multimedia group owned by Silvio Berlusconi, who went on to become prime minister of that nation. Of these groups, News Corporation and Fininvest were known for espousing and spreading the conservative, sometimes extreme right-wing thoughts of their owners. Not since the days of Hearst and Colonel Robert McCormick, reactionary owner of the *Chicago Tribune*, had media owners been so blatant in allowing their personal viewpoints to shape the reporting of their organizations. The ethical problems created by such a situation, while obvious to many media observers and members of the general public, did not seem to trouble Murdoch and others.

At the same time, non-news corporations were purchasing media outlets, chief among them the major television networks in the United States. During the 1980's, the American Broadcasting Corporation (ABC) was bought by Capital Cities Communications, the National Broadcasting Corporation (NBC) by General Electric, and the Columbia Broadcasting System (CBS) by Loews Corporation. In addition to cutbacks in their news budgets, with possible negative impacts on coverage, diversity, and objectivity, the networks also faced the delicate situation of reporting potentially negative stories about their corporate owners that could lead to possible loss of value in the stock of the parent company. Such situations were clearly filled with potential ethical dilemmas, most of which could be traced back to the problem of media ownership that influences not only what stories are covered, but how and to what purpose as well.

Medical bills of rights

DEFINITION: Documents that explicitly list the rights of patients with regard to access to care, control over their care, privacy, or any other issues relevant to medical treatment

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Rights language shifts the focus of moral attention from the duty-bound caregiver to the patient to whom there is a duty—to the claims of the right holder.

Although the express use of rights language in medicine is an artifact of the late twentieth century, deontological (duty-based) conceptions of medical ethics trace back to the Hippocratic oath, which explicitly obligates physicians to “abstain from all intentional wrong-doing and harm”—particularly “from [sexual] abus[e]”—and from “divulging [information about patients] holding such things to be holy secrets.” Correlative to these obligations (although unstateable at the time, since the language of rights had yet to be invented), patients have the right not to be intentionally harmed, not to be sexually abused, and not to have confidential information divulged.

Duty-based conceptions of the physician-patient relationship were dominated by the Hippocratic oath until three eighteenth century British writers—the Reverend Thomas Gisborne, Doctor John Gregory, and Thomas Percival—developed theories of obligation deriving from physicians' social responsibilities and from their sympathy with patients. In 1803, Percival published a syncretic version of all three theories in the form of a code of ethics; that code, in turn, became the basis of codes of medical ethics issued by nineteenth century regional and national medical associations throughout the world. Although these writers were familiar with rights language, their primary focus was stating the duties of physicians. Consequently, even though their theories on physicians' duties generate correlative rights, they eschew the language of rights—as do the codes of medical ethics they inspired.

The first document to focus primarily on patients' moral claims is the 1947 Nuremberg Code, a set of ten principles issued by the Nuremberg Tribunal to justify its finding that the medical experiments conducted by twelve German physicians and their assistants were “crimes against humanity.” The first

Historical Table of Patients' Rights

<i>Document</i>	<i>Date</i>	<i>Author</i>	<i>Rights</i>
Hippocratic oath	400 B.C.E.	Unknown	Not to be harmed; not to be sexually abused; confidentiality.
<i>Lecture on the Duties of Physicians</i>	1772	John Gregory	Sympathetic and humane care.
<i>On the Duties of Physicians</i>	1794	Thomas Gisborne	Diligent attention; confidentiality; honesty; punctuality; steadiness and sympathy.
<i>Medical Ethics</i>	1803	Thomas Percival	Attention and steadiness; humanity; confidentiality; authority and condescension (to be treated as equals).
<i>Code of Ethics</i>	1847-1957*	AMA	Skill, attention, fidelity. Tenderness and firmness; authority and condescension (equal treatment); humanness and steadiness; confidentiality; not to be abandoned; treatment during epidemics (even if physician jeopardized).
<i>Nuremberg Code</i>	1947	Nuremberg Tribunal	To consent to, and to refuse to, be experimented upon; to be informed of experiments; to terminate experiments unilaterally.
<i>Patient's Bill of Rights</i>	Current	American Hospital Association	To considerate and respectful care; to know the name of one's physician; to be informed of diagnosis, prognosis, treatment plans, and alternatives; to consent to, and to refuse, treatment; to privacy and confidentiality; to be informed of conflicts of interest; to be informed of, and to refuse to participate in, research; to have continuity of care and appointments; to examine bills and have them explained; to be informed of hospital rules.
<i>Accreditation Manual</i>	Current	Joint Commission on Accreditation of Health Care Organization	Impartial access to treatment, regardless of race, creed, sex, or national origin, or sources of payment; to considerate and respectful care; to privacy and to wear personal clothing; to request a change of room; to know who is providing treatment; to refuse to be treated by trainees. to be clearly informed of diagnosis. to visitors, phone calls, and letters; to informed participation in health care decisions; to consent to, and to refuse, treatment; to be informed of, and to refuse to participate in, experiments; to consult with a specialist and to continuity of care; to receive itemized explanations of bills; to be informed of a hospital's rules and complaint procedures

* Most contemporary statements of medical and nursing ethics are formulated as standards or principles rather than duties or obligations, and thus do not generate correlative rights. In 1957, for example, the AMA replaced its *Code of Ethics* with *Principles of Medical Ethics*, the principles state standards of conduct rather than duties, but Principle IV of the current AMA *Principles* stipulates that a "physician shall respect the rights of patients."

Nuremberg principle opens by stating that for “moral, ethical, and legal [experimentation] . . . the voluntary consent of the human subject is essential.” It closes by stating that “the duty . . . for ascertaining consent rests on each individual who initiates, directs, or engages in the experiment.” The Nuremberg Code never uses the language of rights, yet most commentators treat it as the progenitor of patients’ rights theory because its focus (exemplified in these quotations) is on the moral claims—the rights—of the subjects of research.

Rights language was first expressly used in major medical documents during the 1970’s, when it surfaced in the American Hospital Association’s 1972 *A Patient’s Bill of Rights* and, concurrently, in the section “Rights and Responsibilities of Patients,” in the *Accreditation Manual* of the JCAH(O), the Joint Commission on the Accreditation of Hospitals (later, Health Care Organizations)—the organization that accredits American medical hospitals, psychiatric hospitals, and nursing homes.

Medical ethics

DEFINITION: Formal, informal, institutional, and personal codes of conduct for health care professionals

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Because medical workers deal with matters of life and death, as well as the most intimate details of their patients’ lives, the ethics governing their actions are both especially important and especially complex.

Health care professionals are faced with many situations that have moral significance. These situations are characterized by such questions as whether or when to proceed with treatment, which therapy to administer, which patient to see first, how to conduct research using human subjects, where to assign resources that are in short supply, and how to establish an equitable health care system. The discipline of medical ethics seeks to engage in a systematic and objective examination of these questions.

HISTORY

An ethical code of behavior is central to the writings collected in the *Corpus Hippocraticum*, attributed to an ancient physician known as Hippocrates and other writers of the fifth through third centuries B.C.E. Medicine, according to these writings, should relieve suffering, reduce the severity of an illness, and abstain from treating that which is beyond the practice of medicine; the physician is defined as a good person, skilled at healing. The notion of a morally good dimension inherent in the medical practitioner has survived to this day. The Hippocratic texts were expanded upon by medieval physicians in the West so that, by the fifteenth century, rules of conduct had been established in the medical schools of the time.

Eighteenth century physicians such as Benjamin Rush, Samuel Bard, John Gregory, and Thomas Percival stressed the need for primary moral rules of medical practice and began to wrestle with questions of truth-telling in the physician-patient relationship. Percival’s writings would become the basis for the first American Medical Association Code of Ethics, issued in 1847.

Nineteenth century physicians such as Worthington Hooker, Austin Flint, Sr., and Sir William Osler continued to refine a primarily beneficence-based

understanding of medical ethics (that is, a code based on taking action only for the patient's good). Osler argued that physicians should be broadly educated in the liberal arts so as to be able to practice medicine properly.

The enormous growth of medical research in the twentieth century led to remarkable advances in health care but also raised troubling ethical questions. In 1947, the Nuremberg Code established the first basic ethical requirements for the conduct of medical research. This document was a direct result of the Nuremberg Trials of Nazi war criminals who had engaged in human experimentation considered far outside the grounds of decency. The code was later expanded and revised to become the Declaration of Helsinki of the World Medical Association, originally issued in 1964.

During the 1950's, medical ethics began to move away from being primarily a set of internally generated rules of professional behavior. The writings of such nonphysicians as Joseph Fletcher and Paul Ramsey (both originally trained in theology) began to examine the impact of medicine and medical technology on the moral fabric of society.

The 1960's and 1970's brought an emphasis on patient autonomy to the consideration of biomedical ethics in the United States: Reverence for the wisdom of the medical doctor's decisions, which had been the rule during previous decades, was tempered by a growing respect for the patient's need to contribute to decisions affecting his or her future well-being. The ascendancy of autonomy parallels a rise in the technological capabilities of modern medicine, a time of unusually pronounced affluence in the West, and the appearance of what have since become paradigmatic legal challenges to the notion of the physician or medical institution as the sole participant in medical decision making.

Concurrent with these developments was the appearance of new institutions dedicated to the study of biomedical ethics, such as the Kennedy Institute of Ethics at Georgetown University and the Hastings Center in New York. At the same time, ethical theories developed by nineteenth century philosophers such as John Stuart Mill and Immanuel Kant began to be applied to situations arising out of medical practice by a number of individuals whose primary training was in philosophy and theology rather than clinical medicine.

With the 1980's and 1990's, the prospect of scarcity came to dominate ethical discussion in the United States, raising concern about such questions as health care rationing and public access to medical care. An emphasis on distributive justice began to temper the preceding two decades' concern with obligations of social justice to the individual.

ETHICAL PRINCIPLES

Ethical analysis consists of the application of primary principles to concrete clinical situations. It also employs comparative reasoning, whereby a particular problem is compared to other situations about which a moral consensus exists. Principled reasoning rests on four fundamental principles of biomedical ethics.

The principle of respect for autonomy requires that every person be free to take whatever autonomous action or make whatever autonomous decision he or she wishes, without constraint by other individuals. An example of respect for autonomy is the doctrine of informed consent, which requires that patients or research subjects be provided with adequate information that they clearly understand before voluntarily submitting to therapy or participating in a research trial.

The principle of nonmaleficence states that health care providers should not inflict evil or harm on a patient. Although straightforward in its enunciation, this principle may come into conflict with the principle of respect for autonomy in cases where a request for withdrawal of therapy is made. Similarly, the principle may come into conflict with obligations to promote the good of the patient, because many medical decisions involve the use of therapies or diagnostic procedures that have undesirable side effects.

The principle of double effect in the Roman Catholic moral tradition has attempted to resolve this latter conflict by stating that if the intent of an action is to effect an overriding good, the action is defensible even if unintended but foreseen harmful consequences ensue. Some commentators suggest, however, that intent is an artificial distinction, because all the consequences, both good and bad, are foreseen. As a result, the potential for harm should be weighed against the potential for benefit in deciding the best course of action. A formal evaluation of this kind is commonly referred to as a risk-benefit analysis.

Individual interpretation of the principle of non-maleficence lies at the heart of debates over abortion, euthanasia, and treatment withdrawal.

The principle of beneficence expresses an obligation to promote the patient's good. This can be construed as any action that prevents harm, supplants harm, or does active good to a person. As such, this principle provides the basis for all medical practice, be it preventive, epidemiologic, acute care, or chronic care. Not all actions can be considered uniformly beneficial. Certain kinds of therapy which may prove to be life-saving can leave a patient with what he or she finds to be an unacceptable quality of life. An examination of the positive and negative consequences of successful medical treatment is commonly called a benefit-burden analysis. In this context, the principle of beneficence most frequently comes into conflict with the principle of respect for autonomy. In such situations, the physician's appeal to beneficence is often considered paternalistic.

The principle of justice applies primarily to the distribution of health care resources in what can be considered a just and fair fashion. Because there are many competing theories of justice, there is no single, clear statement of this principle capable of being succinctly applied to all situations. However, the principle does require careful consideration of the means by which health care is allocated under conditions of scarcity. Scarce resources in the United States, for example, include transplantable organs, intensive care beds, expensive medical technologies in general, and in some circumstances basic medical care itself. Under conditions of scarcity, one's understanding of justice can easily come into conflict with the obligations to each of the three preceding principles. In general, the scarcer the resource, the more concerns about distributive justice influence the deployment of that resource.

ETHICAL ISSUES

Questions of medical ethics generally fall into two categories. A quandary is a moral question about which detailed ethical analysis yields a single undisputed answer. A dilemma, on the other hand, is a moral question to which there are at least two ethically defensible responses, with neither one taking clear precedence over the other.

Ethical issues in medicine can also be divided into macrocosmic (large-scale, societal) and microcos-

mic (small-scale, often individual) concerns. Macrocosmic issues are those that apply to a broad social constituency and therefore often involve both statutory and common law. Microcosmic concerns, on the other hand, are those that arise in the day-to-day practice of medicine, the discussion and resolution of which generally have less impact on society as a whole.

Primary among the macrocosmic ethical debates is the question of health care allocation, which centers largely on the development of health care delivery systems and health care financing. Proposals for reform of the U.S. health care system range from the creation of a single-payer national health insurance program, which would insure every citizen, to a series of proposals that would establish multiple requirements for private health insurance, often linking these requirements to employment. A problem common to all proposals for health care reform is the definition of what constitutes a basic minimum of health care to which each citizen is entitled. Even if consensus can be reached regarding a basic minimum, how and to whom scarce resources will be allocated remains to be determined. In both cases, solutions require an assessment of mechanisms for increasing supply and fairly distributing the resource in an ethically acceptable fashion.

PRIVACY

In medical ethics, respect for privacy stems both from the Hippocratic tradition and from the principle of respect for autonomy. Privacy also has been argued as a fundamental right of persons. All rights-based theories imply a correlative obligation on the part of others to respect these rights. Debate, therefore, centers on when an individual's unbridled right to privacy begins to abrogate the public good. For example, does an individual's right to choose privately to have an abortion or to request euthanasia place an unacceptable burden on society to comply with these requests? If a physician considers a patient to be a public menace, what levels of justification are required before confidentially obtained personal information is divulged? To whom is it appropriate to release this information? Concerns of this nature lie at the center of public discussions surrounding the rights of persons infected with the human immunodeficiency virus (HIV).

MEDICAL RESEARCH

Research ethics, as it applies to human subjects, deals primarily with two questions. First, does the proposed research appear to provide important information of substantial value to society at minimal risk to the research subject? Second, is the research subject completely aware of the personal risks and benefits of participation in the project so that consent is fully informed? In order to answer these questions, research involving human subjects must undergo ethical review at both the macrocosmic and the microcosmic levels. Nationally, it is regulated by agencies such as the U.S. Food and Drug Administration (FDA). At the microcosmic level, the FDA mandates and supervises the administration of institutional review boards (IRBs), which are charged with the responsibility of ensuring that human subjects are involved in creditable research, are treated in a humane manner, are not subjected to undue risks, and are fully cognizant both of the nature of the project in which they are participating and of any potential risks and benefits associated with it.

A third concern in biomedical research ethics, which does not directly apply to human subjects, is the question of what constitutes a conflict of interest on the part of the principal investigator or research institution. This becomes an increasing problem as more research is funded by private rather than public sources.

THE NATURE OF LIFE AND ETHICAL DECISION MAKING

This is perhaps the thorniest of all issues in that it revolves around definitional questions about which no consensus exists. Is human life consistently of greater value than all other forms of life? Is the value of human life defined primarily by consciousness? Is human life defined by genetic information, and if so, is alteration of this information a moral enterprise? If genetic engineering is in principle morally acceptable, are there circumstances under which it becomes unacceptable? When precisely does life begin and end? Each of these questions has a profound effect on an individual's opinion of issues such as abortion, the appropriate circumstances for treatment withdrawal, brain death, organ transplantation, euthanasia, animal research, and allocation of health care.

Although some commentators tend to assign primacy to one of the four principles of medical ethics—

autonomy, nonmaleficence, beneficence, or justice—relegating others to subordinate roles, the prevailing approach to principled reasoning interprets each principle as being *prima facie* binding; that is, each principle confers a binding obligation upon the medical professional to the extent that it does not conflict with another, equally binding principle. When two *prima facie* principles require actions that are diametrically opposed, there is an appeal to proportionality that allows the requirements of each principle to be evaluated in the light of circumstances at hand. On a case-by-case basis, one principle may be judged to be more binding than another, depending on the context of the problem.

An alternative form of ethical analysis employs the technique of casuistry, or case-based analysis. Using this method, the circumstances of a particular ethical quandary or dilemma (the “reference case”) are compared to those of a case about which it is abundantly clear what the correct moral decision should be (the “paradigm case”). The degree to which the reference case resembles or differs from the paradigm case provides guidance as to what the ethically appropriate course of action might be. This method of analysis has the advantage of being similar to the way in which conclusions are reached both in common law and in clinical medicine. Clinical decisions are regularly made in medical practice by comparing the facts of a particular case about which the treatment may be in question with those of similar cases in which the correct treatment is known.

