ties by claiming that people have a moral intuition, a moral sense. The notion of a moral intuition or sense, however, is itself a rather mysterious notion that is left unexplained. Some proponents of moral realism, agreeing with Moore's claim that there are moral facts, have simply accepted this mystery. Philosophers such as William D. Ross, in *The Right and the Good* (1930), accept the notion of moral intuition as a commonsense given. Just as many people would accept the use of intuition in mathematics as a given, so do Moore and those who follow him accept the use of moral intuition in making moral claims.

A more troubling problem with moral realism involves explaining the ontological status of moral facts. If, as moral realists argue, moral facts have a reality that is independent of thinking, desiring subjects, and if these facts can give direction to and place constraints on actions, then the question of what this independent reality is arises. The reality of moral facts is not the same as that of natural facts, yet they have the power to motivate individuals to place constraints upon themselves. How do they do this? Critics argue that in answering this question, moral realists must argue for an extravagant and unnecessary ontology. In short, they must unjustifiably attribute rather strange attributes to an equally strange entity called a moral fact if these facts are to do what the moral realist says they do.

There have been many attempts to resolve this apparent problem, but two are of particular note. Richard Boyd, in "How to Be a Moral Realist" (1988), argues that moral properties can indeed be identified with physical properties, though in a sophisticated and peculiar way, and hence a moral realist need not be committed to the view that moral properties are nonnatural. The difficulty with Boyd's position lies in explaining this peculiar identification of moral properties with physical properties while avoiding what Moore calls the "naturalistic fallacy"—the fallacy of identifying simple, unanalyzable moral properties with identifiable natural properties. Boyd's response is to state that a moral realist can claim that moral properties are in some sense physical properties and also claim that these moral properties remain undefinable or unanalyzable. Precisely because moral properties are undefinable, the way in which the property of goodness is to be understood as physical will also always remain undefinable.

John McDowell, in "Values and Secondary Qual-

ities" (1985), argues that moral properties are to be identified with physical properties (he avoids non-naturalism in this way) but are to be identified in the same way that secondary qualities such as color are identified with physical things. Thus, in the same way that red, a secondary quality, emanates from a physical object (which is a primary quality) by means of this object's reflection of light at a certain wavelength, so too are moral properties to be understood as an emanation from a primary quality such as a physical action or an event. Secondary qualities are inseparable from primary qualities, and therefore moral properties are inseparable from physical properties, but they are not strictly identical to primary qualities. For example, one can turn off the light in one's room at night and the objects (primary qualities) in the room will still be there, but the colors (secondary qualities) will not. Secondary qualities and moral properties are real, but they are not real in the same sense, or in the same way, that primary qualities and physical properties are real.

There are many variations among those who argue for moral realism, but they are all agreed, following Moore, that moral facts are independent, real, and distinct from the individuals who know and are motivated to act on the basis of such facts.

Moral responsibility

DEFINITION: Quality that renders one subject to ethical judgment, blame, or praise; accountability

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: To determine the conditions under which one is morally responsible for a given action, ethicists must first determine the nature of the connection between people and their actions. Thus, theories of moral responsibility necessarily engage theories of mind and of free will versus determinism.

Many philosophers claim that determinism and moral responsibility are compatible. Austin Duncan-Jones claims that the statement, "He deserves blame for doing that wrong" simply means, "Blaming him for doing that wrong will favorably influence him and others." In that case, even if the man was causally determined to act as he did, blaming him could favorably influence him and others, and therefore determinism and moral responsibility are compatible.

Duncan-Jones's account cannot make good sense, however, of one person's being more blameworthy than another person. One person's deserving more blame than another person is not simply a matter of his being more favorably influenceable by blame. The person who is least blameworthy may be the person who is most favorably influenceable. Moreover, deserving blame and being overtly blamed to a good effect do not amount to the same thing. A wicked king on his deathbed may deserve blame for some wrong even if overtly blaming him for it will not favorably influence him or very many others.

P. H. Nowell-Smith defends the compatibility of determinism and desert as follows. "Finding the cause of a thing does not necessarily affect our evaluation of that thing. For example, finding that Wolfgang Amadeus Mozart's musical ability was due to his education, practice, and heredity would not diminish our admiration for his ability. Similarly, no

matter how a person came to have his moral principles, they are his and he is judged for them. Explaining how one came to be as he is does not save the bad pianist who reveals his incompetence; nor does it save the bad man who reveals his wickedness."

Typically, people do ignore determinism when making judgments of praiseworthiness and blameworthiness. Yet if one cannot help being the way one is, can one really deserve credit or blame? This challenge to the typical approach is not adequately answered by merely redescribing that approach. Determinism would not rule out excellent qualities or the appreciation of them, but in spite of Nowell-Smith's argument, determinism might rule out the deserving of credit for such qualities.

In *Freedom and Resentment* (1977), P. F. Strawson argues as follows that determinism would not rule out the rationality of blame. "Because of our human nature and our membership in society, we have a certain way of looking at human relationships. For example, whether we feel grateful or resentful depends on what we think of other people's attitudes and behavior toward us. And we connect blame with wrongdoing. This way of looking at human relationships is part and parcel of being human and living in society. It is not something we choose or something that we can give up. It needs no further justification. But if we could give it up, our choice in this matter would not depend on whether determinism is true, but instead on whether giving up these attitudes would lead to an improved life in society. Therefore, whether we can give up blame or not, determinism would not rule out the rationality of blame."

Even if one cannot give up blame, however, that does not mean that blame is justified. If one cannot help feeling regret over something, it does not follow that one is adequately justified in having this feeling. If one had absolutely no control over what one did, it would make no sense to regret. It also might be possible to give up blame, since a society in which wrongs are viewed as illnesses beyond one's control is conceivable. If it is possible to give up blame, the question of whether it would be in the interests of society to do so is important. The main question at issue, however, is whether determinism would provide the kind of excuse that would rule out blame. It may be in the interests of society not to regard determinism as an excuse, even if, in all fairness, it is one.

OBJECTIONS TO DETERMINISM

In contrast to Strawson, Nowell-Smith, and Duncan-Jones, C. A. Campbell maintains that determinism is incompatible with moral responsibility. To support his position, Campbell cites the testimony of those he regards as being at an advanced stage of moral reflection. Such individuals are aware that everything may be causally determined and have wondered whether people really have a choice about what they do. They agree that one must have a choice in order to be morally responsible. For them, a person is blameworthy only if he or she could have chosen otherwise without being caused to do so. Campbell is making an appeal to moral authority. For it to succeed, there must be a consensus among the authorities. The problem for his argument is that such a consensus is lacking.

Even if the moral authorities agreed with Campbell, there would still be the following basis for maintaining the compatibility of determinism and moral responsibility. Making choices without being caused to do so would seem to be a matter of chance. If such choices are matters of chance, they seem to be things that simply happen to turn out well or ill and therefore are not things for which people deserve praise or blame. Thus, making choices without being caused to make them would seem to rule out moral responsibility. Also, if not being causally determined rules out being morally responsible, then being morally responsible requires being causally determined, in the same way that if being nonperfect rules out being God, then being God requires being perfect. Thus, it seems that moral responsibility is compatible with causal determination. A major question for this argument is, "Can making a choice without being caused to make it be plausibly construed as something besides a matter of chance?"

Moral-sense theories

DEFINITION: Set of theories locating morality within a human sense or faculty

DATE: Developed during the eighteenth century

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Moral-sense theories assert that humans are innately moral and that morality is a function of this innate faculty or capacity. They oppose attempts to locate moral codes in trans-human sources such as objective moral facts or divine revelation.

The best summary of moral-sense theory as a philosophical movement can be found in the Preface to James Bonar's book *Moral Sense* (1930):

The subject [of this book] is the rise, progress, and decline of a theory of moral philosophy which prevailed in this country [England] for the greater part of the eighteenth century.

Founded by Shaftesbury, and built up by Hutcheson, it derived our moral perceptions from a special Moral Sense, interpreted on the analogy of the Five Bodily Senses.

The book attempts an account of these two leaders, and of their principal followers and critics. The followers include the doubtful supporter David Hume [and] the critics Adam Smith and Immanuel Kant.

The movement had its origin in reaction, its growth in the positive statements of its principals, and its decline as much in changing fashions of explanation as in actual criticism.

ORIGINS

By the end of the seventeenth century in England, conventional religious morality, with its imposed standards of behavior, had come into serious question for a number of reasons. First, the rise of Protestantism had introduced an antiauthoritarian note into much of the discussion of the subject. The rationalist-materialist philosopher Thomas Hobbes argued that the human organism was a mechanical object whose principal motivation was avoidance of pain and death, and that what passed for social morality was the calculating surrender of certain rights to avoid these unpleasantnesses; no positive source of morality existed. Second, Isaac Newton's mathematical demonstrations loosened God's hold on the physical universe, so to speak, as the motions of stars and planets and of microscopic particles were explained without recourse to divine intervention.

The bodies of animals and humans had been found by Stephen Hales and William Harvey, among others, to be governed by mechanical principles; perhaps human spirit and morality might find a similar explanation. Finally, John Locke's relentless questioning of sources of knowledge—how can one truly know anything when the connection between the senses and brain impressions is so tenuous (a problem that continues to exist even in the present state of knowledge: Does translation of diverse stimuli into chemical-electrical impulses mean that one knows the world about one?)—suggested that new explanations were in order for morality and much else.

THE MORAL-SENSE ANSWER

The man who proposed and named the "moral-sense" was Anthony Ashley Cooper, the third earl of Shaftesbury. Principally in reaction to Hobbes's idea of the innate selfishness of man, Shaftesbury pointed out that, far from being selfish, humankind must necessarily possess a capacity for moral cooperation, or a successful society could not exist. Moral behavior, therefore, is that which works for the public interest, an argument later expanded by Hume. Francis Hutcheson developed the idea of the moral sense as a sense, explaining that good and bad actions arouse in people feelings of pleasure or revulsion, and feelings are the results of a sense like any other. The moral sense mediates between moral knowledge and moral behavior, and it is the motivation for the latter. It is also innate, not the result of moral education. One

could not, in fact, be morally educated if one's moral sense were not present to identify virtuous and benevolent actions.

CRITICISM AND DECLINE

Moral-sense theory was not without its critics even as it was being developed. At the lowest level, equating it with sight, hearing, and so forth was derided because there was no moral sense organ comparable with the eyes or ears. Hume answered this objection by sidestepping it: People know their senses through their characteristic perceptions, and it is clear that people perceive the morality of behavior. Other objections had to do with the nonuniversality of moral standards and the lack of symmetry between pleasure and virtuous action—that is, one recognizes a virtuous action by one's feeling of pleasure at it, but a feeling of pleasure by itself does not imply a virtuous action. In these matters Hume, as already noted, strengthened the argument that human morality is largely societal and the greatest good for the greatest number is therefore a primary moral principle.

Other moral faculties were proposed: Samuel Clarke and others held that moral perception is the province of reason or understanding, not feeling. Adam Smith argued for "sympathy," which today people tend to call "empathy," the recognition of the passions or affections of others that leads to benevolent consideration of their welfare. The cleric Joseph Butler chose conscience as his implement of moral discrimination. Finally, Kant, in his monumental summation of the philosophy of reason at the end of the eighteenth century, rendered the question moot by stating that no logical or scientific demonstration was possible for God, freedom, or immortality, but that these were nevertheless logical necessities in a system that contained morality. Thus, a special moral sense or faculty was not necessary and efforts to demonstrate one gradually fell off.

AFTERMATH

Although identification of a moral faculty or sense is no longer considered a valid philosophical preoccupation, a number of the concerns of the moral-sense thinkers have persisted. Among these are the identification of morality as social in nature and the positions that feeling has a legitimate place in a system of morals, that there must be general rules

for judging conduct, and that one of these rules should be the greatest good for the greatest number.

Moral status of animals

DEFINITION: Presence or absence of innate moral worth in animals

TYPE OF ETHICS: Animal rights

SIGNIFICANCE: One's moral obligations to other people may be seen as arising from people's innate

moral worth. If animals possess a moral status similar to that of human beings, then one may have similar obligations to them.

In many respects, nonhuman animals are treated as morally irrelevant. Humans eat them, conduct painful experiments on them, and use them for entertainment and sport; animals are seen as a part of the material world to be manipulated for the benefit of humankind. This attitude has its roots deep in Western culture. In Genesis 1:28, God says: “Be fruitful, multiply, and replenish the earth, and subdue it; and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth,” and philosophers including Saint Thomas Aquinas and Immanuel Kant have echoed this attitude. John Locke, whose ideas helped to shape capitalist democracies, regarded the dominion over nature given to humankind by God as the source of human rights to property.

A number of arguments have been put forward against this “dominion position.” The indirect-value argument holds that, although humans are the only morally relevant beings, other animals are essential for human well-being and are valuable as means to that end. A sophisticated version of this argument merges the need for human well-being with a recognition of the need for biodiversity. This view, however, gives animals only the most tenuous grip on moral relevance. If people found that the eradication of crocodiles had no effect on the integration and stability of the ecosystem, then crocodiles would suddenly become morally irrelevant. Furthermore, the worth of the animal in question still depends on its contribution to human welfare, and this misses an important part of what it means to have moral worth. No one wishes to be regarded merely as a means to an end, and any morality that regarded people as such would be fundamentally impoverished.

The second counterargument to the dominion position is utilitarian. Utilitarianism holds that the only morally relevant feature in any situation is the presence or absence of pain and pleasure, and that in moral calculations everyone’s pain or pleasure counts for one and no one’s for more than one. Concerning animals, Jeremy Bentham argued: “The question is not ‘Can they reason?’ nor ‘Can they talk?’ but ‘Can they suffer?’” (*Principles of Morals and Legislation*, 1789).

THE UTILITARIAN ARGUMENT

The utilitarian argument is powerful and for many people has proved decisive. Trips to a slaughterhouse, factory farm, or cosmetics testing laboratory, the utilitarian’s visual aids, have often proved more powerful than a thousand academic discussions.

The third common route out of the dominion position is via a consideration of moral rights. A strong case for this approach is made by Tom Regan in *The Case for Animal Rights* (1983). Regan argues that, contrary to utilitarianism, in which value is attached simply to the pains and pleasures that people experience, individuals, as agents, have inherent value. This value is independent of gender, race, age, birthplace, or abilities and is founded on the fact that all people are “experiencing subjects of life.” Each person is “a conscious creature having an individual welfare that has importance to us whatever our usefulness to others.”

Regan then sets out to show that animals are just as much experiencing subjects of life as are humans and therefore also have inherent value, by showing that the differences postulated between humans and other animals are not significant. The primary supposed difference is reason—people are said to be the only rational animals. Regan argues that many animals have reasoning capacity and that although some humans don’t have that capacity (infants, the comatose, and so forth), it is not assumed that they are less morally valuable than other humans.

In response to the utilitarian or rights argument, some people have tried to argue that animals do not feel pain or have interests. This argument is clearly vacuous. The question is really whether that pain and those interests count in the moral calculus in the same way that human pain and interests count. Someone who accepts that animals feel pain and have interests but claims that these features do not count in the same way that they do for humans may be immune to both the utilitarian and rights arguments. To argue that one should accept the moral significance of the pain of the animal on grounds of the pain of the animal, or the moral significance of its being an experiencing subject of life on the grounds of its being an experiencing subject of life, is clearly circular. Simply to argue on grounds of consistency and relevant similarity will not work, since the idea that those similarities are relevant in this case has already been rejected. This difficulty is experienced by all those who try to expand

the circle of moral concern. It faced those who tried to abolish slavery and to extend full consideration to women and minorities.

Despite their difficulties, these three arguments have proved to be powerful and persuasive. International concern for the welfare of animals has led to the founding of groups campaigning for the ethical treatment of animals. The latter part of the twentieth century, in particular, has seen an intense focus on human attitudes toward animals and other elements of the natural world.

Morality

DEFINITION: Set of personal and social values, rules, beliefs, laws, emotions, and ideologies collectively governing and arbitrating the rightness and wrongness of human actions

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The nature, basis, and meaning of morality, and even assertions that morality has a nature, a basis, or a meaning, are all the subjects of enduring controversy.

Although less inclusive than ethics, morality encompasses a wide variety of areas related to the field of ethics. Many but not all ethical theories come

within the sphere of morality. Theories that lack a primary notion of obligation or duty, concern for the noninstrumental good of other persons, the demand for responsibility, and the recognition of the distinction between moral and nonmoral reasons cannot be accounted moral theories.

Morality includes within its scope far more than ethical theories, however, for it accounts for (or attempts to account for) the human mechanisms for the choice between good and evil. In addition, since there is a social aspect to human moral adherence, the structures of religion, law, and society are often examined from the perspective of the roles they play in promoting morality.

VARIETIES OF MORALITY

Personal codes of morality and societal structures supportive of morality are an obvious reality in the world, but the theory of ethical nihilism (amoralism) holds that morality is based upon illusions and that moral enforcement by, and the supportive structures of, society serve other purposes.

Friedrich Nietzsche denied the legitimacy of any objective or totalizing theories of morality, claiming instead that different values were appropriate for different people. Whether familiar with the original or not, Nietzsche seemed to have divined the truth of Hume's is/ought dichotomy and its implications for objective morality. Nietzsche claimed that the question left unanswered by all systems of morality was "Why be moral?"

Additionally, Nietzsche's hard determinism led him to the same conclusions about the impossibility of any objective moral order, with its necessary dependence upon moral responsibility. Interestingly, Nietzsche ascribed the institution of a singular unified morality to the attempt of the weak and inferior members of the herd to restrain the strong and superior members. In doing so, the German philosopher was only elaborating and making more sophisticated the arguments put forward by Thrasymachus in Plato's *Republic*.

Immanuel Kant's critical philosophy was, in Nietzsche's view, an attempt of the class of the clergy to retain its influence and power by mystification and mysticism, and this was especially true of the moral philosophy surrounding the doctrines of the categorical imperative. Nietzsche may be credited with further developing the sociological critique of

morality, but Karl Marx, the father of communism, competed with him in that enterprise. The Marxian socioeconomic analysis of morality may be seen as the mirror image of the Nietzschean.

Karl Marx interpreted all history as the history of class conflict; particular forms of morality represented reflections of the economic orders out of which they arose. Thus, in the Marxian view, morality in general, along with religion, arose from the interests of the upper classes in controlling the proletariat—impeding both general uprisings and lesser depredation against property.

RELIGION AND MORALITY

For many people, religion is inextricably associated with morality, and the taboo systems of primitive mythic religions bear a distant but discernible relationship to the more elaborate and sophisticated systems of philosophy-based morality. Fear of vengeance by gods, demons, or animistic spirits for trespasses against sacred taboos may seem to be a long way from the Kantian categorical imperative or John Stuart Mill's act utilitarianism, but many moral systems—including many of great complexity—rely at least in part upon the fear of supernatural reprisals for violations against the moral law.

In Christian natural law ethics, acts done for the love of God, without fear of punishment and without desire for reward, are the most meritorious—the very embodiment of pure *caritas*. Despite this judgment, Saint Thomas Aquinas enthusiastically endorsed the biblical maxim that “Fear of God is the beginning of wisdom.” Indeed, even Immanuel Kant declared posthumous rewards and punishments to be necessary so that the virtuous person not be proved a fool.

Historically, the notion of after-death rewards and punishments seems to have developed slowly. Taboo violations were usually punished here and now, as in Greek mythology, where various wrongdoers were cursed and punished in this life by the gods and Furies. Hades—the underworld abode of the dead—was a place of universal assignment of the shades of the departed, where the good and bad alike enjoyed a fleshless, tepid existence, as portrayed in the eleventh book of Homer's *Odyssey*. Tartarus was a place of special torture for those who, like Tantalus and Sisyphus, had directly offended the gods, while certain heroes, such as Hercules, underwent apotheosis, becoming divine. Such extraordinary positive and

negative sanctions were rare, however, and the ordinary mortal could expect neither.

In like manner, the divine justice recorded in the early books of the Old Testament seemed to stop at the grave. In both the Hebrew and the classical traditions, this incomplete vision of justice may finally have culminated in the supreme artistry of the Greek tragedy and the Hebrew Book of Job. The unique tension in both forms arose from the development of full moral codes in the absence of a full theodic system at those times in those cultures.

In the *Republic* and elsewhere in the Platonic dialogues, Socrates spoke of souls that went before the lords of the underworld to be judged and suitably rewarded or punished for moral decisions made during their lives. Likewise, in Vergil's *Aeneid* (reflective of the ideas of the late Roman Republic and the early Roman Empire), the afterworld has become much more a place of reward, punishment, and purgation, and in Christianity, of course, the dogmas of Heaven, Hell, and purgatory combined with the doctrine of an all-loving, all-just God to provide a more thoroughgoing theodic system that served to reinforce the laws of morality.

CONSCIENCE AND MORALITY

In addition to promoting the idea of external reinforcement of the moral law, Christianity gave great prominence to the notion of *conscientia* (“conscience”), an interior faculty of the soul that aided the intellect in the recognition of the good. Medieval commentators attempted to relate the ancient Greek notion of *synderesis* to conscience, but although there were similarities between the two concepts, they were scarcely synonymous.

With the concept of conscience, late Judaism and early Christianity made the moral law an intimate and essential part of the individual person rather than a purely external constraint only. Natural law philosophers had to face the fact that many cultures did not conform to their moral teachings. If conscience were a natural faculty of soul, how could it be possible for diverse cultures to take such remarkably divergent positions regarding moral law? One society condemns cannibalism, while another condones it. In one nation, sexual libertinage is a punishable offense, while in another it is an unsanctioned common practice. In one land, slavery is an accepted practice; in another, it is the gravest of evils.

Natural law ethicists traditionally answered this problem by maintaining the position that although the conscience was a natural faculty of the soul that was not a social construct by one's culture, one's conscience could be perverted so that it would endorse evil. Such a perversion of conscience could be one of two kinds: Persons attracted to an evil action often indulge in elaborate self-deception in order to pervert conscience in a culpable manner. The most common form of nonculpable perversion of conscience is by an invincible ignorance of the good that blinds a person to certain moral truths, often because of the training, education, and orientation provided by the person's culture.

Morality is often enforced by the external constraints of society as well as the influences of conscience and reason. The training and instruction of society—in the family, in the church, in formal education, and in the structuring of life experiences—reinforces or undermines the official moral codes promulgated by society.

MORALITY AND LAW

In regard to the legal codes of society, as viewed by natural law analysis, a distinction may be made between two types of relations to the moral law. First, not all moral law needs to be enforced by positive law. Even the most theocratic of societies usually leaves a space between moral law and positive law—not every vice is punishable by the state. Few societies, for example, punish gluttony or private drunkenness (if they permit the drinking of alcohol) or simple lying (as opposed to fraud, perjury, or libel).

Within the law, however, another distinction applies—that between intrinsic and extrinsic morality. Acts forbidden or commanded by intrinsic morality are held to be obligatory or, alternatively, morally wrong in themselves (*malum in se*). When positive law commands or forbids acts under intrinsic morality, it is merely recapitulating and sanctioning the moral law. Divine law, ecclesiastical law, and civil law all have aspects of intrinsic morality. God commands humankind not to steal, but in the natural law view, stealing is wrong in itself, apart from being forbidden in the Decalogue. In Roman Catholic ecclesiastical law, priests are forbidden to perform the sacrament of matrimony in order to link a brother and a sister in marriage, but incest is wrong apart from this rule of canon law, and the positive law only recog-

nizes and articulates this inherent evil. Finally, the laws of New York State outlaw murder, but the willful killing of the innocent is a moral wrong that is independent of any statute law against it.

EXTRINSIC MORALITY

In the case of extrinsic morality, the act commanded or proscribed by the positive law is morally neutral in itself but is made morally wrong or morally obligatory by being commanded by just authority. In divine law, God commands the observance of the sabbath, but a day of rest, let alone a particular day of rest, is scarcely obligatory by virtue of the moral law written in human nature. It is obligatory only because it is commanded by just authority. In Catholic ecclesiastical law, priests in the Latin Rite are forbidden to marry. This is simply a rule of the Church that could be altered at any time. A priest who violates this rule does wrong not in the act itself, but because the Church is presumed to have the right to make that morally neutral act impermissible (*malum prohibitum*). Finally, residents of the United Kingdom are instructed to drive on the left-hand side of roadways. A British subject who drives to the right is not directly violating a moral law but is doing wrong because he is defying the Queen-in-Parliament.

Extrinsic morality, furthermore, is held to have three clear relations to intrinsic morality. First, extrinsic morality can never contradict intrinsic morality but may only supplement it. Second, the purposes served by extrinsic moral commands are ones that ultimately would be endorsed by values inherent in intrinsic morality. To take an example, most traffic regulations are in the sphere of extrinsic morality, but saving innocent persons from death and injury and facilitating commerce relate to values of the intrinsic moral order. Finally, obedience to just authority is itself a principle of intrinsic morality.

Many of the particular moral rules and structures of society are of the extrinsic moral order, although tradition and long usage may lend them sacrosanctity in the eyes of the people.

MORALITY AND PSYCHOLOGY

The psychological mechanisms of moral choice have also been a central concern of morality from the earliest days of ethical theory. In less-complex theories, such as hedonism, the mechanism of choice could be described simply. An individual instinctually

pursues pleasure, and when he or she makes a choice that results in pain rather than pleasure, or in less pleasure than that which an alternative choice would have produced, that can be explained by ignorance. Even in the theory of the Cyrenaic (or irrationalist) school of hedonism, which clearly maintained the subjectivity of values, errors about consequences of actions or about one's own anticipated reaction to those consequences were still the source of "evil" actions.

In Immanuel Kant's deontology, there was, to a great extent, the assumption that freedom of the will, which itself was made central by the principle that "'Ought' implies 'can,'" explained the selection of evil. In the *Groundwork for the Metaphysics of Morals* and the *Critique of Practical Reason*, Kant spoke as if there could be such a thing as freely chosen evil, but by the time of his last work, *Religion Within the Limits of Reason Alone*, he had clearly abandoned that position as untenable. He took the Judeo-Christian story of the Fall in Eden and applied his own analysis. Did the tempter's wiles, or weakness of will, or the promptings of the first parents' lower natures cause the choice of evil? From the Kantian perspective, the problem in each of these explanations was that if they forced the will, then the will would not seem to be free. If the tempter's temptation was irresistible, then how could the Fall have been the moral fault of Adam and Eve, since they could not have acted otherwise, but if the serpent's seduction was resistible, why was it not resisted?

Given the full implications of Kant's moral psychology, there could be no such thing as freely chosen evil, and Kant ended by denying the possibility of "devilish minds"—that is, minds that freely and knowingly select evil over the good.

THOMISTIC ETHICS

It is, perhaps, in Thomistic ethics that the most detailed and complex explanation of the agathokakological (containing good and evil) paradox appears. Thomas Aquinas explained that all human action arises from a desire (*appetitus*) in the subject. This desire aims at obtaining a good (*bonum*) that the subject lacks, as a state of being (*ens*). All action, therefore, seeks self-perfection (*perfectio*), which is only completely achieved in the state of blessedness in Heaven (*beatitudo*). For Thomism, problems arise because every good can be a personally held value (*bonum proprium*), but such personally held values

may be truly good (*verum bonum*) or may be only an apparent good (*apparens bonum*). For Thomism, evil consists in the pursuit of a relative, apparent good in place of a true, absolute good.

Despite the sophistication of the Thomistic analysis of moral choice, serious questions remain unanswered: Why would the subject select an apparent good over a true good? If that choice had been made deliberately, how could the decision to pursue the apparent good over the true good have been made? If such a pursuit had not been deliberately chosen, how could the subject be morally responsible for that pursuit?

Another aspect of morality concerns the relationship of interior intentionality to exterior moral action. The subjective and objective elements in moral and immoral actions are necessarily related in all serious theories of moral philosophy. In the primitive taboo ethic, the simple act alone was sufficient. Speak the words, eat the substance, touch the object, and divine retribution followed, no matter what the motivation for the act, no matter what the subject's knowledge of the nature of the act.

Among libertarians and determinists alike, there is a recognition of the need for an interior disposition to the objective moral or immoral act for that act to make its perpetrator culpable. Habituation of vicious or virtuous actions eliminates the direct intentionality before particular acts of vice or virtue, but it is generally held to meet the standards for moral responsibility because the general intention in the course of habituating the action is held to replace the specific intention that would normally be present before each particular act.

MORALITY AND LAW

Although much of the relationship between interior disposition and external act has been explored in moral philosophy, it has not all been sufficiently explained. Why do moral philosophy and the law alike regard the actual accomplishment of external, objective acts of evil as crucial to the degree of immorality or of criminality in the intention? It is clear that without the intention, killing is not murder, but the justification of the greater immorality and the greater criminality in murder over attempted murder is not so easily justified. If one clearly intended to kill an innocent person without justification and carried out the attempt, but the attempt failed through some techni-

cal flaw, how might one be said to be less blameworthy than if one had succeeded?

From the point of view of human positive law alone, the sharp distinction between the criminal act that has been completed and that which has been merely attempted may, in fact, rest upon no more than accident or chance. One attempted to shoot a man, but one's aim proved faulty, and the bullet missed. One's intention has been precisely the same as that of a successful murderer, and it is only a matter of moral luck that one is not guilty of murder, but only of attempted murder. Why should the fact that one is a bad shot excuse a degree of guilt for what one has both intended and attempted?

Since the civil law deals with the needs of society as well as the moral values of its citizens and since the law can only very imperfectly scan the intentions of the human heart, it may well be understandable that the law of the state differentiates between crimes attempted and crimes completed, but why should the moral order make such a distinction? Intuitively, such a distinction seems to be reasonable, but no carefully articulated justification of such a distinction has been successfully made.

Morality is at the core of the ethical sciences, and the most interesting problems in ethics are concentrated in the sphere of morality. The nature of obligation, the logic and mechanism of moral choice, and the relationship of intentionality to the objective factor in the blameworthiness and praiseworthiness of moral actions are among the most challenging areas for further intellectual investigation.

Moses

IDENTIFICATION: Ancient Hebrew leader

BORN c. 1300 B.C.E., near Memphis, Egypt

DIED: c. 1200 B.C.E., place unknown

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Moses delivered the Hebrews from Egyptian slavery, introduced the concept of ethical monotheism, and created or transmitted the first legal code to be based on the idea of a divine covenant. He is traditionally regarded as the author of the Torah.

Moses is best remembered for delivering the Hebrew people from Egyptian slavery and subsequently providing them with a legal code that he claimed he re-

ceived from God. Questions of authenticity, dates, and other issues raised by critical scholarship are beyond this article's scope. Rather, it is assumed here that the books of Genesis, Exodus, Leviticus, Numbers, and Deuteronomy, sometimes referred to as "The Laws of Moses," or simply the Torah (or Pentateuch), constitute a distinct body of literature. The latter four volumes contain specific directives that the ancient Hebrews believed to be a divinely sanctioned basis for their legal, political, religious, and social systems.

DIVISIONS WITHIN THE LAW

There are three primary divisions within the Hebrew law. The first division is the Decalogue, or Ten Commandments (Exod. 20:1-17; Deut. 5:1-21). The first four commandments define the proper attitude that one should exhibit toward God. Commandments five and ten establish the sanctity of the family, while commandments six through nine establish individual rights. Each commandment is a moral injunction aimed at establishing a code of right conduct.

Civil legislation marks the second division in Moses' law. These laws focus mainly on Hebrew interpersonal relationships. For example, between Exodus 20:18 and Exodus 23:33 there are more than seventy specific statements delineating between accidental and premeditated acts. Hebrew civil law usually determined the appropriate compensation that one should receive in the event of property loss.

The third division in Moses' law involved ceremony (Exod. 24-34; Lev.). This was perhaps the most far-reaching element of the Hebrew legal code. Whereas the civil law concerned individual relationships, the ceremonial law focused on the relationship between God and humanity. These laws outlined every facet of Hebrew worship, ranging from the construction of a suitable place of worship to the role that priests played both in religious ritual and society in general. The ceremonial law also outlined an elaborate system of offerings that Hebrews were commanded to offer to God. In some cases, these offerings were animal sacrifices; in others, grain offerings. In any event, the ceremonial law was designed to keep the Hebrews' religion pure and free from pagan influence. Moreover, since Moses described God both as holy and as expecting the Hebrews also to be holy, the ceremonial law provided a means whereby they could express a wide variety of spiritual needs,

ranging from ceremonial cleansing from sin to joy and thanksgiving.

OLD TESTAMENT ETHICS

Ancient legal codes, most notably the Babylonian Code of Hammurabi, addressed legal issues on a case-by-case basis and emphasized retribution—"an eye for an eye." Certain features of the Mosaic code also called for retribution, but Moses' Law was more far-reaching. In *Toward Old Testament Ethics*, Walter C. Kaiser, Jr., enumerated characteristics of Old Testament ethics. First, they were personal. Since God used himself as the standard of absolute righteousness, he expected his people to obey the law. Second, Old Testament ethics were theistic. In addition to believing that God had given the law to Moses personally, the Hebrews also believed that the law reflected God's character. Third, Old Testament ethics were internal. Moses indicated that God's law was not merely an external checklist. Rather, God was concerned about the Hebrew's internal spiritual condition. Additionally, these ethics were future oriented.

Throughout the Old Testament, biblical writers indicate that a Messiah will ultimately fulfill the law perfectly. Hence, Old Testament ethics are rooted in hope. Jesus claimed to fulfill all requirements of the law (Matt. 5:17-18). Other New Testament writers likewise claimed that Jesus was the fulfillment of the law (Rom. 10:4; Gal. 3:24). Finally, Old Testament ethics are universal. Even though Moses delivered the law to the Hebrews, it is understood that God's standard of holiness was applicable to all nations (see Gen. 13:13, 18:25).

SIGNIFICANCE

Moses' significance to ethics is that he introduced ethical monotheism. If the Hebrews were to be God's people, Moses explained, they were obligated to obey God's commandments. Yet the Hebrews were not to keep Moses' law simply to win God's favor. Rather, Moses said that God was infinitely holy and, hence, the law was a standard of personal rectitude. Moreover, since the Hebrews saw God as infinitely good, the law was good because God himself had given it. Moses, therefore, revealed God as an ethicist. Additionally, Moses' law revealed a God who was genuinely interested in humanity. True, he could be offended, but he also provided forgiveness. He

likewise promised to bless the Hebrews and go with them wherever they went. This concept of a holy God who placed just expectations upon people and cared about them personally laid the foundation for the ethics of the Western world.

Motion picture ratings systems

DEFINITION: Formal systems for classifying films based on content which may be deemed inappropriate for children, detrimental to society, or objectionable on moral or religious grounds

TYPE OF ETHICS: Arts and censorship

SIGNIFICANCE: Ratings systems may be created by third-party organizations independently of film studios, or they may be self-regulatory systems instituted by the studios themselves. In the latter case, they raise issues regarding the boundaries between voluntary self-regulation and institutionally imposed censorship.

The motion picture industry of the United States of America has long attempted to forestall government controls by observing self-imposed regulations. Originally, those regulations were proscriptive, intended to make a preponderance of exhibited films palatable to general audiences, but subsequent policy, using ratings to influence public exposure, enabled a wider range of material to appear in major releases. Regulatory systems have been established elsewhere, but the varying U.S. approaches provide excellent studies in the application of standards.

State and local government attempts to censor film date back to a 1907 Chicago ordinance that was upheld by Illinois's supreme court in 1909. The potential impact of such rulings was evident in the proliferation of state and local censor boards as well as a 1915 U.S. Supreme Court determination that cinema was not protected under the First Amendment. With the goal of curtailing widespread government censorship, from 1909 to 1921 the National Board of Censorship assumed some responsibility for the pre-release evaluation of film content. This citizens' group, supported by the film industry, was the nation's first voluntary censorship body.

In 1922, the major Hollywood studios appointed Will Hays the head of their newly formed association, the Motion Picture Producers and Distributors of America (MPPDA). Created to maintain industry sovereignty, the MPPDA in 1934 enacted a code of ethics known as the Production Code, or "Hays Code." Arising out of the Mae West era, the code combined lofty statements of principle ("No picture shall be produced which will lower the moral standards of those who see it") with a battery of specific regulations (for example, "*Methods of Crime* should not be explicitly presented" and "The treatment of bedrooms must be governed by good taste and delicacy").

THE RATINGS

Two major ratings systems originated during this period. In 1933, the Film Board of National Organizations formulated the MPPDA-supported Green Sheet, which used age and educational criteria to classify films as *A* (Adult), *MY* (Mature Young People), *Y* (Young People), *GA* (General Audience), *C* (Children, unaccompanied), or a combination of those ratings. The following year, a committee of bishops formed the influential Legion of Decency, which

rated movies on a scale from *A-I* (morally unobjectionable for general audiences) to *C* (condemned).

Movies without the Production Code Seal were effectively banned from theaters. Code stipulations were, however, periodically amended and perennially subject to administrative give and take (intense lobbying won a place for Rhett Butler's "forbidden" last word in 1939's *Gone with the Wind*). The Code remained in place during the 1940's, as Eric Johnston replaced Hays, the MPPDA became the Motion Picture Association of America (MPAA), and antitrust decisions forced studios to sell their theaters.

After the Supreme Court overturned its 1915 ruling in 1952, the newly opened theater market exhibited not only unapproved foreign features but also domestic productions such as *The Moon Is Blue* (1953),

which had been denied the Seal for its treatment of virginity. The commercial viability of such films, together with the precedent-setting releases of *Son of Sinbad* (1955) and *Baby Doll* (1956)—the first *C* films to receive the Seal—heralded further shifts in standard application. Additional Court decisions and jolting thrillers such as *Psycho* (1960) and *Cape Fear* (1962) built momentum for extensive Code revision in 1966, when Jack Valenti became the third MPAA president. Early frustrations with language in *Who's Afraid of Virginia Woolf* (1966) and nudity in *Blow-Up* (1966) influenced his replacement of proscription with a voluntary film rating system in 1968.

Officially intended to place responsibility for children's moviegoing with parents and guardians, the new system reflected contemporaneous rulings on children and obscenity. Overseen by the MPAA, the National Association of Theatre Owners (NATO), and the International Film Importers and Distributors of America, it classified submitted films according to their appropriateness for one of four possible audience groups. *G* for General Audiences, *M* for Mature Audiences (parental guidance suggested), and *R* for Restricted Audiences were trademarked; *X* (no one under 17 admitted), adopted at the urging of NATO, was not. *M*, which parents misinterpreted as being sterner than *R*, was initially replaced with *GP* (implying a "General Audience" film for which "Parental Guidance" was suggested) and later with *PG*. In 1984, the young audience categories were expanded to include *PG-13*.

ADULT FILMS

Adult film classification also changed. At first, some *X* features won significant mainstream interest. Soon, however, the rating became identified with pornography, to which it was frequently self-applied. Excluding the young audience market by definition, the rating also precluded advertising in most outlets, leading many major producers to edit movies from *X* to *R*. (Some features, such as *Midnight Cowboy*, 1969, eventually made that transition without cutting.) Ongoing debate over film tailoring and the need for another "adults only" category sparked the creation of the MPAA's federally registered certification mark, *NC-17*,

Image not available

Dustin Hoffman (left) and Jon Voight in Midnight Cowboy, the first major motion picture to receive an X rating. (Museum of Modern Art, Film Stills Archive)

first assigned to *Henry and June* (1990). During the early 1990's, the MPAA also began issuing explanations of specific ratings to theaters and critics.

Although criticized for representing an abandonment of moral and ethical responsibility, the shift from proscription to ratings has been praised for enabling major producers to exercise greater freedom of expression. Despite such increased license, the questions of the ratings system constituting a form of self-censorship remained.

Because ratings greatly influence a project's viability, films are not simply rated after completion; throughout the creative process there may be ratings-oriented interplay involving filmmakers, the Rating Board, and occasionally (after the code has been assigned) the Appeals Board. This process may receive wide public attention, often dwelling on potentially offensive material and sometimes leading to the creation of alternate versions aimed at different markets. Naturally, content not recognized as potentially offensive may be perceived as implicitly approved. The MPAA uses regular polling to establish that its standards represent the views of a majority of citizens.

Besides advising parents and guardians about film content, the ratings system, which encompasses trailers and film advertising, requires the cooperation of theater owners. At the box office, administrators discriminate according to age and appearance (sometimes requiring potential consumers to identify themselves by birth date), as well as geographic location. This approach reinforces and establishes taboos and hierarchies related to age, appearance, maturity, and media.

The ratings system has been endorsed by the Video Software Dealers Association. Similar systems of self-regulation have been adopted or proposed for recording, video games, and television programming.

Motivation

DEFINITION: Purpose behind an action

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Motivation is important to virtue-based ethics and other systems that judge actions according to their intent. It is irrelevant to consequentialist theories, which attend only to the effects of one's actions. Some models of behavior hold that human action is overdetermined, that is, that there are so many separate motives behind an action that it is impossible to know or evaluate them all.

Ethics deals with determining what is good and bad and with moral principles and values. These are all aspects of behavior. In order for behavior to occur, a person must be motivated. Without motivation, the person would do virtually nothing. Driven to action by a motive, however, the person engages in behavior that persists until the motive is satisfied. The word "motive" derives from the Latin *movere*, meaning "to move."

One of the prevailing issues of motivation is the nature of human motives and thus the nature of human nature. As Charles N. Cofer and Mortimer H. Apley have stated the issue in *Motivation: Theory and Research* (1964):

Is man—unfettered and untarnished by the experiences and constraints of society—essentially good, altruistic, brotherly, creative, peace loving? Or, alternatively, is he essentially evil, egocentric,

aggressive, competitive, warlike, requiring the constraints of society in order to keep him from destroying his fellows and himself?

EARLY CONCEPTIONS

In Aristotelian ethics, as in ethics generally, the issue concerned the appropriate direction of desire and action (that is, motivation). Good or right action was a product of reason and a strong will. Practicing performing good or just acts caused those acts to become pleasurable and habitual, and the will then chose freely that which knowledge determined to be good. Through the ensuing centuries, this belief that the will controlled the animal side of humanity and guided it toward right virtue and salvation persisted. The philosopher Immanuel Kant believed that good actions originated from a sense of duty or moral law. The will is motivated to choose a course of good action in the light of moral law.

A different view was elaborated during the mid-nineteenth century by the philosopher Arthur Schopenhauer. Will was viewed as a basic force or striving and was evil. The impulses of the will brought no pleasure, only pain. Gratification of the will's impulses did not produce happiness, only satiety.

These philosophical views have been carried into modern times by psychology. "Will" has been replaced by "motivation." The issue of whether human motivation is good or evil is addressed by three major theoretical systems, each of which provides a different answer: behavioral theory, psychodynamic theory, and humanistic theory.

BEHAVIORAL THEORY

Behaviorism was founded by John B. Watson in 1913. Behaviorists viewed motives as internal stimuli that persist and dominate behavior until the person reacts to satisfy the motive. Human motives are, however, neither good nor evil. Good and evil depend on conditioning provided by the environment. One of Watson's most famous (and outrageous) statements says: "Give me a dozen healthy infants, well formed, and my own specified world to bring them up in and I'll guarantee to take any one at random and train him to become any type of specialist I might select—doctor, lawyer, artist, merchant-chief and, yes, even beggar-man and thief, regardless of his talents, penchants, tendencies, abilities, vocations, and race of his ancestors." Although modern behaviorists are

no longer such extreme environmental determinists, they would agree with Watson that ethics is primarily a matter of environmental conditioning.

PSYCHODYNAMIC THEORY

To Sigmund Freud, the true purpose of life lay in the satisfaction of its innate motives. These motives derive from bodily needs, produce tension, and cause all activity. The two classes of motives are the life-sustaining motives (sex, hunger, and so forth) and the death or destructive motives (cruelty, sadism, violence, destruction, and murder).

The life and death motives arise from the oldest and most primitive part of the mental apparatus: the id. The id is not conscious of reality; it is illogical and irrational, has no values and no concept of good or evil, has no morality, and continually seeks instant discharge and pleasure. In part, the functions of the other two divisions of the mental apparatus, the ego and the superego, are to control, regulate, and contain the id in a manner consistent with the demands of external reality. Acts of destruction and aggression, such as war, represent a failure to regulate and control the expression of the death motive.

The idea that the id knows no values and has no sense of good, evil, or morality is similar to the behavioral view of neutrality about the nature of human nature. Psychodynamic theory, however, is essentially a pessimistic view of human nature. The true purpose of life is not some lofty or idealistic state, but the satisfaction of the motives of the id in a manner consistent with maintaining civilized society. World War I and other widespread acts of death and destruction convinced Freud of the primacy of aggression and that the ego and superego often lose the battle to effectively control and regulate it.

HUMANISTIC THEORY

According to the clinical psychologist Carl Rogers, "The basic nature of human beings when functioning fully is constructive, trustworthy, forward-looking, good and capable of perfection." In 1956, John Adelson stated: "Man is born without sin, aspiring to goodness, and capable of perfection; human evil is exogenous, the betrayal of man's nature by cruel circumstance." This motive of full functioning or self-actualization is part of an inherent process called syntropy, a movement toward growth, expansion, and realization of the self.

That self-actualization is difficult to achieve is a result of societal constraints and the false goals set by society. Society often rejects, punishes, ridicules, or threatens nonactualized individuals, rather than helping them.

EVIDENCE

The nature of human nature has been debated since antiquity. Since humans are capable of both good and evil behaviors and amply exhibit both types, and since it is conceptually and ethically impossible to conduct an appropriate experiment to resolve the issue, the nature of human motivation will no doubt continue to be debated for many more centuries.

Mozi

IDENTIFICATION: Ancient Chinese philosopher

BORN: c. 470 B.C.E., China

DIED: c. 391 B.C.E., China

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The founder of the Mohist school of philosophy, Mozi (Mo Tzu in Wade-Giles spelling) maintained that wars, social disasters, and similar forms of chaos resulted because people did not love one another. He was alone among the Chinese philosophers of his day in not only condemning acts that were harmful to others but also calling on people to care for others as they cared for themselves and their own families.

Mozi lived during the fifth and fourth centuries B.C.E., an era of Chinese history known as the period of the “hundred philosophers” for its flowering of philosophical and religious thought. According to tradition, Mozi came from a declined noble family, served as an official of the kingdom of Sung, and studied the Chinese classics, including the writings of Confucius. Confucian thought maintained that social order could only be achieved if mutual responsibilities were fulfilled in a clearly defined hierarchical system.

Some sources say that although Mozi was born into a clan of the kingdom of Song, his family later emigrated to the kingdom of Lu, home of Confucius. It is said that here Mozi grew increasingly hostile to the Confucian classism and political conflicts of his day and abandoned Confucian thinking to establish the Mohist school, a system of thought based on principles described in the *Book of Mozi*. In this work, Mozi calls for a new, egalitarian society based on a sense of mutual aid and commitment to the common good.

THE BOOK OF MOZI

The collection of philosophical essays bearing Mozi’s name was probably compiled by his disciples in the generations after his death. In this document, Mozi condemned the desires for profit, luxury, and wealth as the societal ills of his day. He also condemned the corresponding manifestations of these desires, including the practice of offensive warfare, the development of military power, the use of rituals, the pursuit of entertainment, and the cultivation of music. He considered offensive warfare to be mere

thievery and supported strong defensive preparations only to prevent it. He deemed music, entertainment, and rituals to be costly activities of the wealthy that detracted from the material well-being of the poorer classes. As remedies for these desires and the conflicts they produced, Mozi championed frugality, strict respect for laws, advancement of people based on performance instead of class, and fear of the gods and spirits. The coordinating mechanism for these was the principle of universal love, of loving all others equally.

The religious characteristic of Mozi's thinking derived from his admonitions concerning the Will of Heaven and a belief in spirits. Mozi maintained that Heaven rewarded those who conducted themselves in a manner consistent with universal love—loving others as themselves and engaging in activities that benefited everyone. He believed that Heaven punished the evildoers—especially those who had been charged with the job of ruling others. He opposed fatalism, insisting that through work and honorable hardship, order could be achieved.

Mozi held that knowledge came through the experiences of the senses. In judging the validity of knowledge, he applied three criteria: the basis of the knowledge itself, its potential for verification, and its utility.

THE MOHISTS

During the last two hundred years before the unification of China (221 B.C.E.) Mohism attracted numerous converts. Its philosophy of defensive warfare, coupled with the belief that promotion should be based on merit rather than social status, led to the growth of a sect whose behavior was characterized by a soldierly discipline. Probably recruited from among the knights for hire or petty aristocrats, Mohists sold their services as specialists in defensive warfare. When a leader planned to invade or annex another territory, Mohists argued eloquently and passionately against it. If the leader could not be dissuaded, they joined the opposite side, defending the attacked kingdom. Hence, Mohists became known as both noteworthy orators and skillful defensive soldiers. Their obedience to the law and unswerving loyalty were also legendary, for they would even kill their own sons if they had committed crimes requiring the death penalty.

LEGACY OF MOHISM

The philosophy of Mozi lost ground after the onset of China's imperial period in the third century B.C.E. Mohism maintained that wars were unjust because they interfered with the survival of the agricultural classes by interrupting planting and harvesting as well as by destroying fields. Although the assessment of the impact of war on farmers was accurate, the conclusion that war was to be avoided was incompatible with the objectives of early imperial Chinese leaders, who saw territorial expansion as a means of obtaining more power and resources. Mozi's admonition against preferential treatment based on status was also distasteful to the increasingly hierarchical society that attended imperial rule. Consequently, the Mohist sect declined after the third century B.C.E. Its unique contribution to Chinese ethical thought lies in advocating universal love as the operative method for ordering society and avoiding chaos and harm.

Muhammad

IDENTIFICATION: Founder and Prophet of Islam and author of the Qurʾān

BORN: c. 570, Mecca, Arabia (now in Saudi Arabia)

DIED: June 8, 632, Medina, Arabia (now in Saudi Arabia)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Muslims believe that Muhammad received the visions from Allah that constitute the Qurʾān, the scripture of Islam, and that his life served as a model for proper living.

Born in Mecca, Muhammad was orphaned at age six. After being reared by his grandfather and an uncle, he became a caravan driver. At twenty-five he married Khadija, a wealthy widow who bore him two sons who died in infancy and four daughters. Around the age of forty, Muhammad received the first of the

many revelations that would become the Qurʾān. The monotheism of Muhammad's new religion created friction with the polytheistic Meccans, leading to his famous flight, or *hijra*, to Medina in 622.

Medina's citizens pledged to follow Muhammad both politically and religiously, a connection between religion and the state that became the norm for traditional Muslims. Military conflicts between Medina and Mecca were fought from 624 to 630, ending in victory for Muhammad. After becoming Mecca's political ruler, he cleansed Mecca of its idols to various gods and resumed his annual pilgrimages, making his final trip in 632.

The basic principles taught Muhammad are largely contained in the Five Pillars, one of which directly concerns ethical behavior. Muhammad taught that his followers should give alms of two types: obligatory assistance to the poor and charity beyond that. Such almsgiving was based on idea that the more one owns, the more one should give.

Muhammad has occasionally been criticized, by Westerners especially, for taking several wives after the death of Khadija, and allowing his followers to take as many as four. During his time, however, when women outnumbered men and had few rights, polygamy may have been the best way to ensure the care of widows and others who might otherwise have gone unmarried.

Accountability for ethical decisions may presuppose freedom to choose among more or less equal alternatives. Muslims have nevertheless often been deterministic and fatalistic. Muhammad was less so, or not consistently so. He spoke on determinism in at least three different ways in the Qurʾān. Sura 18:28 says that God allows people to believe or disbelieve as they wish. By contrast, Sura 35:9 says that God leads astray or guides correctly whomever God wishes. Sura 2: 24-25, however, may mediate between these two views by saying that God leads astray only those who would go wrong anyway.

Much of Muhammad's ethical teachings seems to have the pragmatic end of preserving and expanding his community and defending it from attack. Consequently, he permitted plunder, revenge, and war at the collective level and expected obedience to authority.

Paul L. Redditt

Muhammad's Place in Islam

It is incorrect to say that Muhammad is "worshipped" in Islam: Muslims worship only God (Allah). Muhammad and his family are, however, deeply revered. Pilgrimage to Muhammad's mausoleum in Medina is common, and the image of Muhammad as merciful intercessor on behalf of the faithful emerged early in the history of Islam. Popular songs and poetry celebrate Muhammad's life, and numerous stories of miracles have grown up around his biography. Intellectuals who are skeptical of many of the popular tales nevertheless have profound respect for the Prophet and his guidance of the Muslim community.

Muhammad's life often has been interpreted in Sufism as having mystical and allegorical meaning. The *Isrā'* and *Mi'rāj* (the traditions of Muhammad's nocturnal tours through Hell and through Paradise, respectively), in particular, have been fecund sources of Sufi literature, in which those journeys are seen as allegories representing the journey of the soul from worldly attachments, along the path of spiritual development, to the state of final mystical bliss. The Prophet is also seen by some philosophers, as having an eternal essence that exemplifies Divine Reason and is manifested in the Prophet's temporal life and teachings.

Muir, John

IDENTIFICATION: Scottish American naturalist

BORN: April 21, 1838, Dunbar, Scotland

DIED: December 24, 1914, Los Angeles, California

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Muir lobbied for the establishment of Yosemite, Sequoia, and General Grant National Parks; was a founder of the Sierra Club; and increased general public interest in preservationism.

John Muir moved to a Wisconsin homestead when he was eleven and attended the University of Wisconsin from 1858 to 1863. After a year of farming while waiting for a draft call, he decamped to stay in Canada from 1863 to 1864. In 1867, he began a full-time career in nature study, starting with a projected thousand-mile walk to the Gulf of Mexico on his way to South America. Frustrated by serious illness, he

John Muir. (Library of Congress)

went to California and lived in the Yosemite Valley for five years. In 1873, he began a full-time career as a nature writer and preservationist, spending summers hiking and observing natural phenomena in the mountains.

In 1889, Muir began writing and lobbying to preserve Yosemite Valley as a National Park. In 1896, as one of its founders, he became the first president of the Sierra Club; he remained in that position until 1914. He was preeminent in publicity and lobbying (1905-1913) against San Francisco's Hetch Hetchy water project. Although unsuccessful, this effort broadcast the preservationist ethic nationwide. Muir's contributions to glaciology and geomorphology give him minor scientific status. He published more than 500 articles and essays, many of which were based on his mountaineering journals. His books include *Mountains of California* (1894), *My First Summer in the Sierra* (1911), and *The Yosemite* (1912).

Multiculturalism

DEFINITION: Position that education should reflect various cultures, ethnic backgrounds, and traditions, not merely the culture and traditions of the dominant segment of society

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: For educational traditionalists, multiculturalism represented an attack on the ethical core of modern society, because education was improperly politicized and universities were teaching ideology instead of timeless truths and core ethical values. Proponents of multiculturalism, on the other hand, asserted that education had always been political and that the truths and ethical values which traditionalists called "timeless" were merely the ones which embodied their own, dominant politics and ideologies.

Although the concept of multiculturalism is as old as the ancient Greeks and Hebrews, its advent as a ma-

ajor issue in American education during the 1980's brought it into the mainstream of public debate. Questions about multiculturalism and the related "political correctness" movement were among the most widely discussed and divisive in the United States during the late 1980's and early 1990's. Particularly on college and university campuses, clashes over alleged sexism, racism, and insensitivity attracted extensive media attention. In public schools, where ethnic and racial diversity was a fact of life, parents, students, and public officials struggled with the complicated question of how to balance the broader community's interests with those of Native American, Mexican American, African American, and other minority groups.

The rights and dignity of women, homosexuals, and others not adequately represented, in the multiculturalist perspective, in American education or in the use of resources were basic concerns of the movement. Advocates of multiculturalism argued that traditional education ignored, and even distorted, the contributions of people outside the European American mainstream.

CONFLICTING ETHICAL VIEWS

Both advocates and critics of multiculturalism have appealed to ethical principles to justify their perspectives. Supporters have generally emphasized the need to correct the alleged harmful effects of traditional policies on the grounds that these policies have distorted the truth and have encouraged isolation and self-doubt. Growing evidence that many ethnic minority children were losing self-confidence and falling behind in their education seemed to substantiate the claims of multiculturalists that something was seriously wrong with the American educational process. As the proportion of minority children in American schools climbed from 21 percent in 1970 to more than 26 percent in 1984, public awareness of cultural diversity and related problems significantly increased. To many multiculturalists, it seemed obvious that inherent bias, especially in schools and colleges, was a major cause of inequality and its many socially harmful effects.

Critics, however, argued that the real causes of inequities lay elsewhere—in social history rather than the educational system and its support mechanisms—and that multiculturalism actually made matters worse by heightening tensions and group

identity at the expense of community. Historian Arthur M. Schlesinger, Jr., wrote that multiculturalism encouraged the fragmentation of American society into “a quarrelsome spatter of enclaves, ghettos, tribes.” Former secretary of education William J. Bennett dismissed multiculturalism as a symptom of the “disuniting of America.”

POLITICAL CORRECTNESS AND CULTURAL PLURALISM

Complicating the quest for an ethical consensus on multiculturalism during the early 1990's was the “political correctness,” or PC, movement, which sought to eradicate racist, sexist, and ethnocentric language from the classroom and public forums. When political correctness first appeared in public discussion around the turn of the twentieth century, it was a slogan among Marxists and certain other ideology-intensive groups indicating adherence to accepted party principles and interpretations. In the later environment of the multiculturalist movement, it was applied to the treatment of minorities, women, and ethnic groups. This added to the task of defining common ethical and political ground by subtly transforming the issue of community into one of words about community and symbolic behavior that might offend or discourage a particular group or individual within it.

Supporters of multiculturalism insisted that sensitivity to the feelings and positions of all people is not only ethically compelling but also politically and economically essential for the effective functioning of a democratic society. Without it, larger numbers of people drop out in one sense or another, to the detriment of the entire society. The art, historical contributions, and personal worth of all people, it is argued, augment the traditional culture with creative new elements that benefit all. If they are ignored, a potential enrichment of the culture is lost, and tragic consequences can result in regard to the ability of those left out to find a productive place in society.

IMPLICATIONS FOR ETHICS

In his *Civilization and Ethics* (1923), Albert Schweitzer observed that “ordinary ethics” seek accommodation and compromise. That is, “they try to dictate how much of my existence and of my happiness I must sacrifice, and how much I may preserve at the cost of the existence and happiness of other

lives.” In essence, that is the pivotal issue in current multiculturalist theory. Its ethical norms are centered in the need to balance the individual's interests with those of the larger community.

For Schweitzer, the solution lay in envisioning a higher ethic that he called “reverence for life”; that is, an absolute regard for all life in a broadly inclusive ethic. The ethical challenge of multiculturalism is to find ways to avoid violating basic individual rights such as freedom of speech and conscience while protecting the rights of all segments of society and incorporating their identity and contributions into the whole. This thrusts it inevitably into the realm of politics, where moral vision is often blurred by considerations of resources, the need for competent personnel to lead multicultural educational programs in schools and elsewhere, and the development of cooperative undertakings that give substance to theory. In that sense, multiculturalism, to be meaningful, must defy the image that it is merely a buzzword or a new kind of oppression and ground itself in its most basic ethical principles of responsibility and cooperation to ensure both justice and respect for all.

Multinational corporations

DEFINITION: Large commercial organizations that conduct business in more than a single nation

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Ethical issues arise due to the very existence of multinational corporations in foreign countries, especially with respect to fundamental human rights and the problem of ethical relativism.

The single most important objective of any business enterprise is to create a monetary surplus, which, in turn, allows the business to reinvest in itself in order to continue to pursue the same fundamental objective. Should the business be a corporation with publicly held shares, its financial profits are also used to pay dividends to its shareholders. Should the corporation engage in any business activity with people in any country other than the one in which it is legally incorporated, it achieves the status of a multinational corporation. Such activities include, but are not limited to, the advertising and marketing of the corporation's products or services to people in other countries, the establishment of manufacturing plants in other countries, and the hiring of employees in other countries to work in such plants.

A variety of special ethical issues arises in the context of the normal business practices of any corporation. They concern workplace conditions, including health and safety issues; employee financial compensation issues; employee privacy issues; race, gender, and age discrimination issues; issues of due process when it comes to hiring and firing and the promotion and demotion of employees; product safety

issues; issues concerning the environment; and many others. In addition to all these issues is the problem of ethical relativism.