A problem for those who favor casuistic analysis is the wedge argument, sometimes known as the “slippery slope.” Detractors suggest that the use of a particular logical argument, such as the defense for withholding or withdrawing certain kinds of therapy, will drive a wedge further and further into the fabric of society until an undesirable consequence (for example, active nonvoluntary euthanasia) ensues. Proponents of casuistry respond that the undesirable consequence is far enough removed from the paradigm case to no longer resemble it.

Most clinical ethicists combine principle-based analysis with case-based reasoning to answer the specific ethical questions that arise in the practice of medicine. In addition, clinical ethicists benefit from training in law, sociology, and psychology, as well as the primary studies of medical science and philosophy.

PUBLIC POLICY

Macrocosmic, public issues are addressed publicly by a number of mechanisms. Blue-ribbon panels, such as the New York State Task Force on Life and the Law, can study a problem in depth, after which a consensus report with policy recommendations is issued. Such panels have the advantage of bringing together people who represent a wide range of opinion. Another avenue is the formation of grassroots organizations, such as Oregon Health Decisions, that attempt to generate a public consensus on ethically sensitive issues.

In one fashion or another, issues of public concern often are argued on the floors of both federal and state legislatures. Numerous state laws regulate the withholding and withdrawing of therapy; federal legislation, such as the Patient Self-Determination Act, also governs the disclosure of patients' rights to determine the course of their care when they cannot make decisions.

Even with legislative guidance, individual institutions often find themselves beset by microcosmic ethical questions such as when to terminate life-sustaining therapy or who should be admitted to intensive care units. Other common microcosmic dilemmas involve maternal-fetal conflict, wherein the autonomous requests or medical best interests of the mother do not coincide with the presumed best interests of her unborn child. In such situations, health care facilities often solicit the assistance of institutional ethics committees. Such committees are characteristically composed of individuals representing a broad spectrum of professional disciplines as well as community members not directly employed by the facility. In situations that require an institutional response, these committees will often assist in policy development. Ethics committees also serve as primary educational resources for both the institutional staff and members of the surrounding community.

Many committees have established mechanisms for case consultation or case review for patients whose care raises ethical questions. Consultations of this type involve review of the patient's clinical condition as well as pertinent social, religious, psychological, and family circumstances. Consultants investigate the ethical arguments that support alternative courses of action before issuing a final recommendation. In most cases, the recommendations are not binding; however, certain models do require that

consultative recommendations determine the outcome in specific settings.

Although intervention by an ethics committee often allows for the resolution of ethical disputes within the walls of an institution, sometimes irreconcilable differences require judicial review by a court of law. Under these circumstances, the court's decision becomes a matter of public record, providing precedent for similar cases in the future. Microcosmic cases can thereby generate a body of common law that has profound effects at the macrocosmic level.

Medical insurance

DEFINITION: Provision of or payment of costs incurred by health care services when needed, given to a particular group whose membership is limited by factors such as payment of premiums, employment, income, or citizenship

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Inequities in health insurance coverage are both indicative of, and contribute to, unjust and inequitable policies and practices for the poor.

At the beginning of the twenty-first century, health insurance was possibly the greatest cause of the rapidly escalating cost of medical care in the United States. The lack of regulation, the control of the industry by those who profit from it rather than those who purchase services, and the openness to abuse by both the insured and the providers of care combine to charge the insurance industry with helping have caused one of the most unfair aspects of modern American society: lack of access to needed care by a large portion of the population.

Access to health care has two major components: the patient's ability to pay and the availability of accessible and culturally acceptable facilities capable of providing appropriate care in a timely manner. Lack of health insurance is the greatest barrier to health care accessibility. In the absence of insurance coverage, people often postpone or forgo treatment. In 1980, 25 million Americans were uninsured; by 1999, over 42 million, or nearly one in six, people were uninsured according to the 2000 U.S. census. In 2002 the figure jumped to 43.6 million.

Generally employment-related and -financed, health insurance is a relatively recent development in the medical field. Only within the twentieth century did access to health care become of general concern, primarily because earlier systems of health care were for, the most part, ineffectual. Historically, the care of the sick was the responsibility of families and churches, and the costs of such care consisted mainly of lost wages, rather than payments to outside providers.

Skyrocketing costs and a shift in the workforce from the highly paid, largely unionized full-time manufacturing sector with employer-sponsored health insurance to a low-wage, increasingly part-time non-unionized service and clerical workforce whose employers are less likely to provide insurance account for the widespread lack of insurance. Many people who are not provided with employer-sponsored insurance plans choose not to seek health insurance. The recessionary cycles in the mid-1970's to mid-1990's resulting in massive layoffs also accounted for lack of insurance coverage or underinsurance

(lack of insurance for catastrophic illness, preexisting illness, gaps in Medicare, lack of coverage for long-term care, deductibles, and co-payments).

In a survey conducted by the Commonwealth Fund, a private foundation supporting independent research in health and social issues, 26 percent of American adults aged nineteen to sixty-four (or an estimated 45.4 million people) experienced a period of time when they were uninsured in 2003. In addition to instability in insurance coverage, the survey found evidence of a decline in the quality of coverage among those who were insured. Premiums increased as cuts or new limits in benefits emerged. Instability in insurance coverage and declines in the quality of private health benefits appear to impede Americans' ability to obtain necessary health care. Health insurance premiums increased 13.9 percent in 2003, faster than the 8.5 percent growth in health care costs. Health care expenditures in 2002 were \$1.6 trillion, or 14.9 percent of the nation's gross domestic product.

The United States has the highest health care spending of any country, yet it is the only major industrialized nation not to provide health insurance coverage for everyone. The uninsured generally have higher mortality rates. They are also three times more likely than the insured to experience adverse health outcomes and four times more likely to require avoidable hospitalizations and emergency hospital care.

HISTORY

In 1883, Germany enacted laws providing compulsory national health insurance to all workers. This was done to produce a more productive labor force and to enhance national defense rather than out of concern for the individual. Other countries in Western Europe quickly followed suit. In the United States, commercially provided insurance policies were available from the turn of the twentieth century, but it was not until the Great Depression that health insurance became a major industry. At that time, since few people had money to spend on anything but necessities, all but the most crucial medical treatments were neglected. Hospitals, finding themselves in increasingly difficult financial situations, banded together to form Blue Cross, an organization designed to elicit prepayment of hospital costs to insure against future need. Soon afterward, a similar organization was formed by local and state medical associations in order to collect funds to reimburse physicians for ex-

penses incurred in service. This organization was known as Blue Shield.

The commercial insurance industry (as opposed to the "nonprofit" nature of Blue Cross and Blue Shield) expanded after World War II, with the increasing demands of labor unions to provide health insurance for all workers. The federal government got involved in 1965, when the plans for Medicare, which provides coverage for people over the age of sixty-five, and Medicaid, designed to give access to health care to the poor, were enacted as amendments to the Social Security Act. During the early 1990's Medicaid coverage expanded to include children and pregnant women.

HEALTH CARE IN THE TWENTY-FIRST CENTURY

During the first years of the twenty-first century, the United States was the only industrialized nation to provide total health care protection for less than 25 percent of its population. Only two other industrialized nations, Libya and Cyprus, provide for less than 90 percent of their populations. The majority of completely uninsured people in the United States are young people working at low-income jobs. Most are employed but work at jobs that do not provide group health coverage.

In most states, Medicaid does not provide care for employed persons, and the cutoff income for coverage is lower than the national poverty level; therefore, many people who are living in poverty do not have any form of medical insurance. Low-income Hispanic adults are particularly affected: 37 percent of this group were never insured with private coverage. As many as 80 percent of low-income Hispanics were uninsured sometime during 1996 through 1999 compared with 66 percent of low-income African Americans and 63 percent of low-income whites. Unstable work patterns and part-time employment increase the risk that families will experience gaps in coverage or periods of time without insurance. Gaps in coverage impede people's ability to obtain needed care and increase the risk of burdensome medical bills. The U.S. Department of Health and Human Services has said that closing the health gap for minorities is a key public policy priority.

BENEFITS OF INSURANCE

The greatest benefit derived from health insurance is security from financial risk in case of illness,

security that health care will be available if needed. The other, more global benefit is ethical. Health insurance provides some equity by spreading the costs of undeserved illness between the sick and the healthy. While this does not compensate the ill person for the loss of health, it does allay some of the financial burden. Insurance also allows people the immediate gratification of providing for the possibility of bad times by spending a little less during the good. Health insurance is considered among life's most important commodities. In fact, significant numbers of employed individuals were reluctant to change jobs because they feared loss of health insurance. The Health Insurance Portability and Accountability Act (HIPAA) of 1996—which became effective on April 14, 2003—guaranteed “portability,” or the ability of people with preexisting conditions to retain their insurance coverage when changing jobs.

COSTS OF INSURANCE

Aside from the actual premiums for insurance, there are several hidden costs. There are the administrative costs and risk of liability to the insurer. More ethically significant are the consequences of insurance. Insurance companies, as third-party payers, set limits as to the types of treatments or procedures that they will cover for a particular illness or condition. The medical community is obligated to respect the limits set forth by insurance companies, although the latter are not trained in medicine. Managed care is a system that strives to provide the cheapest option available for care, without regard to efficiency, quality, or cost-effectiveness. Financial incentives exist to undertreat, although the underlying framework of managed care is improving the health of the population, instead of focusing on an individual patient. Cost is the major concern.

In response to this decreased incentive, insurers have instituted cost-sharing plans including deductibles, coinsurance (in which the patient pays a certain percentage), and copayment (in which a flat fee is paid at the time of service). These cost-sharing means are much harder on the poor, because they take a larger portion of their income.

Medical insurance can be said to be an inherently unfair means of providing health care. If health care is considered to be a right, it cannot depend on individual ability to pay. Medical treatment for the uninsured is often more expensive than preventive, acute,

and chronic care of the insured, because the uninsured are more likely to receive medical care in the emergency department than in a physician's office. Those higher costs are passed on to the insured by cost shifting and higher premiums or to taxpayers through higher taxes to finance public hospitals and public insurance programs.

Improved access to health care is a vital and politically divisive issue. Presidential candidates, federal and state legislators, and health care industry leaders have all proposed ways to increase health insurance coverage, ranging from incremental expansions to various approaches that promise near-universal coverage.

Medical research

DEFINITION: The application of bioethical principles to investigations whose goal is generalizable knowledge rather than individualized treatment

DATE: Fifth century B.C.E. to present

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Ethical medical research attempts to ensure that human subjects understand risks, while minimizing harm to them and distributing the benefits of research equitably within the context of social morality; it also promotes the humane treatment of animals.

Medical research, like other types of scientific inquiry, seeks either to discover patterns or to test proposed solutions (hypotheses) to problems. Broadly, the research entails observation and experimentation in accordance with the scientific method. Observation may be entirely passive—for example, an epidemiological study that tracks the spread of a disease through a population. Experiments depend upon intervention, that is, introducing some variable, such as a new drug or surgical procedure, in order to define that variable’s effect on a disease.

Whether involving animal or human subjects, research poses complex ethical problems. In the case of human subjects, both the individual subject and the physician-researcher may face dilemmas if the social benefit of increased knowledge comes at the expense of the subject’s health or societal moral principles. The trend in contemporary medicine has been to limit or eliminate ethical conflicts through defined principles, governmental regulation, and oversight panels.

THE NEED FOR RESEARCH

Every time physicians treat patients, some experimentation is involved, since however well tested a medicine or procedure may be, its use on the unique physiology of an individual patient amounts to a new

test and carries some risk. In daily practice, however, physicians intend treatments to improve only the individual patient’s health. By contrast, researchers hope to acquire generalized knowledge either to increase the basic understanding of the human psyche and soma or to treat all people who have a given disease. Accordingly, research has even broader social and scientific implications than does treatment.

The social implications of medical research become particularly important when such research contravenes a basic moral conviction held by the public in general or by a particular group. Beginning in the 1990’s, advances in genetic engineering, stem cell research, and mammalian cloning provoked objections from diverse religious and humanitarian groups in the United States and prompted legislation by state and federal governments. To receive government funding and to protect their research from political pressures, scientists increasingly must accommodate research to extra-scientific moral issues.

HISTORY

In Western medicine, the Epidemics, traditionally attributed to the fourth century B.C.E. Greek philosopher Hippocrates, presented the first preserved general guidelines for physicians; its dictum to help patients or at least not harm them acquired pervasive moral authority. (Similar strictures appear in early Hindu and Chinese medical treatises.) The Hippocratic method stressed that physicians should observe patients and their surroundings and assist nature in restoring their health. The method was not innately experimental in the scientific sense.

Although Hippocrates’ prestige was great, many early physicians approved of experimental procedures, and so the conflict between research and preserving patients from harm began early. The third century B.C.E. Alexandrian physicians Herophilus and Erasistratus believed that understanding the body’s structures must precede effective treatment of diseases. Accordingly, they practiced vivisection on condemned prisoners to study anatomy, reasoning that the pain inflicted on them could lead to knowledge that would benefit humanity in general, which to them justified the vivisection. Later classical writers often disagreed. Celsus and the Christian philosopher Tertullian, for example, considered vivisection to be murder.

During the European Middle Ages, the teachings

of the second century Greek physician Galen dominated medicine. Galen taught that nature does nothing without a purpose and that the physician simply must discover that purpose. Medicine was primarily the application of the four-humors theory to specific cases, a method that was congenial to medieval Christian philosophy. Empirical experimentation was considered unnecessary and immoral.

After the Renaissance, when physicians began to abandon the humors theory and investigated the pathology of disease, biochemistry, and anatomy, the impetus to experiment grew. Little research was rigorous, and most of it involved experiments on patients, sometimes resulting in a public outcry. Such was the case in Boston during the smallpox epidemic of 1721-1722. Learning from England that small amounts of infected material stimulated immunity to the disease, Cotton Mather and Zebdeil Boylston inoculated 250 healthy Bostonians; 2 percent died, while 15 percent of plague victims died among the general population. However, the immunization experiment was decried. Not only did the procedure meddle with the workings of God, opponents claimed, but the 2 percent who died might not have contracted smallpox otherwise.

MODERN DEVELOPMENTS

The debate over the welfare of patients and the need for validated medical knowledge began to assume its modern shape during the second half of the nineteenth century. In 1865 Claude Bernard, a French physician, published his *Introduction to Experimental Medicine*, a fundamentally influential treatise. In it he argued that researchers must force nature to reveal itself; since experimental trials and procedures, including vivisection, are the surest means to produce verifiable knowledge, the physician has a duty to employ them. He added, however, that all research must benefit the test subjects. Those experiments that do only harm must be forbidden.

Bernard's book appeared as an antivivisection movement was spreading, intent upon exposing the cruelty of medical experiments on both animals and humans. Antivivisectionists criticized researchers for looking upon research subjects as objects rather than living, individual beings and for using subjects for the researchers' own ambitions with careless disregard of the pain and injury they may inflict. Such attitudes, according to the argument, are immoral be-

cause they conflict with the Christian principle of benevolence and the physicians' Hippocratic oath.

Efforts to codify ethical principles increased following World War II, mainly in reaction to grisly experiments performed in concentration camps by Nazi doctors. The post-World War II Nuremberg Code sought to prohibit experiments upon humans against their will or when death is the likely outcome; most subsequent codes were modeled upon it. The World Medical Association's Declaration of Helsinki (1964; revised 1975) suggested methods of protecting human subjects and urged researchers to respect animals' welfare and be cautious about the effect of experiments on the environment. In the United States, various federal agencies published regulations for experiments financed by public funds, especially the Food and Drug Administration (FDA) (1981) and the Department of Health and Human Services (1983), which required that institutional review boards (IRBs) approve research proposals before projects begin and monitor their execution.

In 1978, the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research released *The Belmont Report*, which proposed broad ethical principles to guide researchers in designing ethical studies. While widely influential, this brief document provided only a framework. Upon researchers and IRBs falls the task of interpreting and applying the principles to resolve ethical problems, sometimes in unprecedented contexts. For example, subsequent epidemics, such as acquired immunodeficiency syndrome (AIDS), challenged the ethics of clinical trials and research funding and raised concerns about public safety.

By 2000, IRBs in their traditional form were increasingly considered inadequate to handle ethical problems. With an estimated two million to twenty million people enrolled in clinical research projects, sometimes tens of thousands in a single drug trial, the case load for monitoring experiments threatened to be overwhelming. Additionally, the complexity of modern experiments and the potential effects on test subjects require understanding a broad range of research protocols and extensive scientific and technical expertise, difficult requirements for many local review boards to meet. At the same time, there was a trend for researchers or their academic institutions to seek profits in the research outcome, especially in patenting and licensing the applications of thera-

peutic innovations produced by genetic engineering. For these reasons, the Institute of Medicine recommended that IRBs be reconstituted to enhance protection of subjects, rigorously to exclude potential conflicts of interest, and to increase training in the ethics of human studies for board members and researchers.

Furthermore, although some government agencies regulate animal experiments, animal rights advocates condemn tests that harm animals for the benefit of humans, and groups such as the People for the Ethical Treatment of Animals (PETA) have sought legislative and judicial intervention to restrict the practice.

ETHICAL PRINCIPLES

The Belmont Report draws from assumptions about equity and autonomy that are common in modern cultures: Each human is to be treated as an individual, rather than as a component of a group; no individual is inherently superior; and no individual can be used primarily as the means to an end. The report's three *prima facie* principles—respect for persons, beneficence, and justice—assert these values' primacy when they conflict with the central value of scientific research, the acquisition of knowledge.

Respect for persons, also called autonomy, rests upon ensuring the self-determination of research subjects. Prospective subjects must not be enrolled in a study through coercion or deceit. Investigators must explain the nature of their study and its potential to harm subjects; then the subjects' formal, written consent must be obtained. For those subjects incapable of informed consent, such as children, the mentally impaired, and the brain dead, responsible guardians must consent to the enrollment. During the course of a study, researchers must protect the well-being and rights of subjects and permit them to end their participation at any time. In effect, researchers are to treat subjects as partners and collaborators, not as objects.

Beneficence obligates researchers to design a study protocol (the plans and rules for a study) so that the risk of harm to subjects is minimized and the potentiality for benefits is maximized. (Some ethicists divide this principle into beneficence, which assures the well-being of subjects, and nonmaleficence, which requires avoidance of harm. The division, they argue, reduces confusion and emphasizes the tenet in the Hippocratic oath against harming patients.) The

Department of Health and Human Services has defined minimal risk as the risk one runs in daily life or during routine physical or psychological tests. Beneficence entails a dual perspective: Not only should each subject expect benefits to health to be greater than harms, but there should also be a reasonable expectation that the study's findings will benefit society.

Because research risks the health of a few subjects, even if volunteers, in order to improve medicine for everyone, an innate inequity exists. The principle of justice seeks to moderate this inequity. No class of people, as defined by poverty, race, nationality, mentality, or condition of health, is to be exploited as research subjects so that they assume a disproportionate burden. The subjects are to be treated fairly; that is, their general human rights must be guarded. The benefits of research must be distributed equally among all groups in the society.

ETHICAL NORMS

Six norms, or standards, are widely used to verify that a study adheres to the principles of respect for persons, beneficence, and justice.

First, the design of the study should be rigorously defined and based upon the null hypothesis (also called equipoise). The null hypothesis assumes that none of the treatments involved in a study is known to be superior when the study begins; likewise, if a placebo (inert drug or innocuous procedure) is used, there must be no persuasive evidence beforehand that the treatment is superior to the placebo. This norm protects subjects, especially those with disease, from receiving treatments known to be inferior, and it helps physician-researchers overcome their central dilemma in medical research: withholding the best available treatment in order to test new treatments. Thereby, good research design supports respect for persons and beneficence.

Second, researchers must be competent, possessing adequate scientific knowledge and skill to conduct the study and to give subjects proper medical care. This norm also supports respect for persons and beneficence.

Third, the study should either balance possible benefits with harms or expect more benefits. Furthermore, if in the course of the study one treatment proves to be superior to another or to the placebo, researchers must terminate or modify the study so that

all its subjects receive the better treatment. This norm incorporates all three ethical principles.

Fourth, researchers must obtain documented informed consent from each subject before a study begins, which assures respect for persons.

Fifth, to affirm the justice of a study, the selection of subjects must be equitable, drawing at random from the eligible population.

Sixth, again for the sake of justice, researchers should compensate subjects for any injuries incurred because of a study.

ETHICAL ISSUES

The most common form of medical research is the three-phase clinical trial, which usually tests new drugs. To eliminate possible biases toward the data and to provide equal treatment of subjects, researchers may incorporate one or more of the following four techniques. First, randomization assigns subjects by a lottery system, rather than on the basis of health, group affiliation, or economic condition. Second, one group of subjects receives the treatment under study, while a second, the control group, receives a placebo. When the first group reacts favorably to the treatment and there is no change to the control group, the researchers can conclude that the treatment causes the reaction, and it is not just an accident. Third, studies are blinded, which means that either the researchers, the subjects, or both (double-blinded) do not have access to documents recording which subjects are receiving treatment and which placebos. Fourth, the groups can exchange roles (crossover); that is, the first group changes from treatment to placebo and the second group from placebo to treatment. A study employing all these techniques is usually called a randomized, double-blinded, placebo-controlled clinical trial with crossover.

PHASE I AND PHASE II

Ethical issues trouble every step of such studies. For example, government regulation requires that a new drug be tested on animals before humans try it, and animal rights advocates have long denounced this procedure as cruel and exploitative. A phase I study determines the toxicity, side effects, and safe dosage of a drug on a small group of people in good health. Since an experimental drug can confer no health benefit on these "normals," the study lacks beneficence; however, the trend has been to conduct

phase I tests on subjects who have a disease for which a drug or procedure is a potential treatment, which obviates the ethical objection.

Phase II studies are controlled clinical trials on a small number of patients to determine whether a drug has a beneficial effect and is safe. Phase III trials, either with or without a control group, compare the effect of the new treatment with that of the standard treatment on a large group of subjects, while defining the medicinal properties and adverse effects as precisely as possible. When patients in a clinical trial are desperately ill, they may grasp at any new treatment with hope, so the use of randomization, blinded dispensation of treatment, and placebos can seem a deprivation of well-being.

Such was the case in the 1980's when azidothymidine (AZT) was tested on subjects carrying the human immunodeficiency virus (HIV) associated with AIDS; the phase I trial showed clinical improvements in some patients. Federal regulations called for a placebo-controlled phase II follow-up, yet scientists were sharply divided over the morality of withholding AZT from HIV-infected persons, because AIDS, once fully developed, was then thought to be universally fatal. A controlled study would be selective and would involve rationing of the drug, which they argued was unjust. Other scientists contended that only a thorough, controlled study could determine whether AZT had side effects more debilitating than the disease itself, and therefore the beneficence of the experimental treatment would remain in doubt.

When federal regulations made AZT the control drug for all further studies, concerns about confidentiality were raised. By selecting subjects for AIDS-related trials, researchers exposed the fact that these subjects were infected, and many subjects worried that they would face discrimination. Furthermore, the large amount of public funds devoted to AIDS research in the late 1980's brought complaints from scientists that other projects were left underfunded as a consequence. Some of these issues apply to studies of other widespread, deadly diseases, such as cancer and heart disease.

Ethical issues literally arise before subjects' births and continue after their deaths. For example, using the bodies of the brain-dead persons, even if legal wills explicitly grant permission, is potentially unethical if the family members object. Some right-to-life advocates, whose convictions demand that all

human life is sacred, object to the use of fetuses or fetal tissue in research. Their beliefs come into direct conflict with stem cell research, one of the most promising lines of investigation at the beginning of the twenty-first century. Stem cells possess the capacity to self-renew and to differentiate into more than one type of cell. There are differing types of stems cells with disparate capacities, but the best for research and therapy are those human stem cells with the ability to become all types of cells, called pluripotent stem cells. They are harvested only from the embryo in an early stage of development. Such cells can be cultured indefinitely and hold great promise in testing pharmaceutical products, regenerating damaged organs, treating cancer, and investigating birth defects and fertility problems.

GENETIC RESEARCH

Because many religions accord full human status to embryos, harvesting embryonic cells following abortion is judged abhorrent, and the abortion itself is regarded as murder. Even the use of excess embryos from in vitro fertilization raises troubling questions about the moral and legal status of the human embryo to many observers. In 2001 President George W. Bush ordered that federal funding be restricted to embryonic stem cell research involving the cells lines already developed from sixty-four embryos.

Research into transgenic organ transplantation, genetic engineering, and the possibility of cloning humans raise even more basic ethical and moral questions than does embryonic stem cell research. By altering a basic natural process in some way, each challenges the nature of human identity and uniqueness. For example, scientists succeeded in introducing specially designed fragments of DNA into patients to treat genetic disorders. Transplanting a baboon's heart into a human baby can keep the child alive until a human organ can be found. Thus, cloning—making copies of embryos—promises to help elucidate basic cellular processes, simplify the testing of pharmaceuticals, create rejuvenation therapy, and provide treatments for infertility, genetic syndromes, and cancer.

Few dispute the potential benefits of such modern technologies. However, theologians, ethicists, and some scientists object to them for three basic reasons. The first is often characterized as the “playing god” accusation. Some religions find that the genetic engi-

A Biotechnological Conundrum

If a woman named Alice were to give birth to a daughter named Barbara, who was cloned from her, Alice might assume the role of Barbara's mother. However, Alice would, in fact, be Barbara's identical twin.

Relationship ambiguities such as this one raise difficult questions about human identity. For example, is the cloned person self and/or other? Are changes in these identities and roles beneficial or harmful? to what extent and to whom? Who should decide and on what basis should decisions about these changes be made?

neering of novel DNA and cloning (should it occur) are impious human attempts to replace the natural processes created by God and accordingly efface the complicated natural chain of events that makes each human unique. Scientists similarly worry that manufactured novelties, untested by the slow process of evolution through natural selection, may introduce counterproductive, even deadly, features into the human genome and accidentally eliminate some that are needed. The second objection comes from a general unease concerning the misuses of technology. The therapeutic effects, the argument runs, are admirable, but the power to intervene could escalate little by little into the power to dominate and change, a form of “technotyranny.” So, genetic engineering and cloning, critics contend, might eventual produce designer children, eliminate politically unpopular traits, end diversity, and even create a new subspecies of *Homo sapiens*. This argument is sometimes called the “slippery slope” thesis. The third objection concerns matters of choice and justice. If it is possible to eliminate or replace human traits, who should decide which traits and on what basis? Moreover, since the technology involved is very expensive, there is the risk it will remain available only to a limited number of privileged persons. Although transgenic transplantation and genetic engineering weathered such critics for the most part, cloning research did not. By 2003, the United States, Great Britain, and many other countries considered partial or outright bans on human cloning.

Purely observational research may also be unethical when it withholds treatment and allows a disease to progress. For example, the Tuskegee Syphilis Study (1932-1972), designed to define the natural history of syphilis, illustrates harm by omission. The study followed four hundred black men with syphilis and about two hundred without it to determine the occurrence of untreated symptoms and mortality. The study continued even after penicillin, an effective treatment, became available during the late 1940's.

REGULATION

Scientists applying for public funding and pharmaceutical companies seeking FDA approval of a new drug must comply with federal regulations, many of which are designed to satisfy the ethical principles enunciated in *The Belmont Report*. The initial responsibility for compliance belongs to IRBs, which act on behalf of their parent institutions (mainly hospitals and universities), not as agents of the government. Composition of IRBs varies, but all must have doctors and scientists capable of reviewing the scientific merit of a proposed study; clergy, nurses, administrators, ethicists, and members of the public may also participate to safeguard the rights, well-being, and privacy of subjects. Even institutions that do not rely on public funds routinely convene IRBs to review research proposals.

Since federal agencies lack the resources to scrutinize every research project, medical research is largely self-regulated from a project's beginning, through IRBs, to its final product: publication. Medical journal standards call for editors to reject articles written by researchers who have not adhered to *The Belmont Report's* principles, although some editors do publish such articles but follow them with editorials calling attention to ethical problems.

In the United States, the courts have also begun to provide ad hoc review of medical research as a result of litigation. Both individual and class-action civil suits seek redress, usually monetary awards, for injury sustained in research, but there have also been allegations of fraud or deception, which can involve punitive judgments as well. Researchers, institutions, and IRBs have been named as plaintiffs. As a result, research designers and IRBs must anticipate possible legal liabilities as part of their analysis of ethical issues.

Mencius

IDENTIFICATION: Ancient Chinese philosopher

BORN: Meng Ke; c. 372 B.C.E., Zou, China

DIED: c. 289 B.C.E., China

TYPE OF ETHICS: Classical history

SIGNIFICANCE: A Confucian sage second only to Confucius, Mencius articulated, defended, and developed Confucianism; he held that human nature is inherently good and that the force of moral goodness is indefeatable.

In China, "Confucianism" is often referred to as "the way of Confucius and Mencius." Mencius (Chinese name, Mengzi) accepted Confucius's teachings without reservation, and his own teachings are largely elaborations of those of Confucius. He articulated Confucianism in an ingenious way, he defended Confucianism against rival ideologies such as Mohism and Yangism, and he combined Confucianism with his own theory of human nature. The book of *Mencius* is therefore regarded as one of the four central Confucian classics (the other three are the *Great Learning*,

the *Doctrine of the Mean*, and the *Analects of Confucius*). Mencius's moral courage and adherence to the practice of Confucianism exemplified the ideal personality of Confucianism.

REN AND YI

In Mencius's theory, as in that of Confucius, *ren* (benevolence, human-heartedness) and *yi* (righteousness) are central concepts. To be *ren* and to do whatever is in accordance with *yi* are essential to having a good life and a good society. According to Mencius, "*ren* is man's peaceful abode and *yi* his proper path." In other words, *ren* is the standing position of a moral agent, and *yi* is the character of moral acts. *Ren* is moral perfection that results in wisdom, courage, honor, and *yi*. Although *ren* and *yi* do not derive their justification from beneficial consequences, the power of *ren* and *yi* is so great that nothing can stop it. The "kingly way" defined by *ren* and *yi* can render *ba dao* (hegemonic force, the way of a despot) totally ineffective.

YANGISM AND MOHISM

To defend Confucianism against rival ideologies, Mencius focused his criticism on Yangism and Mohism. Yangzi advocated egoism. "He would not even pull out one hair to benefit the entire empire," because a hair is part of one's body, which is given by Heaven. This attitude is in direct opposition to Confucius's teaching that one has moral obligations to society; it is also, as Mencius put it, "a denial of one's ruler." Mozi, at the other extreme, advocated love without discrimination, which is not only unnatural but also amounts to a denial of one's father, for loving without discrimination will cause one's father to be treated in the same way as a stranger. "To deny one's ruler and one's father is to be no different from the beasts."

THEORY OF HUMAN NATURE

A fuller rejection of Yangism and Mohism requires a theory of human nature, a theory that answers the question, What is the decree of Heaven? According to Mencius, humans differ from other animals in that they have four hearts or incipient tendencies: The hearts of compassion (the germ of *ren*), of shame (of *yi*), of courtesy and modesty (of *li*, or rites), and of right and wrong (of wisdom). Their existence is indicated by the immediate impulses that one feels

in certain situations. For example, when one suddenly sees a child on the verge of falling into a well, one would have an instantaneous feeling of compassion, although the feeling does not necessarily lead to an action. Since the feeling is spontaneous, it is the result of one's nature, which is given by Heaven; since it is disinterested, it is purely good; and since everyone has the feeling, no matter how faint and momentary, it is universal. Evil is a result of human failure to care for those tendencies and guard them against bad external influences.

"Man has these four tendencies just as he has his four limbs. When, having these four tendencies, he says of himself that he is incapable (of developing them), he is injuring himself," Mencius wrote. "Everyone is capable of becoming a Yao or a Shun" (ancient sage-kings of China). Since human nature is initially good, the way to be moral is to "retain the heart of a new-born babe."

HAO RAN ZHI QI

One can nourish one's good nature by accumulating righteous deeds. As one performs acts of righteousness, one will obtain and develop a *hao ran zhi qi*, a floodlike, vital, and refined energy. "As power, it is exceedingly great and strong"; "nourish it with integrity and place no obstacle in its path and it will fill the space between heaven and earth." This *qi* is both ontological (it actually exists) and moral. One cannot have the *qi* without being morally right. "If on self-examination I find that I am not right, I would tremble before a common fellow coarsely clad. But if on self-examination I find that I am right, I can go forward even against men in the thousands."

Mencius's theory gives clear answers to the following important questions that any adequate theory of ethics needs to answer: Why be moral? Who decides what is moral? How can one be moral? One should be moral because it is one's nature to be so. One need only look deep inside one's heart to find the answer about what is moral. To protect one's good nature from bad influences and to develop it by doing good deeds is the way to become a morally good person.

Men's movement

DEFINITION: Multifaceted, generally decentralized movement responding to changing conceptions of gender identity and gender politics from a masculine or a masculinist perspective

DATE: Late twentieth century

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: The men's movement was largely prompted by the second wave of feminism during the late 1960's and 1970's, but that prompting came in two different forms with very different consequences. For some members, feminism was perceived as accurately diagnosing problems with the construction of gender in patriarchy, and their response was to attempt to create a similar movement that would analyze and react to the patriarchal construction of masculinity. For others, the political and social activism of women was perceived as a threat which either victimized men or unfairly monopolized cultural attention with women's issues. This branch of the movement responded by creating advocacy groups to counteract what they saw as reverse or antimale sexism.

There actually have been several men's movements in North America, Europe, and other Westernized areas of the world. What is often taken to be a monolithic phenomenon is in fact composed of numerous groups that are sometimes in conflict with one another. Among these groups are profeminists, men's rights activists, spiritual revisionists, socialists, and African American and gay rights activists.

PROFEMINISM

Profeminism, as the name implies, is a positive male response to feminism. In the United States, profeminism is institutionally centered in the National Organization of Men Against Sexism (NOMAS), formerly the National Organization of Changing Men (NOCM) and the National Organization of Men (NOM). Similar groups exist in Europe and Australia (in Great Britain, for example, Men Against Sexism).