ETHICAL RELATIVISM

Every culture has, to varying degrees, unique standards of morality that might conflict with those of other cultures; this is an empirical fact and is usually referred to as cultural relativism. Some people assume that, because cultural relativism is a fact, so too is ethical relativism. "Ethical relativism" is the belief that because people in various and different cultures do, in fact, adhere to different and sometimes conflicting standards of morality, there is (and can be) no objective standard of morality that applies equally to all people in every culture and throughout all of human history. In addition to the fact that the belief in the accuracy of ethical relativism does not logically follow from the empirical fact of cultural relativism, there are numerous beliefs that do logically follow from the belief in ethical relativism but that, typically, are found to be unacceptable even by proponents of ethical relativism. For example, to take seriously the belief in ethical relativism is to obligate one to accept the belief that there neither exists nor should exist any absolute moral prohibition of any type of human behavior, including murder.

EFFECTS OF ETHICAL RELATIVISM

Through the last four decades of the twentieth century, numerous Western-based multinational corporations attempting to start up business activities in foreign countries such as Indonesia, Nigeria, and Malaysia immediately faced threats of being prohibited from conducting any such business unless they paid what were, in effect, bribes to foreign officials. Despite the fact that most Western multinational corporate executives find such ultimatums to be morally offensive, they tend to attempt to justify compliance with such requirements on grounds of ethical relativism.

One of the most significant cultural distinctions to be found among various nations is the host of different positions of their respective governments on the question of fundamental human rights and the extent to which such rights are, and/or are allowed to be, abused. Historically, relationships between multinational corporations of industrialized Western nations and developing countries in South America, Africa,

the Middle East, and the Far East are such that any of a variety of fundamental human rights are routinely neglected, if not abused outright. Again, executives of multinational corporations in such situations typically attempt to justify human rights abuses of foreign citizens on grounds of ethical relativism.

It is not uncommon for Western multinational corporations operating in poor foreign countries to hire children to work in unsafe and unhealthy conditions for long hours each day for the equivalent of only a few dollars per day. Despite the fact that such working conditions might be consistent with what is normally expected in the host countries and the fact that the wages that are paid might actually compare favorably to standard local wages, employing children raises serious ethical questions.

One might reasonably argue that children, in any country, have the right to at least a modicum of a formal education as well as the complementary right to not be coerced to work. Moreover, one could argue that employees (typically, as adults) have the right to reasonably safe and healthy workplace conditions as well as the right to financial compensation that is commensurate with work performance that is both of good quality and of whatever duration. Such rights are consistent with the Universal Declaration of Human Rights that was adopted by the United Nations in 1948. It was designed to be an objective standard by which to measure the extent to which any nation on Earth either respects or abuses the fundamental human rights of its citizens.

ABUSE OF THE PROFIT MOTIVE

Sometimes, attempts to justify, on grounds of ethical relativism, the business practices in each of the two types of examples as set out above, specifically, the bribery of government officials and the use of child labor (both in poor foreign countries), are really only veiled attempts to justify what is, arguably, the abuse of the profit motive. For multinational corporations, as for any businesses, the more that the executive decision makers are committed to the fundamental objective of creating profits, the more they are tempted to venture into business practices that may be morally suspect.

If bribing government officials is not the normal business practice within a foreign country, then such a practice cannot be justified on grounds of cultural, much less ethical, relativism. In such cases, the most reasonable explanation for bribes is greed on the part of the foreign government officials and abuse of the profit motive on the part of the multinational corporation's executives.

It is arguable that in the vast majority of cases of morally questionable business practices, from workplace conditions to issues concerning the environment, abuse of the profit motive is the most reasonable explanation.

Mutually assured destruction

DEFINITION: Cold War doctrine in which nuclear powers are deterred from attacking each other by the fact that any resulting conflict would utterly destroy both nations

DATE: Term coined during the 1960's

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: Mutually assured destruction (MAD) was, in retrospect, a successful doctrine, but it also created a pervasive, semiconscious fear that arguably colored the lives hundreds of millions of people for the duration of the Cold War. Moreover, the post-Cold War nuclear landscape contains new threats, such as nuclear terrorism, against which MAD is no longer a practical defense, and the nations which once relied upon MAD have been faced with the challenge of developing effective alternative strategies.

To protect and preserve values is the only justifying cause for the use of force that is admitted in civilized moral tradition. The defense and protection of the innocent is one of the cardinal points of those values. Counterpopulation destruction deterrence—that is, the threat to destroy civilian population as retaliation against a nuclear strike—is thus immoral, even when this threat is part of a strategy to prevent war. MAD defies one of the most fundamental traditional ethics of warfare, the principle of noncombatant immunity, which has been in operation since World War II and which requires that deliberate physical harm be limited to military targets. Others will argue, however, that even if it is morally wrong under any circumstances to deliberately kill innocent civilians, it is not necessarily wrong to threaten (or intend to risk) such killings, provided that such threats are necessary to deter greater evils. Nevertheless, it is virtually impossible to untangle the good and the evil elements in this concept; the good is an aspect of the evil, and the evil is both the source and the possible outcome of the good it seeks to achieve.

Mysticism

DEFINITION: Belief that there is a single objective reality beyond or in excess of the tangible world, and that this reality may be accessed or known through subjective experience

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Controversy exists about the relationship of mysticism and ethics. Some claim that mystical experience supports ethical behavior, while others claim that it can lead to indifference to ethical issues.

Some religious thinkers and philosophers condemn mysticism because they view it as an attempt to escape from the duties and responsibilities of life. Ethical behavior presupposes a concern for self and others. Mystical experience occurs when a person directly perceives an undifferentiated unity that is beyond the deepest center of the individual self. While in the grip of mystical experience, one forgets everything else, including oneself and the world. Apologists for mysticism assert that although mystical experience involves a temporary withdrawal from the world and its problems, it is not intrinsically escapist. Mystical experience supports better ethical choices by expanding and sharpening awareness, making the person who has such an experience better able to assess the ethical ramifications of conduct.

DEFINITION OF MYSTICAL EXPERIENCE

Mystical experience is best defined first in terms of what it is not. Mysticism does not seek experience of the occult, such as that of ghosts or disembodied spirits. It does not include parapsychological phenomena, such as telepathy (communication at a distance), clairvoyance (perception beyond natural range of the senses), or precognition (knowledge of an event in advance of its occurrence). Mystical experience does not necessarily involve seeing visions or hearing voices. Individuals who are not mystics may possess supernormal powers or experience visions. Mystical experience is not necessarily associated with religion, although it is often sought for religious reasons and described in religious language.

The core of mystical experience involves an apprehension of an ultimate nonsensuous unity beyond all created things. Extrovertive mysticism finds the fundamental Unity manifesting itself in the diversity

of the world, while introvertive mysticism finds the One beyond the deepest center of the individual self. The Upaniṣads of India, spiritual treatises that date from 800 to 400 B.C.E. and provide some of the oldest descriptions of mystical experience in the world, record experiences of both extrovertive and introvertive mysticism. The Upaniṣads claim that the Ultimate Reality is both inside and outside creation. The person who beholds all beings in the Ultimate Reality and the Ultimate Reality in all beings is truly wise and free.

The extrovertive mystic perceives the One by looking outward. While appreciating the diversity of the created world, the extrovertive mystic perceives the objects of perception in such a way that the One shines through them. The medieval German mystic Johann Eckhart described an experience in which he found the grass, wood, and stone that he observed to be distinct and yet One. The extrovertive mystic perceives the One in all things. It is a type of experience that tends toward pantheism, the view that God and creation are identical.

Extrovertive mysticism is not the predominant way of experiencing the Unity beyond the multiplicity of the created universe. Introvertive mysticism is the most common kind of mystical experience. The introvertive mystic finds the One beyond the deepest center of the self in an experience of pure consciousness. Conscious but not conscious *of* anything, the mystic is absorbed in a state of alertness that does not contain any concept, thought, or sensation. The mystic's individuality seems to melt away into infinity. This oneness, encountered beyond the deepest level of the self, is often identified with God because it is experienced as being eternal and infinite, beyond space and time. Saint John of the Cross, the sixteenth century Spanish poet and mystic, described pure consciousness as a state in which the person is so united to the simplicity and purity of God that the awareness is pure and simple, devoid of all objects of perception.

The actual experience of undifferentiated unity is said to be independent of the interpretation given to it. Religious people associate the experience with God. The Jewish tradition identifies pure consciousness with the apprehension of divine glory, not with God's being; while the Christian and Islamic traditions identify it as an experience of union with God. Other philosophies and religious traditions, such as

Hinduism, tend to view pure consciousness as an experience of the impersonal Absolute in which the individual self merges with the Ultimate Reality.

Evidence of mystical experience is found in religious and philosophical traditions all over the world and in all periods of history. Mystical experience is usually incorporated into a religious or philosophical tradition the purpose of which is to secure full knowledge, salvation, or liberation for the people who participate in it. Each tradition recommends ascetical practices to prepare a person for mystical experience. These include the practice of virtue and right action, the removal of sin and inclinations toward evil, and the renunciation of personal desires. Ascetical disciplines are practiced to remove obstacles between self and the Ultimate Reality and to prepare the person to enjoy direct contact with the One beyond all created things.

OBJECTIONS TO MYSTICISM ON MORAL GROUNDS

Although virtuous behavior is usually considered to be a prerequisite for mystical experience, some philosophers and religious thinkers have objected to mysticism on the basis of their belief that it undermines the basis for ethical decision making. The experience of a fundamental undifferentiated unity beyond perception causes the experienter's awareness to transcend all distinctions, including the duality of good and evil. Mystical experience implies that the separation of the individual self, the created world, and the Absolute are illusions and that the eternal One is the only reality. All these ideas about the nature of mystical experience and the Ultimate Reality have implications for the mystic's approach to ethical issues.

The twentieth century theologian Paul Tillich objects on moral grounds to the experience of pure consciousness because individual identity seems to disappear when the mystic's awareness transcends all objects of perception. The experiencing individual, who is involved in relationships with self, others, and the wider environment, is necessary for morality. If all contents of consciousness disappear in mystical experience, the mystic steps outside both the positive and the negative elements of concrete experience. Those who transcend experience altogether allow themselves to forget about the existence of evil and problems in themselves and in the world. A truly

moral person cannot withdraw from life, from relationships with others, or from involvement with the community. By retreating into oneself in search of a private experience of union with Ultimate Reality, the mystic neglects ethics and social obligations.

Another twentieth century theologian, Martin Buber, objects to mysticism because the loss of awareness of individuality in pure consciousness leaves open to doubt the reality of each individual self and each thing in the world of ordinary experience. Ethical values and obligations can be applied only to real selves and real things. In addition, a relationship between real selves and real things is a prerequisite for moral and ethical activity.

Mysticism is also attacked on the ground that morality has no basis if the phenomenal world is considered to be an expression of the infinite and eternal One beyond space and time. If individuals are not really separate beings, then the mystic might conclude that the wrong perpetrated by one person against another is an illusion. There is no reason to intervene to stop injustice if the person who is being wronged and the offender are two aspects of one reality. In transcending all differentiation in pure consciousness, the mystic also transcends the distinction between good and evil. A person who considers evil to be an illusion may be apathetic in the face of it, choosing to accept it rather than change it or fight it. Since the mystic makes no moral distinctions while united with the Ultimate Reality, one might conclude that mysticism is amoral at best.

In early Christianity contemplation of the divine essence was valued more highly than action. Since the ultimate goal of moral action in the world is salvation or the contemplation of God in Heaven, life's highest aspiration is to gain pure consciousness, which prefigures life in Heaven. When the would-be mystic is advised to reject all love and attraction for created things in order to direct all love toward God, he or she is encouraged to neglect social and moral obligations. The pursuit of mystical experience seems to undercut morality when it is considered to be superior to ethical action. Work in the world is downgraded to second-class status.

Hinduism and Buddhism are especially criticized on moral grounds for emphasizing contemplation of the Ultimate Reality over action. Both traditions define salvation as *mokṣa*, or liberation from ignorance about the true nature of the self. Enlightenment

or salvation means the direct experiential knowledge that the individual self is in reality the Cosmic Self, the Ultimate Reality. The pursuit of *mokṣa* involves efforts to transform one's own state of consciousness and thereby change the quality of one's experience. The person is not primarily concerned with changing the world or fulfilling personal and social duties.

MYSTICISM'S CONTRIBUTION TO ETHICS

While apparently selfish reasons, such as the desire to escape personal suffering or gain eternal happiness, do inspire people to seek mystical experience; most mystics come to realize that mystical experience is not an end in itself. Supporters of mysticism on ethical grounds point out that the mystic prepares for mystical experience by concentrating on growing in virtue, developing self-discipline, and acting in accord with moral principles. In turn, mystical experience accelerates the growth of virtue and brings greater ethical effectiveness to the mystic's activity. Direct contact with the Ultimate Reality in pure consciousness has very direct and beneficial ethical consequences. Rather than a selfish and self-centered withdrawal from the world of action, the experience of pure consciousness is considered to be a most effective means of fostering right action.

The arguments against mysticism on moral grounds take the description of pure consciousness out of context. They disregard the ethical frameworks surrounding mystical experience, which demand moral conduct to prepare for it and consider moral conduct to be its fruition. They conclude that the experience of pure consciousness can have negative consequences for morality only in the sense that all distinctions are transcended within it. Although pure consciousness is an experience of undifferentiated unity, it does not necessarily lead the mystic to conclude that multiplicity and distinction are inconsequential. It does not make the mystic apathetic in the face of suffering and evil in the world. Mystics do not abandon ethical action because their enlightened state allows their awareness to go beyond distinctions between good and evil.

Such conclusions reflect a one-sided judgment of the impact of the experience of pure consciousness on the lives of the people who experience it. Advocates of mystical experience counter the objections to mystical experience on moral grounds by pointing to

the descriptions of enlightened individuals found in different traditions and the testimony of the lives of great mystics. It is a paradox that the experience of pure consciousness in which individual identity seems to dissolve into absolute nothingness can improve the quality of the person's action. Critics of mysticism fail to recognize that the experience of unity can provide a basis for ethical decision making and conduct that is as good as or better than that provided by the experience of the separateness.

Mystics are described as friends of God whose extraordinary virtues follow from the powerful intimacy with God that union with God in pure consciousness creates. They are held up as models for others to emulate. In the Christian tradition, a person's spiritual attainment is found lacking if that person claims to enjoy mystical experience but does not lead a life of exemplary virtue. The Christian tradition considers charity or love of self and others because of God to be the most important virtue. Charity requires the mystic to tend to the needs of others and not only focus on mystical experience.

Gregory the Great, a sixth century pope and theologian, maintained that mystical experience reinforces morality. He advocated a lifestyle that combined the cultivation of mystical experience (the contemplative life) with active service to others. According to Richard of St. Victor, a twelfth century Scottish mystic, after enjoying the heights of mystical experience, the contemplative goes out on God's behalf in compassion to others.

The Advaita Vedānta tradition, founded by the ninth century Indian philosopher Śankara, maintains that *Brāhmin*, the Ultimate Reality, is all that exists. The person who views *Brāhmin* as the only Reality does not engage in immoral acts. The enlightened person works for the benefit of others.

BUDDHIST MYSTICISM

According to Buddhism, the goal of mystical experience is nirvana, the annihilation of desire in pure consciousness. Four virtues grace the person who experiences nirvana: friendliness toward all creatures, compassion for all sentient beings and the desire to remove their suffering, joy in the happiness of all creatures, and impartiality toward them all. Since an enlightened person is no longer governed by egocentric considerations, he or she acts for the benefit of others. The *bodhisattva* exemplifies the highest ex-

ample of virtue and enlightenment in the Buddhist tradition. Just as the Buddha worked in compassion to relieve the suffering in the world by making known the experience of nirvana, the *bodhisattva* renounces nirvana out of compassion for all created things, vowing not to step out of time into eternity until all other created things have entered nirvana first.

In Buddhism the emptiness of nirvana is said to manifest as infinite compassion toward all created beings. The goal of the *bodhisattva* is to lose all ego-consciousness through expanding in boundless giving to others. Separateness of individual persons and things from each other and from the Ultimate Reality is not necessary to motivate virtuous behavior. The compassionate conduct of the *bodhisattva* exemplifies this fact. Oneness can also serve as the basis for ethical conduct.

CHRISTIAN MYSTICISM

Christian mystics especially emphasize that mystical experience overflows into love for others and action for the benefit of others. Pure consciousness in the form of the secret infusion of God's love into the soul is the source of moral activity. When the person loses the awareness of the boundaries of the individual self in pure consciousness, the once-separate self is aligned with the Ultimate Reality. The love that flows out of mystical experience has its basis in the realization of the One, which eliminates the separation between one's neighbor and oneself. All selfishness, cruelty, and evil originate in alienation from self and others.

The relationship between mystical experience and ethics is also explained by the paradoxical assertion that absolute fullness and virtue is located in unmanifest form in the apparent nothingness of pure consciousness. Saint John of the Cross, a sixteenth century Spanish poet and perhaps the most important European mystic, describes pure consciousness as the nothingness (*nada*) that contains everything (*todo*). Every experience of pure consciousness infuses absolute divine attributes into its recipient.

The process of personal development through mystical experience involves the progressive infusion of these divine qualities. The infusion of divine attributes implies a corresponding process of purification, the removal of personal limitations that disallow that infusion to be complete. The Upaniṣads call the Ultimate Reality the source of all virtue and

the destroyer of sin. The mystic's transformation through this dual process of illumination and purification improves his or her activity. The mystic performs action with a more finely tuned appreciation of right and virtue because contact with pure consciousness results in greater alertness and freedom from personal limitation.

Although initially a person might shun worldly concerns in order to concentrate on acquiring mystical experience, at some point, the mystic becomes concerned about moral issues. The life of Thomas Merton, the twentieth century writer and mystic, unfolded in this way. After seeking refuge from worldly life by entering a Trappist monastery near Louisville, Kentucky, he became increasingly concerned with the world he thought he had left behind. He called himself a guilty bystander who was implicated along with the rest of humanity in the crises and problems of society. His physical withdrawal from the world outside the monastery walls did not prevent him from trying to change the world. He attacked racism, the existence of nuclear weapons, and U.S. participation in the war in Vietnam. Merton exemplifies the contemplative who, by withdrawing from the world and devoting time to cultivating mystical experience, creates a certain distance between himself and the rest of the world that allows him to perceive evil more clearly. Merton became the prophet whose voice was heard in the wilderness, demanding the end to the madness of the nuclear threat and the injustice of racial discrimination. As prophet, the contemplative becomes involved and tries to communicate a vision of what God wants for society and for the world.

Personal limitations in the would-be mystic might initially motivate the person to seek mystical experiences in order to avoid problems or find personal salvation. Since mystical experience fosters increased awareness and removes personal limitations, however, at some point the mystic renounces such selfishness. The mystic's personal growth eventually translates itself into love and concern for others, two virtues that are fundamental for ethical decision making.

Mysticism does support ethics. The personal development that results from mystical experience provides the mystic with the means to reflect and to act in greater harmony with ethical and moral principles. Those who attack mysticism on moral grounds seem to disregard the evidence of the experience of the great mystics, who inspire others to emulate such high levels of personal integration and moral conduct that their admirers are tempted to proclaim them to be nothing less than perfect reflections of the divine on Earth.

N

Nader, Ralph

IDENTIFICATION: Pioneer crusader for consumer rights

BORN: February 27, 1934, Winsted, Connecticut

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Noted for his advocacy of consumer rights, Ralph Nader merged his socioeconomic interests with a political agenda by running for president of the United States in four elections. Although his campaigns did not win, they succeeded in focusing debate on violation of citizen and consumer rights.

Born to Lebanese immigrants to the United States, Ralph Nader graduated from Princeton University and the Harvard Law School. While working in the federal Department of Labor during the Kennedy administration in the early 1960's, he began his crusade as a consumer advocate and published a scorching exposure of safety abuses in the auto industry, *Unsafe at Any Speed*, in 1965. By the end of the 1960's, Nader and his "Nader's Raiders" had effectively pressured Congress to pass legislation to improve the safety of automobiles, the quality of meat and air, and open access to government information. Founding organizations for responsive law and public interests, Nader argued that producers had responsibilities to paying consumers and that government officials had legal and ethical duties to monitor the producers' fidelity to these responsibilities.

Throughout his reform campaigns, Nader found a common political problem. Corporations and business interests protected them-

selves from regulatory legislation by financing the election of politicians and by funding lobbyists to mold the legislation and regulations. As such funding mushroomed during the 1980's, Nader decided that he had to enter the national political arena in order to address that threat directly.

Nader's first presidential campaign, as a write-in candidate in 1992, was weakly organized and overshadowed by the antilobbyist rhetoric and fortune of Reform Party candidate H. Ross Perot. At that time Nader published *The Concord Principles*, his statement of ethical conduct in government. The document suggested ten procedures and practices citizens and their elected representatives could pursue in order to regain and maintain control of government against a minority of corrupted political and economic power brokers. Nader's 1996 bid for the presi-

Image not available

dency attracted support from the Green Party, a political entity dedicated to protecting the environment from industry.

Nader's 2000 presidential campaign, again waged with Green Party support, proved controversial among his supporters. Many thought that he pulled away votes from the ecology-minded Democratic Party candidate, Al Gore. Nader divided the environmentalist vote against the Republican Party candidate, George W. Bush, allowing the latter's victory. To Nader the key issue was the financial corruption of the electoral system, in which he thought that both major parties were hopelessly mired. The Green Party needed to win 5 percent of the national vote to qualify for federal funding in the 2004 election and thereby obtain a sustaining political status to combat both political corruption and environmental pollution. Nader failed to obtain enough votes to achieve future federal campaign funds but nevertheless ran for president again in 2004.

In 2001 Nader founded Democracy Rising, a non-profit organization, to continue the objectives of his campaign. Through its "People Have the Power" rallies in cities throughout the country, it alerted citizens to the need to combat public apathy and wrest civic interests from corporate manipulation.

Crucial to the support of Nader's efforts for consumer rights and responsible government has been the uniform recognition of his ethical integrity. Supporters and even foes of his efforts have repeatedly acknowledged the upright dedication of his work.

Nāgārjuna

IDENTIFICATION: Indian Buddhist philosopher

BORN: c. 150, India

DIED: c. 250, India

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Nāgārjuna founded the Mādhyamaka school of Mahāyāna Buddhism and developed the philosophy of *śūnyatā*, or "emptiness."

Nāgārjuna was an Indian Buddhist thinker central to the Mādhyamaka school of Mahāyāna Buddhism. He lived from approximately 150 to 250 and continued the classic Buddhist approach to liberation from suffering through mental discipline.

Nāgārjuna's innovation was the concept of "emptiness," or *śūnyatā*. This is a recognition that things have no meaning in themselves; instead, they derive significance from their relationship to other things. (For example, "day" has no meaning apart from "night.") This contextual understanding of meaning is called *pratītya-samutpāda*, or "dependent co-arising."

Despite the essential emptiness of the categories that people employ to understand the world, on a pragmatic level people have to use those categories in order to live. In terms of ethics, Nāgārjuna's contribution was to separate ultimate from conventional truths, because although people should live fully aware of the basic illusoriness of reality, they should also uphold a moral path in their daily lives. Rather than release from this world (*nirvāṇa*), Nāgārjuna believed the ideal to be that of the *bodhisattva*, or "enlightened being": living in the world but being aware of its insubstantiality and working for the benefit of all beings.

Nāgārjuna's thought has influenced Buddhism in Tibet, China, Korea, and Japan for the nearly two millennia since his death, particularly in the Zen tradition.

Nagel, Thomas

IDENTIFICATION: American philosopher

BORN: July 4, 1937, Belgrade, Yugoslavia

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Best known for his books *The Possibility of Altruism* (1970) and *The View from Nowhere* (1986), Nagel formulates a version of ethical realism that recognizes the existence of both objective and subjective reasons for action.

In his first book, *The Possibility of Altruism*, Thomas Nagel defends an extreme form of objectivism in ethics. He argues that objective reasons are the only legitimate kinds of reason. Thus, if someone has a reason to act in a way that will bring about some end, then everyone has a reason to bring about that end. Nagel's early view, then, was that there are only "agent-neutral" reasons, and thus there are no reasons that are simply "agent-relative."

SUBJECTIVE AND OBJECTIVE PERSPECTIVES

Nagel modified his view in *The View from Nowhere* by allowing for the possibility of agent-relative reasons. This change was, in part, due to his analysis of philosophical problems resulting from the human capacity to occupy increasingly objective perspectives. Nagel points out that transcending one's own subjective perspective is important in both science and ethics since new facts and values are revealed from the objective standpoint. However, it is a mistake to conclude from this that subjective perspectives are unreal or reducible to something more objective.

The recognition of irreducible subjective perspectives thus provides a metaphysical framework for acknowledging the reality of agent-relative reasons. These reasons stem from an agent's own desires and projects, deontological obligations not to mistreat others in certain ways, and special obligations to family members. However, such reasons cannot be explained in neutral terms making no reference to the agent, or in terms of the impersonal good.

ETHICAL REALISM

Nagel also employs the distinction between subjective and objective perspectives in his formulation of realism about values. The central claim of his version of ethical realism is that ethical propositions can be true or false independently of human judgment.

While Nagel's realism about science is based on the fact that there are mind-independent facts, his realism about ethics does not rest on an analogous view regarding the metaphysical status of values.

Many ethical realists are Platonists and thus believe that values are nonnatural entities or intrinsic properties of states of affairs. In contrast to this more metaphysical conception of ethical objectivity, Nagel's view is that people can transcend their own subjective perspectives and evaluate their reasons and motives from more objective standpoints. This process can lead them to reorder their motives in order to make them more acceptable from an external standpoint. Thus, they can discover motives and reasons for action that they did not have before. Nagel's later view thus endorses realism for both objective reasons that hold for everyone, independently of their individual perspectives, and subjective reasons that do depend on the specific standpoint of an agent.

Nānak

IDENTIFICATION: Indian religious leader

BORN: April 15, 1469, Rāi Bhoi dī Talvaṇḍī, Punjab (now Nankana Sahib, Pakistan)

DIED: 1539, Kartārpur, Punjab, Mughal Empire (now in Pakistan)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The founder of the Sikh faith, Nānak put forward a religious code of ethics that emphasized the equality of all people.

Nānak, who was born in Punjab, in what is now Pakistan, founded the faith known as Sikhism. Nānak was called *guru*, or spiritual teacher, and his followers were called Sikhs, or disciples. The religious system established by Guru Nānak was firmly monotheistic, rejecting idolatry and ritualism of all kinds. The Sikh community, called the *Panth*, was egalitarian in its social life, emphasizing rejection of the Hindu caste system through its tradition of eating at community kitchens. Charity toward the poor and defense of the weak characterized the Sikhs.

After Guru Nānak's death, there were nine successor gurus who led the Sikh *Panth* in turn. Various innovations were introduced, most notably involving greater militancy in the face of persecution, but all of them continued to build on the ideals established by Guru Nānak. After the death of the last guru, Guru

Gobind Singh, leadership passed to the holy book of the Sikhs, the *Guru Granth Sahib*. It is housed in *gurdwaras*, Sikh shrines where people gather to worship, eat together, and discuss community events. By the end of the twentieth century, there were about 16 million Sikhs in the world who claimed the heritage of Guru Nānak, most of them in the state of Punjab in India.

Napster

IDENTIFICATION: Site on the World Wide Web through which computer users share digital recordings of music

DATE: Began operation in early 1991

TYPE OF ETHICS: Arts and censorship

Image not available

Rapper Ludacris studies his song listings on the Napster Web site after the music-downloading site began offering downloads for fees in October, 2003. (AP/Wide World Photos)

SIGNIFICANCE: Napster's song-sharing software and Web site allowed Internet users to download songs to their own computers for free, prompting lawsuits from artists for copyright infringement, launching a major fight between the newest information technology and established copyright protections. Napster's eventual agreement not to violate copyright law saw the Internet partially brought under the control of the legal system.

The Napster Web site, with its song-sharing technology, prompted one of the earliest clashes between the Internet and some of the oldest laws in the United States. Users of Napster downloaded digital files of songs from the site and shared those songs with other users. Most of the songs distributed through Napster were protected under federal copyright law, which required the Web site to pay for their use and distribution. When Napster was sued by the copyright owners, ethical questions were raised about artistic freedom and property rights.

Copyrights are issued by the federal government, providing artists, writers and composers monopoly power over their creations for limited periods of time. Copyrights are given to provide incentives to creative persons, who earn money by selling access to their work. Eventually, all copyrighted works fall into the public domain and can be used by anyone without a fee. The Napster case presented a clash between those competing interests: artists wanting to protect their property and the public seeking to use technology to gain access to popular songs.

Public sharing of copyrighted songs raises ethical concerns about property rights and the right of artists to be rewarded for their efforts by selling their works, rather than having them traded freely. However, another ethical question arose when the artists sued for copyright infringement. Copyrights are intended to advance the creative arts by providing monetary incentives for artists to produce works. However, the protections granted to artists are to advance a general good—the furtherance of knowledge. Using copyright laws to restrict use of the Internet—one of the greatest tools for advancing knowledge ever developed—seems to defeat the purpose intended for issuing copyrights.

Internet users using Napster to download music were violating the copyright laws protecting artists.

Pious Pirates

When the Gospel Music Association conducted an online marketing study in early 2004, people within the Gospel music industry were dismayed to learn that avowedly Christian teenagers were pirating religious music from the Web at almost the same rate that other teenagers were pirating secular music. The study showed that many of the young Christian music pirates rationalized their illegal downloading of Christian music as an ethical way to help spread the Gospel. However, people in the industry thought that the practice violated the commandment, "Thou shalt not steal." Shawn C. Ames, a member of the Christian band Diligence agreed that downloading Christian songs was stealing, but called it "like stealing a Bible—why would someone have a problem with that?"

However, the reaction of the copyright owners, thousands of dollars of fines for people sharing music, was at times seemingly out of proportion to the damage being inflicted. Napster and its song sharing brought another technology under the partial control of government regulation. Napster's agreement to pay copyright owners and charge Internet users downloading songs may have marked a shift in the Internet from a freewheeling new technology to one that could become a center of profit-making activity.

Narcissism

DEFINITION: Excessive self-interest or self-love

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The primary hallmark of narcissism is understanding everyone else in terms of oneself. Narcissists thus violate the ethical principle that one should treat others as ends in themselves rather than as means for one's own ends.