Profeminism developed during the late 1960's and early 1970's as groups of men began to take seriously the emerging body of feminist theory and began to consider ways to dismantle the male role in the maintenance of patriarchy, the institutionalization of male dominance. Drawing on the insights of feminist theory, profeminist men conducted critiques of male socialization and gender roles with an eye toward assisting women to gain political and economic parity with men; reducing male violence against women, children, and other men; and eliminating other expressions of sexism against females. The theoretical and critical work of profeminists is embodied in political activism directed at ending specific manifestations of sexism such as rape, pornography, and homophobia.

The men's rights movement is also politically active, but the focus of its activism is decidedly different from that of profeminism. Men's rights groups are concerned that modern constructions of the male gender unfairly limit men legally, socially, emotionally, and psychologically. Activists in this sector of the men's movement have called attention to numerous legal and social realities that place the male at a disadvantage, such as gender-based military conscription, the tendency of courts to favor mothers in child custody suits, and the much higher rates of suicide and violent crime (both perpetration and victimization) among men.

While not intrinsically antifeminist, men's rights groups often have been represented (and sometimes

misrepresented) as such. To be sure, extremists within this group have reacted to what they regard as the excesses of feminism. In contrast to profeminists, some men's rights activists have argued that institutions and belief systems already overvalue the female. Principally, however, this movement is less a backlash against feminism than a utilization of feminist methods in the analysis of gender from the male point of view.

Spiritual revisionists share with men's rights activists a general dissatisfaction with traditional male roles, a ferment that may be rooted in countercultural tendencies of the 1950's, thus antedating the second wave of feminism. If this is true, the feminist movement that resurged during the late 1960's essentially provided a catalyst for the expression of a male discontent that was theretofore largely subterranean. Spiritual revisionism—or, as it is more commonly known, the mythopoetic men's movement—focuses primarily on the psychological and spiritual transformation of men. While there are certainly significant elements of political analysis and social activism in mythopoesis, spiritual revisionists usually focus attention on the individual self, maintaining that male malaise is fundamentally based on disorders of the soul.

Proponents believe that men need to overcome alienation from their bodies, their emotions, their work, other men, women, and the earth by recovering or creating myths and rituals, especially those that originate outside the industrialized Western world. This dimension of the men's movement has little or no organizational core; it is structured instead around small local support groups (akin to women's consciousness-raising groups), weekend retreats, and workshops. The mythopoetic movement has been influenced by the Jungian tradition in depth psychology and by recovery (twelve-step) programs. Many credit poet Robert Bly and psychologist James Hillman with inspiring this movement.

RELATED MOVEMENTS

Socialist, African American, and gay rights movements represent areas of overlap between the men's movement and other movements. Socialism has a broad political and philosophical perspective that involves more than gender analysis. Socialists in the men's movement view the construction of masculinities as part of larger economic conflicts, and hence

they tend to be sensitive to the class differences between men. Profeminism, in particular, has ideological affinities with socialism.

The African American men's movement is especially concerned with the plight of the black male, who is faced both with the limitations and problems of the male sex role and with the injustices of racism. Many African American men have been comfortable in alliance with the spiritual revisionists, but others have criticized the men's movement for not making race a more prominent issue.

The gay rights movement intends to end social and political discrimination against homosexuals through political activity. Men who are involved in this movement are often allied with lesbians, profeminist men, and spiritual revisionists. Gay rights activists have called attention to the destructive effects of homophobia on all men, since the fear of homosexuality often leads to alienation between men and to insidious forms of self-hatred.

While the analyses and programs of these various groups differ considerably, they are all united in the conviction that traditional forms of masculinity require serious reevaluation and transformation for the greater well-being of both males and females.

Mental illness

DEFINITION: Nondevelopmental psychological or behavioral disorders

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: Responses to mental illness by medical professionals, criminal justice systems, public policy experts, and society at large engage issues of paternalism, confidentiality, the right to privacy, individual autonomy, informed consent, the right to treatment, the right to refuse treatment, and the limits of criminal responsibility.

By conceptualizing mental disorders as illness, physicians are awarded primacy in regard to treatment decisions. Persons who suffer from mental illness may be viewed as requiring treatment, even when they do not desire such care. Under certain circumstances, persons who are mentally ill may be declared not responsible for their actions.

HISTORY

Historically, persons with mental disorders have been beaten, driven from their homes, subjected to inhumane treatments, and put to death. Early views of mental disorders were founded on a mixture of demonology and theories of organic causality. Demonology is founded on the idea that evil spirits or an angry god can dwell within or directly influence a person. Organic theories attribute the development of mental disorders to physical causes—injuries, imbalances in body fluids, or abnormal body structures.

Skulls dating back as far as 500,000 years show evidence of trephining, a technique using stone instruments to scrape away portions of skulls. It is assumed that these operations were performed to allow evil spirits to escape from the bodies of the people whose skulls were found. A modified form of trephining was revived in Europe in the Middle Ages. As late as the sixteenth century, some patients were subjected to surgical procedures in which a physician would bore holes in a patient's skull and an attending

priest would remove stones that were assumed to be a cause of insanity.

An Egyptian papyrus of 3000 B.C.E. describes recommended treatments for war wounds and shows that the Egyptians recognized the relationship between organic injury and subsequent mental dysfunction. Another papyrus, of the sixteenth century B.C.E., shows that in regard to diseases not caused by obvious physical injuries, the Egyptians were likely to rely on magic for their explanations and incantations for their cures. Still, superstition was tempered with humane care—dream interpretation, quiet walks, and barge rides down the Nile.

The Hebrews viewed insanity as resulting from God's wrath or the withdrawal of his protection. Without God's protection, a person was subject to invasion by evil spirits, which could cause madness.

For the Hebrews, mental disease was a consequence of not living according to God's word.

Prior to the fifth century B.C.E. Greek beliefs concerning mental illness were founded on a mixture of religion and superstition. While the most typical responses to persons with mental abnormalities were banishment and stoning, some individuals received humane and supportive care. As did the Egyptians, the Greeks built temples devoted to healing and medicine. Baths, changes in diet, moderate exercise, and dream interpretation were aspects of the early Greek treatment regimen.

Subsequent to the fifth century B.C.E., Greek thought concerning diseases came under the influence of the physician Hippocrates. Hippocrates rejected the prevailing belief that attributed disease to possession. The writings of Hippocrates, nearly all of which were authored by his followers, are very clear in attributing diseases to natural processes. While many healthful remedies followed the Hippocratic idea that mental disorders could be traced to imbalances in body fluids, this same theory also led to many improper and inhumane interventions, such as bloodletting and the forced consumption of foul potions.

In addition to the deductions of Greek physicians, Greek philosophers also speculated concerning mental disturbances. The Greek philosopher Plato addressed the need to treat persons afflicted with mental disorders with compassion and argued that persons who commit a crime as a result of madness or disease should pay a fine but otherwise should be exempt from punishment.

The early Romans expanded upon and refined Greek ideas in regard to mental diseases. After the death in c. 199 C.E. of the Greek physician Galen, who practiced in Rome for most his lifetime, Roman medicine stagnated.

While Europeans abandoned scientific explanations for mental disorders, Islamic countries continued the inquiries initiated by the Greeks. In 792, the first hospital devoted exclusively to the care of mentally ill persons was opened in Baghdad. Humane treatment and a concern for the dignity of disturbed persons were key aspects of treatments recommended by Islamic physicians.

In 1811, Benjamin Rush, one of the founders of the American Psychiatric Association, invented what he called the "tranquillizing chair" to help calm patients with mental illness. (National Library of Medicine)

EUROPEAN TRADITIONS

In contrast to the Islamic tradition, Europeans routinely expelled, tortured, abused, and murdered the mentally disturbed. With the rise of Christianity, insanity was variously ascribed to demonic possession, hormonal imbalances, and folk superstitions. While some monasteries offered healing rituals based on incantations and prayer, it was far more common to view the mentally disturbed as abandoned by God or in league with Satan and in need of redemption rather than assistance.

During the mid-thirteenth century, the Church focused on the need to search out and identify witches and warlocks. Mentally ill persons were perfect targets for the papal inquisitors, although it is believed that many more sane than insane persons died as a result of the Inquisition. Commonly, the accused were tortured until they confessed, after which they were burned to death.

The fifteenth century also saw a major movement that was directed toward the confinement of the mentally ill. The institutions for the mentally disturbed were administered by physicians, and as a result, doctors assumed primacy in the care of the mentally disturbed. While the care of persons with mental disorders was transferred from the clergy to physicians, the quality of the patients' lives showed little improvement. Bloodletting, emetic potions, straitjackets, chains, dunking chairs, spinning devices, and terror were the most frequently prescribed treatments.

It was not until the late eighteenth century that positive changes occurred in regard to the treatment of the mentally ill. In 1793 a French physician, Philippe Pinel, was put in charge of a Paris asylum. Dismayed by the treatment that was provided the inmates, Pinel initiated a series of reforms that became the foundation for what was later called the Moral Treatment Revolution. The Moral Treatment Revolution was founded on the principles that mental patients should be treated with compassion, provided with supportive counseling, housed in comfortable surroundings, and given purposeful work.

While a number of existent asylums adopted the Moral Treatment approach and new hospitals were dedicated to its principles, it did not take long for economics and neglect to make a mockery of the stated principles. Over time, mental hospitals became little more than warehouses where the mentally ill were admitted, diagnosed, and forgotten.

THE MODERN ERA

While the late nineteenth century saw the development of new theories and techniques for the treatment of mental disorders that were based on free association and catharsis, only a few affluent persons with mental disorders received these treatments. Still, by the early twentieth century, bloodletting, purging, terror, and treatments designed to cause disorientation were being abandoned. These treatments were replaced by somatic therapies and pharmacological interventions. Major problems existed, however, in that the somatic therapies caused brain damage, and the drugs that were available prior to the 1950's were sedatives that caused extreme lethargy and sometimes death.

By the early 1930's, psychiatrists began experimenting with various types of somatic therapy. Insulin coma therapy involved administrations of toxic doses of insulin to nondiabetic patients. Electroconvulsive therapy (ECT) involved passing an electric current through a patient's brain, causing a seizure. Between the late 1930's and the 1960's, several hundred thousand mental patients were involuntarily treated with ECT.

During the mid-1930's, the Portuguese physician António Egas Moniz introduced a surgical procedure that evolved into the prefrontal lobotomy. Between 1935 and 1955, more than fifty thousand mental patients were subjected to lobotomies, in which healthy brain tissue was destroyed in a misdirected effort to treat mental illness.

By the mid-1950's, new pharmacological agents became available. The first of the drugs to be used was reserpine. Although the effects of reserpine on the behavior of psychotic patients were profound, the drug had dangerous side effects. Reserpine was soon replaced by the drug Thorazine. Over the next several years, hundreds of thousands of patients, some voluntarily and many involuntarily, were given Thorazine and other major tranquilizers. One side effect of Thorazine and other drugs of its class is tardive dyskinesia, a disfiguring disturbance that manifests as facial grimacing, palsy, and a staggering gait. For most patients, the tardive dyskinesia disappears when the drug is discontinued, but for some the symptoms are irreversible.

Partially as a result of the availability of psychotropic medications and as a result of changes in social policy, the 1960's saw the beginnings of the commu-

nity mental health movement. The community mental health movement promoted the concepts of deinstitutionalization, treatment in the least restrictive environment, and treatment as close to the person's home community as possible. Deinstitutionalization involved discharging as many patients as possible from state hospitals and discouraging new admissions. As a result of deinstitutionalization, state hospital populations went from a peak of more than 500,000 during the mid-1950's to fewer than 130,000 during the late 1980's.

CLARIFICATION OF TERMS

Throughout the preceding narrative the terms "mental illness," "mental disease," "insanity," "madness," "mental abnormality," "mental disturbance," "mental dysfunction," and "mental disorder" have been used interchangeably. While this is a common practice, it can lead to misunderstandings.

While medical practitioners, legal documents, and the general public frequently refer to aberrant behavior and mental disorders as mental illness, this is a misuse of the term "illness." Illness implies that some underlying disease process exists. The American psychiatrist Thomas Szasz has argued that the complaints that are called symptoms of mental illness are simply communications concerning beliefs, discomfort, or desires that an individual experiences in regard to self or others. Labeling such communications as symptoms of mental illness is a sociopolitical process that vests authority in physicians to control and abuse persons whose communications make others uncomfortable or who are presumed to be dangerous.

While "insanity" is used interchangeably with "mental illness," it would be best if the term "insanity" were reserved to describe a mental state pertinent to legal proceedings. Most countries mitigate punishment if it is determined that a person was insane at the time of committing an illegal act. In fact, most states in the United States allow a finding of not guilty by reason of insanity. This means that a person who commits an illegal act while insane should be found not guilty of any criminal offense.

The terms "madness," "mental abnormality," "mental disturbance," and "mental dysfunction" are simply descriptive in nature. They have no particular standing in regard to the legal system or the medical establishment.

The term "mental disorder" is the official term adopted by the American Psychiatric Association and the American Psychological Association to describe abnormal behavioral or psychological states that cause personal distress, impaired functioning, or conflict with society. The Diagnostic and Statistical Manual of Mental Disorders catalogs the symptoms and behaviors of the various types of mental disorders. Only a minority of the several hundred disorders listed fit the criteria for identification as diseases. That is, it is not possible to identify infectious processes, biochemical imbalances, organ malfunctions, or physical trauma as causes of most disorders. Therefore, it is questionable to refer to them as illnesses.

ETHICAL ISSUES

The treatment of persons with mental disorders brings into consideration a number of ethical issues. Among the ethical issues that are of importance in regard to the treatment of persons identified as mentally ill are the following: paternalism, confidentiality, right to privacy, autonomy, informed consent, right to treatment, right to refuse treatment, and criminal responsibility.

In the United States, persons may be involuntarily confined in mental hospitals if they are "mentally ill" and a danger to self or others. Additionally, many states allow the commitment of "mentally ill" persons who are likely to deteriorate mentally or physically if they do not receive care. While at one time simply having a mental disorder could serve as grounds for loss of freedom, states now require an additional finding of dangerousness or probability of deterioration. The right of the state to confine selected citizens involuntarily is based on the concepts of paternalism and police power. Paternalism, or *parens patriae*, allows the state to protect citizens from themselves.

CONFIDENTIALITY

Confidentiality is central to the practice of psychotherapy. Professional codes and legal procedures require that certain communications be held in confidence. Still, all states provide exceptions to confidentiality, which include the following: when criminal charges have been filed, in child custody cases, when a criminal offense is planned, when the client is a danger to self or others, and when the client has been

informed that certain communications are not privileged.

While the right to privacy is a fundamental right that most citizens enjoy, it is frequently denied persons who have been diagnosed as mentally ill. If the mentally ill person does not cooperate with treatment, divulge personal secrets, and participate in routine hospital activities, he or she will be identified as an uncooperative patient and will find it very difficult to obtain his or her freedom.

Autonomy is the right to act in a manner that is consistent with one's personally held beliefs and to make decisions that affect one's fate and destiny. This is a right that is refused many mentally ill persons. Through involuntary commitment and forced treatment, persons deemed to be suffering from mental diseases are denied the right to make key decisions that affect their quality of life and their personal survival. Concerning personal survival, only two states have laws making suicide illegal. Furthermore, all states allow a competent adult to make decisions regarding the continuation of life-support devices. Most states either allow or are mute on the right of a competent person to terminate his or her life. Still, all states allow the forced incarceration of a mentally ill person who attempts suicide.

PATIENT RIGHTS

Informed consent requires that persons understand the nature of the procedures they are to experience, that their participation be voluntary, and that possible consequences be explained. Involuntary commitment, forced treatment, and failure to discuss side effects of psychotropic medications are examples of violations of informed consent in regard to mentally ill persons.

Right to treatment refers to the concept that persons involuntarily confined in mental institutions have a right to humane care and therapeutic treatment. During the 1971 Alabama case *Wyatt v. Stickney*, Judge Frank Johnson stated, "to deprive any citizen of his or her liberty upon an altruistic theory that the confinement is for humane and therapeutic reasons and then fail to provide adequate treatment violates the very fundamentals of due process."

During the 1975 case *O'Connor v. Donaldson*, the Supreme Court ruled that Donald Donaldson, who had been confined to a mental hospital in Florida

for fourteen years, deserved a periodic review of his mental status and could not be indefinitely confined if he was capable of caring for himself and was not a danger to himself or others. While not directly ruling on the issue of right to treatment, the court let stand an earlier decision that if Donaldson was not provided treatment, he should have been discharged from the hospital.

The right to refuse treatment is an issue that causes a great deal of controversy. Prior to the 1960's, it was common practice to force patients to undergo dangerous and disabling treatments. Involuntary sterilizations, electroconvulsive therapy, and psychosurgery were frequently prescribed for recalcitrant or difficult patients. While patients now have specific rights in regard to certain invasive treatments, their right to refuse unwanted medications was undefined as late as the early 1990's. During the 1979 case *Rogers v. Okin*, a patient who had been committed to the Boston State Hospital complained that he should not be required to take psychotropic medications against his will. While the initial court finding was that Rogers should have had a right to refuse medication, the case was appealed, and no clear precedent emerged from the case.