Narcissism is a complex vice and a neurotic complex. The narcissus complex, identified by Havelock Ellis and by Sigmund Freud, involves an inordinate fascination with one's self—one's body, one's mind, one's actions.

Narcissism was named for Narcissus, a beautiful youth in Greek mythology who spurned all lovers. Nemesis, the avenger of *hubris* (inordinate pride), punished Narcissus by causing him to fall in love with his own reflection in the water, rendering him unable to move away. He was transformed into a flower by the gods.

Selfishness and immoderate self-love may be a part of the effects of narcissism, but there is a core that is unique to the vice. In some ethical systems, only the effects of narcissism could be judged culpable, but in natural-law analysis, at least, narcissism would itself be blameworthy as an "occasion of sin" and as an orientation of will and intellect whereby one denies the appropriate concern owed to one's fellow humans and the appropriate worship owed to God.

The neurotic complex might seem to be outside the considerations of ethics, but to the extent to which the complex developed as the result of freely chosen actions and freely entertained dispositions, it is blameworthy. To the extent that the proclivities of the complex could be resisted but are not, the complex is subject to ethical analysis.

Finally, narcissism must be viewed not only as an endangerment to one's relationship to God and to fellow humans but also as a warping of the proper development of the self. Narcissism causes the aesthetic judgment, the intellectual faculty, and the power of the will to be perverted from their proper outward orientation, stunted, and turned inward.

Narrative ethics

DEFINITION: Ethics involving the use of literature to engage in ethical inquiry

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Literature can illuminate realms of human experience that may be otherwise inaccessible to abstract philosophical prose and thus can enrich ethical reflection.

Several genres of literature may be seen to have didactic potential in that they can teach moral virtue. For example, moral fables are often edifying in this way, providing moral instruction by illustrating the rewards of virtuous action and the ill consequences resulting from immoral deeds. Epic stories of moral heroism may also instruct by example.

There are also ways in which good literature can go beyond moral instruction and stimulate ethical reflection. Certain ethicists turn to literature—ranging from the ancient tragedies to the modern novel—as moral philosophy because, they argue, narratives offer a philosophical view that is unavailable in conventional philosophical discourse. Philosopher Martha Nussbaum has argued that literary narratives illumine the contexts in which moral deliberation and action take place in ways that abstract rational principles do not. She suggests that literature is attentive to particularity, to the complexities and ambiguities in human life that are often flattened or omitted in abstract ethical reasoning. Moreover, moral philosophy can and should be concerned with particulars, since human life, like literary experience, cannot be reduced entirely to abstract generalizations. In addition to philosophers, some novelists see in literature the potential for posing important moral inquiry. For example, South African writer J. M. Coetzee's *Elizabeth Costello* (2003) and *The Lives of Animals* (1999) explore the borders of literary aesthetics and moral philosophy.

Reading literature may itself be a moral practice; this can occur because reading literature requires the reader to take another person's point of view, to step outside of one's own world and imaginatively enter into another's, which is a crucial skill in developing a moral sense. Literature can expand one's horizons by cultivating empathy and sympathy toward those quite different from oneself, a capacity vital for moral agency.

Nation of Islam

IDENTIFICATION: African American religious and social movement that proclaims adherence to the Islamic faith and practices as the way to achieve equality, justice, and freedom in all spheres of life

DATE: Founded in 1931

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: The Nation of Islam's use of Islam to proclaim a millennium in which white racist supremacy would be supplanted by black supremacy was unprecedented. The group's advocacy of separatism has placed it at the center of continuing controversies over the ethics of segregation in the name of activism.

Variouly referred to as Black Muslims, the Black Muslim Movement, the World Community of Al-Islam in the West, and the American Muslim Movement, the Nation of Islam is heir to the separatist and self-improvement ethics of Marcus Garvey's Universal Negro Improvement Association and the each-race-for-each-religion philosophy and strict ethical behavior of Noble Drew Ali's Moorish Science Temple. It is both a religious movement and a social movement. As part of the worldwide Islamic religion and as an African American expression of Islam, the Nation of Islam has evolved some uniquely radical ethics vis-à-vis the American racial problem.

HISTORY

The Great Depression of the 1930's was particularly difficult for African Americans. Living in overcrowded slums, laid off and displaced by white workers as jobs became scarce, culturally marginalized and insulted by welfare officials, most African American workers and their dependents resented the power and control wielded by white Americans. Noble Drew Ali had died and Marcus Garvey had been deported in 1927. A leadership vacuum among African Americans was thus created as the Great Depression arrived.

It was the destiny of Wallace D. Fard to fill this

leadership role by shaping the frustrations, anger, and energy of marginalized African Americans into an Islamic redemptionist religious movement that taught Afro-Asiatic history in house-to-house meetings and fiercely proclaimed a divinely ordained future era in which black supremacy would replace white supremacy and blacks would rule the earth. Such was the beginning of the Nation of Islam in Detroit, where it built its first temple as African Americans became members in large numbers. Fard was succeeded by Elijah Muhammad, and under the latter the Nation of Islam moved its headquarters to Chicago and spread to other states, building temples, schools, farms, apartment complexes, restaurants, and grocery stores. It developed a security force called the Fruit of Islam (FOI) and began its own publications. As it grew, the movement experienced some internal problems, and in the course of its years has had prominent leaders such as Malcolm X, Warith Deen Muhammad, and Louis Farrakhan.

POLARITIES

Although changing social circumstances have resulted in its changing or modifying its views and beliefs, especially as it moves toward orthodox Islam, the Nation of Islam has tended to see things in racial polarities to counteract what it sees as the racist ideology of the dominant American culture. In place of the Magnolia myth (the stereotype of music-making servile African Americans "lounging peacefully under the sweet-scented magnolias behind the big house—happy and contented in their station" as loyal servants to the generous master), which is the foundation of the idea that the African American is naturally docile, inherently imbecilic, and instinctively servile, the Nation of Islam created the myth of Yakub, which states that the "original man" to whom Allah (God) gave the earth to rule was the black man and his race, and that a rebellious scientist named Yakub performed a genetic experiment from which an inferior white race emerged. White supremacy is thus counteracted by black supremacy, and in this polarity it is the unnaturally white devils versus naturally divine blacks, and the white religion (Christianity) versus the black religion (Islam). The black Zion is where the white man is absent. Thus, there seems to be a strong determination by the Nation of Islam to belie white myths and beliefs.

ETHICS

The Nation of Islam adheres to strict moral behavior in private and social life. Its religious practices include praying five times a day, facing east toward Mecca and making proper ablutions (for the Muslim must be clean inwardly and outwardly) before praying. It is morally binding on members to attend temple activities; defaulters are suspended. The religion forbids certain foods, such as pork, both for religious reasons and to denigrate white supremacy (because the hog is “dirty, brutal, quarrelsome, greedy, ugly, a scavenger which thrives on filth . . . [and] has all the characteristics of a white man!”); in addition, black-eyed peas, cornbread, and chitlins must be avoided because they are not easily digestible and are a “slave diet”—and there are “no slaves in Islam.” Fresh lamb, chicken, fish, and beef are approved. Moderation in eating is encouraged. Members are also forbidden to gamble, use drugs, smoke, or consume alcohol.

Members of the Nation of Islam are encouraged to marry within the movement; those who marry outside the movement are pressured to bring their spouses to join it. Interracial marriages and liaisons may bring severe punishment, if not expulsion, and male members are expected constantly to watch and protect their women against the white man’s alleged degrading sexual obsession. Divorce is discouraged, though not prohibited. Sexual morality is strictly enforced under the puritanical vigilance of FOI. The use of cosmetics and the wearing of revealing and provocative clothes are forbidden. It is unethical for a married woman to be alone in a room with a man other than her husband.

Long before social and governmental agencies in America took seriously the relationship between crime and drugs, the Nation of Islam had developed a method for ferreting out and rehabilitating drug addicts so that they could remain themselves and stay away from crimes. It introduced a six-point drug therapy: making the patient admit his drug addiction; making him realize why he is an addict; telling him how to overcome this by joining the Nation of Islam; exposing him to the religious and social habits of the clean and proud members of the movement; making him voluntarily initiate a break from drug addiction with the full support and charity of the Muslim fraternity during the agony of the withdrawal period; and, finally, sending him out, when cured, to seek out

other drug addicts for rehabilitation. Under the watchful and caring eyes of the Nation of Islam, an ex-drug addict also becomes an ex-criminal, since the drug habit that requires stealing, killing, or engaging in prostitution to support it is eliminated.

The Nation of Islam believes that territorial, political, and economic separation of blacks and whites is necessary to the mutual progress, peace, and respect of the two races in North America; the alternative is for them to leave America—the blacks to Africa and the whites to Europe. It urges peace among brothers, including whites, but points out that peace with whites is impossible because the white man “can only be a brother to himself.” Members should be willing to die for dignity and justice if that becomes necessary, and should never hesitate to defend themselves and retaliate when attacked. The movement warns that “an eye for an eye and a tooth for a tooth” is the most effective manner to resolve racism, and that members should “fight with those who fight against [them].”

While respecting the “original” Bible, the Nation of Islam teaches that the Bible dedicated to the white man called King James has been corrupted and used by the Christian religion to enslave African Americans. Christianity thus becomes a “slave religion” teaching the oppressed to love and pray for the oppressor and the enemy; it further teaches the oppressed to offer both cheeks to be repeatedly slapped by the oppressor without retaliation, even offering the oppressor the cloak after the oppressor has taken away the coat of the oppressed. Christianity in this view is a “religion organized and backed by the devils for the purpose of making slaves of black mankind.”

The Nation of Islam encourages thrift and discourages buying on credit because “debt is slavery.” Members are discouraged from living beyond their means and wasting money. Hard work is extolled, and honesty, competence, cleanliness, and respect for authority, self, and others are expected of all members. The movement operates numerous businesses and encourages members to buy goods made by African Americans.

CONCLUSION

The dynamism of the Nation of Islam is in its ability to modify some of its views to changing circumstances. Although it asks for a separate nation, it

did not hesitate to support Jesse Jackson's attempt to run for the presidency of the United States in 1984. Keeping ethical behavior in perspective, Louis Farrakhan challenged Ronald Reagan's 1986 order that banned American citizens from visiting Libya and rebuked popsinger Michael Jackson for corrupting American youths by means of his effeminate behavior. Members of the movement have also castigated Michael Jackson for unethically disclaiming his blackness by bleaching his skin to a "leprous" color that is neither white nor black nor brown, and for destroying, through plastic surgery, the face that Allah gave him. The Nation of Islam makes strong demands on its adherents and draws attention to race relations in America.

National Anti-Vivisection Society

IDENTIFICATION: Organization established to abolish surgical experimentation on live animals

DATE: Founded in 1929

TYPE OF ETHICS: Animal rights

SIGNIFICANCE: The National Anti-Vivisection Society (NAVS) questions the validity of human domination over animals, believing in the fundamental equality of animals and humans.

As one of several national and international humanitarian organizations dedicated to the elimination of biomedical research using animals, The National Anti-Vivisection Society was formed as a reaction against more conservative animal welfare organizations such as the Humane Society of the United States and the American Society for the Prevention of Cruelty to Animals.

While these societies are dedicated to the prevention of cruelty and improvement of conditions for all animals, unlike the NAVS, they are not officially committed to the total elimination of animal experimentation for human gain. While vivisection narrowly refers to the surgical cutting of animals, with or without anesthesia, the term has been broadened to include any experimentation on animals. The anti-vivisection movement challenges the utilitarian notion that the sacrifice of animals for the greater good of humanity is acceptable and desirable, thereby condemning speciesism—the belief that humans have the right of domination over nature and are superior to animals. On a pragmatic level, the organization also challenges the usefulness and applicability of animal experimentation to human medical science.

National Association for the Advancement of Colored People

IDENTIFICATION: Organization established to fight for legal rights for members of minority groups in the United States

DATE: Founded on February 12, 1909

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: The National Association for the Advancement of Colored People (NAACP) was the first major organization to seek legislation at the national, state, and local levels banning racial discrimination.

With more than 500,000 members and 1,600 local chapters at the turn of the twenty-first century, the

NAACP promotes equality of rights for all Americans and continues to fight against racial discrimination in employment and education. It is an interracial organization seeking, through “litigation, legislation and education,” a complete end to racial prejudice and discrimination. Its most important victory came in *Brown v. Board of Education* (1954), when Thurgood Marshall, chief counsel for the NAACP and a future Supreme Court justice, successfully argued that the “separate but equal” doctrine established by the Court in 1896 was unconstitutional. Segregation by law was declared illegal, and school districts that separated students by race would have to begin to desegregate “with all deliberate speed.”

The National Negro Committee, out of which came the NAACP, was organized in 1909 in response to a bloody race riot in Springfield, Illinois, in 1908.

Roy Wilkins (second from right), who led the NAACP during the 1960's, confers with U.S. attorney general Robert F. Kennedy (left), Martin Luther King, Jr., and union leader A. Philip Randolph (right). (National Archives)

Two African Americans were murdered by a white mob and seventy more were injured. The state militia eventually restored order, but only after many homes in the black community were burned by a white mob and two thousand African Americans were forced to flee the city. No white rioters were punished.

William English Walling, a white southern journalist, was appalled by the death and destruction and called for “a large and powerful body of citizens” to come to the assistance of the African Americans in Springfield. At a national conference, the committee called for an end to “caste and race prejudice” and for “complete equality before the law.” W. E. B. Du Bois, the famous black scholar and future editor of the NAACP’s magazine *The Crisis*, along with Jane Addams, founder of Hull House in Chicago and a leading white advocate of equality, were among the early members.

Lawyers for the NAACP first appeared before the U.S. Supreme Court in 1915 and decided to seek out cases that violated the Constitution, especially the Fourteenth Amendment’s protection of equal rights for all citizens of the United States. In their first successful case in 1927, NAACP lawyers convinced the court that a state law denying people the right to vote unless their grandfathers had been registered to vote was unconstitutional. Without the NAACP’s litigation and successful pursuit of justice for all, equality of rights would have continued to be denied and segregation might still be the law of many states.

In 1915, the NAACP established a prize, the Spingarn Medal, to be given annually to the African American who had “reached the highest achievement in his field of activity.” Named for Joel E. Spingarn, a white professor of literature at Columbia University and longtime chairman of the board of directors of the National Association, the medal became the group’s highest tribute. Among the winners of the Spingarn Medal were Thurgood Marshall; W. E. B. Du Bois; George Washington Carver, the famous scientist; James Weldon Johnson, the poet; Carter Woodson, the historian; educator Mary McLeod Bethune; soprano Marian Anderson; novelist Richard Wright; labor leader A. Philip Randolph; chemist Percy Julian; U.N. diplomat Ralph J. Bunche; Jackie Robinson, the baseball player; poet Langston Hughes; and social scientist Kenneth Clark, for his work on the *Brown* decision.

National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research

IDENTIFICATION: Interdisciplinary body that formulated ethical guidelines governing the treatment of human subjects in federally funded research

DATE: Established in July, 1974

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: The commission was the earliest and most successful government effort to establish a basic code of ethical conduct regulating scientific inquiry.

From 1966 through 1972, several revelations that reputable scientists had routinely risked the health and well-being of subjects without their knowledge eroded public confidence in science. Many incidents involved poor, institutionalized, old, military, or prison populations. Most notorious were the 1972 Tuskegee Syphilis Study revelations. For forty years, Public Health Service researchers had studied the natural course of syphilis in poor African American men from Tuskegee, Alabama; the researchers kept the men unaware of the study’s purpose, failed to treat them, even when penicillin became available, and actively prevented outside treatment. In 1974, Congress established the commission and provided that its recommendations were to be accepted by the U.S. Department of Health, Education, and Welfare unless the reasons for rejecting them were made public.

The commission issued several reports, including the *Belmont Report: Ethical Principles and Guidelines for the Protection of Human Subjects of Research* (1979), which led to the establishment of comprehensive regulations. The basic regulations require that most federally funded researchers obtain informed consent, protect confidentiality, and minimize risks to subjects. Additional safeguards were implemented from other reports to govern research

on children, pregnant women, prisoners, and other special populations. The commission's impact extends beyond directly funded research. Since institutions receiving federal funds must ensure that all research is conducted ethically, most institutions review all research under the same guidelines, which have become the accepted standard for ethical research.

National Gay and Lesbian Task Force

IDENTIFICATION: Organization established to fight for full equality for gay, lesbian, bisexual, and transgender people

DATE: Founded in 1973

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: The National Gay and Lesbian Task Force (NGLTF) was the first national activist organization established on behalf of gay and lesbian rights. Its adjunct, the NGLTF Policy Institute, is the most significant national information clearinghouse and resource center dedicated to educating and organizing around gay and lesbian issues throughout the world.

The National Gay and Lesbian Task Force represents the estimated twenty-five million homosexual Americans and fights to secure full civil rights and equality for these citizens. Its activities involve strengthening and supporting grassroots groups; promoting research, education, and outreach; and providing activist leadership training to foster public policies to advance gay rights and end discrimination based on sexual orientation.

The NGLTF also compiles and publishes statistics on hate crimes (which increased 172 percent between 1988 and 1992), discrimination (the NGLTF has been working since 1975 to ensure passage of a federal civil rights bill that would end discrimination for reasons of sexual orientation in the areas of housing, employment, public accommodations, credit, and federally assisted programs), health care

(including AIDS-HIV concerns), and family issues (including domestic partnerships, foster and adoptive parenting, and child custody and visitation questions) and the impact of these problems on the gay community. The NGLTF lobby helped to secure the passage of the Federal Hate Crimes Statistics Act, the Americans with Disabilities Act, and AIDS emergency relief funding.

National Labor Relations Act

IDENTIFICATION: Labor law outlawing unfair practices by employers and legalizing important labor practices, including collective bargaining and the closed shop

DATE: Enacted on July 5, 1935

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The National Labor Relations Act represented an attempt by the federal government to promote harmony between labor and management and to avoid costly strikes in the midst of an already devastating Depression.

Within months of the U.S. Supreme Court's invalidation of the National Industrial Recovery Act of 1933, Congress, led by Senator Robert Wagner of New York, passed legislation to assist employees and at the same time attempt to cure industrial strife by eliminating its chief cause: strikes. The law (known as the Magna Carta of labor) would eradicate the underlying cause of strikes, unfair employer practices, by encouraging collective bargaining, thereby granting employees equal bargaining power with their employers. Using the National Labor Relations Board to administer its provisions, the act, which applies to all employers engaged in interstate commerce, provides governmental processes for the selection of employee bargaining representatives. The act prohibits employers from interfering with union formation, establishing a "company" union, discriminating against union workers, refusing collective bargaining, or retaliating against workers who file charges

under this act. Congress amended the act in 1947 to forbid the closed shop and again in 1959 to monitor union officials' activities.

National Labor Union

IDENTIFICATION: National federation of trade unions organized to secure workers' rights

DATE: 1866-1873

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The National Labor Union (NLU) represented an attempt to create a movement for economic equality which would parallel earlier national movements toward political and religious equality.

Fearing the widening economic gap between employer and worker, William H. Sylvis led the Molders' Union and other national labor (craft) unions to join forces to organize the NLU to lobby for the rights of labor. The platform of the highly political NLU provided a plan to maintain its laborers' freedom, equality, and stature in American life. The NLU advocated higher wages, an eight-hour day, cooperative stores, and government action to assist labor. Women and African Americans were encouraged to organize and participate in the NLU. Upon President Sylvis's death in 1869, the NLU split over such ethical issues as women's rights, labor party involvement, and monetary expansion. By 1872, the NLU had become essentially a labor party, and after its lack of success in the election of 1872, both the NLU and the labor party collapsed. The NLU established the first truly national association of labor unions and succeeded in lobbying Congress in 1868 to establish an eight-hour day for federal laborers and artisans.

National Organization for Women

IDENTIFICATION: Organization established to lobby for women's rights

DATE: Founded in 1966

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: The National Organization for Women (NOW) has become an organization of significant power in U.S. politics. It seeks statutory protection for what it believes to be fundamental moral rights.

NOW's activities are based on the assumption that women have been denied the opportunity for professional achievement because practices that discriminate against them are not illegal. Since the United States is committed to equality, NOW believes, its laws should prohibit practices that impede women's climb to success. The years of NOW's existence have been marked by controversy over what sorts of rights require legal protection if women are to advance. For example, most members of NOW believe that reproductive rights, including the right to abortion, must be protected by law if women are to be free to make career choices. Many antiabortionists support women's rights but criticize NOW for condoning killing.

Some members of NOW have argued that NOW should lobby to protect the rights of homosexuals and minorities if it is to help the advancement of women in those categories. Other members have responded that the organization can best serve the majority of women if it maintains a narrow focus on employment rights, as it did in its early years when it was headed by its founder, Betty Freidan, author of *The Feminine Mystique*.

National Park System, U.S.

IDENTIFICATION: Group of over 360 parcels of land owned, administered, and protected by the federal government

DATE: First park established in 1872

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: The National Park System seeks to preserve environmental resources from industrial development, unregulated tourism, hunting, and other encroachments, on the theory that the nation's populace has an interest in, or benefits from, the conservation of wilderness. The creation of new parks may raise ethical issues regarding federal seizure of private or state land.

In 1870, members of the Washburn survey decided, around a campfire, to recommend public ownership and preservation of scenic features in the Yellowstone region rather than claim them for themselves.

The First U.S. National Parks

<i>Date</i>	<i>Park</i>	<i>Location</i>
1872	Yellowstone	Wyoming, Montana, and Idaho
1890	Kings Canyon	California
1890	Sequoia	California
1890	Yosemite	California
1899	Mount Ranier	Washington
1902	Crater Lake	Oregon
1903	Wind Cave	South Dakota
1906	Mesa Verde	Colorado
1914	Everglades	Florida
1915	Rocky Mountain	Colorado
1916	Hawaii Volcanoes	Hawaii
1916	Lassen Volcanic	California
1919	Acadia	Maine
1919	Grand Canyon	Arizona
1919	Zion	Utah

This led Ferdinand Vandiveer Hayden, director of the U.S. Geographical and Geological Survey of the Territories, to lobby Congress, which established Yellowstone National Park in 1872. In 1886, the park was organized under the Army. In 1916, the National Park Service was established in the Department of the Interior, with Stephen Mather as its first director.

Mather organized the system, emphasizing preservation and display. During the mid-1960's, Congress responded to the land ethic by directing the establishment of wilderness areas within existing parks. The park system also has broadened its scope from preserving spectacular scenic areas such as the Grand Canyon to include significant historical sites, outstanding recreational areas, and areas designed to preserve practical examples of important ecosystems, such as the Florida Everglades. National Parks are established by acts of Congress that define their areas and control their operation. Some national monuments, such as Death Valley National Monument, are of the same character as national parks but are established and controlled by Executive Order, a power granted to the president under the Antiquities Act of 1906.

National security and sovereignty

DEFINITION: Political concept concerned with preserving the identity of a state as such and with protecting its citizens from armed attack by other states or groups

TYPE OF ETHICS: International relations

SIGNIFICANCE: National security presents ethical challenges for liberal democracies seeking appropriate balances between security and freedom.

Because liberal democracies are fundamentally open societies, ensuring national security poses special problems for those governments. Unregulated government surveillance of citizens and other such tools of more repressive regimes are generally considered

unacceptable within open societies. However, the September 11, 2001, terrorist attacks in New York and Washington, D.C., left Americans in shock from the devastation and carnage and predictably led to a rush of government actions aimed at increasing national security. These actions ranged from internal measures such as the passage of the Patriot Act of 2001 to external measures such as the NATO- and United Nations-sanctioned military attack against the Taliban government in Afghanistan, as well as the U.S.-led invasion of Iraq in 2003.

Although the U.S. Constitution places limits on government action, those limits are legal, not ethical, and in times of crises may be illusory. For example, during World War II, the federal government rounded up tens of thousands of American citizens of Japanese descent, confiscating their property and detaining them in “internment camps.” The U.S. Supreme Court upheld the detainment as constitutional in the time of war in its 1943 *Korematsu v. United States* ruling.

The ethical challenge for a liberal democracy in the face of severe threats to national security is to resist the temptation to abandon traditional ideals in favor of short-term measures that trade away too much freedom for not enough security, particularly in situations in which costs are concentrated on discrete groups. An especially dangerous temptation is to use a consequentialist approach, or strict cost-benefit analysis, to resolve all national security concerns.

RACIAL PROFILING

Because all nineteen terrorists implicated in the September 11 hijackings were young men from Middle Eastern countries—primarily Saudi Arabia—the federal government engaged in a dragnet that snared hundreds of young Middle Easterners residing in the United States. Some were quickly released, others were prosecuted in Detroit, Michigan, and in Portland, Oregon, and many others were held on charges of immigration violations. In addition, in complying with Federal Aviation Administration directives to conduct “secondary screening” of passengers and carry-on luggage, commercial airlines were accused of engaging in “racial profiling”; that is, selecting men of supposed Middle Eastern appearance for disproportionate numbers of such searches. In one notable incident, American Airlines kicked a United States Secret Service agent named Walied Shater off

The Mathematics of Racial Profiling

The seductive appeal of a racial profile lies in the belief that if members of group *X* are disproportionately more likely to commit a particular crime than other people, it makes sense to focus attention on group *X*. However, if only a tiny percentage of group *X* members commit the crime, then such a focus may be ethically questionable, as it would burden the overwhelming majority of law-abiding members of group *X*. It is instructive to consider the mathematics of profiling.

If a particular crime that is committed by only 0.1 percent of the general population is committed by 1.0 percent of the members of group *X*, then any individual member of group *X* is ten times more likely to commit the crime than a member of the general population. However, 99 percent of the members of group *X* are law-abiding with respect to this crime. Moreover, if all the members of group *X* constitute less than 10 percent of the total population, then fewer than half of the people who commit the crime in question are actually members of group *X*.

a flight on Christmas Day in 2001 because of “inconsistencies in his paperwork.”

Racial profiling was controversial even before the terrorist attacks. For example, a number of academic writers have long argued that the Drug Enforcement Agency’s “drug courier profile” contains a racial component. At least one federal judge reached the same conclusion in 1992, labeling it “a racist practice . . . that openly targets African-Americans” in *United States v. Taylor*.

TORTURE AND OTHER EXTREME MEASURES

The threat that terrorism, particularly after the September 11 attacks, poses to society also poses a challenge to ethical conduct in law enforcement and antiterrorism actions. With terrorist groups such as al-Qaeda seeking weapons of mass destruction, including nuclear weapons, a successful terrorist attack could result in the deaths of hundreds of thousands, if not millions, of people.

Given such potentially catastrophic dangers, it is not easy to remain wedded to the principle that the ends do not justify the means. Indeed, the problem has been well known to philosophers and law professors as the “ticking time bomb” scenario, in which authorities capture a suspect who knows the location of a time bomb due to detonate at any time. Can the authorities torture the suspect in order to determine the location of the bomb, thereby saving hundreds of lives?

One familiar line of thought on this scenario is the consequentialist approach, a simple cost-benefit analysis: the harm of torturing one person is presumably outweighed significantly by the gain of saving hundreds of people. The problem with the consequentialist approach from an ethical perspective is that it has no readily apparent limits and might justify, for example, the killing of a healthy person to harvest that person’s organs if doing so would save a large enough number of other sick persons.

Moreover, the ticking time bomb scenario offers comfort in the certainty that the suspect to be tortured is in fact the perpetrator, the bomb is real, and the only way to determine the bomb’s location in time to stop it is to employ torture. In real life, it is doubtful that law enforcement authorities will have the luxury of such perfect information, making decisions to employ torture even more ethically difficult.

IMPLICATIONS FOR ETHICAL CONDUCT

Consequentialism is a seductively attractive principle in implementing national security, particularly during times of crises when the potential casualty toll from a terrorist attack or an armed attack by a foreign nation can be staggering. Because consequentialism knows no limits, however, it is not an attractive ethical guideline, even in the name of national security. This is not to say that one should not consider the potential consequences of failing to take a step in the name of national security; but rather that the ethics of ensuring national security require more than just balancing of numbers.

Nationalism

DEFINITION: Loyalty to a nation and devotion to that nation’s interests over those of all other nations

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Nationalism is based, either consciously or unconsciously, upon the premise that one’s nationality is the most important aspect of one’s identity, overriding concerns of class, sex, race, religion, and so on. It may be seen as a vice, motivating unethical conduct, but it may also be seen as a virtue, in which case it is often called patriotism.

Nationalism is usually manifested in two forms: as a sentiment and as a movement. Nationalist sentiment is the feeling of anger aroused by the violation of the nationalist principle or the feeling of satisfaction aroused by its fulfillment. A nationalist movement is one that is actuated by a sentiment of this kind. There are various ways in which the nationalist principle can be violated. The political boundary of the state can fail to include all members of the nation or it can include them all but also be host to a substantial number of foreigners.

A nation may even exist in a multiplicity of states with no distinct political boundary, as in the case of the Jews before the creation of Israel in 1948. Another violation of the nationalist principle to which the nationalist sentiment is very sensitive and often hostile occurs when the political rulers of the nation belong to a nation other than that of the majority of people over whom they rule, a fact that explains the

violent resistance encountered by some imperialist and colonial regimes.

HISTORICAL ORIGIN

The roots of modern nationalism have been traced to what was for perhaps a hundred thousand years the basic social institution of humankind: the tribe. Out of this institution grew a sentiment of union that was nurtured and reinforced by common traditions and customs, by legends and myths, and, most important, by a common language. Prior to the sixteenth century, military conquests, commercial activities, and certain religions overflowed tribal barriers and imposed "international" loyalty in place of tribal loyalties. Tribal nationalism was thus systematically replaced by a form of internationalism, which meant the subjection of local group feeling to the claims of a great empire or the demands of an inclusive church.

During the sixteenth and seventeenth centuries, this traditional internationalism would also crumble as the Roman Catholic Church was disrupted by the rise of the Protestant Reformation and empires fell one after the other. Out of the ruins of the empires and the wreckage of the church emerged a new system for Europe. This system involved an agglomeration of peoples with diverse languages, dialects, and traditions, whose purpose was more to increase the wealth, prestige, and power of reigning families than to build up homogeneous nationalities. In France and England, and later in Spain, Germany, Italy, and Russia, the strongest noble families won the territory and, with their supporters, created monarchical governments that by the early eighteenth century had started evolving steadily into modern-day national states.

EVOLUTION TO NATION STATES

The evolution from monarchical governments to national states was catalyzed in the eighteenth century by the advent of the philosophers of the Enlightenment, who did more than anybody else to convert people's loyalty from the royal families and the church to the service of the nation. Prior to the eighteenth century, wars were usually dynastic and religious in origin and had nothing to do with individual rights. European peoples were bartered from one reigning family to another, sometimes as a marriage dowry, sometimes as the booty of conquest. In the same manner, overseas peoples were exploited by rival sets

of European tradesmen and soldiers, and there were great commercial wars to determine whether natives of America, Asia, and Africa should belong to Spain, France, Belgium, Holland, Germany, or England. The so-called national frontiers, which were referred to then as "natural," had been acquired by any means other than natural: force, guile, marriage, inheritance, purchase, diplomacy, and illegal confiscation, for example. Individuals (or subjects) could not choose to whom they wanted to give their loyalty.

Through the efforts of the Enlightenment philosophers, this status quo was challenged. Religion, which had hitherto been untouchable, was substantially demystified. The natural was substituted for the supernatural, and science for religion. The philosophers held that Christianity, be it Catholic or Protestant, was a tissue of myths and superstitions. In place of religion and the church, human reason was exalted and almost deified.

Perhaps the greatest contribution of the Enlightenment philosophers to modern nationalism was their insistence on the natural rights of the individual, and in particular the right of national self-determination, which allows the individual to choose the sovereign state to which to belong and the form of government under which to serve. Furthermore, they insisted that all governments should be for the good of the governed and that the prince should be the servant of the people. The first outbursts of modern nationalism (the French Revolution of 1789) were directly inspired and fanned by these principles.

THE SPREAD OF NATIONALISM

After the French Revolution, believing themselves to be the benefactors of the human race, the French were eager to impose their newly found liberty and their superior national institutions upon all of Europe and perhaps the world. That most of Europe and the world were not ready or willing to accept liberty *à la française* made little difference. French expansionism took precedence over its revolutionary messianism; what had been supposed to be a support for national liberation became a pretext for territorial expansion. Reacting to this turn of events, the rest of Europe became animated by the desire to resist the French. The name of France became not only feared but also hated. That fear and hate would later become fundamental in spreading the sentiment of modern nationalism, for it was in a bid to stop French expan-

sionist aggression that the rest of Europe started appealing to national sentiment.

From that point on, nationalism was well on its way to becoming the dominant force. For many people, the nation became the chief object of allegiance. The loyalty and devotion once given to old dynasties and the church were now given to the fatherland. The defense of the fatherland had become the end of most people's endeavors and almost the sole object, other than immediate family, for which they would willingly die.

ETHICS VS. REALPOLITIK

In the same way that the realization of a common culture and destiny as well as the instinct to survive induced a group to believe itself a nation, so they also made that group aware of the differences that set it apart from other groups. As these differences sharpened, so did feelings of national exclusiveness and the national dislike of others.

Friedrich Hertz's *Nationality in History and Politics* (1957) identifies two aspects of the spirit of nationalism: its positive and constructive side, which promotes national solidarity and freedom; and its negative and destructive side, which promotes the mental seclusion of the nation, leading to mutual distrust and prejudice, and culminating in a striving for superiority and domination. In the latter case, nationalist sentiment is often accompanied by a show of national aggressiveness, in which, more often than not, the primary aim is the quest for national honor, which in turn is expressed in terms of power, superiority, a higher rank among nations, prestige, and domination. In other words (to echo the thoughts of Niccolò Machiavelli), the aims of politics in the national interest became ultimately centered on the acquisition of land, human energy and resources, and the relative weakening of other powers.

By the beginning of the nineteenth century, realpolitik nationalism had become the new religion of the people. Boyd C. Shafer, in *Nationalism: Myth and Reality* (1955), finds a number of parallels between the "new faith" and many of the distinguishing marks of the "old religions." According to him, like the traditional religions, nationalism developed a morality that had its own rewards and punishments, virtues and sins, and missionary zeal. There were many similarities, even in the fanaticism with which those of contrary opinions were persecuted in the

name of the new "divinities": liberty and fatherland. The similarity with religion did not end there.

Like the Christians, "good" nationalists were zealous in spreading their gospel, as indicated by the national imperialistic and colonial ventures of the nineteenth century, although behind the new national will for expansion, the motives were mixed and sometimes contradictory. Bourgeois entrepreneurs coveted trade and profit, politicians sought popularity, military men wanted glory, some hoped to propagate liberty and the Christian faith, and others were simply looking for adventure. That this might mean a denial of other people's right to a fatherland made no difference.

Nationalism became more and more violent and exclusive as people began to show an absolute faith in their superiority over other nationalities. National egoism, becoming more and more intensified, came to be accepted as moral and therefore desirable. Thus, most Western European powers, particularly France and Britain, acquired huge colonial empires to serve their national interests and bolster their national power. Germany, Italy, and Japan, all in the name of the nation, embarked on a series of expansionist aggressions that later culminated in World War II. After the war, in order to consolidate its national power, the Soviet Union pushed westward in Europe to absorb the Baltic states, making Poland, Czechoslovakia, Hungary, Romania, and Bulgaria into satellite nations. Finally, the United States, in an effort to propagate its own form of democracy abroad and thereby ensure its national security, "fought" the Cold War.

Nationalism also comes in other forms besides that of aggression against other nations. In some cases, it is manifested in the form of intolerance and aggression against internal opposition (totalitarian regimes), minorities (such as the Iraqi Kurds), or a racial segment of the population (as in apartheid-era South Africa). When this happens, more often than not, nationalism becomes a disruptive force, tending to destabilize rather than enhance social order. It may even come in a form of economic egotism, such as protectionism. During the early stages, political considerations dominated nationalism, but over the years, a tendency developed to regard the state as an economic as well as a political unit. Economic nationalism merged with imperialism to become one of the driving forces of modern history.

Thus, over time, nationalism had evolved from its original phase of liberalism as conceived by the Enlightenment philosophers, when reason, tolerance, and humanitarianism were the watchwords, and had become inevitably tied to the *realpolitik* that had begun with the rivalries of earlier tribal groups. In its process of transformation from a positive to negative force, liberal nationalism gradually deteriorated until it lost most, if not all, of its earlier moral character. Just as Machiavelli excluded morality from politics, so did Georg W. F. Hegel during the early nineteenth century place the nation-state above morality, a legacy that continued well into the twentieth century.

THE IMPERIALIST/COLONIAL LEGACY

In *Macro-Nationalisms: A History of the Pan-Movements* (1984), Louis L. Snyder identifies two lesser-known but important satellite movements running concurrently with established modern nationalisms.

The first movement involves the many mini-nationalisms that are seeking to break away from the established nation-states. The disadvantage of modern nationalism as it emerged from the European model in the eighteenth century is that it presupposes a common language and a reasonably homogeneous society. By the middle of the twentieth century, however, few states could claim to be “pure” nations with a completely homogeneous ethnic composition. Thus emerged the problem of minorities, their rights, their dubious loyalties, and their mistreatment by the majorities.

Expansionism, which was begun in the eighteenth and nineteenth centuries and which hitherto had been an attribute of national power, eventually became a Pandora’s box for the imperialist powers, as problems of homogeneity and self-determination forced issues of nationalism into the forefront of global politics. This is particularly true of some Western European states, in which many mini-nationalisms inside the established nation-states seek to break away from larger units; for example, France (Corsica), Spain (Basque), and Britain (Catholic Ireland). Meanwhile, in the East, for similar reasons, the Soviet Union completely disintegrated, giving way to a multiplicity of new nations; Czechoslovakia gave birth to two autonomous states, while the former Yugoslavia, which is terribly divided along ethnic lines, engaged

in a bitter civil war to determine the fate of the newly created “nations.”

The second movement involves the many macro-nationalisms that seek to expand the established nation-state to a supranational form. According to Snyder, macro-nationalisms, or pan-movements, seek to promote the solidarity of peoples united by common or kindred languages, group identification, traditions, or characteristics such as geographical proximity. Like established nationalisms, they reveal an aggressive impulse that seeks to control contiguous or noncontiguous territory. In addition to this power syndrome, they are also animated by specific elements: for Pan-Slavism, it was messianic zeal; for Pan-Germanism, territorial expansion; for Pan-Arabism, religious zeal; for Pan-Africanism, racial unity; for Pan-Asianism, anticolonialism; for Pan-Americanism hemispheric solidarity; and, finally, for Pan-Europeanism, economic unity.

The moral issues involved in the nationalism of Europe are different from those that operate in other parts of the world—especially in Asia and Africa—principally because, from the onset, the liberal values of the Enlightenment were not applied to the colonial possessions. Anticolonial nationalism was an intellectual response to this contradiction. Most of the peoples in these two continents were initially united in their struggle to gain national independence and to secure better standards of living for their people. Almost everywhere in the Third World, the ideology of nationalism was firmly linked to the ideology of development. Unfortunately, in some of these cases, nationalism and self-determination have had to be settled not by votes but by armed conflicts.

In Africa, the situation became particularly delicate when colonialism bestowed on the new states administrative structures that were anything but ethnically homogeneous. To preserve or attain national independence, African people have had to resort to civil wars (Belgian Congo, Nigeria, Sudan, Ethiopia), terrorism and guerrilla warfare (South Africa); or even full-scale war (Morocco).

THE MORAL LEGACY

In conclusion, it could be said that during the course of the twentieth century, the nationalist process matured into a real cult of superiority in which nationalism assumes the role of a “political religion,” with prestige and power as its “supreme gods,” as

was the case in Nazi Germany and Benito Mussolini's Italy. Governments acted as they pleased, in their own national interest, and were limited only by superior strength, although in almost all cases elaborate efforts were made to cloak all acts of nationalism in moralism. Even the superpowers had to resort to the moral crusade to identify their own standards with general humanitarian principles to legitimize nationalistic endeavors. Thus, in the Cold War, the United States and the Soviet Union not only challenged each other along political and economic lines but also presented themselves as bearers of universal moral systems, proclaiming standards that they recommended for all nations.

Native American casinos

DEFINITION: Legal gambling establishments owned and operated by officially recognized Native American tribes

DATE: 1979 to the present

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: By taking advantage of their special legal status as sovereign nations, many Native American tribes have opened highly profitable gambling centers that have raised a number of ethical questions about the fairness of their tax exemptions, the unequal distribution of benefits among impoverished tribes, and the morality of profiting from gambling, which many people regard as an inherently sinful activity.

Is gambling the answer to Native American impoverishment—the "new buffalo," as some Native Americans have called it? In some places, such as the Pequots' Foxwoods Resort Casino, in Connecticut, legalized gambling has been an economic boon, as members of small tribes have been enriched. For others, such as the New York Oneidas in upstate New York, gambling has provided an enriched upper class with the means to hire police to force dissident anti-gambling traditionalists from their homes.

The Foxwoods Money Machine

The Mashantucket Pequot's Foxwoods Resort Casino complex in Connecticut began as a small bingo parlor after roughly forty banks refused to lend the tribe money for a larger project. The bingo parlor began operating in 1986 and became wildly successful, drawing its clientele mainly from the urban corridor that stretches from Boston to New York City. With the profits from the bingo parlor, the Pequot's opened a full-scale casino in 1992. By the year 2000, the resulting Foxwoods complex was drawing about fifty thousand gamblers on an average day. The surrounding complex included five casinos containing more than 300,000 square feet of gaming space, 5,842 slot machines, 370 gaming tables, a 3,000-seat high-stakes bingo parlor with \$1,000,000 jackpots, a 200-seat Sportsbook, and a

keno lounge. The Foxwoods casino complex also included four hotels, twenty-three shopping areas, twenty-four food services, and a movie-theater complex, as well as a museum.

Foxwoods quickly became a financial success for its sponsors, as well as the state government of Connecticut, to which the casino's management pledged a quarter of its profits. During the fiscal year spanning 1999 and 2000, Foxwoods' gross revenues on its slot and video machines alone totaled more than \$9 billion. Foxwoods and a second casino, the Mohegan Sun, with thirteen thousand employees, paid the state of Connecticut more than \$318 million in taxes during the 1999-2000 fiscal year.

Although many Native American cultures traditionally practiced forms of gambling as a form of sport—such as the Iroquois Peachstone game—there is no traditional Native American precedent for large-scale experience with gambling as a commercial enterprise. The history of reservation-based commercial gambling began during 1979, when the Seminole of Florida became the first Native nation to enter the bingo industry.

By the year 2000, Native American gaming revenue had grown to \$10.6 billion—a figure representing 16 percent of the \$64.9 billion generated by gaming in the United States as a whole. According to the National Indian Gaming Association, Indian gaming was contributing approximately \$120 million in state and local tax receipts annually by 2002. Moreover, gaming patrons spent an estimated \$237 million in local communities around Indian casinos.

Of the 562 federally recognized Native American governmental entities in the United States at that time, 201 participated in class II or class III gaming by 2001. Class II includes such games as bingo, pull-tabs, lotto, punch boards and certain card games permissible under individual state laws. Class III includes everything else, including casino-style table games, such as roulette and craps, and card games, such as poker and blackjack. Indian casinos operated in twenty-nine states under a total of 249 separate gaming compacts.

THE ONEIDA EXAMPLE

By the 1960's, the landholdings of New York's Oneida tribe had been reduced to a mere thirty-two acres, east of Syracuse, with almost no economic infrastructure. Three decades later, the New York Oneidas owned a large casino, the Turning Stone, which had incubated a number of other business ventures. Many of the roughly one thousand Oneida people who resided in the area were receiving substantial material benefits.

Despite the economic benefits, a substantial dissident movement arose among Oneidas who assert that Ray Halbritter, the "nation representative" of the New York Oneidas, had never been voted into his office. The dissident group was centered in the Shenandoah family, whose members include the notable singer Joanne Shenandoah and her husband, activist Doug George-Kanentiio. The dissidents argued that the New York Oneidas under Halbritter had merely established a commercial business, called it a "nation," and then acquired the requisite approvals from New York State and the federal governments to use their status to open the Turning Stone.

Under Halbritter's direction, the New York Oneidas appointed a "men's council"—an unheard-of body in traditional matrilineal Iroquois law or tradition—which issued a zoning code to "beautify" the Oneida Nation. That code enabled Halbritter's fifty-four-member police force to evict from their reservation homes Oneidas who opposed his role as leader of the tribe. Halbritter's control also was supported by the acquisition of *Indian Country Today*, a national Native American newspaper.

The experience of the Oneidas raised several ethi-

cal questions, among them the question of whether the Oneida model might be a key to defining the future of Native American sovereignty. Critics wondered if the Oneidas' economic gains had been offset by an atmosphere of authoritarian rule and a devastating loss of traditional bearings, as many Oneida dissidents believe.

CULTURAL INTEGRITY

Writing in *Modern Tribal Development* in 2000, Dean Howard Smith erected a theoretical context in which he sought a model for Indian reservation development that would be consistent with "the cultural integrity and sovereignty of the Native American nations . . . leading to cultural integrity, self-determination, and self-sufficiency." Instead of being assimilated into an industrial capitalistic system, Smith believes that Native American traditions can be used to design "a new type of system that incorporates competitive behavior, social compatibility and adaptation, and environmental concerns."

Native American ethics

DEFINITION: Diverse set of ethical systems and moral codes of North America's tribal peoples

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Many Native American cultural traditions and worldviews differ significantly from those of Western traditions. The history of the interactions between Western colonizers and Native Americans, moreover, has imparted a unique status to the ethical systems of the latter group, which have been appropriated by many political dissidents and used as the basis for critiques of modern environmental and capitalist practices.

Several problems attend to any overview of Native American ethics. First, students of Native American cultural traditions have rarely focused on the topic of ethics, and therefore the amount of material available is minimal. Introductory texts on Native American religions typically fail to consider the topic. For example, Åke Hultkrantz's *The Study of American Indian Religions* (1983) and *Native Religions of North America* (1987), Sam D. Gill's *Native American Religions: An Introduction* (1982), and Lawrence E. Sullivan's *Native American Religions: North America* (1989) have no entries for "ethics" or "morality."

Second, the few scholars who did give some consideration to the manners, customs, and moral codes of Native American peoples generally had no formal training in ethics. Those who did tended to assume that the moral categories defined by the Western philosophic and religious traditions could be transferred to Native American cultures without any fear of misrepresentation. Thus, these scholars were preoccupied with questions of sexuality and general social structures, whether or not these were considered of prime importance by the natives.

Finally, the phrase "Native American ethics" suggests historical fiction. Only in the last four decades of the twentieth century did any pan-Indian identity emerge for Native Americans. The reality is that each tribal tradition considers itself to be a unique entity with a specific identity and cultural web.

TRAVELERS AND MISSIONARIES

Historically, Western discussions of the moral condition of Native American peoples date from the fifteenth century. For the next four centuries, materi-

als relating to the ethics of Native American peoples primarily were recorded in the accounts of early travelers and missionaries. Typically, the debate centered on the question of the status of Native Americans as moral beings.

The earliest example dates from 1550, when Charles V of Spain summoned Juan Gines de Sepúlveda and Bartolomé de Las Casas to Valladolid to hear arguments on the nature of the beings discovered in the New World. Sepúlveda argued that the "Indians" were natural slaves. His evaluation provided justification for the Spanish system of *encomiendaro*. Las Casas, having spent four decades in the New World, provided broad evidence for a contrary view that the natives were highly developed and possessed natural virtues. New England Calvinists and romantics in the tradition of Jean-Jacques Rousseau carried forth the ignoble-noble savage debate into the twentieth century.

ANTHROPOLOGICAL AND ETHNOLOGICAL STUDIES

During the mid-nineteenth century, Max Müller, Edward Tylor, Herbert Spencer, and other evolutionary positivists used the existing materials on Native American cultures to serve their universal theories of human development. Spencer, for example, concluded that "savages" lacked the necessary mental capacities to make moral distinctions, while Tylor argued that primitive peoples had not risen to the stage of ethical development that is characteristic of higher religions. These ethnocentric appraisals of "primitive" peoples in general, and Native Americans specifically, continued to inform the study of Native American peoples through the first half of the twentieth century.

Led by Franz Boas and Clark Wissler, twentieth century anthropological and ethnological studies of Native American cultures tended to ignore religious topics except as they contributed to cultural or diffusionist theories. Discussions of social relations focused on kinship patterns and formal social organization. Boas's *Kwakiutl Ethnography* (1966), for example, contains no references to ethics, moral codes, or values. Paul Radin's *The Winnebago Tribe* (1923) and *The Trickster* (1956), Ruth Benedict's *Patterns of Culture* (1934), and Gladys Reichard's *Navaho Religion* (1950) use psychological approaches that reduce moral values to the satisfaction of human

needs. Religion, when considered, focuses on topics such as the supernatural, sorcery, and witchcraft to the exclusion of ethical matters. Ruth Landes's *Ojibwa Religion and the Midéwiwin* (1968), for example, limits the term "ethics" to a distinction between "good" and "evil" in the context of sorcery and witchcraft, with no discussion of the ethical principles that might inform those evaluations.

PHILOSOPHICAL AND EMIC STUDIES

Richard Brandt's *Hopi Ethics* (1954) and John Ladd's *The Structure of a Moral Code* (1957) provide the only published formal theoretical studies of Native American ethics. Brandt and Ladd conclude that pragmatism best characterized Hopi and Navaho ethics. Brandt's methodology uses native interviews about ethical issues defined by Brandt rather than by the Hopi. Ladd's methodology is aimed at hypothetical reconstruction of Navaho ethics from the native point of view. Both Brandt and Ladd assume that ethics is concerned exclusively with social relations and therefore give little consideration to religious issues.

A. Irving Hallowell's *Ojib-wa Ontology, Behavior, and World View* (1960) marks a turning point in the study of the ethics of Native American peoples. Hallowell concluded that the key to Ojibwa behavior and worldview is found in a distinctive ontology that, on one hand, expands the category of person to include "other-than-human persons," and, on the other hand, defines moral behavior relationally. N. Scott Momaday's "The Man Made of Words" (1970) suggests that the idea of appropriation and the related concepts of appropriateness and propriety guide Native American relationships. Dorothy Lee's *Freedom and Culture* (1959), Howard Harrod's *Renewing the World* (1987), and Fritz Detwiler's "All My Relatives" (1992) further argue for the relational nature of the ethics of Native American peoples based on the expanded notion of "person." Harrod's work, in particular, grounds ethics in ritual experience. Through ritual, the ethical bonds that sustain a relational worldview are renewed and enhanced. If a relational ontology is fundamental to Native American worldviews, then further investigation of Native American ethics from a relational perspective is required.

Native American genocide

DEFINITION: Long, slow destruction of the indigenous peoples of the Americas and their ways of life

TYPE OF ETHICS: Race and ethnicity

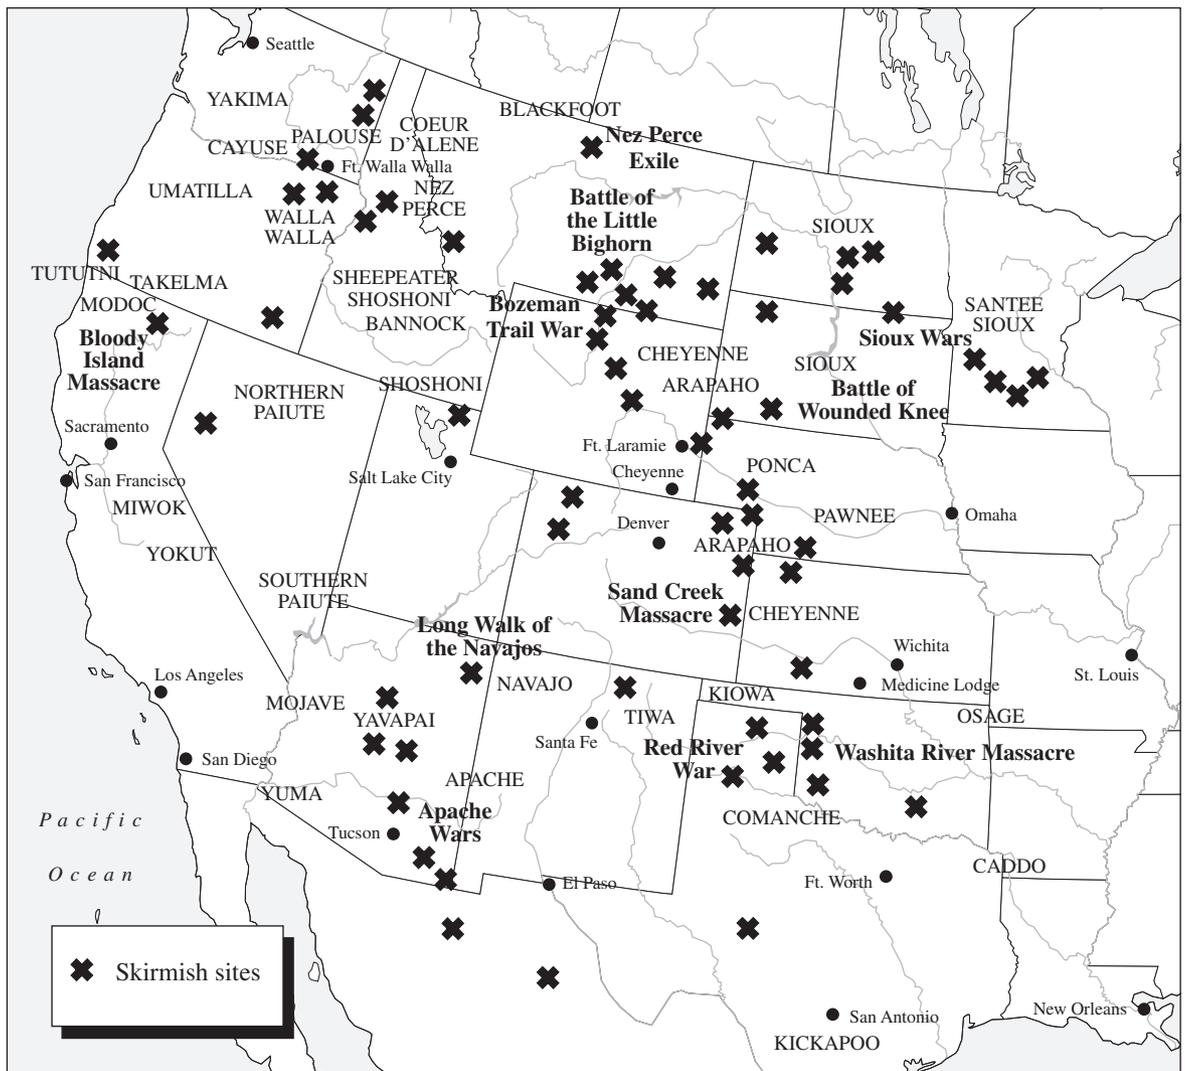

SIGNIFICANCE: European Americans justified the extermination of millions of Native Americans by judging them to be less than human.

The European discovery of the New World had devastating consequences for the native population. Within a century of Christopher Columbus's landing in 1492, the number of people living in the Americas had declined from more than twenty-five million to a few million. Whole societies in Mexico and South

America died within weeks of initial contact with Spanish explorers and adventurers. The major cause of the devastation was disease. Native Americans had lived in total isolation from the rest of the world since first arriving in the New World from Central Asia around 20,000 B.C.E.; hence, they had escaped the devastating epidemics and diseases, such as small-pox and the plague, that had afflicted the rest of humankind for generations. Such diseases normally required human carriers to pass them on to others, and such conditions did not exist in the New World until after 1492.

Columbus and his crew made four separate voyages to the New World between 1492 and 1510, and on each of those voyages sailors brought new diseases with them. Even the common flu had devastating consequences for defenseless Native American babies and children. Other people of the world had built up immunities to these killers, but Native Americans had none, so they died in massive numbers. During the sixteenth century, most of the dying took place from Mexico south, since the Spanish appeared to be uninterested in colonizing North America. Only after the English settled Jamestown in 1607-1608

Indian Wars in the American West, 1840's-1890

Examples of Native American Tribes That Were Exterminated

<i>Date</i>	<i>Tribe</i>	<i>Region Inhabited</i>	<i>Cause</i>
1513-1530	Calusa	Florida	Spanish warfare
1617-1633	Massachusetts	New England	Smallpox
1637-1638	Pequot	New England	English warfare
1637-1705	Powhatan	Virginia	English warfare
1675-1676	Narraganset	Rhode Island	English warfare
1675-1763	Susquehannock	New York	Disease and wars
1706-1717	Chitimacha	Louisiana	French warfare
1716-1731	Natchez	Mississippi	French warfare
1782-1853	Chinook	Columbia River region	Smallpox
1873-1905	Yavapai	Arizona	Tuberculosis

and Plymouth in Massachusetts in 1620 did the epidemics affect Native Americans in that region.

The first major tribe to be exterminated in North America was the Massachusetts of New England, whose population died out completely between 1619 and 1633 from a smallpox epidemic. Yet other things besides disease were killing Native Americans. Most Europeans believed that the people they came across in their explorations were not truly human at all, but instead savage, inferior beings who had no law and order, no cities, no wealth, and no idea of God or progress. When they died from “white man’s diseases,” this offered further proof of the weakness and helplessness of the population. They could not even make good slaves because they died so quickly from “minor” illnesses. That is why the Europeans turned to Africa for their supply of slave laborers; Africans, who had had a much longer history of contact with other peoples of the world, had built up immunities to the killing diseases. Native Americans were not so lucky.

U.S. GOVERNMENT POLICIES

As time passed, immunities were built up by native peoples, and fewer tribes were extinguished by diseases. Warfare, however, continued to take its toll. Thousands of Native Americans died defending their homelands from American settlers in the aftermath of the War for Independence. Native Americans

were not made citizens by the Constitution of 1787 but were legally defined as residents of foreign nations living in the United States. Wars and conflicts over territory had devastated many tribes by 1830. In that year, President Andrew Jackson and Congress adopted a program, the Indian Removal Act, that they hoped would put an end to wars with the Native Americans. Under this new act, the American government would trade land west of the Mississippi River for land owned by the tribes in the east. Land in the west, acquired from France in 1803 as part of the Louisiana Purchase, was deemed unsuitable for farming by Europeans. Native Americans, on the other hand, would be able to survive on the Great Plains, called the “Great American Desert” by most whites, by hunting buffalo and other game.

Congress authorized the president to exchange land beginning in 1831. Three years later, a permanent Indian Country was created in the West and settlement by whites was declared illegal. By 1840, Indian Removal was complete, though it took the Black Hawk War in Illinois, the Seminole War in Florida, and the terrible march forcing the Cherokee from Georgia to the Indian Territory, to complete the process. At least three thousand Native American women and children died at the hands of the U.S. Army on the Cherokee “Trail of Tears.” Indian Removal meant death and disaster for many eastern tribes.

Conflict was reduced by the program only until

whites began moving into the West during the 1860's. During the U.S. Civil War (1861-1865), several Indian Wars were fought in Minnesota and Iowa, and the infamous Chivington Massacre took place in Colorado in 1864. In this incident, 450 Native Americans were slaughtered without warning in a predawn raid by the Colorado militia. To prevent massacres in the West, Congress enacted a "reservation policy," setting aside several million acres of western lands for "permanent" Indian settlement. The Army had the job of keeping the tribes on their reservations. Frequent wars resulted as Great Plains tribes attempted to leave their reservations to hunt buffalo and the army drove them back.

Problems increased with the coming of railroads. The first transcontinental railroad began carrying passengers in 1869. Huge buffalo herds presented the railroads with a major problem, however, because they took hours and sometimes days to cross the tracks. To keep trains running on time, railroads hired hunters to kill the buffalo. By the late 1880's, they nearly accomplished their goal of killing off all the herds. Buffalo had once numbered 100 million, but by 1888, there were fewer than 1,000. With the destruction of the buffalo came the end of the Native American way of life.

The final war was fought in 1890 in the Black Hills of South Dakota on the Pine Ridge Reservation. An Indian holy man claimed that the whites would disappear and the buffalo would return if Native Americans danced a Ghost Dance. Magical shirts were given to the dancers that were supposed to protect them from white men's bullets. When the white Indian agent asked Washington for help to put down the Ghost Dancers, the Army responded by killing hundreds of the Native Americans, whose magical shirts did not work.