The issue of criminal responsibility is bound up with the concept of insanity. If a person, because of mental defect or state of mind, is unable to distinguish right from wrong, then most states would find the person exempt from criminal punishment. Beginning in 1975, however, Michigan adopted an alternate verdict of "guilty but mentally ill." As of 2000, twenty states had followed the Michigan example. The option of finding a person guilty but mentally ill increases the probability that incarceration will follow a crime committed by a person who previously would have been declared insane. Additionally, it allows for mitigation of the length of sentencing and provides for specialized treatment in a prison hospital.

Mentoring

DEFINITION: Teaching or training relationship between a person acting as a counselor, or guide, to a person in a subordinate position

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Relationships between mentors and their charges, or mentees, must be founded on trust and devoted to increasing the skills, knowledge, and abilities of the mentees.

Mentors may be peers, colleagues, or friends and are usually persons with more experience than those whom they instruct. Mentoring may occur as the result of a planned, systematic process that is designed and supported by an organization or may develop as an unplanned process in which two parties naturally form a relationship and realize mutual benefits. Within organizations, mentors are usually selected because they exhibit positive character values, professional integrity, and high ethical standards in addition to their specialized knowledge, abilities, and skills.

In planned mentoring, mentors and their charges, known as mentees, are matched based on the charges' needs and what the mentors can provide to them. Regardless of the settings and the individuals involved in mentoring, however, there is an implicit understanding that mentoring is a special relationship whose success depends upon maintaining several ethical parameters.

The first parameter is confidentiality. Both the mentors and their charges must agree as to what issues are bound by limits of confidentiality and which are not. For example, in a situation within an organization in which a mentee expresses difficulty in resolving an issue that might negatively impact the organization, it must be clear to all parties whether or not the mentor is required to disclose that fact to someone else within the organization. Likewise, if the mentor discloses an issue as a teaching tool, the mentee must not betray trust by discussing the issue with anyone else. With that said, the limits of confidentiality should be discussed early in the relationship.

A second ethical issue involves maintaining the integrity of the relationship by not using it as a vehicle for self-promotion. That is, mentors should be never use information provided by their charges to advance their own interests. A third ethical issue involves not violating the trust of the relationship by

making inappropriate advances, contact, or innuendo. Because of the frequent contact and close nature of mentor relationships, it is not unusual for one or both parties to feel a degree of emotional intimacy. Such intimacy must be confined to the professional relationships and not be allowed to drift into more personal intimacies.

A fourth ethical issue also deals with trust and integrity. Mentors must provide safe and supportive environments in which their charges can openly discuss and explore their concerns, weaknesses, and anxieties without fear of adverse occupational consequences or diminution of personal standing. A final ethical issue is that both mentors and their charges should be sensitive to the impact of cultural differences on each others' values, ideas, and viewpoints.

Mercenary soldiers

DEFINITION: Soldiers who serve in government or private military forces for money or adventure, rather than for reasons of patriotism or idealism

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: By the end of the twentieth century, the use of mercenaries was rising throughout the world as the collapse of the Soviet Union made available large numbers of trained soldiers while at the same time the end of the Cold War led to increased instability that bred the kinds of small

Image not available

One of the late twentieth century's most notorious mercenary leaders, Bob Denard (right) hands a surrender note to a Comorian policeman in October, 1995, one week after toppling the legal government of the Comoro Islands. Denard's short-lived coup was overturned by French forces invited in by the prime minister. Denard was later tried in France for the 1989 murder of an earlier Comorian prime minister. (AP/Wide World Photos)

wars that employ mercenaries. Additionally, the United States increasingly employed civilian contractors for duties traditionally performed by soldiers.

While the rise of nationalism in the nineteenth century seemed to doom large-scale use of mercenaries, such soldiers continued to be employed throughout the twentieth century, mostly in colonial and post-colonial regions. During the 1970's, the rebel government of Rhodesia, for example, depended heavily on mercenaries from North America and Europe in its attempt to remain in power. During the 1990's mercenaries were used by several factions in the conflicts that followed the collapse of Yugoslavia.

By its nature, mercenary service is generally seen as unethical behavior. To most military professionals, the very term "mercenary" is an insult. However, there exists among mercenaries themselves at least a theoretical code of conduct. Soldiers of fortune, as they often call themselves, are expected to provide professional and competent service to whomever or whatever pays for their services. However, those who employ mercenaries are aware that while mercenaries might form tight bonds with their fellow soldiers, their loyalty to the causes for which they fight depends largely on the amount of their pay, and the mercenaries might switch sides if the opposition offers them more money. Moreover, while mercenaries are usually willing to kill other people, they seldom are willing to die for the causes for which they fight.

BLURRING OF ROLES

Within the United States military, the line between mercenary and contractor blurred during the 1990's and into the twenty-first century as growing numbers of civilian employees—both U.S. nationals and local hires in foreign countries—performed many functions traditionally performed by soldiers. During the 1991 Persian Gulf War, for example, U.S. Army units in the Middle East theater of war contained about one civilian contractor for each one hundred soldiers. During the 2003 war against Iraq, the U.S. military had about one contractor for every ten soldiers. The tasks these civilians performed ranged from erecting tents to calibrating weapons systems. Their status under international law was uncertain. Although none of the civilian contractors served as riflemen, civilian technicians were involved in activi-

ties such as targeting and even firing land-based and sea-based missiles. Performing such activities makes them combatants, but they are not entitled to protections afforded soldiers under international laws. Although few contractors consider themselves to be mercenaries, the distinction was unclear.

Mercy

DEFINITION: Compassion and leniency toward someone over whom one has power

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Mercy is generally thought of as a virtue on an individual level. On a social level it can be much more controversial, however, since by definition it entails either forgoing or lessening a punishment dictated by impersonal standards of justice.

Mercy originated as a theological term. Although it came into the English through the French and Latin, its meaning goes back to an ancient Israelite concept of how God acted toward people and how he expected people to act toward one another. Mercy most often is used to translate the word *hesed* in the Hebrew Bible, a word that is also often translated as "kindness," "loving kindness," and "steadfast love." In Jewish scripture, *hesed* denotes God's attitude toward people as pledged in a covenant relationship. If the people of Israel would be loyal to their agreement with God, then God's attitude would be one of mercy.

Hesed more often describes an activity than it does a disposition. Thus, after crossing the Red Sea and escaping from Egypt, Moses and the Israelites sang a song in which they called God's saving act *hesed*: "In your steadfast love [*hesed*] you led the people whom you redeemed; you guided them by your strength to your holy abode" (Exodus 15:13). *Hesed* is not used in the Hebrew Bible only to describe God's activity. It also denotes the mutual, right attitude that God expects of people in a covenant relationship. Thus, the trust and faithfulness that should characterize relations between relatives, friends, and other societal groups is *hesed*, and without *hesed*, society would be characterized by disorder. For example, the prophet Hosea (Hosea 4:1-3) claims that since the Israelites are living without *hesed*,

Swearing, lying, and murder, and stealing and adultery break out; bloodshed follows bloodshed. Therefore the land mourns, and all who live in it languish; together with the wild animals and the birds of the air, even the fish of the sea are perishing.

In the Septuagint, which is the oldest surviving Greek version of the Old Testament, *hesed* was most often translated as *eleos*. *Eleos* also carried the connotations of the Hebrew *hesed* into the Christian New Testament. For example, Matthew's Gospel twice cites the announcement in Hosea that God desires mercy (*eleos*) rather than sacrifice (Hosea 6:6; Matt. 9:13, 12:7).

Eleos also carried with it other meanings, however, and it is from this Greek heritage that "mercy" received connotations of a sentiment. In prebiblical Greek literature, *eleos* denoted that feeling or emotion that occurs when witnessing suffering that is undeserved. Aristotle defined it "as a feeling of pain caused by the sight of some evil, destructive or painful, which befalls one who does not deserve it, and which we might expect to befall ourselves or some friend of ours, and moreover to befall us soon." The sentiment described here resembles pity more than mercy. Indeed, for Aristotle, *eleos* was not a virtue; it was an impediment, along with fear (*phobo*), to living a productive life. The importance of tragic art, according to Aristotle, lay in its ability to purge its audience of both pity and fear so that they could leave the theater and return to their lives free of such emotional baggage.

CHRISTIAN VIEWS

In the Christian New Testament, mercy is sometimes an activity and sometimes a sentiment. As in later Judaism, the merciful activity of God in the Christian scripture is sometimes connected to God's judgment at the end of time. In fact, the old French *merces* signified a payment or reward, and thus indicated the heavenly reward awaiting the compassionate person. Also, Christianity reinterpreted *eleos* in light of Jesus' death on the cross. Thus, there is more of a tendency in Christian literature than in the Hebrew Bible to think of God's mercy as preceding people's mercy and to relate mercy to suffering activity. For example, in the very influential parable of the Good Samaritan (Luke 10:29-37), the merciful Samaritan, following the model of Jesus, pays a price on behalf of the one who was assaulted. He is a good neighbor because he goes out of his way to care for another person who needs help.

In Jerome's *Vulgate*, the Hebrew *hesed* and the Greek *eleos* were often translated by *misericordia*, which combines the meanings of pity, compassion, kindness, and leniency. The Latin root emphasizes wretchedness and sorrow. Thomas Aquinas defines a merciful person as being sorrowful at heart (*miserum cor*); that is, as being affected with the sorrow or misery of another as if it were one's own. God's work of dispelling misery is the effect of his mercy. God's mercy, then, especially in medieval theology, connotes God's unmerited grace as he reaches down to wretched humans. Thus, Augustine can love and thank God "because Thou has forgiven me these so great and heinous deeds of mine. To thy grace I ascribe it, and to Thy mercy, that Thou hast melted away my sins as it were ice."

In modern usage, mercy retains elements of its earlier meanings, but it always connotes some form of leniency or restraint, whether from physical punishment or merely in the way one person judges another person's actions. Mercy always exists, then, within the context of an unequal power relationship. One could easily imagine, for example, that a subject would feel compassion for the troubles of a monarch, but that feeling would not under most circumstances be considered merciful. Normally, only compassion of the monarch for the subject could result in a show of mercy.

Although William Shakespeare claimed in *Titus Andronicus* that "Sweet Mercy is nobility's true

badge” and wrote in the *Merchant of Venice* that “It [mercy] blesseth him that gives, and him that takes,” mercy has not always been thought of as something good. For example, it was not included among Plato’s cardinal virtues (justice, temperance, prudence, and fortitude), and because the Stoic philosophers thought that mercy was an emotion that might sway reason and misdirect justice, they did not trust it.

The tendency of mercy to resist justice was a trait that nineteenth century philosopher Friedrich Nietzsche found admirable. Nietzsche thought of mercy as one of the noblest of all virtues. He saw two things to admire in mercy. First, because of the power relationship within which it took place, the exercise of mercy was always the exercise of strength. For Nietzsche, this meant that mercy was a virtue based on the positive values one possessed, making it preferable to virtues like meekness that were based upon the negative values one lacked. Second, and more important, an act of mercy according to Nietzsche was based in the personal value system of the actor, and was performed solely for the actor’s benefit. It was not based in supposedly universal values like justice which were meant to apply to everyone and which were meant to benefit society as a whole. For Nietzsche, this rendered mercy superior to justice, because he endorsed the development of distinctive, appropriate moral values for each individual and attacked universal systems of morality which expect everyone to share the same values. Mercy, Nietzsche said, is a virtue for the individual precisely because it is destructive to the general interests of society.

Likewise, the proponents of “lifeboat ethics” tend to think that the sentiment of mercy masks and makes it difficult for society to deal with the moral dilemma posed by a world population that is outstripping the available resources. Finally, from a different perspective, mercy’s close association with power has led liberation theologians to associate human mercy with paternalism and imperialism. They call for solidarity with the poor rather than for mercy upon the poor.

Merit

DEFINITION: Character, performance, or skill that deserves or is worthy of recognition or reward

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Merit is the basis for systems of social justice that are based primarily on desert rather than on need.

As Wolfgang von Goethe said, “It never occurs to fools that merit and good fortune are closely united.” Thus, types of justice can clash. Two main types of justice are meritocratic justice and distributive justice. Meritocratic justice requires that only the most qualified and worthy person be chosen for any position in question. Distributive justice requires people to minimize serious inequalities in well-being; for example, those arising from good or bad fortune.

Robert K. Fullinwider gives an example that undermines the decisiveness of meritocratic justice. He says that meritocracy is “too rigid and specific” and would condemn acts that “seem unobjectionable.”

Suppose . . . an employer had two well-qualified applicants for a position, the slightly better quali-

fied applicant already having a good, secure job, the other being unemployed. If the employer hired the unemployed applicant, would he have violated a . . . moral principle? To suggest [so] is . . . strongly counter-intuitive.

The distributive justice of hiring the unemployed seems to outweigh the problem with meritocratic justice. Moreover, Norman Daniels tries to show that the argument from meritocracy is not an argument from justice. Daniels considers the following example:

Jack and Jill both want jobs *A* and *B* and each much prefers *A* to *B*. Jill can do either *A* or *B* better than Jack. But the situation *S* in which Jill performs *B* and Jack *A* is more productive than Jack doing *B* and Jill *A* (*S'*), even when we include the effects on productivity of Jill's lesser satisfaction. [Meritocracy] selects *S*, not *S'*, because it is attuned to macroproductivity, not microproductivity. . . . It says, "Select people for jobs so that *overall* job performance is maximized."

Daniels anticipates the objection that meritocracy would select *S'*, not *S*, because meritocracy implies that "a person should get a job if he or she is the best available person for *that* job." He admits that this objection appears to be based on the point of justice "that it seems *unfair* to Jill that she gets the job she wants less even though she can do the job Jack gets better than he can." Daniels, however, thinks that the seeming unfairness derives from "inessential features of our economic system"; namely, that promoting microproductivity happens to be "the best rule of thumb" to follow to achieve macroproductivity. He says that favoring microproductivity (*S'*) over macroproductivity (*S*) because *S* seems unfair is relying on an intuition that is "just a by-product of our existing institutions" rather than based on justice. The happenstance that there is a mere rule of thumb in existing institutions is too superficial and arbitrary to be a fundamental consideration of justice. Once it is realized that the basis of meritocracy is macroproductivity, meritocracy will not support the intuition that Jill, in justice, deserves her favorite job *A* or the claim that justice requires *S'*. That the "inessential features of our economic system" are irrelevant to justice undermines that standing of meritocracy—

when conceived of as microproductivity—as a principle of justice. Meritocracy as macroproductivity survives.

Ronald Dworkin adds the following argument, which supports Daniels's claim that there is no merit abstracted from macroproductivity. Dworkin says,

There is no combination of abilities and skill and traits that constitutes "merit" in the abstract; if quick hands count as "merit" in the case of a prospective surgeon, this is because quick hands will enable him to serve the public better and for no other reason. If a black skin will, as a matter of regrettable fact [e.g., the need for black role models], enable another doctor to do a different medical job better, then that black skin is by the same token "merit" as well. That argument may strike some as dangerous; but only because they confuse its conclusion—that black skin may be a socially useful trait in particular circumstances—with the very different and despicable idea that one race may be *inherently* more worthy than another.

One may object that black skin cannot count as merit, since pigmentation is an inherited accident of birth rather than a matter of choice and achievement. As Dworkin argues, however,

it is also true that those who score low in aptitude or admissions tests do not choose their levels of intelligence. Nor do those denied admission because they are too old, or because they do not come from a part of the country underrepresented in the school, or because they cannot play basketball well, choose not to have the qualities that made the difference.

Tests allegedly measuring merit are often biased. Furthermore, a lower score under inferior conditions often indicates more ability than does a higher score under superior conditions. African Americans tend to take the tests under conditions (poverty, reduced parental supervision, reduced incentives, bleaker prospects caused by racism, and so forth) that are dramatically inferior to the conditions under which whites take such tests. For example, consider the dramatic differences between the best group and the worst group of American public high schools. The best group will generally give its students at least the

following advantages over the students in the worst group: better teachers, better equipment, more programs (for example, extracurricular activities), better atmospheres in which to learn (atmospheres with less crime, noise, and disorder), better role models, and more peer pressure to achieve.

For example, Peter Singer notes, affirmative action programs “taking into account a student’s race would merely be a way of correcting for the failure of standard tests to allow for the disadvantages that face blacks in competing with whites on such tests.” Such disadvantages include less ability to afford preparation courses, which whites commonly take and which the free market has specifically designed to boost scores on standard tests (such as the SAT).

Similarly, Richard Wasserstrom argues,

Most of what are regarded as the decisive characteristics for higher education have a great deal to do with things over which the individual has neither control nor responsibility: such things as home environment, socioeconomic class of parents, and of course, the quality of the primary and secondary schools attended. Since individuals do not deserve having had any of these things vis-à-vis other individuals, they do not, for the most part, deserve their qualifications.