Native Americans did not become American citizens until 1924 and were required to live on reservations. Not until 1934 was self-government granted to the tribes, and by that time the reservations had become the poorest communities in the entire United States. The reservations continue to have the highest levels of unemployment, alcoholism, crime, and drug addiction found in U.S. communities. These signals of social disintegration and disruption are the final results of a policy of extermination that began in 1492.

Natural law

DEFINITION: Moral law existing in, or deriving from, nature rather than culture

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The many contradictory permutations of natural law theory share the notion of a universal law common to all humanity and derived in some fashion from nature or from the natural (pre-social) state of humanity. This notion is broad enough to have supported religious, secular, optimistic, pessimistic, human-centered, and non-human-centered versions of the theory.

The natural law theory of morality has its roots in classical Greek and Roman philosophy. Greek thinkers such as Aristotle emphasized the teleological nature of humanity. In other words, each human being has a fixed human nature and a certain "function"; namely, the capacity for rational thought. It is implied in Aristotle's philosophy that moral actions are

those that fulfill one's nature as a rational human being. Furthermore, in the *Rhetoric* (c. 335 B.C.E.) Aristotle differentiates between positive or "particular" laws and laws "according to nature." Aristotle described the latter as a "common" law; that is, one that was common or natural to all humanity.

The notion of natural law is even more explicit in the writings of the ancient Roman philosopher and statesman Cicero, who is usually associated with the Stoic school of philosophy. Cicero argued in his essays for an eternal and immutable law that prevailed for all people at all times. Moreover, this law is grounded in human nature. According to Cicero, "Law is the highest reason, implanted in Nature, which commands what ought to be done and forbids the opposite." In general, this notion of a natural law (*ius naturale*) permeated the Stoic philosophy, which emphasized the equality of all persons according to the law of nature. Moreover, this idea of a natural law was not foreign to Roman jurists; hence, it affected the development and application of actual laws in Roman society.

One finds intimations of the presence of this natural law in several other classical writers, such as Saint Augustine and Boethius. Augustine, for example, contended that the only valid temporal laws were those that were consonant with the eternal and immutable law of God. Other laws were simply unjust and hence lacked any authority. Even Saint Paul concludes in one of his epistles that we find a morality that conscience discerns naturally inscribed in our hearts (Romans 2:14-16).

SAINT THOMAS AQUINAS

The philosopher who is most closely associated with the natural law ethic is Saint Thomas Aquinas. He developed an elaborate philosophical system based in large part on the philosophy of Aristotle. His most famous work is known as the *Summa Theologica* (1266-1273). The *Summa* is a lengthy treatise in which Thomas Aquinas presents and defends his complete philosophical system. In a major section of this work known as "The Treatise on Law," he articulated his conception of natural law morality. This brief work has been extremely influential in the history of moral and political philosophy.

Thomas Aquinas begins from what he calls the "eternal law," which is the law of God's creative work by which he directs everything to the fulfillment he

has in mind. All true laws are derived from and related to this eternal, unchanging law of God. According to Thomas Aquinas, the natural law that governs the lives of human beings is a participation in this eternal law. God created humans and gave them a definite nature that is subject to certain laws; specifically, the laws of its own development. Moreover, each nature is oriented intrinsically toward the goal of developing and realizing all of its vast potential. Hence, the primary obligation placed on humans by God is simply self-fulfillment. In other words, a human being's fundamental moral obligation is to fulfill his or her nature, to actualize his or her potentials, to develop in a fully human way. This obligation comes from God the creator but it is also written or inscribed ontologically into each human nature and clearly manifests itself to any intelligence that discerns this nature.

Given that human nature is oriented toward its own fulfillment, the first principle of morality is simple to deduce: "Good is to be done and promoted and evil is to be avoided." All other precepts of the natural law are based on this principle. It is important to note that the word "good" here refers to the final end of self-realization or self-fulfillment. Thus, the first precept of the natural law could be expressed as follows: "Fulfill your true nature as a person," or simply "Follow nature."

How exactly can one fulfill one's nature and actualize one's potential in order to become more fully human? In Thomas Aquinas's view, one must merely follow one's natural inclinations. These inclinations are a deep-seated and innate part of human nature, and they provide the general specifications of the first precept, "do good," as applied to human nature. The natural inclinations derive from three levels. As beings (or substances), humans are naturally inclined toward self-preservation; hence, whatever is a means of preserving life and avoiding death belongs to the natural law. As animals, humans are naturally inclined to take in food, to reproduce through sexual intercourse, and so forth. As rational human beings, humans are naturally inclined toward a life of reason (that is, the acquisition of knowledge), toward friendship and a social life, and toward a life of virtue and the love of God. Unfortunately, Thomas Aquinas does not provide a very extensive list of these inclinations, he lists only a few primary precepts of the natural law.

The main point, however, is clear: If one follows these natural inclinations, one will attain genuine self-fulfillment and happiness. Indeed, one is obliged to follow these inclinations and not to oppose one's own nature. The natural inclinations are not known by means of conceptual reasoning or logical analysis. Instead, they are known intuitively and naturally by anyone possessing a properly functioning practical reason. Hence, one's practical reason both knows these natural inclinations and directs their implementation in particular circumstances. In this sense then, reason—or what Thomas Aquinas calls “right reason” (*recta ratio*)—is indisputably the ultimate norm of morality.

Since, as Thomas Aquinas points out, people grasp as goods the fulfillments to which they are naturally inclined, it follows that there is a basic precept of the natural law that corresponds to each natural inclination. In other words, the natural inclinations as intuited or known by reason become the natural laws that bind one from within. They become the basic principles of morality—the so-called primary precepts of the natural law. These principles are immutable because they emanate from the fixed human nature. Also, these laws are universal, since all humans share a common nature. It becomes clear, therefore, that these primary precepts of the natural law, which are universal and immutable, serve as a fixed and unshakable basis for all morality and law.

Thomas Aquinas stresses that there are also secondary precepts of the natural law. These are derived from applying the primary precepts to more particular kinds of situations. Unlike the primary precepts, the secondary ones are not infallibly or intuitively known, may be disputed at times, and often hold only as a general rule or “for the most part.” Many civil laws and other moral mandates fall into this category. Thomas Aquinas's treatment of these secondary precepts reveals that he does allow for some flexibility in the development of law and morality.

The final issue considered in Thomas Aquinas's discussion of natural law is the relationship between human law and the natural law. Human law, according to Thomas Aquinas, is a further application of the natural law in a particular community and historical epoch. The necessity of such laws emanates from the unwillingness of some people to follow their own natural aptitude for virtue. Thomas Aquinas insists that every genuine human law must be derived from

and based on the natural law. He argues that the force of law depends on its justice and rightness, which in turn depends on the rule of reason.

Since the first rule of reason is the law of nature, every law must be based on this law of nature. Many laws will be established by tyrannical or inept rulers and legislators that will depart from the natural law and will be neither right nor just. When such laws deviate from the natural law, they are a corruption of law and have no binding force. Thomas Aquinas maintains that laws can be unjust or illegitimate in two ways: They are opposed to either the human good or the divine good. Clearly, then, any law that violates the common good, that is not just and does not participate in the natural law, is no law at all. All human law must, therefore, yield to the higher law of nature. It should be pointed out that even laws passed by good and upright rulers, laws perhaps good in themselves, might be poorly adapted to a particular situation. Hence, one might be justified in not following such a law under such circumstances.

Thus, there is an explicit hierarchy in Thomas Aquinas's philosophy of law. The natural law participates in and derives from the eternal law, and human law is subservient to the natural law. Whenever it conflicts with that law, it is null and void. The natural law, then, should be the ultimate guide and moral compass for all legislators and leaders.

NATURAL LAW AND NATURAL RIGHTS THEORY

A related but conceptually different approach to morality is the natural rights theory, which was developed by English philosophers such as Thomas Hobbes and John Locke. Locke, for example, argues for various natural rights such as the right to life, liberty, and property. According to Locke, these natural rights should be the basis for the laws and rules of civil society. The similarity between this viewpoint and the natural law ethic of Thomas Aquinas is the grounding of morality in rights that emanate from the nature of human beings. Locke, however, detaches his limited natural law theory from the metaphysical and theological underpinnings used by Thomas Aquinas. He also rejects the idea of natural hierarchies. Like Thomas Aquinas and other natural law philosophers, however, he claims that there is something higher than civil laws. In other words, the ultimate standards of law and morality are the natural human rights of life, liberty, and property. Moreover,

the state exists to secure and guarantee those fundamental rights. Thus, strictly speaking, Locke did not adopt a traditional view of morality based on natural law, but he did infer certain natural rights in the same manner as natural law philosophers such as Thomas Aquinas. Also, like traditional natural law theories, Locke's philosophy argues from the facts of human nature to the values that ground morality and law.

THE SCHOOL OF NATURAL LAW

During the seventeenth and eighteenth centuries, there were many further developments in the evolution of natural law theory. What came to be known as the school of natural law was dominated by thinkers such as Hugo Grotius and Samuel von Pufendorf, along with Johann Gottlieb Fichte and Immanuel Kant. These philosophers discussed natural law in purely secular terms; hence, they too disassociated natural law from its metaphysical and theological suppositions. They regarded the law of nature as manifest to anyone through the natural light of human reason. This school also focused on different types of associations that form in society—particularly those regulated by law. They developed theories of the state, society at large, and associations and their relation to the state. Grotius, for example, developed a natural law conception of the state. Beyond any doubt, even these obscure works have had a notable impact on the evolution of legal and political theory.

MODERN VERSIONS OF THE NATURAL LAW PHILOSOPHY

There are several insightful modern versions of natural law morality that for the most part have been inspired by the philosophy of Saint Thomas Aquinas. For example, legal philosophers such as John Finnis have attempted to build on and advance the work of Thomas Aquinas. In Finnis's version of natural law morality, there is a fuller and more elaborate articulation of human goods. Like Thomas Aquinas, Finnis contends that the end of each human being is self-fulfillment, or what he calls "human flourishing." In his seminal work *Natural Law and Natural Rights* (1980), Finnis argues for seven basic goods, or aspects of human well-being that contribute to this flourishing: life, knowledge, play, aesthetic experience, sociability and friendships, practicable reasonableness, and religion.

Human flourishing is realized by actualizing

these basic goods. Finnis also contends that practical reasonableness directs and guides the way in which people actualize the other goods. It is a critical intermediate principle that guides the transition from human goods to judgments about right and wrong actions. According to Finnis, one is practically reasonable when one participates in all human goods *well*. Thus, the bedrock moral principle for Finnis can be summed up as follows: "Make one's choices open to human fulfillment; that is, avoid unnecessary limitations of human potentialities." In other words, the moral law holds that one should promote human flourishing by respecting these basic human goods in one's own actions and in the actions of others.

Finally, it is worth noting that the notion of a natural law grounded in human nature is implicit in the writings of many other modern thinkers. Consider, for example, the writings of Martin Luther King, Jr.; specifically, his famous "Letter from Birmingham Jail," which was written in 1963. In this letter, he explains his rationale for disobeying the law by claiming that an unjust law is not really a law at all. Citing Saint Augustine, King invoked a higher "natural" law as a standard for judging the unjust discriminatory laws that could be found in some states during the early 1960's. King's writings raise the question of how one is to judge the laws of civil society if one does not have this higher standard cited by Aristotle, Cicero, Augustine, Thomas Aquinas, and many others.

CRITICISMS

Critics have identified many problems associated with the natural law approach to morality. Some of the strongest criticism has been directed against Saint Thomas Aquinas, since he is regarded as the most noted systematizer of natural law theory. To begin with, the critics argue that Thomas Aquinas's discussion is seriously deficient in that he does not enumerate more primary precepts of natural law. Thomas Aquinas mentions only a few such precepts and should have given much more attention to the actual content of the natural law. Thus, the famous question 94 of the *Summa* in which these precepts are articulated under the form of natural inclinations is one of the most disappointing sections in the whole "Treatise on Law." It is difficult, then, to arrive at a comprehensive list of specific and definable duties that should be followed in the light of the natural law.

In addition, Thomas Aquinas and other natural

law advocates perhaps place too much emphasis on the immutability of human nature, which in turn accounts for the remarkable stability of the law. A more adequate moral theory must focus more explicitly on *possible* and future human fulfillment. In other words, more attention must be given to humanity's continual evolution and to possible forms of human fulfillment that have not yet been defined.

Still another criticism that is directed against Thomas Aquinas and his followers is the dependence of his natural law theory on the metaphysical assumptions of his philosophy. One such assumption is that the universe is organized in a teleological fashion and that all beings are ordained a certain end. Without this assumption, Thomas Aquinas's version of natural law becomes somewhat problematic, since it is predicated on the notion that human nature is oriented intrinsically toward self-realization. Science, however, specifically physics and biology, has rejected this teleological view of nature. For example, the biologist would argue that the development and growth of organisms is not caused by some inner teleology, but by the presence of genetic information that controls the process of growth. Thus, modern science and reason do not support the teleological assumptions of Aristotle and Thomas Aquinas. It is possible, of course, to revise the natural law framework so that it is not dependent on a foundation of teleology. In other words, the absence of a teleological assumption does not preclude a coherent natural law ethic.

RELEVANCE OF NATURAL LAW

The natural law tradition has had a significant influence on the development of law and political theory in Western civilization. First of all, it represents the viewpoint that there are objective moral principles that can be discerned by reason. It has also influenced the emphasis on natural rights that is expressed in constitutional laws. Natural law theory seeks to justify these rights and other moral requirements that should serve as the basis of any legal system. Unless a system adheres to this natural law, it cannot be considered legitimate or justified. Thus, the rules of any society are not valid if they come into conflict with the demands of the natural law. In short, a valid law must be a moral law; that is, one that is consistent with the natural law.

The natural law tradition stands in unequivocal opposition to the tradition of positivism that distin-

guishes between law and morality. In addition, legal positivists stress that an unjust law is still a law. They hold that natural law theory confuses what law is with what it ought to be. Obviously, the debate between positivists and natural law proponents is a spirited one that will not be resolved easily. It is also clear, however, that the framework of natural law, despite its flaws, has many merits, since it accounts for the authority of law and provides a general guideline for judging the worth and quality of diverse legal rules.

Natural rights

DEFINITION: Inalienable rights of all people which exist in nature, prior to the institution of a social order, and which may be protected by governments but do not derive from governments

TYPE OF ETHICS: Human rights

SIGNIFICANCE: An influential doctrine during the Enlightenment, natural rights theory was used to justify the American and French revolutions of the eighteenth century. Moreover, a version of natural rights divorced from its original dependence on natural law became the basis in the twentieth century for discussions of universal human rights.

After World War II, the member nations of the United Nations were aghast at the systematic violations of human rights that had been committed during the war. Aware of the lack of enforcement mechanisms to hold persons accountable for such behavior, they initiated the process of developing legally binding international standards of conduct.

In 1948, the United Nations General Assembly adopted the Universal Declaration of Human Rights (UDHR), marking the introduction of a basic canon

of civil, political, economic, social, and cultural rights into the international forum.

The Universal Declaration of Human Rights consists of thirty articles that declare, among others, the rights to life, liberty, property, nationality, education, thought, and religion, and freedom from torture, arbitrary arrest, and detention. Because of its ties with natural law, the UDHR has been criticized for being Eurocentric, giving rise to claims that its standards are not applicable to non-Western nations. Indeed, several pillars of the UDHR and subsequent international human rights instruments (the Covenant on Civil and Political Rights, the Covenant on Economic, Social and Cultural Rights, the Convention on the Elimination of All Forms of Racial Discrimination, and the Convention Against Torture) are rooted in the early ideas of justice that derive from Western civilization.

IDEAS OF JUSTICE IN ANCIENT GREECE

The Greek idea of justice was one that both guided individual behavior and served as a blueprint for the organization of society. The ethical beliefs of prominent Greek thinkers—Sophocles and Aristotle, in particular—were grounded in the belief that the higher laws of the gods transcended the obligations and duties dictated by the rulers of society. Like Plato and Socrates, Aristotle believed that adherence to ethics creates an ideal society, one in which hereditary class status does not determine one's social rank.

ROMAN AND CATHOLIC DOCTRINE OF THE MIDDLE AGES

Influenced by classical Greek philosophy, the Roman emperor Justinian (502-565) distinguished among Roman natural law (*jus civile*), the common law of all nations (*jus gentium*), and natural law (*jus naturale*). The Romans emphasized the necessity for a proper trial, the presentation of evidence and proof, and the illegality of bribery in judicial proceedings.

The ideas proposed by the Roman Marcus Tullius Cicero further cultivated a theory of natural law. Cicero's *Brotherhood of Man* made no distinction between what is legally right and morally right, and he promoted the idea that Roman law should be filled with "natural reason" (fair, equitable solutions) instead of reliance upon positive legal provisions. Natural law was God-given, eternal, and immutable, and it could be applied to all people at all times.

The emphasis on natural reason as the foundation of law continues with the Roman Catholic doctrine of the Middle Ages and the writings of Saint Thomas Aquinas. Hugo Grotius clearly breaks from the older doctrine of natural rights by maintaining that natural law originates in pure reason, not the scriptures. For Grotius, even nature and mathematics are unchangeable by God.

THE ENLIGHTENMENT

The basis of the Enlightenment was a belief in the perfectibility and decency of humankind. John Locke’s essay on civil government (1689) contends that in the original state of nature all persons have the same rights and obligations and are entitled to de-

fend their rights to life, freedom, and property. Jean-Jacques Rousseau’s *Social Contract* (1712-1778) argued that the presence of evil cannot be blamed on humankind’s natural tendencies, but must be ascribed to social injustice and inequality; like Locke, Rousseau believed in a natural state of existence in which all are equal. Voltaire, another eighteenth century natural law theoretician, advocated for the rights still demanded today, including the freedoms of person, press, and religion.

The basic documents of the American Revolution, which reveal the evolution of natural law theory during the Enlightenment, influenced the French struggle for freedom. The rights of man, the social contract, popular sovereignty, separation of government powers, right to property, religious freedom, and freedom of thought all are contained in the Declaration of Independence and the U.S. Bill of Rights.

Parallel to constitutional developments in America, the French Declaration of the Rights of Man and the Citizen (1789) recognized the rights to liberty, property, equality before the law, repudiation of all hereditary privilege, national sovereignty, accountability of public officials, freedom of speech and press, separation of government powers, personal safety, and the right to resist oppression. Subsequently, in 1793, a new French constitution was developed that went beyond the document of 1789 in providing for the rights to work, to mass education, and to rise in insurrection.

GENERATIONS OF HUMAN RIGHTS

France’s development of the 1793 constitution is a historical example in which the dichotomy between civil, political rights, and economic, social, and cultural rights is visible. Just as the 1793 French document linked economic status and opportunity to the attainment of basic human rights, elements of current human rights discourse maintain that human

Human Rights That Evolved out of Natural Rights Concepts	
<i>Natural Rights Concept</i>	<i>Human Rights</i>
Freedom	Self-determination: rights to food, shelter, education, medical care, and social security
Liberty: freedoms of expression and religion	Liberty: freedoms of assembly, expression, religion, thought, culture, nationality, and movement; right to asylum
Equality	Equality: equality before the law, equal education, equal employment
Property	Property: right to employment, equal pay
Self-government	Representative government: fair elections, participatory government, equal suffrage, equal access to public service.
Freedom from arbitrary arrest	Due process: presumption of innocence, right to fair trial; freedoms from torture, detention, and exile
Personal privacy	Right to privacy: domestic privacy, privacy of correspondence; rights to family, marriage, honor, reputation, and leisure

rights are indivisible. Poor nonwestern countries assert that civil and political rights (referred to as first-generation rights because they are readily attainable) cannot be given priority over economic, social, and cultural rights (second generation rights, inclusive of the rights to education, housing, employment, and social security). Amid diverse global conditions, the development of an international code of ethics, which began in ancient times, has been broadened by the demand for economic, social, and cultural justice.

NATURAL LAW AND APPLICABILITY OF HUMAN RIGHTS

The natural-law origins of the Universal Declaration of Human Rights fuel the conflict over the global application of human rights. Countries not rooted in the Western tradition of natural law agree that although human beings are born free and equal in dignity, the source of this higher order is dependent upon cultural protocol. Adherence to tradition and desire for its maintenance have given rise to the development of human rights documents that reflect differing social, cultural, and religious realities. Examples of such documents are the African (Banjul) Charter on Human and Peoples' Rights and the Islamic Declaration of Human Rights.

CONCLUSION

Since 1948, an extensive register of international human rights has been developed. For example, feminism has extended human rights arguments to the defense of women and their protection against male-biased social, religious, and legal norms. The continuous articulation of human rights is both an extension of natural-law doctrine and an effort to respond to varying cultural perceptions of human rights and differing global economies, religions, and political conditions. The 1948 Universal Declaration of Human Rights, with its mixture of first- and second-generation rights—civil and political rights with economic, social, and cultural rights—is testimony to the merging of tradition and modernity in the effort to develop an international collection of ethics. While the first twenty articles of the UDHR cover the rights to life, liberty, property, equality, and justice, subsequent articles proclaim the rights to education, equal pay, an adequate standard of living, nationality, and the cultural life of one's community.

The loss of natural rights as the major authority

for human rights has led to two problematic results. The creation of seemingly unlimited and unattainable economic, social, and environmental rights, as well as the justification for the proliferation of many other rights; and the relativism of rights when each culture claims its own unique rights for itself and opposes any universal (natural rights) claim for human rights.

Naturalistic fallacy

DEFINITION: Mistaken attempt to define a moral entity such as good in terms of a natural one such as pleasure

DATE: Term coined in 1903

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The argument against the naturalistic fallacy is meant to establish that the good is an irreducible quality, one which cannot be understood as a function of anything else. It therefore opposes any ethics that defines the good in terms of happiness, pleasure, enlightenment, or anything other than simple goodness.

G. E. Moore, a Cambridge philosopher, argued in his *Principia Ethica* (1903) that ethical naturalism should be rejected because it commits the naturalistic fallacy. Moore said that the naturalistic fallacy “consists in the contention that good *means* nothing but some simple or complex notion, that can be defined in terms of natural qualities.” To the contrary, Moore maintained that good is simple and indefinable in any terms, natural or otherwise. Thus, he sometimes seemed to apply the “naturalistic fallacy” designation to *any* attempt to define good.

Moore did not object to saying that pleasure is good. In fact, it is the business of ethics to determine what things are good. His objection was against those who would claim that pleasure *means* good, that good and pleasure are the same thing. He would claim that people rightly say that a lemon is yellow, but they do not mean by that that lemon and yellow are the same.

“OPEN QUESTION ARGUMENT”

To support his claims about a fallacy, Moore offered what has been called the “open question argument.” For any definition that might be proposed for “good,” it can always be meaningfully asked whether that thing really is good; whereas, with a legitimate definition, such a question would not be meaningful. For example, if “mother” means “female parent,” then these terms are interchangeable. It would make no sense to inquire whether your mother were really your female parent, since this would be asking whether your mother were really your mother. Moore maintained, however, that it will always make sense to ask whether pleasure (or any other proposed definition) is really good.

JOHN STUART MILL AND THE FALLACY

Moore stated that John Stuart “Mill has made as naive and artless a use of the naturalistic fallacy as anybody could desire.” According to Moore, Mill claimed that good meant desirable and that what was desirable was to be discovered by looking at what was desired. Since pleasure is what is desired, it is the good. Moore accused Mill of slipping fallaciously from what *is* desired to what *ought* to be desired, from the *fact* of desired to the *value* of desirable.

In a summary of what he had said about Mill, Moore said, “if his contention that ‘I ought to desire’ means nothing but ‘I do desire’ were true, then he is only entitled to say, ‘we do desire so and so because we do desire it’; and that is not an ethical proposition at all; it is a mere tautology.” Thus, it can be seen that Moore was concerned not only with the naturalistic element of Mill’s definition but also with his attempt at any sort of definition.

CRITICISM OF MOORE

There have been numerous critiques of Moore’s fallacy claims. Some have pointed out that it is a misnomer, since the objection is to all definitions, not only naturalistic ones, and that it should perhaps be called the “definition fallacy.” These critics have gone on to propose answers to the “open question argument.” Some have suggested that perhaps “good” has several meanings and thus an examination of any one of these might seem to leave an open question. Perhaps, alternatively, the term is extremely difficult to define, as Socrates found with moral terms, but this difficulty does not prove that *no* definition is possible.

Other critics have denied that Mill and other naturalists were making any attempt at definition. In response to these critics, however, it has been argued that whether the naturalist appeals to a definition or to a principle, one always turns out to be grounded in the other, and in neither case can the moral element be logically deduced from the nature of things.

In further support of Moore, it has been said that if indeed a definition of “good” in some natural (or even metaphysical) term could be established, then this would rob moral judgments of their prescriptive force. That is, a judgment of “X is good” would become purely descriptive and would elicit a “so what?” response, just as might a judgment of “That apple is red.” Put another way, although Moore’s dis-

cussion of the naturalistic fallacy may be confusingly presented, it nevertheless testifies to the special character of moral terms as evaluative and action-guiding elements that cannot be captured by any descriptive substitution.

Nature, rights of

DEFINITION: Rights which may be said to inhere in the natural world, including both organic life and inorganic aspects of the landscape

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Theories which ascribe rights to nature are generally attempts to construct a moral framework within which to reconcile the human ability to damage and manipulate the environment with the needs of other species and with the sense that lands and waters may themselves have qualitative worth. Such theories are anthropocentric, however, in the sense that they tend to ascribe moral worth to the environment by investing it with human moral characteristics.

Western thought, being greatly influenced by Christianity, has historically assumed the dominance of humans over all plant and animal species. The ability to destroy, domesticate, and alter other species has been seen as an inherent argument for human dominance of the natural world. Until the latter part of the twentieth century, little regard was given to the rights of nature to exist within a framework beneficial to species other than humans. The development of environmental crises such as global warming, extinctions, and the depletion of natural resources has led philosophers to consider the rights of nature.

When Thomas Jefferson wrote the Declaration of Independence, he declared that all men were created with unalienable rights that allowed them to be treated with equality. Jefferson's ideal, while extended to all humans, was not at the time the reality for all humans.

DARWINISM

Approximately one hundred years after Jefferson wrote the Declaration of Independence, Charles Darwin presented the idea of the evolution of species. Darwin's idea suggested that those species that currently exist do so because they were best able to adapt to the changing environment in which they live. It is important to note that Darwin did not put forth the idea that the strongest species survived, but rather that the most adaptable species survived. Darwin's theory was slightly distorted and generally believed to be survival of the fittest or strongest. This distortion of Darwin's theory, coupled with Jefferson's em-

phasis on the unalienable rights of humankind, led to a popular belief that humans had the right to regard nature as simply a resource to use and dominate without regard for any rights that nature might possess.

As a result of the idea of dispensable natural resources, be they inanimate or animate, human technological development and industrialization led to several ecological problems during the latter half of the twentieth century. Global warming, depletion of the earth's protective ozone layer, increases in harmful gases in the atmosphere, and the extinctions of plant and animal species are a few of these problems. The burgeoning ecological crisis began to illustrate the intricate and dependent relationship of humans with the natural world. As a result, philosophers and other thinkers began to reevaluate the rights of nature and the role of humans. It became clear that all species on the planet were interconnected and that the environment had forced all species into a subtle compact for survival.

Initially, nature was not viewed as possessing inalienable rights. Instead, the argument was made to protect nature for the benefit of human existence. Nature was important only insofar as it provided what was needful for human existence; if a human activity infringed upon nature in a way that was not viewed as destructive to human existence, then the activity was morally acceptable. Indeed, this view is still held; however, a deeper view of nature began to develop from this perspective. This deeper view argued that humans are only a percentage of an ecological whole, and that each part of this whole is dependent upon the other parts. The interdependence of the parts means that the rights of any one part are not greater than the rights of other parts of the ecological whole. Each species acts upon the society of other species and is acted upon by this society. This fact is commonly illustrated by such concepts as the food chain. In fact, all species, as a result of their existence in the environment, are involved in a social contract with one another. Those who argue from this perspective point out that humans as well as other animals perceive and react to the environment; therefore, humans and other animals have equal value in an environmental context.

INTERDEPENDENCE OF SPECIES

The interdependence of species is the cornerstone for the rights-of-nature argument. The theory of evo-

lution supports the idea that all species are created equal because all species have evolved from common ancestors. The species currently residing on the planet are not historically the strongest or most fit but the descendants of the most adaptable species. It is an error to use one species' ability to manipulate the environment as a sanction to disregard the rights of other species. Furthermore, the fact that humans are able to know many of the details about how nature works as a result of biological science does not mean that humans have the right to disregard the rights of nature. Jefferson's unalienable rights for men do not discriminate upon the basis of intelligence; thus, the argument is applied to nature and humans. Humans are capable of knowing the workings of other species, but this should not justify disregard for these species' rights.

If it is held that nature has rights and that human rights are rights that should be accorded to the entire community of species, then how should actions be judged to be right or wrong? Perhaps the best definition is that of Aldo Leopold, who defines an action as being right when it preserves the integrity, stability, and beauty of the biotic community. If nature is accorded an ethical status that is equal to human ethical status, a benchmark such as Leopold's will be needed to make judgments about the actions that humans take.

Nature Conservancy Council

IDENTIFICATION: British agency established to promote the conservation of natural environments

DATE: Chartered as Nature Conservancy in 1949; Council established 1973 by an act of Parliament; dissolved December 21, 1991

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: The Nature Conservancy Council (NCC) established national nature reserves and conducted research within them, simultaneously preserving wildlife and increasing the scientific community's understanding of the importance of such preservation.

The Nature Conservancy Council was established "to provide scientific advice on the conservation and control of the natural flora and fauna of Great Britain; to establish, maintain and manage nature reserves in Great Britain; and to organize and develop the research and scientific services related thereto." While the NCC was not the only conservation organization in the United Kingdom, its mission of scientific research combined with conservation was unique. Some national nature reserves were owned by the conservancy; others were privately or publicly owned lands that were subject to reserve agreements.

The conservancy was given the power to acquire land compulsorily when necessary. Through its land acquisition activities, it provided an alternative to development and played an important role in habitat preservation. The NCC worked with voluntary organizations, universities, and other government organizations in its conservation and scientific efforts. It increased public awareness of ecological processes and support for conservation. The British Nature Conser-

vancy provided a model for the United States organization of the same name, established in 1951. The latter is a private nonprofit organization that conserves critical habitats by acquiring land through purchases or gifts, manages the sanctuaries, and supports research. In 1991, the NCC was divided into three smaller entities: English Nature, Scottish Natural Heritage, and the Countryside Council for Wales.

Nazi science

DEFINITION: Experiments conducted by the German scientific establishment during the period when Adolf Hitler and the Nazi Party dominated Germany

DATE: 1933-1945

TYPE OF ETHICS: Scientific ethics

SIGNIFICANCE: The experiments conducted on Jews and other unwilling subjects by Nazi scientists have been used to symbolize the convergence of logic and moral atrocity in the Holocaust and the rationalist, dispassionate evil of the "final solution."

For more than twelve years (January 31, 1933-May 2, 1945), Germany was dominated by a political movement called the *Nationalsozialistische Deutsche Arbeiterpartei* (NSDAP or Nazis, for short). Upon becoming the chancellor of Germany, Nazi leader Adolf Hitler launched the twin programs of *Machtergreifung* and *Gleichschaltung* (the former term meaning "seizure of power" and the latter meaning "coordination"). The Nazis first installed members of their own party or party sympathizers into positions of authority in every government organization in Germany—schools and universities, scientific research institutes, medical facilities, youth groups, women's organizations, museums, philharmonic orchestras, art galleries, and virtually everything else in Germany.

Nazis or Nazi sympathizers in those organizations then "coordinated" the activities of the people

they controlled with Hitler’s view of what all Germans should do and think. German scientists also had to coordinate their experiments with Hitler’s own peculiar view of the universe and humanity’s place in it. The ultimate result was the destruction of human lives on a scale so massive as to defy understanding.

EUGENICS THEORIES

Hitler’s understanding of human society represented a vulgarized form of ideas that evolved from scientific experiments and theories in Western Europe and the United States during the nineteenth century. Evolutionists, geneticists, and eugenicists from the so-called “hard” sciences, along with psychologists and Social Darwinists from the “soft” sciences, contributed to the construction in the minds of Hitler and many other people of an essentially racial interpretation of human history.

Evolutionists taught that all members of a species of living organisms are involved in a constant struggle for survival. Those organisms that have inherited characteristics from their ancestors that are best suited for survival will outcompete their less genetically blessed rivals and thus pass along those beneficial traits to their offspring. When scientists rediscovered Mendelian genetics immediately after 1900, many of them began to realize that breeding a superior stock of human beings poses no more of a scientific problem than does the selective breeding of plants and animals. A program of selective human breeding would assure that only desirable characteristics would pass from one generation to the next.

Social Darwinists argued that human races (or nations) are engaged in a struggle for survival, as are the members of individual species. If a nation or race does not possess or adopt the physical and intellectual qualities necessary to allow it to outcompete its rivals, it will be swept into the dustbin of history and become extinct or its members will become subservient to superior nations or races. Social Darwinists combined with advocates of selective human breeding to form the international eugenics movement.

Eugenicists included scientists from every discipline, but especially anthropology, medi-

cine, and psychology. They argued that governments should adopt regulations to assure that future generations would enjoy the best physical and intellectual constitutions that their gene pools could supply. Eugenicists advocated that individuals with congenital diseases of the mind or body should undergo mandatory sterilization to prevent their disabilities from being passed along to future generations. During the 1920’s and 1930’s, governments in many Western European countries and several state legislatures in the United States adopted laws mandating sterilization for persons with inheritable infirmities.

Some of the eugenicists advocated that enlightened governments should adopt euthanasia programs to eliminate persons with mental or physical disabilities that were of a terminal nature or that rendered

Examples of Nazi Science	
<i>Field</i>	<i>Research and Experiments</i>
Physics	Research program to produce a nuclear bomb
Optics	Research program to establish a giant mirror in low earth orbit that would focus the Sun’s energy on enemy targets on Earth and incinerate them
Chemistry	Experiments that succeeded in producing synthetic rubber and synthetic gasoline; development of several new types of poison gases, including nerve gas
Aeronautics	Development of aircraft powered by jet and rocket engines; development of ballistic missiles
Medicine	Experiments on unwilling human subjects, including mass sterilization utilizing X rays, experiments in reviving persons subjected to extremely low temperatures, and experiments in the medical killing of terminally ill and incurably insane patients
Biology	Selective breeding of human beings (the <i>Lebensborn</i> program); biological warfare experiments

them incapable of enjoying an ill-defined “quality of life” acceptable to the euthanasists. The euthanasists tried to convince governments that the inmates of medical clinics, hospitals, and insane asylums should be screened by qualified physicians who would determine whether their lives were of any further value to themselves or to society. Those inmates deemed by screening physicians to be incurably ill (mentally or physically) or as “useless eaters” should, according to the euthanasists, be granted “mercy deaths.” Only in Nazi Germany did the government adopt euthanasia. The German euthanasia program led directly to mass murders in Nazi concentration camps.

WEAPONS

The Nazi government also coopted all the other sciences in Germany to advance its own view of how Germany and the world should be organized. The sciences of aeronautical engineering, chemistry, and physics in particular became integral parts of a huge military-industrial complex designed to make advanced weapons of war. In Hitler’s Social Darwinistic worldview, war was a natural and necessary condition of human evolution. In his semiautobiographical *Mein Kampf* (1926), Hitler clearly expressed his intent to conquer territory in the Soviet Union into which the German race could expand. As one of his earliest actions after attaining dictatorial power in Germany, Hitler began a massive expansion of the German armed forces. German scientists from every discipline began to devote their research to areas that would further Hitler’s military intentions.

Some German scientists began programs that led to the development of the world’s first operational jet fighter aircraft. Others began developing experiments in rocketry that culminated in the V-2, a ballistic missile that wreaked great havoc among civilians in Britain. German chemists developed toxic gases (never used) that were more deadly than any that had been used in World War I. Chemists also discovered how to make synthetic rubber as well as synthetic gasoline derived from coal, in an effort to assure that the German war machine could continue to function even if it were cut off from supplies of petroleum and rubber by an enemy blockade. German physicists began research designed to produce revolutionary new weapons of war, including a program that almost produced a nuclear bomb. Other exotic weapons-

systems research included plans for a giant mirror that, when placed in low Earth orbit, could focus the sun’s rays on any spot on Earth with devastating results.

MEDICAL RESEARCH

Perhaps the most flagrant violations of accepted scientific ethical principles in Germany during the Nazi era occurred in medical science. Medical researchers in some concentration camps routinely used unwilling human subjects in macabre experiments that often resulted in the death or disfigurement of the subjects. Physicians in concentration camps, medical clinics, and insane asylums willingly participated in “selections” (determining whether individuals were fit for work or should be summarily executed). In the case of some of the concentration camps, physicians made these selections without conducting even cursory medical examinations. The physicians also extracted organs from the cadavers of those who had been killed and sent them to medical research institutes throughout Germany for experimentation. Physicians perpetrated this dismemberment without the knowledge or approval of the victims or the victims’ families.

Many scientists presently condemn the atrocities that were committed in the name of science in Germany during the Nazi era. They believe that German scientists of the period abandoned all accepted ethical principles while they were caught up in a national madness brought on by extraordinary circumstances. A number of the German scientists involved, however, maintained that their actions were entirely ethical, because they were all intended to serve the highest good—the improvement of the human condition. In the long view of history, they maintained, the human race will benefit enormously from their actions—materially, physically, and intellectually. The Nazi scientists adopted the position that, in science, the end justifies the means. Many scientists in all countries today accept that position, at least to some degree. Perhaps more than any other event in history, the Nazi era underscores the absolute necessity of a universally accepted code of scientific ethics if any semblance of humanity is to be maintained in the wake of an increasingly technological and scientific society.

Nazism

DEFINITION: German political movement that advocated racial nationalism, including anti-Semitism, dictatorial government, and expansion into eastern Europe by means of war

DATE: Party organized in 1919, dissolved in 1945

TYPE OF ETHICS: Modern history

SIGNIFICANCE: By far the most famous example of a fascist movement in modern history, the rise of Nazism in Germany began with the suppression of democracy and civil rights and led ultimately to World War II and the Holocaust.

Nazism, a contraction of the term "National Socialism," was a German political movement that emerged in the aftermath of World War I with Adolf Hitler as its leader. From the very start, it espoused ideas that

rejected Western values of humanitarianism, rationalism, liberalism, democracy, and socialism in favor of extreme nationalism, racism, and a political system of single-party dictatorship. Nazi policies and practices violated human and civil rights, first in Germany and later in conquered Europe, and resorted to violent power politics in international affairs.

The forerunner of Nazism as a political party was the German Workers' Party, which was organized in Munich early in 1919. Adolf Hitler, a lower-middle-class Austrian by birth and a corporal in the German army during World War I, joined the German Workers' Party later in the year. It soon was renamed the National Socialist German Workers' Party, and Hitler, showing oratorical and organizational talent, became its undisputed leader in 1921.

The main tenets of Nazism were drawn from the party program of 1920, Hitler's speeches and writings (especially his ponderous two-volume *Mein Kampf* [My Struggle], published in 1925 and 1926), and other Nazi publications. They attacked liberalism and parliamentarianism, including democracy, as inherently weak political systems and branded the early leaders of the Weimar Republic, liberals, socialists, and Jews as "November criminals" of 1918, who had overthrown the imperial government. In place of the failed parliamentary democracy, Nazism offered authoritarian rule rooted in a solid hierarchical system of leaders and followers. At the head would be a *Führer*, or "leader," who, with the support of the Nazi Party, would exercise total control over the society and mobilize it for the achievement of the political and social goals that he postulated.

Nazism, above all, extolled racial nationalism, which was derived from the nineteenth century racial theories of the Frenchman Joseph-Arthur de Gobineau, the Germanized Englishman Houston Chamberlain, and the German Paul de Lagarde. Proponents of Nazism contended that human races were divided into culture-creating and culture-destroying groups, which were engaged in a Social Darwinian struggle of survival of the fittest. At the top of the culture-creating races stood the Nordic-Aryan-Germanic group, the "master race," which was destined to dominate inferior races.

At Hitler's instigation, Nazism singled out the Jews as the greatest threat to the pure Aryans because the Jews, the leading culture-destroying race, were conspiring to gain domination over the world. In

Adolf Hitler (left) in 1935 with his top military commanders, including air force commander Hermann Göring (second from left), and Schutzstaffel (SS) chief Heinrich Himmler (center). (Library of Congress)

Nazi foreign policy, the idea of the primacy of the Aryan race was combined with a Great German nationalism or imperialism, whose aim it was to create a Great German empire far beyond the borders of the German nation. Such an expansion was to give the German people the *Lebensraum*, or “living space,” that it needed to ensure its security and economic independence.

EXERCISE OF POWER

The Nazis did not conceal that they would attain power legally, but once in office they would destroy the constitutional system. Within one month after Hitler was appointed chancellor early in 1933, he had communists and many socialists confined to quickly established concentration camps and suspended civil rights. Through cajolery, pressure, and terror, he prevailed upon the Reichstag (parliament) to give him dictatorial powers, which he used to eliminate trade unions and all political parties except the Nazi Party. In 1934, he murdered the top leadership of the Storm Troopers, or S.A., and some non-Nazis, when he felt threatened by a rival from within his own ranks. He justified these acts of criminality by declaring: “I was

responsible for the fate of the German people and thereby I became the Supreme Judge of the German people.”

The Nazi practices of eliminating opponents by sending them to concentration camps or murdering them, persecuting Jews purely on racial grounds, maintaining a police state, and pursuing an aggressive foreign policy left no room for the observance of ethical principles in politics. It is important to realize, however, that liberal democratic governments also generally do not feel bound by ethical constraints if the national interest is at stake. Although idealists among philosophers and scholars argue that, for example, foreign policy must be based on prudence and ethical principle, realists on the order of George Kennan (and they are a majority) maintain that in world politics moral or ethical concerns must be subordinated to national interest. Given the absence of accepted international standards of morality and effective bodies of enforcement when violations occur, each government, being concerned with military security, the integrity of its political life, and the well-being of its citizens, must act on its own to protect its national interests. Implied in this stance, however, is

a sense of moderation and responsibility when pursuing the national interest in international relations.

EXPANSIONISM

The Nazi regime under Hitler's direction defined national interest in the most expansive terms. Hitler once characterized Germany's foreign policy by declaring: "Germany will become a world power or it will not exist at all." During the early years of Nazi dictatorship, he and his associates constantly proclaimed the German Reich's "sincere desire for peace," while unilaterally abrogating the restrictions of the Treaty of Versailles, rearming Germany, and then, in 1938, annexing Austria and the German-speaking Sudetenland of Czechoslovakia. In 1939, Nazi Germany unleashed World War II through aggression against Poland, followed by campaigns into France and other European countries in 1940. One year later, Hitler attacked the Soviet Union, waging an unparalleled brutal ideological war in the quest for *Lebensraum* in the East.

While worldwide violence was raging as a result of war, the Nazi regime also prepared for the elimination of "racially inferior" populations and "those of lesser value" in society. The persecution of German Jews culminated in the violence against Jewish property and people of the *Kristallnacht* of 1938. With the outbreak of the war in 1939, a euthanasia program was begun, resulting in the killing by injection or by gassing of almost 100,000 mentally and physically disabled persons, most of whom were German. Finally, the plan to liquidate all European Jews in Nazi hands—the Final Solution—was implemented by Hitler and some of his immediate associates in 1941. It claimed the lives of almost six million people. In addition, Nazi actions led to the murder of millions of Gypsies, Slavs, homosexuals, and other racial and political "enemies." This unprecedented mechanized genocide was only stopped by the defeat of Nazi Germany and the suicide of Adolf Hitler in 1945.

COLLAPSE OF HITLER'S REGIME

After the total defeat of Germany and the inglorious death of Hitler, Nazism never revived as a significant force. Following the establishment of the Federal Republic of Germany in 1949, its Federal Constitutional Court outlawed the noisy but unim-

portant Socialist Reich Party in 1952 as a neo-Nazi organization. During the 1960's and 1980's, two right-wing parties were formed: the National Democratic Party and the Republicans. Both have shown some neo-Nazi features but have achieved little influence. More noteworthy have been a number of small neo-Nazi groups formed since the 1970's, whose racist hate propaganda and violence, directed not primarily against Jews but against foreigners, especially Turks, have aroused consternation since the unification of Germany in 1990. These groups cannot, however, be viewed as the forerunners of an organized neo-Nazi movement.

Needs and wants

DEFINITION: Needs are generally understood to be whatever is necessary to enable human beings to continue to be human, and not merely what is necessary for survival; wants are things that enhance human life but are not necessary to it.

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: A principal challenge in any theory and practice of distributive justice is the construction of a system of claims and desert related to a defensible index of human needs and wants.

An index of human needs is never completely exhausted by speaking of food, clothing, and shelter. Nobody dies from a lack of music or good books, but this does not mean that such things do not constitute human needs. Indeed, needs may even arguably include such basic liberties as freedom of speech, movement, thought, and choice.

The distribution of what one needs is related to questions of fairness, equality, and justice. However, to distribute goods in proportion to basic needs is equivalent to neither equality nor justice, because there must first be some grounds for saying whether distribution should be independent of the question of desert.

One may ask whether it is the case that to say that *S* needs *X* is to say that if *S* does not have *X*, he or she will be harmed. If *X*'s absence is a crucial or fundamental harm to *S*, then a moral ought arises apart from desert. This is different from saying that the fact that *S* needs *X* means that without *X* that person cannot achieve some goal or purpose he or she wants to achieve.

A person wants a certain thing if when a certain desire occurs, there is an increase in one's inclination to perform an act to satisfy it. Wants are thus related to desire, and among desires the ethicist may ask which are rational and which are not, and whether some are derivative and some final. After all, there may be no limit to what human beings can want, but there are limits on what can be done or provided. For example, men cannot give birth to babies, no matter how much they may want to do so.

If an index of needs and wants can be established, one may still wonder whether these are natural, or whether they vary according to human condition and technological achievement. Generally speaking, the

more abundant a society's material goods, the more previously thought of wants become seen as needs. This means that if needs are determined by nature and wants are circumstantial, then an ethicist's task is of one sort. Whereas, if both are circumstantial, culturally and technologically contingent, then the work of ethics is different because the line between need and want is fixed by human decision.

Negligence

DEFINITION: Failure to maintain due standards of care in one's actions, thereby causing or potentially causing harm to another

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Negligence raises interesting and unique questions about the relationship of intentionality to guilt. Virtually all moral relations have a potential for negligence.

Negligence has long been an important concept in both ethics and law. In ethics, the notion of negligence arises out of the conception that one owes a duty of a degree of care toward one's fellow humans in all one's activities and that under given circumstances, one may owe even greater degrees of care arising out of special duties that one takes upon oneself in virtue of the public office or profession one has assumed.

Law and morality both recognize a distinction between advertent negligence, which involves the wrongdoer's proceeding with acts after recognizing the dangerous nature of those actions or omissions, and inadvertent negligence, which involves the

wrongdoer's undertaking dangerous acts (or omissions) without having recognized the risk that they impose upon others. The former, which is often called recklessness, is generally regarded as the more culpable form, while the latter raises complex theoretical difficulties for ethicists and legal scholars.

The primary problem with inadvertent negligence both in ethics and in law arises from the seeming contradiction between the nature of such negligence and the deliberate intentionality requisite for an act to be culpable. In moral theory, the problem is easily resolved by linking the inadvertent negligence to the idea of culpable ignorance.

The wrongdoer behaved unsafely because he did not know the potential consequences of his actions, but this ignorance does not exculpate him because he should have known. At some time in his past, he failed to acquire the knowledge necessary to recognize the character of his acts. If this failure resulted from deliberate neglect on the part of the wrongdoer—for example, skipping sessions of his job training—then this was culpable ignorance and the wrongs which flowed from it were blameworthy.

In the case of legal negligence, both civil and criminal, more difficult problems seem to present themselves. Criminal guilt usually involves both an *actus reus*, or guilty act, and a *mens rea*, or guilty mind (criminal intention). H. L. A. Hart, the noted British legal philosopher, wrestled with this problem without reaching a conclusive solution: How can inadvertent negligence have a *mens rea*? If one were to recognize the nature and potential consequences of one's act(s), would one not be guilty of advertent negligence, or worse?

The answer to this puzzle may lie in a nonproximate *mens rea* that the law may be seen as assuming to exist in the absence of plausible proof to the contrary. Take, for example, the case of a roofer who has been carefully dropping waste materials from a roof into a dumpster several floors below. Suddenly, after such care, he hurls a bucket off the roof without checking its trajectory and injures a pedestrian below.

The roofer testifies at his trial that he does not know why he threw the bucket as he did and that he gave no thought to the dangers involved in such an act. If he is believed, he will be convicted of an offense connected with inadvertent negligence. If the roofer could provide a plausible explanation of his

action that could trace its origins to a cause ultimately outside the roofer's control, however, he might expect acquittal.

Assume that the roofer produces proof that the tar he employed—a new variety on the market—emitted hallucinogenic fumes and that he was working with that tar just before the allegedly negligent incident. If his proofs were accepted, he would doubtlessly be exonerated, because he had indicated a cause for his actions that lay outside his control.

In the absence of such proof, however, the unstated assumption of the law must be that at some earlier time—perhaps even years before—the defendant developed (by omission or commission) habits of mind that were likely ultimately to lead to negligent actions in the future and that in the acquisition of these habits lay the culpability.

The acceptance of those habits of mind constitutes a nonproximate *mens rea* for any negligent acts that might later be done as a result. This interpretation demonstrates that the law of negligence is not a strict liability statute—that is, one enforced without regard to intentionality—as some have maintained.

OTHER DIFFICULTIES

Another difficulty that has perplexed legal theorists involves whether the standard of negligence should be objective or subjective. H. L. A. Hart stated that the objective standard attributes fault to an agent who failed “to take those precautions which any reasonable man with normal capacities would in the circumstances have taken.” A subjective standard would give greater weight to the particular circumstances and capacities of the subject.

Finally, there is the question of the relationship of the degree of blameworthiness in negligent acts to the actual results that flow from them. A negligent driver (for example, one using excessive speed) might injure somebody or might not. Under one theory, his or her blameworthiness remains the same despite the external circumstances, but others have asserted that effects in the extramental world are a factor in guilt, as a result of so-called “moral luck.”

New York Times Co. v. Sullivan

THE EVENT: U.S. Supreme Court decision that limited states' authority to award libel damages and established "actual malice" as the standard for cases involving public officials, later expanded to include "public figures"

DATE: Ruling made on March 9, 1964

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: The Supreme Court's opinion in *Sullivan* significantly expanded the First Amendment protection of the press's right to engage in social criticism and political commentary by specifying that nothing printed about a public official could be deemed libelous unless it was the specific intent of the author to defame the official. Thus, even untrue stories are protected in the absence of malicious intent to do harm.

New York Times Co. v. Sullivan was sparked by an advertisement placed in *The New York Times* in 1960 by the Committee to Defend Martin Luther King and the Struggle for Freedom in the South. The advertisement, which was meant to raise support for King's Civil Rights movement, criticized several southern jurisdictions, including Montgomery, Alabama, although it did not name any individuals. In response, Montgomery city commissioner L. B. Sullivan sued the *Times* for libel in circuit court, which found the newspaper guilty under Alabama law. After the Ala-

bama Supreme Court affirmed this judgment, the *Times* appealed to the Supreme Court, claiming violations of its rights of free speech and due process under the First and Fourteenth Amendments to the Constitution. The Court held unanimously that Alabama law failed to protect adequately freedom of speech and of the press, and that "actual malice" would henceforth be the national standard for determining libel actions involving public officials.

News sources

DEFINITION: Individuals who provide information to reporters for mass media dissemination

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: Journalistic codes of ethics require reporters objectively to evaluate information provided by sources, to verify important information with multiple independent sources, and to protect the privacy of confidential sources by withholding their names and other identifying details from the public.

The information conveyed through the mass media is of fundamental importance to American society. On the basis of this information, public opinion is formed, votes are cast, and democracy is enacted. Media professionals, therefore, are obligated to seek out and make use of information sources that are reliable, credible, and well-intentioned. Too often, however, such exemplary sources do not exist, and journalists are left to struggle with questions of conduct and concerns about the ethical treatment of their sources.

JOURNALISTIC ETHICS

The National Society of Professional Journalists attempts to address the issue by assessing both the journalist's principles and the consequences of his or her actions. Truth-telling is a fundamental governor in a free society and becomes, therefore, an activity that journalists are both morally and socially obligated to pursue. Developing and maintaining reliable

news sources is an essential part of this journalistic mission, for without credible sources, reporters may never gain access to the type of information that their “watchdog” role requires.

The U.S. Constitution, through the broad protections offered by the First Amendment, recognizes the unique nature of the press’s responsibilities and grants generous latitude in the cultivation and protection of source-reporter relationships. Strict, absolute rules of conduct are incompatible with this intentionally unrestricted domain, leaving questions of ethics up for examination on a case-by-case basis.

The three main ethical considerations regarding sources of information are anonymity, confidentiality, and the source-reporter relationship. The use of anonymous sources is a fairly common media practice despite industry concerns about both its practical and ethical value. Practically, media professionals agree that the custom detracts from the press’s integrity and engenders suspicion about the veracity of the report. Ethically, related considerations range from the erosion of the public trust to the publication of stolen or purchased information and the potential for furthering someone else’s purpose by disseminating information that is politically or financially expedient to the source.

ANONYMITY

Anonymity undermines the journalistic mission of truth-telling because the source is an important part of the story. Failure to disclose the name of the source results in an incomplete or distorted version of truth. Once an anonymous source has been used, the issue of confidentiality arises. Various ethical questions surround this issue. How far is a news organization obligated to go in order to protect the identity of its source? How binding is a reporter’s promise of anonymity?

A 1991 Supreme Court decision ruled that the Minneapolis *Star Tribune* violated an implied contract created by the promise of anonymity when the paper publicly revealed a source’s identity. The decision reinforced the mutually dependent nature of the source-reporter relationship, one that has long been the subject of controversy. While general opinion agrees that the relationship is frequently characterized by betrayal and manipulation, industry members differ regarding whether it is the reporter or the source who is guilty of malevolence. The debate

sparks the question of intention and the ethical implications of using people as a means to further an individual’s purpose, journalistic or otherwise.

In general, a liberalized deontological approach is employed to resolve these ethical quandaries. That is, media professionals are expected to adhere to general industry guidelines unless there is a compelling reason not to do so. For example, most news organizations have policies that reflect a cautionary stance regarding the granting of anonymity. Reporters are encouraged to try to get the source to agree to attribution and/or to find alternative ways to verify the information. Many news organizations require that journalists receive authorization from a superior before quoting from anonymous sources. Typically, editorial approval for anonymity is granted when that anonymity is supported by duty-based principles: when the information is of vital public interest and consistent with the truth-telling ethic; when the justification of minimizing grievous harm is clearly served, such as in the protection of a whistleblower or the victim of abuse; or when a concern for social justice is at stake, as in governmental corruption cases. In addition, industry guidelines seek to mitigate further the negative effects of anonymous sources by requiring identification as fully as possible, such as by position or title, and by explaining the reason for the use of anonymity.

Because anonymity is zealously guarded, once granted, the promise of confidentiality becomes supreme. The reputation of the press rests on the integrity with which sources are protected, and even the threat of legal action is not justification for exposing a confidential source. Confidentiality may be broken, however, if the news organization discovers that the source has provided false or misleading information. Malicious intent by a source, as was the case in the Minneapolis *Star Tribune* case, is not an acceptable reason to breach the confidential relationship. Rather, the responsibility lies with journalists not only to examine their own motives for publishing certain information but also to explore the possible motives of their sources. These actions act as safeguards against the likelihood that media professionals will fall prey to sources who are using the press in an effort to damage another’s reputation, and reinforce a basic Judeo-Christian principle: Reporters should not treat others or allow themselves to be treated, as a means to someone else’s end.

The use of anonymous sources raises a number of ethical considerations in itself, as well as the potential for confidentiality and source-reporter relationship abuses. Therefore, journalists should pursue such a course of action only after thoughtful and deliberate consideration.

Nicomachean Ethics

IDENTIFICATION: Book based on Aristotle's lectures, recorded by his son Nicomachus

DATE: *Ethica Nicomachea*, wr. c. 335-323 B.C.E. (English translation, 1797)

TYPE OF ETHICS: Classical history

SIGNIFICANCE: The *Nicomachean Ethics* is arguably the first text in Western philosophy to treat ethics as a coherent philosophical system. It defines a virtuous person as one who desires the good that the intellect discerns. Such a good is usually a

mean between the extremes of too much and too little.

Aristotle assumes that all things, human beings included, have a good, a purpose or end, which it is their nature to fulfill. To understand the virtue of human nature, one must discover the specific good that is its purpose. Human nature, in Aristotle's analysis, has two levels: the nonrational and the rational. Each level has its good and corresponding virtue.

The virtue of the rational level is to recognize and contemplate truth. This purely intellectual virtue has value in itself but is not sufficient for morality. Morality is only possible when both levels of human nature work together.

The nonrational level of human nature includes vegetative functions, such as biological growth, over which reason has no control, and appetitive functions, such as hunger and sexual desire, which can be guided by reason. The virtue of this level of human nature occurs when the "appetite" comes to desire the good that the intellect discerns. This is moral virtue. It requires not only insight but also practice that cultivates moral behavior into habit.

In most cases, Aristotle says, the good is a mean between two extremes. Courage, for example, is the good that lies between rashness (too much) and cowardice (too little).

Niebuhr, H. Richard

IDENTIFICATION: American theologian

BORN: September 3, 1894, Wright City, Missouri

DIED: July 5, 1962, Greenfield, Massachusetts

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: In works such as *The Meaning of Revelation* (1941) and *Christ and Culture* (1951), Niebuhr used insights from history, sociology, psychology, and philosophy to explore ways in which the Christian faith could help to transform and redeem the world. He became one of the leading Christian ethicists of the twentieth century.

H. Richard Niebuhr taught and wrote in the heyday of Christian theology in the twentieth century. Karl Barth, Paul Tillich, and his own brother Reinhold were his contemporaries. Niebuhr's ethics emphasized perpetual reformation. His evaluation of Christianity in the United States convinced him that Christian faith everywhere had to keep attuned to the God who could free it from cultural enslavement. To the degree that Christian communities made the "fitting response," they could spark a transformation that would bring the world closer to the kingdom of God.

Niebuhr's greatest contribution may be his way of engaging in ethical reflection. His thought moved back and forth between society and human encounters with the ultimate. His ethics aimed at turning rigidity into openness, misplaced absoluteness into creative relativity, and the difficulties of history into movements of responsible faith. Thus, if adjectives such as existential, relativistic, and cultural are necessary to describe Niebuhr's ethics, no less accurate are terms such as theocentric, communal, and universalistic.

SEE ALSO: Christian ethics; Hartshorne, Charles; Niebuhr, Reinhold; Tillich, Paul.

Theological Seminary in New York; Niebuhr remained there until his retirement in 1960.

Although Niebuhr continued his social activism while at Union, he also became famous as a writer and as a professor of Applied Christianity. He wrote more than twenty books and 1,500 articles, reviews, and editorials. Among his important topics were liberalism and fundamentalism, and the nature of faith in the light of history and science. Perhaps his most significant contribution to American social ethics was in his rethinking of the social gospel, a religious movement prevalent in early twentieth century American theology that optimistically held that people, through their efforts to reform society, could help God bring his kingdom to Earth in the near future.

Niebuhr did not think that the problems of society could be easily solved, for to him, social decisions presented themselves as choices between relative evils. In his writings, he focused on the limitations imposed by evil. Niebuhr argued that, although individuals were capable of moral behavior and development, nations, corporations, labor unions, and other such collective entities were not, because pride more easily manifested itself in groups.

James M. Dawsey

Niebuhr, Reinhold

IDENTIFICATION: American theologian

BORN: June 21, 1892, Wright City, Missouri

DIED: June 1, 1971, Stockbridge, Massachusetts

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: An important leader in, and critic of, the social gospel movement of the early twentieth century, Niebuhr worked to demonstrate that his brand of Christianity was relevant to the practical issues of his day.