In contrast, George Sher argues that society’s conventions establish merit. He takes his view to extremes when he says, “We could even flog or torture in direct proportion to merit. . . . If the convention existed, our suggestion would imply that the meritorious deserved their beatings and abuse.” Sher seems to be mistaken, since recognizing merit for what it is (good) implies that merit should be rewarded. If the convention were to punish merit, then the society would make the mistake of failing to recognize the value of merit, since its actions (punishment) speak louder than words (calling something merit).

Messianism

DEFINITION: Belief in a messiah, that is, a religious savior who will someday appear and lead humankind, or the followers of a particular religion, into an age of perfect justice, peace, and spiritual transcendence

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Messianism provides believers with two models of moral perfection by which to judge reality: the messiah, who represents the ideal person, and the utopian social order the messiah will bring about. Messianism also often entails belief in an apocalyptic event that will precipitate the messianic age, and this may strongly affect believers’ attitudes toward warfare, famine, and other similar events in the present.

Although the term “messiah” is rarely used in the Old Testament, the concept of an ideal ruler was expressed as early as the eighth century B.C.E. Isaiah 9 expressed hopes for a king who would give wonder-

ful counsel (Isaiah 11 spoke of his wisdom), be god-like in battle, be continuous in fatherly care, and establish peace. Jeremiah 33:14-22 and Ezekiel 34:23-24 spoke of a future David who would administer the future golden age that God would usher in. The idea of a permanent Davidic dynasty (2 Samuel 7) developed the royal ideology of ancient Israel (see Psalms 2, 72, and 110). Other passages (for example, Isaiah 24:23 and Zechariah 14:9) looked toward a messianic age with God ruling directly.

The Dead Sea Scrolls, the Talmud, and subsequent Jewish sources reveal an ongoing, though not universal, hope among Jews for a messiah. In debates with Jews, early Christians claimed that Jesus was the messiah; indeed, the title “christ” is the Greek translation of the Hebrew title “messiah.” Christians modified Jewish belief by identifying the messiah with the suffering servant (see Isaiah 52:13-53:12), claiming that he was divine, and looking forward to his return at the end of time. Certain rules of behavior (see, for example, Matthew 5:19, 6:1-6, 10:42, 16:27) tied gaining rewards to following the teachings of Jesus.

Metaethics

DEFINITION: Specialization within moral philosophy that is concerned with fundamental conceptual and epistemological questions in ethics

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Essentially the theory of the theory of ethics, metaethics attempts to ground moral philosophy by specifying what counts as a legitimate question for moral philosophers to answer and what counts as a legitimate method for answering that question.

First and foremost, metaethics seeks to answer the question What is the subject matter of ethics? Moral philosophy may be divided into three sets of concerns: metaethical theory, normative ethical theory,

and applied ethics. In applied ethics, philosophers reflect upon the significance of some general moral point of view for a particular problem of moral decision making. For example, a philosopher might consider whether, according to rule utilitarianism, the practice of euthanasia is morally permissible. Further distinctions (such as the distinction between active and passive euthanasia) might be made to help clarify the difficulty. In contrast to applied ethics, normative ethical theory focuses upon a comparative study of such general ethical theories as utilitarianism, egoism, Kantian formalism, virtue ethics, and so forth. The fundamental question in normative ethics is What makes an action, any action whatsoever, right or wrong?

It can be seen from these brief descriptions of normative ethical theory and applied ethics that both are interested in deciding what is right and what is wrong. Normative ethical theory attempts to develop a completely general account of what is right and what is wrong. Applied ethics investigates the moral quality of agents and their actions in specific moral contexts, usually by appealing to some normative ethical theory.

Metaethics differs from both normative and applied ethics in that it explores conceptual and epistemological questions that arise for those who use moral discourse and who devise and apply normative theories of right and wrong. Conceptual questions are posed for moral terms and statements; epistemological questions are raised about the possibility and character of moral reasoning.

CONCEPTUAL QUESTIONS

Metaethics did not emerge as a major preoccupation in philosophy until early in the twentieth century, when the problems of metaethics became insulated from the rest of moral philosophy primarily through the influence of Anglo-American linguistic philosophy. The change in path that led to the emergence of contemporary analytic philosophy has been called “the linguistic turn.” In ethics, this change meant refined analysis of the terms used in moral discourse and of the structure and meaning of moral utterances. Thus, terms such as “good,” “evil,” “right,” or “wrong” (called moral predicates) are examined directly. This sort of analysis is supposed to clarify what it means to use a moral predicate within a sentence of the form “X is right” or “X is wrong.”

Locutions of the form “X is right” or “X is wrong” have the grammatical appearance of being simple judgments of fact. Many modern ethicists have suggested, however, that their grammatical appearance may be misleading. It is not obvious what facts one could point to to determine the truth value of a statement such as “Unrestricted abortion is morally wrong.” Perhaps, then, such forms of discourse have no truth value at all; that is, perhaps they are neither true nor false. Perhaps they have a very different sort of meaning. Metaethicists who reach this conclusion about the general significance of moral utterances are called noncognitivists. They hold that normative ethics is impossible.

The cognitivists, those who believe that moral utterances are genuine statements with truth values, differ as to what sort of fact a moral fact is. Many have tried to analyze the good in terms of some more basic natural fact (such as pleasure or personal survival). They are called naturalists. G. E. Moore objected that all such attempts to define “good” commit the naturalistic fallacy. One cannot define “good” in terms of some natural property, since one can always ask without redundancy whether that property itself is good. Instead, he argued, the good should be regarded as a basic, indefinable, nonnatural property.

EPISTEMOLOGICAL QUESTIONS

If one adopts the cognitivist view that moral expressions are genuine judgments with truth values, a further question arises: How does one go about determining which moral judgments are true and which are false? Clearly, the possibility of genuine moral disagreement presupposes that moral utterances of the form “X is right” are either true or false, but how does one know which statements of that form are true? What sorts of reasons are relevant for adjudicating between conflicting moral judgments and between systems of normative ethics?

A related but even more fundamental question intrudes as well: Why adopt the moral point of view at all? This question demands the presentation of nonmoral reasons why one ought to be moral. Some have suggested that no nonmoral reasons can be given and that it is therefore not rational to adopt the moral point of view. Others agree that there are no nonmoral reasons for being moral but that this is unimportant since the question itself is mistaken. For them, moral philosophy begins with the observation

that people do care about being moral. Still others have attempted to provide nonmoral reasons to justify taking the moral point of view.

SIGNIFICANCE OF METAETHICS

It is commonplace to assume that the questions of metaethics are logically prior to those of normative and applied ethics, and that there is no use proceeding with either normative or applied moral philosophy without coming to certain definite conclusions about matters of metaethical concern, but this assumption has also been disputed. For one may be right in regarding moral statements as cognitive and moral argument as possible without having any sort of elaborate metaethical theory to justify this view.

Milgram experiment

THE EVENT: Series of studies designed to determine the degree to which subjects would be willing to obey an authority's instructions to harm another person

DATE: Conducted in 1961-1962

TYPE OF ETHICS: Scientific ethics

SIGNIFICANCE: The Milgram investigations produced unexpected data regarding the willingness of people to violate their own moral values when instructed to do so by an authority figure. They also created extreme stress for their participants, leading to a reconsideration of the ethical guidelines governing such research.

Psychologist Stanley Milgram, horrified by the atrocities that had been committed by the Nazis during the Holocaust, conducted a program of research designed to explore the process of obedience to authority. The disturbing nature of his results and the ethical issues raised by his methods make this some of the most controversial and widely discussed research in the history of social science.

Recruited through a newspaper advertisement, a diverse group of adult subjects reported (individually) to Milgram's laboratory at Yale University expecting to participate in a study of memory and learning. Each participant was greeted by an experimenter dressed in a lab coat. Also present was a middle-aged gentleman, an accomplice who was ostensibly another participant in the session. The experimenter then described the research, which would investigate the effect of punishment on learning. Then, through a rigged drawing, the accomplice was assigned the role of "learner," while the actual subject became the "teacher."

THE EXPERIMENT

Next, the three went to an adjacent room, where the learner was strapped into an "electric chair" as the experimenter explained that shock would be used as punishment. The teacher was then escorted back to the first room and seated in front of a shock generator, the front panel of which consisted of a series of thirty switches that could be used to administer shock. Each was labeled with a voltage level, starting with 15 volts and increasing by 15-volt increments to 450 volts; several verbal labels below the switches also

indicated the severity of the shock. After receiving instructions and a demonstration from the experimenter, the teacher presented a sequence of simple memory tests to the learner through an intercom. The learner made "errors" according to a script, and the teacher was instructed to respond to each error by pushing a switch, thus delivering a shock to the learner. The teacher started with 15 volts and was directed to use the next higher switch with each successive error.

The goal of this procedure was simply to determine how long the subject/teacher would continue to obey the order to administer shock. (The accomplice/learner never actually received any shock.) As the shocks grew stronger, the learner began protesting—eventually pleading to be let out, then screaming, and finally ceasing to respond at all. When the teacher balked, the experimenter provided one of several firm verbal "prods" to continue (for example, "you *must* go on"). The procedure was discontinued if the teacher refused to obey after four such prods for a given shock level.

Milgram and other experts felt that few if any participants would demonstrate obedience under these circumstances, particularly after the learner began protesting. Nearly two-thirds of them, however, obeyed the experimenter's orders all the way to the highest level of shock (450 volts). This result occurred with both men and women, even in a version of the study in which the learner was portrayed as having a heart condition.

The typical subject in these studies showed clear signs of distress over the plight of the learner. Subjects often perspired or trembled, and some exhibited nervous laughter or other indications of tension. Indeed, it is this aspect of the research that has been cited most frequently by those who consider the studies unethical. Critics argue that Milgram compromised the welfare of the participants in this research by subjecting them to inappropriately high levels of stress. Many of these same critics have also suggested that Milgram failed to provide his subjects with enough advance information to enable them to make a fully informed decision about whether to participate.

In his defense, Milgram points out that his procedure was not intended to cause stress for the participants. Furthermore, he and other experts did not anticipate the stress that did occur because they

expected that subjects would be reluctant to obey these orders. It is also important to note that Milgram did take care to protect these subjects and their dignity, as indicated by the activities that followed the experimental sessions. These measures included a discussion of the experiment and its rationale, a meeting with the learner involving an explanation that he had not really been shocked, and reassurances that the subject's behavior (obedient or not) was entirely normal given the circumstances. Some three-fourths of all the participants indicated that they had learned something personally important as a result of being in the study, and additional follow-up by a psychiatrist a year later found no evidence of lasting psychological harm in any of those examined.

THE ETHICAL DILEMMA

More generally, this research illustrates a basic ethical dilemma faced frequently by experimental social psychologists. These researchers often need to create and manipulate powerful situations if they are to generate enough impact to observe something meaningful about social behavior, but doing so sometimes risks causing undue stress to subjects. This ethical issue is sometimes complicated still further by the need to deceive participants in order to preserve the authenticity of their behavior.

Few will deny that Milgram's research yielded significant insights into how obedience to an authority can prevent a subordinate from taking responsibility for inflicting harm on another person, but does the end justify the means employed to gain this knowledge? Ultimately, decisions of this sort must be made by carefully weighing the costs and benefits involved. Regardless of one's position on the ethics of the obedience studies, Milgram's work has done much to heighten sensitivity to ethical considerations in social research. Since Milgram's investigations were conducted, psychologists have adopted a more conservative set of principles governing research with people—guidelines that today would probably not allow the procedures he used.

Military ethics

DEFINITION: Codes of acceptable behavior in military situations, particularly those related to the conduct of war, that are unique to military cultures

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: In most modern cultures, military ethics combine professional standards of conduct with more specific codes of conduct designed to regulate the behavior of military personnel in their dealings with their services, governments, enemies, and one another.

In Western culture, military ethics first arose as a field of ethics in ancient Greece. While other earlier cultures certainly had military subcultures that held values different from those of civil society, Greek philosophers began to explore more precisely the relationships between ethical conduct and war during and immediately after the Peloponnesian Wars of the early fifth century B.C.E. Greek conceptions of military ethics held sway, with some modification, through much of the Hellenistic and later Roman periods.

Military ethics underwent a profound shift by the fourth century C.E. The rise of Christianity in the

Mediterranean world replaced earlier concepts of ethical conduct in war with a philosophy based on forgiveness, brotherly love, and pacifism. With the triumph of Christianity over paganism as the official Roman religion, Christianity moved from its earlier position as a sometimes despised and persecuted sect to become the dominant cultural and political force of the Mediterranean world. Military ethics reappeared in the fifth century C.E. with St. Augustine's concept of just war. Augustine attempted to reconcile Christian notions of passivism with the need of societies to defend themselves. Although Augustine's complex work is often oversimplified, it provides much of the underlying moral justification for waging war in modern Western societies, for nations as well as for individual soldiers.

UNIQUENESS OF MILITARY ETHICS

Military ethics must of necessity differ from civilian ethics in that militaries at root use violence and threats of violence to achieve national aims. That violence can be against counterforce targets, which are the means of an enemy to wage war. These can be enemy soldiers as well as the economic infrastructures, such as factories, roads, and communication systems, that support them. Both types of targets are normally accepted as ethical targets in war. Less acceptable are so-called countervalue targets, such as large population centers, whose losses enemy nations cannot bear. Within that broad framework a varied concept of military ethics exists.

Most militaries around the world hold to codes of ethical military behavior, at least in theory. These codes typically set standards for differentiating between combatants and noncombatants in selecting targets for armed attack. Killing enemy soldiers in combat situations is universally seen as legitimate in military cultures. However, killing civilians and captured or wounded enemy soldiers is not considered ethical behavior in most modern militaries. Likewise, the destruction of factories producing military equipment, or military training centers, would be seen as ethical, whereas the destruction of schools, hospitals, and museums would not be.

ALTERNATIVES TO WESTERN THOUGHT

Western military ethics have come to dominate most of the militaries of the world to some extent, mainly as a result of Western military supremacy,

which began to assert itself around the beginning of the sixteenth century. However, other value systems have also had lasting impacts on what is considered ethical or moral in war. The most important of these in the Eastern world has been Confucianism.

Confucian philosophy was mostly concerned with maintaining stable order in society and saw war as the opposite of an orderly society. The unavoidable existence of war forced Confucianists to grapple with the ethical implications of their philosophy on war. In general, most Confucian concepts saw the necessity of separating combatants from noncombatants and the need for soldiers to obey their commanders. In these views, Confucian ethics were similar to later Western military ethics. The main difference came in the status of soldiers in Chinese society. Whereas soldiers in modern Western societies—especially officers—hold privileged positions, soldiers under Confucianism held much lower places in society—even lower than that of peasants.

The other philosophy to challenge Western domination of military ethics came from Marxism in the late nineteenth century. Fundamentally a political and economic philosophy of revolution, Marxism holds that traditional Western military ethics are unethical because they allow military and economic elites to maintain their control of society. Moreover, the societies that they control have perpetuated injustice and misery. Marxists have seen themselves as the vanguard of the final revolution to end human inequality and suffering. Thus any efforts to lessen the impact of wars have only prolonged the suffering of the masses. For these reasons, Marxist armies have tended to feel less restrained by more traditional Western military ethics.

THE MILITARY AND CIVILIAN GOVERNMENT

The militaries of most modern liberal democracies hold a firm ethos for civilian control of the military. In this view, the military exists to fight foreign wars under the orders of civilian authorities. In some nations, however, soldiers have seen their military organizations as the repositories of virtue and thus felt justified in seizing political power when their nations drift too far from what the military regards as government's proper values.

In nations whose militaries hold this value, typically those of developing nations, a central purpose of the military is typically to keep governments in

power, with the fighting of foreign wars a secondary purpose. In such military systems, the involvement of the military in politics, including the seizure of power from civilian control, is not seen as unethical conduct for soldiers. Indeed, it is often seen as highly moral and patriotic.

INTERNATIONAL LAW

Most general modern military ethics, including special protections for wounded and surrendered enemy soldiers, avoidance of civilian casualties, and respect for cultural and historical artifacts in the area of military operations, became codified in international law during the twentieth century. However, only when the internal culture of the military organization of a given nation shares the same ethical standards do international laws of war have much impact.

By the early twenty-first century, wealthy industrialized nations were finding themselves fighting increasing numbers of wars against smaller and weaker nations or against nonstate military forces. Such nonstate forces often see international military ethics as a luxury they cannot afford. The established military sees itself fighting savages, while their opponents see themselves fighting for their very survival.

Mill, John Stuart

IDENTIFICATION: English philosopher and economist

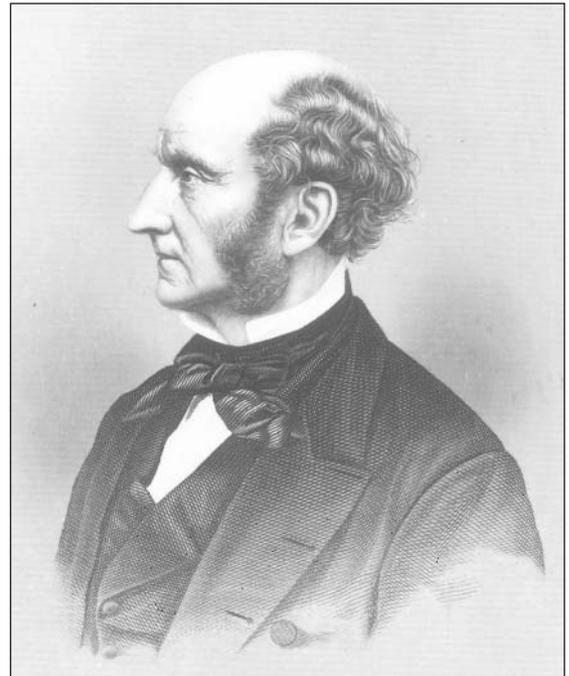

BORN: May 20, 1806, London, England

DIED: May 7, 1873, Avignon, France

TYPE OF ETHICS: Modern history

SIGNIFICANCE: The most famous modern proponent of utilitarianism, Mill revised and enhanced that philosophy by incorporating a discussion of intangible “spiritual” values. His most important works include *On Liberty* (1859), *Utilitarianism* (1863), and *The Subjection of Women* (1869).

Maintaining that a science of society was feasible, Mill focused his philosophic writings on four major issues: the methodology of the social sciences, the principle of utility, individual freedom, and the structure of government. While Mill supported Jeremy Bentham’s corollary that moral problems could never be resolved through sentimental appeals to righteousness, he emphasized the importance of developing the spiritual aspects of humanity. Mill developed an “ethology” that consisted of the elements that were essential in the development of “character”—individual, societal, and national; he argued

John Stuart Mill. (Library of Congress)

that secular society must define and expand its ethical base so that happiness—freedom from pain—may be attained. Unlike Bentham, Mill maintained that an educated elite was necessary to guide society; Mill agreed with Alexis de Tocqueville’s concern that democratic sentiments may lead to the “tyranny of the majority.” Mill’s fullest statement on ethics was advanced in *Utilitarianism*.

Minimum-wage laws

DEFINITION: Laws requiring that workers’ salaries fall no lower than specified hourly rates

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The central ethical issue raised by minimum-wage laws is whether government has a duty to require employers to raise the wages of low-paid workers above what free market forces would dictate. In the background is the deeper problem of whether it is unjust for there to be unequal distribution of wealth.

In medieval Europe, local governments often fixed wages at customary levels for various kinds of work. However, they typically imposed maximum wage levels, rather than minimum levels. During the nineteenth century, classical economists strongly opposed the fixing of wages by government, and comparatively little such wage-fixing occurred. During that period, however, workers, especially those in factories, often labored for low pay under bad conditions. As public concern for their well-being gradually increased, laws setting minimum wages were proposed as one way to help workers. Such laws were enacted first in Australia and New Zealand during the 1890’s. Many other countries soon followed suit.

Massachusetts was the first U.S. state to set a minimum wage, in 1912. Afterward, other states enacted laws setting minimum wages for women and children; however, these laws had little effect. Finally, the federal Fair Labor Standards Act of 1938, one component of Franklin D. Roosevelt’s New Deal, es-

tablished a uniform minimum wage for all workers who were directly or indirectly engaged in interstate commerce. Later, Congress repeatedly raised minimum wage levels and extended them to cover ever more types of employment. Democrats usually have been eager to raise the minimum wage, while Republicans have been less eager to do so. In 2003 the U.S. federal minimum wage stood at \$5.15 per hour.

ARGUMENTS FOR MINIMUM-WAGE LAWS

Advocates of minimum-wage laws hold that without this form of government intervention the lowest-paid workers would be paid less than they need to live on, and this would be unfair, when others are living well. Setting minimum wages is thus seen as a move toward greater justice in the distribution of wealth.

Those who think this way tend to presuppose the view that society is more just when its wealth is more evenly distributed. Historically, one inspiration for this egalitarian view was the Judeo-Christian tradition that stressed the duty of the well-to-do to share with the poor. Another was criticism of the capitalistic system that came from socialists and communists; greedy employers, they said, exploited workers by taking, as profits, revenue that should rightly have belonged to the workers.

A modified version of egalitarianism, not based on religion or on communism, was formulated by the American philosopher John Rawls. He held that if a society is to be just, wealth and other advantages must be distributed equally, except when inequalities serve to raise the level of well-being of the least well-off group in the society. For example, paying physicians high salaries could be just, if that were the only way to ensure that health needs are met. Rawls’s theory offers a rationale for minimum-wage laws, and for much else in the New Deal’s program.

Advocates have often proposed as a guideline that minimum wage levels must be high enough to enable each worker to support a family of four.

ARGUMENTS AGAINST MINIMUM-WAGE LAWS

Opponents of the minimum wage argue that it has bad economic consequences for others in society, especially in that it increases unemployment. Those who fail to notice this are wrongly overlooking the fact that in a free market economy, wage levels affect how many job openings there will be. If minimum wage levels are high enough to have any effect, they

must increase unemployment, because the labor of some would-be workers will have a market value less than the minimum wage, so employers will not hire them. The higher the minimum wage level, the more would-be workers will be excluded in this way.

If there were no minimum-wage law, these would-be workers could find jobs at wages proportionate to the market value of what they can do. Such workers probably would not earn enough to support families of four, but most of them do not have families, as many are adolescents. Those who work but earn too little to avoid poverty could be offered government welfare payments to supplement their low wages. This arrangement would be more efficient than having a minimum wage, since support would go only to those who need it, and the total cost to society of helping the least-well-off would decrease.

Opponents of the minimum wage generally agree with Adam Smith and later classical economists who argued that free market capitalism, functioning without government control over such economic variables as wages and prices, can unleash individual enterprise and make society much richer. Government intervention to set wages will introduce distortions in the allocation of resources, thereby reducing the national income. Instead of emphasizing equality, this way of thinking recommends that members of society tolerate inequality in the distribution of income, in order that total national income will be maximized. Here the idea is that a society is just in which owners who have acquired their property in noncriminal ways are protected in their possession of it, and wages that have been set through free market bargaining will not be altered by government edict. Robert Nozick was an American philosopher who defended this conception of justice.

Miranda v. Arizona

THE EVENT: U.S. Supreme Court decision mandating that all criminal suspects taken into police custody be informed of their constitutional rights prior to any questioning

DATE: Ruling made on June 13, 1966

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: The *Miranda* decision fundamentally altered basic police procedure and sought to ensure that accused citizens were aware of their rights under the Fifth and Sixth Amendments.

The manner in which Ernesto Miranda's rape confession was obtained—without coercion but without benefit of counsel—aroused the conscience of the nation. Despite the fact that he had not been informed of his right to an attorney prior to signing it, Miranda's written confession was admitted as evidence at his first trial, resulting in his conviction and imprisonment. His conviction was appealed to the Supreme Court, however, where Chief Justice Earl Warren, speaking for a divided Court, established guidelines for police interrogations: "Prior to any questioning, the person must be warned that he has a right to remain silent, that any statement he does make may be used as evidence against him, and that he has a right to the presence of an attorney, either retained or appointed."

This decision, denounced by presidents from Richard M. Nixon to Ronald Reagan, has served to

Miranda Warnings

Minimal warning, as outlined in the *Miranda v Arizona* case:

You have the right to remain silent. Anything you say can and will be used against you in a court of law. You have the right to be speak to an attorney, and to have an attorney present during any questioning. If you cannot afford a lawyer, one will be provided for you at government expense.

Full warning:

You have the right to remain silent and refuse to answer questions. Do you understand?

Anything you do say may be used against you in a court of law. Do you understand?

You have the right to consult an attorney before speaking to the police and to have an attorney present during questioning now or in the future. Do you understand?

If you cannot afford an attorney, one will be appointed for you before any questioning if you wish. Do you understand?

If you decide to answer questions now without an attorney present you will still have the right to stop answering at any time until you talk to an attorney. Do you understand?

Knowing and understanding your rights as I have explained them to you, are you willing to answer my questions without an attorney present?

protect the ignorant and the indigent and has resulted in a profound change in police procedure, popularized in the media as the so-called Miranda Warning.

Monopoly

DEFINITION: Exclusive ownership or control of a good or service in a particular market

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Monopolies are illegal in the major modern industrialized capitalist nations because

they are perceived as unfairly interfering with competition. They are thus said to infringe on the rights of companies to compete equitably in the marketplace, and on the rights of consumers to benefit from that competition.

In 1340, an English listing of the “evils of trade” included such things as forestalling (the physical obstruction of goods coming to market, or cornering the supply of goods, which deprived the owner of the market stall his rental), regrating (buying most or all the available goods at a fair for resale at a higher price), and engrossing (contracting for control of goods while they are still being grown or produced). These are all attempts at monopolization of a market, and such actions have been thought wrong since they began. The United States has had laws against monopoly since its founding, based on these terms taken from English common law and justified by reference to an abiding public interest in the maintenance of competition. Competition by ethical individuals results in the completion of mutually beneficial transactions, protects consumers from unreasonable price increases, and, according to Adam Smith (*An Inquiry Into the Nature and Causes of the Wealth of Nations*, 1776), leads to the greatest wealth for the nation.

Monroe Doctrine

IDENTIFICATION: American foreign policy conceived to confine the political spheres of influence of Europe and the United States to their respective hemispheres

DATE: Promulgated on December 2, 1823

TYPE OF ETHICS: International relations

SIGNIFICANCE: The Monroe Doctrine required the United States to refrain from interfering in the internal affairs of European powers or in their intra-European wars. It also declared that any attempt

to interfere with the governance of a nation anywhere in the Western Hemisphere would be treated as a hostile act against the sovereignty of the United States. The Roosevelt Corollary of 1904 later made explicit an always implicit aspect of the Doctrine: that the U.S. was asserting its own rights to intervene in the Americas in whatever fashion it deemed appropriate.

After the defeat of Napoleon Bonaparte in 1815, the continental European leaders, led by Prince Klemens von Metternich of Austria, were concerned with keeping a lid on revolutionary disturbances. During the Napoleonic years, the New World colonies of Spain successfully gained their independence through revolution. Between 1815 and 1823, the European leaders discussed the idea of returning the colonies to Spain. These discussions inspired the Monroe Doctrine, put forward by president James Monroe in his annual address to Congress.

In essence, the Doctrine declared that the United States would keep out of the territories, wars, alliances, spheres of influence, and politics of the world outside the Western Hemisphere, and in return non-American powers would be expected to stay out of the political affairs of the Americas. Non-American countries with colonies in the Western Hemisphere could keep them, but they were to acquire no more colonies.

Montesquieu

IDENTIFICATION: French political philosopher
 BORN: January 18, 1689, La Brède, near Bordeaux, France
 DIED: February 10, 1755, Paris, France
 TYPE OF ETHICS: Enlightenment history
 SIGNIFICANCE: As the leading *philosophe* during the early French Enlightenment, Montesquieu stimulated discussion on the nature of government, laws, and society with works such as *The Persian*

Montesquieu. (Library of Congress)

Letters (1721) and *The Spirit of the Laws* (*De l'esprit des loix*, 1748).

Born Charles-Louis de Secondat, Montesquieu grew up in and around Bordeaux, where he studied law and sat in the French parliament. He disliked the tyrannical and warlike tendencies of the governments of Louis XIV and the Regency. Montesquieu became the most popular critic of the French government, Church, and social customs with his satirical *Persian Letters*. After being admitted to the French Academy, he traveled throughout Europe. He idealized England as a model of liberty, independent judiciary, and commerce.

Montesquieu's *Spirit of the Laws*, which influenced both the French and American revolutions, considers various types of constitutions and laws. He examined societies in terms of their customs and history, not as abstract types. The work's critical tone marks it as the foundation of modern political science. In addition to providing a detached analysis, the *Spirit* argues for personal freedom, toleration of opposing views, separation of church and state, intermediate bodies (particularly a hereditary aristocracy)

to prevent royal despotism, sensible and equitable laws, a more rational and just criminal law system, and the separation of powers.

Moore, G. E.

IDENTIFICATION: English philosopher

BORN: November 4, 1873, London, England

DIED: October 24, 1958, Cambridge, England

TYPE OF ETHICS: Modern history

SIGNIFICANCE: In *Principia Ethica* (1903) and *Ethics* (1912), Moore propounded the view that “goodness” is an unanalyzable, indefinable property which is nevertheless discoverable through human intuition.

Moore was professor of mental philosophy and logic at Cambridge (1925-1939) and editor of the philosophical journal *Mind* (1921-1947). In ethics, he thought it quite important to distinguish two questions: “What ought to be?” (or “What is good in itself?”) and “What ought we to do?” The first question can be subdivided: “What is the nature of goodness?” and “What things possess the property of goodness?” Regarding the nature of goodness, Moore was a nonnaturalist. He maintained that the term “good” stands for a basic or ultimate property that could not be defined in terms of anything else. Every attempt to define the good in terms of something else commits what Moore called “the naturalistic fallacy.” Indeed, even to assume that “good” “must denote some *real* property of things” is to make this same mistake.

With regard to the question “What things are good?” Moore was an intuitionist. The answer to this question is self-evident, but only in some defeasible sense. Finally, the question of morally obligatory conduct “can only be answered by considering what effects our actions will have.” Thus, Moore was a consequentialist, though not of the egoistic or hedonistic utilitarian variety. For him, an action is right if it is, among all alternative actions, most productive of the nonnatural property “goodness.” Moore was a se-

vere critic of all forms of ethical subjectivism, including emotivism.

Moral education

DEFINITION: Inculcation of children with moral values

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Moral education is a key component of the process whereby individuals come to understand themselves as citizens of a given society, members of a given religion, and so on. It is in large part the source of shared moral systems and common languages for talking about moral issues.

Instruction in morality has traditionally been considered to be the province of the home or of the church. Parents are the child’s first teachers and are obligated to communicate to their young what behaviors and attitudes are socially acceptable and what behaviors and attitudes will not be tolerated. “Listen, my son, to your father’s instruction and do not forsake your mother’s teaching” (Prov. 1:8), wrote King Solomon thousands of years ago. “Then you will understand what is right and just and fair—every good path” (Prov. 2:9). The approach used was didactic, unilateral, and passed down from generation to generation. Directly telling the child what is right and what is wrong has long been the most popular way of inculcating morality.

Indoctrination is also used by religious groups. The minister or rabbi or priest, being ordained of God, interprets the sacred writings of the faith in order to convey to the people what is good and what is evil. This interpretation is put in the context of what is pleasing to God. A moral person loves and fears the Lord, obeys God’s commandments, and treats others in a way that makes for harmonious living. The question of whether a person can be morally educated without having religious faith has long been debated. The question “Why be moral?” has both philosophic and religious implications.

MORAL EDUCATION IN SCHOOLS

Provision must be made for those children who are not taught in the home or do not attend a place of worship where ethical instruction is given. The logical answer is the school. A few have argued that the school is even preferable because it introduces the child to a larger, more democratic community. Émile Durkheim, a French sociologist, maintained that the school frees the child from excessive dependency, from being a slavish copy of the family.

Jean Piaget, a Swiss philosopher, believed that the morality of cooperation (autonomy) encouraged by the school was more mature than the morality of unilateral constraint (heteronomy) taught in the home. Durkheim and Piaget differed, however, on the method to be used. Durkheim favored the direct teaching of moral values as essential for the child to become a fully functioning social being. Piaget opted for the use of moral dilemma stories to encourage the child's natural propensity to understand the good as a consequent of a maturing intellect.

During the last quarter of the twentieth century, moral education programs became part of the regular school day in many public and private institutions. This was done in one of two ways. Either the teacher would set aside a special period for a moral lesson or a discussion of an ethical problem would be incorporated into the regular academic curriculum. Which method is better has long been debated, and it is not expected that an agreement will be reached.

In England, the best-known program was designed by British philosopher of education John Wilson, who combined universally accepted principles with individual personal ideals. Wilson believed that the morally educated person has incorporated within the self the principles of a concern for others based on an understanding of the concept of "person," a sense of feeling for others as well as for oneself, basic knowledge and skill in knowing how to deal with moral situations, and acting upon that knowledge in real-life situations. There are sixteen subcategories within these four major areas, each one contributing to the formation of a rational, autonomous, morally educated person. Curricular materials have been developed but are not in a form that makes for ease in implementation in some educational settings. Wilson's desire to have in place a carefully developed philosophy of moral education before it was practiced in the classroom has contributed to the

slow and deliberate pace with which it has been used.

In the United States, the two major programs are Lawrence Kohlberg's moral reasoning and Sidney Simon's values clarification. Both Kohlberg and Simon believe that indoctrination is unacceptable, that a person is not morally educated unless he or she has developed within the self an understanding of what is good and right. Morality by definition must come from within; it is never imposed by an outside source. This stance came in part from research that shows that only a minor portion of moral education occurs at the "facts" level. Simply knowing what society expects does not ensure that one will act in accordance with that knowledge. This idea of self-developed morality also came about because in a pluralistic society there is not always agreement among the groups that constitute a community regarding what is right and what is wrong.

OTHER APPROACHES

Borrowing from Piaget, Kohlberg made use of the moral dilemma story. Each child in the classroom states a position on the dilemma. Responses fall into one of six stages of moral understanding with two stages at each of three levels. At the first level (pre-conventional), the child makes statements that show an egocentric orientation: "It is good if it's good for me." At the second (conventional) level, the young person is concerned with pleasing others and winning their approval. Obeying the law and doing one's duty are also important: "A good person does what society expects of its members." At the third level, the adult wants justice for everyone alike: "Do unto others as you would have them do unto you." As students discuss the stories, they advance in moral understanding by listening to the reasoning of others within the classroom who are one stage or one level higher than their own.

The values-clarification approach used by Simon begins by asking students questions about the way they look at such topics as money, friendship, religion, prejudice, or love. The student must be able to state a position freely, consider alternatives as given by other students, make a choice after considering the possible consequences of each alternative, be happy with the choice made, tell others about the choice, act upon it, and incorporate the choice into his or her lifestyle. Curricular materials abound and are available for use not only in the school but also in

the home and the church. According to Simon, the morally educated person is one who is given the freedom to choose, to affirm, and to act upon those values that make him or her a fully functioning individual.

Moral equivalence

DEFINITION: Term commonly used to equate the morality and ethics of two entities that are not usually seen as comparable

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The term “moral equivalence” is typically employed to justify proposed courses of action that are controversial.

Social commentators, politicians, and other public officials often evoke the term “moral equivalence” in their public discourses. There are several reasons they do so. Whenever the word “morality” is used in reference to public policy, people tend to pay closer attention, and intellectual curiosity is aroused. The term is thus used as a means of gaining an audience. Also, its usage often refers back to events about which people feel strongly and for which they hold nearly consensual feelings, thus evoking a strong sense of emotional nostalgia. Using the expression is a way of trying to build popular and political support for new ideas, developments, or proposals by likening them to known and accepted past events.

The phrase seems first to have emerged during the mid-1960's in reference to American participation in the Vietnam War. Some commentators on the war saw the communist Viet Cong as “morally equivalent” to the American patriots of the Revolutionary War era. During the 1970's and 1980's, the term was used to stress the severity of the economic problems in the United States, by comparing them to the magnitude and severity of wartime conditions.

Critics might assert that evoking moral equivalence is senseless, worthless, and immaterial, arguing that it runs counter to the old adage that history does not repeat itself, and adding that any such comparisons are inherently futile. The claim of moral equivalence equates apples and oranges, doing credit to neither. Another ethical issue is that these comparisons are by nature subjective, as are the responses to them, and often are made only for political or partisan reasons, advancing no worthy goals.

Moral luck

DEFINITION: Chance occurrences, beyond the control of an individual, which nevertheless affect the ethical character or culpability of that individual

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The concept of moral luck has been

used by some ethicists to refute several traditionally held views about morality. The most significant of these are the idea that people can be held morally responsible for all of their morally significant features and the assumption that morality is a trump value (that is, that given a choice between two alternatives, moral considerations are more important than all other considerations in determining which alternative to choose).

Before considering the possibility of moral luck and its implications for ways of thinking about people, it is important to explain the notion of moral luck in some detail.

First, consider the notion of a morally significant feature. People have many features, but only some of them are morally significant. For example, the following features are clearly not morally significant: being six feet tall, being born on a Monday, and having brown eyes. By contrast, the following features are morally significant: being cruel, having murdered someone, being loving, and having saved someone's life. These examples also illustrate the different kinds of morally significant features: some involve character traits, including beliefs and emotions, whereas others concern specific actions from one's personal history.

The notion of having control over a feature is also important for explaining the notion of moral luck. Roughly speaking, people have control over a feature only if there is something that they can do to acquire it or something that they can do to get rid of it. For example, it seems clear that nobody has control over the following features: having been born during the night, having a body that is mostly water, and being unable to run faster than the speed of sound. By contrast, it is typically believed that most people have control over the following features: being excessively selfish, being very generous, being rude to a stranger on a particular occasion, and being patient with a child in a specific instance. Given these notions, it is possible to explain the concept of moral luck with some precision: Moral luck involves people possessing morally significant features over which they have no control.

Is moral luck possible? Are there any actual cases of moral luck? These questions are controversial. Before considering an apparent case of moral luck, it will be helpful to explore the significance of moral luck for ways of thinking about people.

One often holds people responsible for the morally significant features that they possess. For example, if one learns that certain people are greedy and have been caught stealing, typically one thinks of them (rather automatically) as being blameworthy for having these features. Similarly, upon discovering that people are generous and regularly help less fortunate people, typically one thinks of them (rather automatically) as being praiseworthy for having these features. (Besides evaluating other people, one often evaluates oneself in these same ways.)

These nearly automatic reactions to the morally significant features that people possess are called into question by the possibility of moral luck. If moral luck is possible, then it could turn out that some people possess morally significant features over which they have no control; therefore, it would be completely inappropriate to hold them morally responsible for those features. (After all, typically, one does not hold people morally responsible for features over which they have no control, such as the fact that they are unable to jump over the moon.) Therefore, the possibility of moral luck suggests that people's relatively automatic practices of evaluating others may be hasty and superficial.

LUCK AND CHARACTER

Furthermore, the possibility of moral luck also seems to threaten people's conception of themselves as people who have control over their moral characters and actions. Although it is not surprising that there are some features over which one has no control, one's individual autonomy and self-determination seem to be undercut if one possesses morally significant features over which one has no control.

Given the significant implications of the possibility of moral luck, it is not surprising that questions concerning moral luck generate a great deal of controversy. Many people argue that moral luck is possible by appealing to the following kind of case: Imagine a truck driver who fails to stop at a stop sign and passes through an intersection without incident. Now imagine a second truck driver who does exactly what the first one does in similar circumstances but who also runs over and kills a small child who has darted into the street suddenly. This seems to be a case of moral luck, since it is a matter of luck that the second truck driver has a morally significant feature that the

first truck driver lacks (namely, the feature of having killed a child).

Many people think that cases such as this demonstrate the possibility of moral luck. Some of them insist further that people's ways of evaluating others and their concepts of themselves as self-determining agents should be revised. Others simply deny the claim that a person must have control over a feature in order to be held morally responsible for possessing it. Still others, who are not persuaded by cases such as the one described above, reject the claim that moral luck is possible by restricting the notion of a morally significant feature in some way (for example, so that all such features are features over which persons have control). It is hard to say which approach to the question of the possibility of moral luck is best; reflective persons must decide themselves what to think.

Moral principles, rules, and imperatives

DEFINITION: Comprehensive, absolute, universalizable rules governing the judgment of right and wrong and the actions of those who desire to do right

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The principles, rules, and imperatives which together make up morality are taken by definition to apply universally to everyone and to be the proper basis for all human action. Moral philosophers who subscribe to this model of morality take the enumeration of these imperatives, rules, and principles to be their primary task. Exponents of systems such as pluralism which deny the existence of universal values eschew morality in favor of more modest or situated types of ethics.

All people have notions of right and wrong. These notions manifest themselves in a variety of ways. Some of these beliefs pertain to simple matters such as manners or taste, others pertain to more general matters such as customs and laws, and others guide the most fundamental aspects of human life: These are the beliefs that shape one's character and determine what others think about one as a human being. One's moral beliefs say more about one as an individual than does any other aspect of existence. Whether one is rich or poor, old or young, one's moral beliefs do more to define one's life than anything else.

The terms "morality" and "ethics" are often used interchangeably, but the distinction between the two is important to any serious study of ethical matters. The clearest distinction can be revealed by noting that there is a school of ethics called "situational ethics"; there is not, however, a moral school of thought that could be described as "situational." Morality can never be relative. What distinguishes morality from ethics is that morality is always universal and prescriptive. For this reason, the notions cited above about manners, taste, customs, and even laws may be considered ethical beliefs, but they are not part of a moral code. When ethical views and moral beliefs come into conflict, morality must prevail, because moral beliefs are universal and fundamental.

Looking at the negative connotations of these two terms is a helpful way to highlight their differences.

A person who cheats at cards may be considered unethical, but that does not necessarily mean that the person is immoral. Being immoral is a much graver character flaw than is being unethical. A person may behave unethically on occasions and in certain circumstances, but to be immoral is to possess fundamental—if not permanent—character flaws that render one untrustworthy in most situations.

It must be noted that some people are amoral. They have no broad system of beliefs that guide their behavior. This does not mean that they have no notion of dos and don'ts in life, only that their beliefs are not guided by a universal system that provides justification for human actions.

MORAL PRINCIPLES

The best example of moral principles continues to be the one articulated by Aristotle in his *Nicomachean Ethics*. Aristotle's moral principles were guided by a teleological concern. The teleological concern central to Aristotle was happiness. For Aristotle, morality meant doing what would provide a happy life as opposed to doing simply what one desired at the moment. Happiness, in this sense, has more to do with one's total lifestyle than it does with a few activities. It would be fair to say that Aristotle's understanding of happiness is more closely related to satisfaction or contentment than it is to simple pleasures. This is why reason plays such a large role in Aristotle's moral teachings.

Moral principles generally depend on reason. One must first understand the principle and then be able to apply it to different situations as they occur. Utilitarianism provides another good example of moral principles. The principle that guides utilitarianism is "the greatest good for the greatest number." One must understand this principle in order to exercise the judgment necessary to apply the principle.

The moral principles developed by Aristotle lead to a broad discussion of character. To him, morality is what determines who as well as what one is. Morality does much more than merely determine one's actions; it also determines one's thoughts and shapes one's soul.

MORAL RULES

The Ten Commandments listed in the Old Testament of the Bible represent a clear set of moral rules.

The prescribed and prohibited forms of behavior cited in the Ten Commandments provide more specific guides to human actions than do abstract principles. Moral rules place less emphasis on reason and more on authority or obedience. The "thou shalt" and "thou shalt not" of the Ten Commandments do not leave as much room for judgment as one usually finds in moral principles.

It is much easier to provide children with moral rules than it is to describe moral principles. Children are often told to share their toys or not to hit one another. These are good rules, and children are often expected to follow these rules because they have been told by their parents or other adults to behave that way. People often assume that any further explanation would be beyond the reach of very small children.

In a similar manner, religious rules are often presented as rules that should be accepted as an article of faith. While this is true to some extent of all moral guides, rules tend to provide fewer opportunities for individual judgment than do principles. Rules tend to be more rigidly prescriptive than principles. Like the parental rules cited above, they rely on the authority of the rule givers—authority that the rule receiver is in no position to question or challenge.

Moral rules function in much the same way as laws: They spell out, in the most direct and detailed manner, what one should or should not do, and those who fall under their jurisdiction are expected to be obedient. When Moses came down from the mountain with the Ten Commandments, he appeared in the capacity of a lawgiver, not that of a seminar leader. He appeared as a messenger from God with a strict set of specific orders that were intended to shape and guide the lives of the people. The only choice given to the people was obedience and salvation or disobedience and eternal damnation.

Moral rules are the simplest and most direct form of moral guide, but as people become more inquisitive about moral issues, certain moral rules may prove less clear and simple. Most often, moral rules are an effort to apply less tangible moral principles. When this occurs, the justification for the moral rules is found in the moral principles that guide them. When this is the justification for moral rules, it is important to remember that the rules are guided by the principles.

MORAL IMPERATIVES

Immanuel Kant established the most basic set of imperatives found in moral literature. Imperatives are commands or orders, so moral imperatives should be viewed as basic moral commandments or orders. Kant defines two distinct types of imperatives: hypothetical and categorical. Kant's hypothetical imperative is a means to some other end. If one desires a certain end, it is imperative that one employ a particular means. In contrast, a categorical imperative is an end with no reference to something beyond itself. Most ethical rules are hypothetical imperatives; morality, in contrast, consists of categorical imperatives. In the simplest terms, categorical imperatives are obeyed for their own sake.

Moral references to imperatives are generally considered to be references to what Kant defined as categorical imperatives, but it is important to keep the other alternative in mind when the general topic of moral imperatives arises. Kant further considered obligations and duties that accompany imperatives to be limited to rational creatures, for only rational beings can abide by such universal laws. If this is true, one might add that only rational beings are capable of moral considerations of any kind.

MORAL TENSIONS

Alexis de Tocqueville, the nineteenth century French philosopher and social historian, once made a distinction between what he called "instinctive patriotism" and "reflective patriotism." While either might produce the same behavior in a person, the former was akin to a reflex reaction that required little or no thought; the latter was the result of careful consideration and extensive reflection.

Morality would seem to have a similar distinction. There is the morality that is so deeply ingrained in one from an early age that it guides one's actions without one's ever giving it a moment's thought. There is also morality that is the result of extensive study and careful analysis. Generally, there is a link between the two, but not everyone is curious enough to want to examine the basic moral assumptions. Some people feel that a careful examination or questioning of their moral beliefs is heresy. For this reason, certain moral beliefs are caught in a tug-of-war between reason and revelation.

The conflict between reason and revelation can be explained in the light of the realization that some

moral beliefs are the result of factors that claim to be beyond human comprehension, while others are considered the result of human comprehension. Faith in a superior being who reveals moral laws through a person, persons, writings, or acts provides the clearest example of rules that must be accepted yet might never be understood.

The quest to understand moral matters encompasses a wide range of competing notions about how one comes to such an understanding. Ancient philosophers considered understanding to be a matter of discovery. The laws that should guide human behavior were determined by nature and preceded human existence. The task of understanding is one of using intellectual ability to learn the truths over which one has no control. Many modern philosophers believe that people can understand only what they themselves create. Existentialism is the philosophical school most often associated with this belief.

HOW PEOPLE ACQUIRE MORAL BELIEFS

In *A Question of Values*, Hunter Lewis describes six ways of acquiring moral beliefs: authority, logic, sense experience, emotion, intuition, and science. This is a good representative sample of the different ways in which people develop moral beliefs. If one is taught to obey parental authority in one's early years, one will generally find it easier to accept other authorities in later years. For most people, parental authority is their first exposure to subordinating bodily desires to some other influence. If one learns to control one's desires, one can then substitute other influences for parental authority in later years. One's ability to respond to any kind of moral guidance is dependent upon one's ability to control one's own actions.

The factors that influence beliefs usually change as people mature emotionally and intellectually. For this reason, simple rules provide people's first exposure to moral codes. As people grow older, these rules become more complex, and as people develop greater intellectual abilities, they become more likely to look to broader principles for moral guidance. Eventually, an individual should reach the point at which he or she can understand the most compelling and imperative moral guides. This moral maturation should lead from acceptance of authority or emotional considerations to more sophisticated guidance via logic or science.

Moral development need not, however, be linear in nature. David Hume argued that there is a moral sentiment that directs human moral behavior; reason does not have the authority to do so. Moral philosophers have never agreed on the main source of morality or on its final justification; they agree only that moral theories and moral actions are a necessary part of being human.

CONCLUSION

Since the days of Socrates, morality has played a central role in the battle between passion and reason. How people temper their most basic desires and behave in a moral manner has been one of the truly great questions of moral philosophy. This concern has produced many competing theories over justification. How can one convince an individual or a community of individuals to behave in ways that appear to contradict the most basic instincts?

Reason, salvation, and self-interest have all been used to explain why one might choose to combat these most basic and primitive drives. A society's ability to convince its population to adhere to a set of moral rules, principles, or imperatives is what has determined whether that society is judged to be civilized or barbaric. The United Nation's Universal Declaration of Human Rights has become the global barometer that is used to determine which nations are civilized and which are not. In fact, it refers to violations of its moral code as "barbarous acts." The assumption behind this declaration is there are some common and universal moral principles that should guide the activities of any nation or state.

To use the terminology of the United States of America's Declaration of Independence, there are certain "unalienable rights" that human beings naturally possess. These "unalienable rights" constitute the moral imperative that should guide all civilized nations. The general principles called "human rights" are a direct result of this moral imperative.

Moral realism

DEFINITION: Theory that moral facts have an objective existence, independent of the individuals who may or may not come to know and recognize them

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Moral realism holds that morality exists as a set of objective facts in the world, rather than residing in the judgments of moral agents. Thus, a properly trained or intuitive person may be capable of determining moral truth, but someone lacking such training or sensitivity may spend his or her entire life transgressing moral law without ever knowing it.

Moral realism is a philosophical position that views moral facts such as good, right, and wrong in the same way that scientific realism views natural facts: that is, these facts are independent of and exist prior to their being thought, understood, and believed by individuals. G. E. Moore, in his book *Principia Ethica* (1903), was the first to formulate this position. Moore argues that beauty, goodness, right, wrong, and so forth are features of the world and actions that are true whether anyone recognizes them or not. When one claims that someone has done something good, for example, this does not reflect simply what one thinks of the action (as subjectivists argue), but reflects the intuition of a property that this action *really* has: goodness.

Moral properties, however, are not natural properties, or properties that one can recognize with one's natural faculties (senses). Moral properties are what Moore refers to instead as simple, unanalyzable, nonnatural properties. To clarify this idea, Moore compares the intuition of moral nonnatural properties to the intuition of mathematical axioms and proofs. One does not use one's senses to see that one step in a mathematical proof follows from another; likewise, one does not use one's senses to see that an act is good, but it is nevertheless seen to be good.

PROBLEMS WITH MOORE'S POSITION

There are some problems with Moore's position, however, and much of the work in moral realism since Moore has been an effort to resolve these difficulties. For example, since moral properties are nonnatural and are not perceived by the senses, Moore must account for people's intuition of these proper-