Reinhold Niebuhr, the son of an immigrant minister, was born in Wright City, Missouri, in 1892. After studying at Eden Theological Seminary and Yale Divinity School, he became in 1915 the pastor of the Bethel Evangelical Church in Detroit, where he took an active role combating racial prejudice and supporting labor's right to strike. In 1928, Henry Sloane Coffin offered Niebuhr a teaching position at Union

Nietzsche, Friedrich

IDENTIFICATION: German philosopher

BORN: October 15, 1844, Röcken, Saxony, Prussia (now in Germany)

DIED: August 25, 1900, Weimar, Germany

TYPE OF ETHICS: Modern history

SIGNIFICANCE: One of the most influential thinkers of the nineteenth century, Nietzsche created a critique of traditional ethics in *Beyond Good and Evil* (*Jenseits von Gut und Böse: Vorspiel einer Philosophie der Zukunft*, 1886), and *On the Genealogy of Morals* (*Zur Genealogie der Moral*, 1887) profoundly impacted the intellectual landscape of the twentieth century. The precise nature of his critique remains a subject of controversy, however, as there is little or no consensus as to the "authentic" meaning of his texts.

Friedrich Nietzsche. (Library of Congress)

Nietzsche attacked traditional ethical theories, especially those rooted in religion. He did so because he believed that human life has no moral purpose except for the meaning that human beings give it. His outlook encouraged moral perspectivism or pluralism, but he also advocated a demanding personal ethical perspective of his own. It emphasized the individual will, excellence, and discipline. In both its critical and its affirmative dimensions, Nietzsche's philosophy continues to have profound effects on moral theory and practice.

THE WILL TO POWER

"We are unknown to ourselves, we men of knowledge—and with good reason." Thus begins Nietzsche's *On the Genealogy of Morals*. His theme was that even though people may regard themselves as well informed, sophisticated, and knowledgeable, their lack of courage keeps them from uncovering what is happening in human existence and morality. Nietzsche tried to check this plague of self-delusion.

Nietzsche contended that it is self-deception not to admit honestly that "life simply *is* will to power." He was no advocate of the democratic ideal of human equality. Such a doctrine, he thought, only levels the quality of life toward mediocrity. Individuals vary greatly in their talents and abilities, and there are basic qualitative differences that leave us unequal as persons. Nevertheless, each individual, according to Nietzsche, will do what he or she can do to assert power.

As Nietzsche interpreted the course of human history, Western culture had been dominated by an unfortunate distinction between "good" and "evil," a distinction that the Christian religion in particular has done much to encourage. Spurred by a deep hatred of aristocratic ways they could not emulate, the masses of humanity, often supported by religious leaders, indulged in a revenge-motivated negation of the qualities of an aristocratic life. As Nietzsche saw things, the "good" of the good-evil distinction had emphasized equality, selflessness, meekness, humility, sympathy, pity, and other qualities of weakness. It had castigated the noble, aristocratic qualities—self-assertion, daring creativity, passion, and desire for conquest—by calling them evil. The prevalence of this concept of evil, Nietzsche contended, is responsible for weakness and mediocrity among those in dominant positions. It has annihilated the qualities that are essential for excellence in life.

Human existence, however, need not end on this dismal note. If Nietzsche sometimes regarded himself as a voice crying in the wilderness, he also thought human life could redeem itself by going "beyond good and evil": "Must not the ancient fire some day flare up much more terribly, after much longer preparation?" he wrote. "More: must one not desire it with all one's might? even will it? even promote it?" The spirit of nobility—affirmation of life, struggle, conquest, and a passionate desire to excel—these characteristics need to be uplifted. Nietzsche's aim, however, was not to duplicate the past but to put these essential qualities back into modern life.

GOD IS DEAD

Nietzsche's proclamation of the death of God was a fundamental ingredient in the reevaluation of all values Nietzsche advocated. This proclamation emerged from his conviction that the morality of mediocrity and affirmations of God's existence, es-

pecially as the latter are understood in Christianity, stand inextricably tied together. Nothing, argued Nietzsche, has done more than Christianity to entrench the morality of mediocrity in human consciousness. In Nietzsche's view, for example, the Christian emphasis on love extols qualities of weakness. Christianity urges that it is our responsibility to cultivate those attributes, not because of an abstract concept of duty but because it is God's will that we do so. As this conception developed, Nietzsche argued, it bound people in debilitating guilt. It also led them to an escapist tendency to seek for fulfillment beyond this world.

Arguably one-sided, Nietzsche's critique was loud and clear: Christianity, with its conception of a transcendent, omnipotent, omniscient, just, and loving God, denies and negates too much that is valuable in this world. Nietzsche did not deny that the long dominance of the Christian faith is a real manifestation of the will to power and that certain individuals have revealed unusual qualities of strength in establishing Christianity's authority. He was convinced, however, that the result has been to place an inferior breed in control of life. Nietzsche believed that, by proclaiming that God is dead, he would eliminate the underpinning of Christian morality, thus making it less difficult to move beyond the conventional understanding of good and evil.

The issue of God's existence, believed Nietzsche, is more psychological than metaphysical. That is, Nietzsche thought that belief in God is an additional tool used to distort the facts of life and to attack and to bring to submission individuals of noble character. His aim was not so much to prove or disprove the existence of God as to show that belief in God can create a sickness. He wanted to convince people that the highest achievements in human life depend on the elimination of this belief.

IMPLICATIONS FOR ETHICAL CONDUCT

Nietzsche's philosophy places strong demands on those who would live by it. He urged such people to consider that life is an eternal recurrence. Therefore, one ought to choose so there is no need for regret. The goal is to act so that, if confronted by an identical situation an infinite number of times, one could honestly say that one would do nothing differently.

Nihilism

DEFINITION: Doctrine holding that there is no rational foundation for truth and that existence is without meaning

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Nihilism may refer to the ultimate lack of conviction, that is, an inability to believe in anything at all. It may also refer to the active embrace of nothingness—either through ascetic self-denial or through antisocial violence, destruction, or anarchy—as a positive goal. The distinction is elucidated in Nietzsche's famous diag-

nosis: “Man would rather will nothingness than have nothing to will.”

Nihilism in general refers to the view that the world is without meaning. It is often used as a term of criticism, for if a philosophical position can be shown to result in nihilism, its assumptions may warrant reexamination. Other thinkers maintain that nihilism is a tenable position to hold.

FRIEDRICH JACOBI

The term “nihilism” was first used by the German philosopher Friedrich Jacobi. Jacobi criticized modern philosophy’s faith in reason as the foundation of all knowledge. The rationalist doubts everything but what the mind can discover by itself. For Jacobi, this skeptical approach must culminate in the belief that nothing exists, for there is no rational foundation for belief in anything outside one’s own mind. For Jacobi, reason affirmed nothing, and he called the belief in nothing “nihilism,” from the Latin word *nihil*, meaning “nothing.”

In his *David Hume on Belief: Or, Idealism and Realism* (1787), Jacobi argues that the radical skepticism of Hume is in fact nihilism. The nihilist, as epitomized for Jacobi by Hume, sees no justification for belief in the existence of the external world, other people, God, or even a self.

Nihilism, then, is primarily a problem with the theory of knowledge for Jacobi. The reliance of modern philosophy on reason as the source of all knowledge leads to an unacceptable outcome, and therefore the reliance on reason alone must be misguided.

Nihilism also has unacceptable ethical implications, according to Jacobi. If nothing exists outside one’s own mind, there can be no ethical obligations to other beings. The nihilist is free to decide what is right or wrong. Whatever the nihilist wills is good, because there is no standard for goodness other than what the mind itself wills.

RUSSIAN NIHILISM

Nihilism first came into popular use in Russia during the mid-nineteenth century, as both a literary and a political term. In Ivan Turgenev’s novel *Fathers and Sons* (1862), the character Bazarov proudly declares himself a nihilist. For Turgenev, nihilism entails rejecting tradition in favor of scientific rationalism and materialism.

As a political movement in Russia, nihilism was associated with belief in radical freedom, a questioning of all social conventions and authority. The nihilists saw themselves as the vanguard of social change, exposing tyranny and hypocrisy in the name of reason. Factions of the movement degenerated into advocating anarchism and terrorism.

For Fyodor Dostoevski, nihilism is associated with atheism. In *The Brothers Karamazov* (1880), Ivan Karamazov declares, “If God does not exist, then everything is permitted,” exemplifying the destructive ethical consequences of nihilism. There is no basis on which to call any act right or wrong. The individual has complete freedom to follow all desires and impulses and to declare these desires good.

FRIEDRICH NIETZSCHE

The figure in philosophy with whom nihilism is most closely associated is the German philosopher Friedrich Nietzsche. He uses the term in both a negative and positive sense. As a term of criticism, he uses it to describe the result of Western culture’s search for truth. In Nietzsche’s view, this search began with Socrates’ dialectic method as seen in the dialogues of Plato. He sees the reliance on rational inquiry as undermining the healthy, noble, and artistic instincts typified by the ancient Greek tragedians.

In *The Will to Power* (1887), Nietzsche asks: “What does nihilism mean? That the highest values devaluate themselves.” Western culture values truth most highly, but the very search for truth is destined for failure at the outset because, according to Nietzsche, there is in fact no truth to be discovered. He sees himself as the first person to fully grasp this insight, but he believes that the history of modern thought has increasingly moved toward the same realization and thus toward nihilism. The entire enterprise of truth-seeking is in fact nihilistic because it avoids the reality that there is no truth.

In *Thus Spoke Zarathustra* (1884), Nietzsche prophesies that Western civilization will culminate in the “last men,” who are aware that there is no foundation for values or truth, but who are indifferent to this lack. The last men will live a life of pleasure, relieved of the burden of seeking truth and of any moral duties that an objective right or wrong might require. Nietzsche calls this attitude “passive nihilism.”

Out of the last men will emerge an “overman,” one who fully recognizes that there is no independent

meaning or value in the world. The overman in this sense is a nihilist also. In contrast to the last men, however, he sees that the lack of independent meaning gives him the power to create his own truth. This realization enables him to create a world of significance in his own image, breaking free of the passive nihilism of the last men. Nietzsche calls the overman's creative response to nihilism "active nihilism," and sees this creation of meaning out of nothing as the highest, noblest task for humans.

THE TWENTIETH CENTURY

A number of twentieth century philosophers argue that it is impossible to justify moral judgments rationally. Nihilism is sometimes used as a critical term to describe these views. For example, the emotivist Charles Stevenson argues that moral judgments are merely aesthetic expressions of approval or disapproval and cannot be proved or disproved. Similarly, the existentialism of Jean-Paul Sartre and Albert Camus asserts that moral judgments are always simply the arbitrary decisions of individuals.

Nirvana

DEFINITION: Eastern concept of the final transcendent state of being achieved by the virtuous and enlightened when they extinguish desire and individual consciousness, enabling them to end the cycle of reincarnation

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Most closely associated with Buddhism, nirvana provides an ethical teleology similar in some respects to the Christian heaven. Rather than simply representing a reward for virtue, however, nirvana also provides Buddhists with a model of virtue.

The term "nirvana" (Sanskrit, *nirvāṇa*) is used to designate the ultimate reality in Buddhist traditions. While the Hindu and Jain traditions also employ this concept, nirvana has received its most distinctive formulations in the many varieties of Buddhism.

EARLY INTERPRETATIONS

According to Buddhist tradition, Siddhārtha Gautama, the Buddha, achieved enlightenment more than 2,500 years ago and came to see the true nature of existence. The Pali scriptures relate that in that moment Gautama, now referred to as the Buddha, or awakened one, realized both the fundamental problem of existence and its solution. The Buddha's message, based on this moment of insight, was that the basic quality of existence is *duḥkha*, which connotes suffering, illness, emptiness, unsatisfactoriness, and insubstantiality. In his analysis of this situation, the Buddha stated that the pervasive reality of *duḥkha* is predicated on a false understanding of the nature of the self. People suffer anguish because they believe in a permanent, substantial self or soul, a belief that generates obsessive craving (*trṣṇā*) for objects, experiences, ideals, or persons that will provide comfort, security, and enrichment for the "self." Transient reality, however, is unable to fulfill human desires. Those things that people expect to satisfy their cravings for permanence and happiness are unable to do so because they are insubstantial and evanescent. The

more people grasp, the more they suffer and, according to Buddhist teaching, the more they are reborn into the world of *samsāra*. (The Buddhist traditions accept many of the Hindu assumptions about the nature of reincarnation.)

The Buddha then offered a practical solution to the problem of *duḥkha*. If the cause of anguish is a mistaken belief, then its resolution lies in gaining wisdom, or enlightenment. Enlightenment reveals the insubstantiality of the self (*anātman*) and shows that what is called “self” (Buddhists often use the term “ego” to designate this construction) is merely a constantly changing constellation of energies (aggregates of being). The deep existential appropriation of this insight has profound behavioral and moral consequences, beginning with the cessation of craving. The *arhat* (one who has achieved enlightenment) has realized nirvana, the absolute state of perfect wisdom and release from the cycle of rebirth.

Nirvana is most often described in negative terms, not because it designates a negative state, but because it names a reality that is beyond ordinary experience and hence beyond the limitations of language. Nirvana is “the eradication of ignorance,” “the elimination of suffering,” and the “end of desire.” Translated literally, nirvana is “extinction.” Unfortunately, this meaning has often conveyed to the Western mind the misleading impression that Buddhism is a nihilistic religious tradition. Nirvana does not mean extinction of the self—since in Buddhism there is no real self—but rather the extinction of the illusion of self. Referred to in more positive terms, nirvana is bliss, absolute happiness, and unconditioned tranquillity.

Tradition distinguishes between two modes of nirvana: nirvana with substrate (*sopadhiṣeṣa nirvāṇa*) and nirvana without substrate (*nirupadhiṣeṣa nirvāṇa*). The distinction names the difference between the arhat who lives and the one who is dead, or the difference between nirvana and final nirvana (*parinirvāṇa*). As a living person, the arhat may still experience physical pain and other forms of karmic fruition (the consequences of previous actions). At *parinirvāṇa*, however, all karmic energies are dissipated and the arhat is released from rebirth. The Buddha refused to answer his disciples’ questions about the nature of final nirvana. At most, he would say that final nirvana is neither nothingness nor not-nothingness, a paradoxical way of stating that the unconditional is beyond ordinary comprehension.

Nirvana is intrinsically related to the ethical outlook of Buddhism. The path to nirvana is in great measure an ethical one. The Buddha prescribed for his followers a regimen that included study, meditation practice, and moral behavior (the eightfold noble path). He encouraged his followers to live by specific precepts, which were to be accepted not as commandments but as principles for striving to live a compassionate and egoless existence. Among these precepts were abstaining from false speech, not harming sentient beings (*ahiṃsā*), not taking that which is not offered, abstaining from sexual misconduct, not consuming alcohol or other drugs, and earning one’s living in a way that helps rather than harms other beings. The Buddha also counseled the cultivation of wholesome characteristics such as friendliness, patience, and compassion. Each aspect of the Buddhist path is intended to enable the individual to overcome the ego’s tendency to become attached (or addicted) to things, persons, and ideas. The path fosters non-attachment and egolessness, which advances one’s progress toward enlightenment. Wisdom and morality therefore are inextricably connected. To behave in a purely selfless way, one must grasp the truth about the nature of existence, especially the nonexistence of the self; and to realize this truth, one must follow the precepts that help remove the obstacles that hinder awareness.

LATER INTERPRETATIONS

In subsequent development of the Buddhist traditions (particularly in the Mahāyāna and Vajrayāna), greater emphasis was placed on the element of compassion, and nirvana came to be interpreted in more corporate terms. Because of his compassionate and selfless nature, the Buddha, it was believed, would not abandon those who had not yet attained nirvana. Spurred by his conviction, the Mahāyāna Buddhist communities began to venerate the ideal of the *bodhisattva*. The bodhisattva was regarded as a great being who postponed final nirvana to assist all beings in the alleviation of suffering and the realization of nirvana. Since Buddhahood was now considered an ontological reality attainable in principle by anyone, the Buddhist universe came to be populated by countless bodhisattvas, all working to bring about the simultaneous nirvana of all beings.

Nobel Peace Prizes

DEFINITION: Annual prizes awarded to individuals or organizations that have done the most to promote world peace during the previous year

DATE: First award made in 1901

TYPE OF ETHICS: Human rights

SIGNIFICANCE: By honoring those people who have furthered the causes of human rights and world peace, the Nobel Peace Prize has served to publicize and promote good works.

Alfred Bernhard Nobel, a Swedish chemist and industrialist, was initially noted for his invention of dynamite, for which he received a patent in 1867. Although the explosive properties of his invention were later associated with military weapons, the only applications that Nobel had in mind were for peaceful purposes such as the construction of railroad systems and highways. His industrial research also contributed toward the production of a variety of materials, including artificial textiles and rubber. As a consequence, Nobel had amassed a considerable fortune by the time of his death in 1896.

Establishment of the Nobel awards was based on Nobel's will, which was written in November, 1895.

Nobel directed that the major portion of his fortune—which was then worth the equivalent of nine million U.S. dollars, should be set aside for a fund, invested in safe securities, whose interest would be distributed in the form of annual prizes to people who had done the most for humanity during the previous year. The awards were initially to be given in the fields of chemistry, literature, physics, physiology or medicine, and peace. Economics was added later. The Peace Prize was to be administered by a committee of five persons elected by the Norwegian parliament. The Nobel Foundation, which was to supervise the investments, was established and approved by King Oscar II of Sweden, in June, 1900.

Nobel's attitude toward peace evolved from his interest in literature. In 1887, he began conducting a regular correspondence with the Austrian writer Bertha von Suttner. The wife of an Austrian baron, von Suttner was among the first notable women writers to establish a pacifist view. Her 1889 novel *Die Waffen nieder!* (1889; *Lay Down Your Arms*, 1892) was a denunciation of war and its consequences, and its title became the slogan for the peace movement. In 1905 von Suttner herself became the seventh recipient of the Nobel Peace Prize.

Although the extent to which Nobel was directly influenced by the baroness is in dispute, there is no question that Nobel admired both her writings and her work on behalf of pacifism. Nobel had few illusions about the attitude of the peace movements toward immediate disarmament and compulsory arbitration. It was his view that movement toward those worthy goals could only proceed gradually. For example, he believed that governments should develop agreements for the peaceful settlement of disputes but that those agreements should be limited to a single year.

SUPPORTING PEACE

During the early 1890's, Nobel evolved the idea of an economic support for peace. Several concepts contributed to this idea. In a letter that he wrote to von Suttner in 1892, he argued that if nations would establish mutual military agreements, the "atmosphere of security" would ease the transition to disarmament. In addition, the very horror of war itself, particularly in the light of the development of new and more destructive weapons, would cause "all civilized nations . . . to recoil from war and discharge their troops."

It remains unclear why Nobel rejected Swedish

academies for the Peace Prize Committee in favor of the Norwegian parliament. The Swedish press were, in fact, indignant when Nobel's "rejection" became known. Several theories for Nobel's decision have been proposed. The explanation that seems most credible reflects on the Norwegian parliament's strong support for international cooperation and arbitration. In addition, during the period in which Nobel was clarifying his will, the Norwegian poet Bjørnstjerne Bjørnson was playing a major role in the peace movement. Another explanation that seems equally likely is that Nobel had hoped the rivalry between Norway and Sweden would be eased if the final prize were presented in Oslo, rather than in Sweden.

Nobel's original idea was that each year's prize should be awarded to persons who have done the

most to promote the concept of peace during the previous year. However, by the end of the twentieth century most of the awards were going to organizations. The most obvious example is that of the United Nations. Controversy has also been associated with certain choices, though this in itself is nothing new. For example, the 1973 awards made to Henry Kissinger of the United States and Le Duc Tho of Vietnam for their efforts to end the Vietnam War achieved little. Much the same might be said about the 1994 awards to Palestinian spokesman Yasir Arafat and Israeli representatives Shimon Peres and Yitzhak Rabin, and their futile efforts to end the Middle East conflict.

Despite such controversies, the award has brought recognition to organizations and issues about which the international public is often unaware. For exam-

ple, the 1997 award on behalf of attempts to eliminate land mines raised hopes that their use in the future might at least be limited. Likewise, the 1999 award to Médecins Sans Frontières (Doctors Without Borders) brought attention to an apolitical organization that had been largely unknown throughout the world.

SELECTION PROCEDURES

The procedure for selecting recipients of the Nobel Peace Prize is similar to that established for awarding the other prizes. Nominations are requested in September of the year preceding the award, and the deadline is the end of January in the year of the award. Individuals eligible to tender nominations include both current and former members of Norway's parliament, their advisers, members of international committees relevant to the peace process.

Final decisions on recipients are made by the Norwegian Nobel Committee. Committee members are picked by the Norwegian parliament and are chosen on the basis of their expertise in at least one of three areas: international law, political history, and political economy. The field of nominees is narrowed between February and September, and the final decision is usually announced in early October.

The first recipients of the award in 1901 were Jean Henri Dunant and Frédéric Passy. Dunant had spent his life in the pursuit of morality and peace; it was his vision that led to the establishment of the International Red Cross in 1863. During the Franco-Prussian War in the 1870's, Dunant pushed for an international court of arbitration through his association with Alliance Universelle de l'Ordre et de la Civilisation. Among the speakers before the alliance was Passy. Dunant also worked for more humane treatment for prisoners of war, views that eventually came to a measure of fruition. Passy, too, was a strong advocate for peace societies. As a member of the French Chamber of Deputies, he was instrumental in creating a variety of treaties of arbitration.

During the more than one hundred years since the first awards were made, a wide variety of both individuals and institutions have been honored with the prize. Winners have been international, from the Americas and Europe, but also from Asia and Africa. During the first five decades of the award, the basis for the honor was generally international in scope. For example, beginning in 1902, individuals associated with the International Peace Bureau were hon-

ored several times. After World War II, however, honorees tended to be more parochial, in that awards were based on initiatives for changes in more localized areas. In 1952, for example, Albert Schweitzer was honored for his humanitarian work in Africa. In 1960, Albert Lutuli received the prize for his peaceful campaign to end apartheid in South Africa. Lutuli's award represented a watershed for the prize committee in that it was the first time a black African was so honored. Other Africans later honored included Desmond Tutu (1984) and Nelson Mandela (1993), also of South Africa, and Kofi Annan (2001), the Ghanaian secretary-general of the United Nations. In 2004, Wangari Muta Maathai of Kenya became the first African woman to receive the award. She was honored primarily for her environmental work—a reflection of the Nobel Committee's broadening interpretation of Alfred Nobel's intent.

Nonviolence

DEFINITION: Refusal to use violence to resolve conflict and/or the use of nonviolent forms of power to resist oppression or promote social change

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Although based for some practitioners in a belief that nonviolent resistance is in fact more effective than violent resistance in attaining social justice, nonviolence is often an anticonsequentialist practice based in the belief that even just ends cannot justify violent means.

Nonviolence, as Robert L. Holmes has documented, has roots in a variety of cultures and historical documents, including the Bible, the Talmud, the *Bhagavadgītā*, *Laozi*, and Sophocles' *Antigone* (c. 441 B.C.E.). In certain periods and traditions, such as early Christianity (pre-fourth century) and Jainism (a religion related to Hinduism), the prohibition against violence takes an absolute form. Based on the recognition of the sacredness of all human life, nonviolence stands as a continuing protest to the wanton destruction of life evidenced in the collective histories of warfare, crime and punishment, and economic and political oppression.

HISTORY

Throughout most of its history, nonviolence has been expressed as nonresistance, the refusal to use violence to combat evil even for purposes of self-defense. In the nineteenth century, in the work of persons such as Henry David Thoreau and Leo Tolstoy, strategies of passive resistance were developed whose purpose was to point out social injustice with the hope of generating a consensus for positive social change. Such theorists advocated noncompliance with unjust laws and resistance against unjust social policies.

The practice of nonviolence was further developed in the twentieth century, particularly in the work of Mohandas K. Gandhi in freeing India from British rule and that of Martin Luther King, Jr., in struggling to end racial inequality in the United States. Both developed strategies of nonviolent resistance that emphasized the active confrontation of injustice for purposes of social transformation. Both emphasized that true nonviolence is not passivity in the face of evil, but the active confrontation of evil

and injustice wherever they exist. Central to these religious philosophies is the belief in personal as well as social transformation. The practitioner of nonviolence must, as Gandhi notes, renounce the "internal violence of the spirit" and truly love the opponent. Also central is the recognition of the ineffectiveness of violence, which only creates more hatred and more violence in a never-ending spiral. Only nonviolent suffering acting as witness to truth and justice can break the spiral. Nonviolentists must, then, according to Gandhi, learn "the art of dying" just as violentists have learned the "art of killing."

Following the partial success of Gandhi's and King's movements, political theorists began to analyze nonviolence as a political rather than a religious strategy. Here the emphasis is placed on organizing nonviolent forms of power as a means of forcing social change rather than upon personal transformation and the use of the power of love. As analysts recognized, the exercise of power requires the consent of the governed. Organized withdrawal of that consent on a large scale can lead to the collapse or transformation of social systems (such as the collapse of communism in Eastern Europe). Such theorists explore the use of various forms of nonviolent power in such areas as labor (strikes and slowdowns), buying (boycotts), noncompliance with laws, and moral suasion. Much analysis has focused on situations in which nonviolent strategies have been employed.

Theorists have unearthed a rich tradition of historical applications of nonviolence. Although nonviolence is often viewed as a tool for oppressed, powerless groups, advocates have developed plans for the total nonviolent civilian defense of nations against external aggression. Confronted with nuclear weapons, against which military defense may mean self-annihilation, nonviolent civilian defense is presented as the only sane alternative.

As a theory and a practice, nonviolence continues to develop and be refined. Important developments include an expansion of the concept of violence that is to be transformed by nonviolent means to include psychological violence (for example, racism, sexism, terrorism), institutional violence, the violence caused by the structure of existing social institutions (such as hunger, poverty, political oppression), and violence against the natural environment. Feminists have developed connections between feminist theory and nonviolence pertaining to women's issues and

the development of nonhierarchical social structures. Nonviolence continues as an important strategy in a variety of Third World settings in which the resort to violence by oppressed groups is regarded as futile.

ETHICAL ARGUMENTS EMPLOYED

(1) All human life is sacred and all persons have equal worth. People do not have the right to take a life, not even in self-defense. (2) The recognition of the sacredness of persons requires people to intervene nonviolently wherever people suffer from war, political oppression, poverty, or discrimination. (3) Violence breeds more violence and does not provide lasting solutions to conflicts. One must, then, love one's opponent, accept the opponent's violence, and return love. Love, however, requires that one recognize truth and injustice, demanding change. Only such love can break the cycle of violence and create just social structures and renewed relationships. (4) There are many nonviolent means that may be employed. Moral action requires the development of an effective strategy for social change. (5) Although the practice of nonviolence may lead to suffering and death for its practitioners and will sometimes fail, the suffering caused will be much less than it would have been if violent means had been employed. In addition, the likelihood of lasting success is much greater.

Normative vs. descriptive ethics

DEFINITION: Distinction between moral philosophies that tell people what they should do (normative ethics) and moral philosophies that merely describe what people already believe they should do (descriptive ethics).

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Descriptive ethical statements are generally taken to be judgments of fact which may be shown to be true or false. Normative ethical statements are much more difficult to prove, and for some moral philosophers, are statements of value which are neither true nor false.

Normative ethics deals with the formulation of ethical codes of behavior and moral models of evaluative decision making. Normative ethics prescribes moral principles defining the good, the right, duty, obligation, law, and justice. A normative approach assumes the universality of its ethical principles and attempts to justify them on a rational basis.

Christian ethics is a classic example of normative ethics. The following are normative moral utterances: "All promises ought to be kept." "Killing another human being is wrong." "Capital punishment is just because it deters crime." "A father has a duty to provide physical support for his children." In all these examples, the common element is the prescription of a certain course of action or its evaluation. The most famous example of normative ethics is found in the Ten Commandments.

DESCRIPTIVE ETHICS

Descriptive ethics is ethics shorn free of prescriptive or evaluative elements. Descriptive ethics deals with the meanings of moral utterances, the relationships between them and moral actors, and the nature of moral argumentation. Descriptive ethics may take a sociological, psychological, ethnographic, or philosophical approach. A sociological analysis of ethics may concern itself with the relationship between moral behavior and social coercion. Psychology may deal with the relationships between moral behavior

and the different stages of human growth and development. Ethnography may study the relationships between ethical beliefs and culture and tradition. Philosophical analysis will tend to concern itself with the semantic meaning of moral utterances, their sense and pragmatic context.

Thomas Hobbes treated ethics as a descriptive science of the aversions and appetites of the human organism. The good, according to Hobbes, is any object of human desire and appetite. Human behavior, in this view, is motivated by aversion to fear and want and appetites for security and gain. Hobbes's descriptive approach is made possible by his mechanistic view of the universe and human nature.

NATURALISM

The descriptive approach that finds a natural cause for moral behavior is known as naturalism. One famous advocate of naturalism was David Hume, who, more than any other philosopher, thoroughly modernized and secularized ethics and philosophy. In *A Treatise of Human Nature* and *An Enquiry Concerning the Principles of Morals*, Hume attempts to answer the metaethical questions of the meanings of ethical terms such as "good," "right," "justice," "virtue," and "vice." Hume concludes that ethical terms are not qualities of a special moral sense or predicates of ethical objects. Instead, they only convey sentiments of approbation or approval; therefore, ethical judgments are entirely subjective. Whenever an object is judged to be good, it means that it is either pleasant or useful. Thus, moral judgments are really judgments of taste.

Naturalistic analysis claims that the good and the right are determined by human appetites. Naturalism holds that an object is valued as good because it is desirable. The proposition "X is good" means "I desire X." One form of naturalism is emotivism, which holds that ethical judgments are only expressions of personal feelings of approval or distaste. This could lead to subjectivism and ethical relativism. In fact, there can be no real ethical disagreements. Ethical judgments only express the attitudes of speakers.

Hedonism is another form of naturalism. Hedonism equates good and evil with pleasure and pain. Whatever produces pleasure is equivalent to the good. Utilitarianism in the hands of Jeremy Bentham maintained a vulgar view that overvalued the quantitative aspects of pleasure. John Stuart Mill, in *Utilitarian-*

ism, distinguished between good and bad pleasures. Intellectual and cultural pleasures are superior to mere physical pleasures. As Mill put it, "I would rather be Socrates dissatisfied than a pig satisfied." One of the most formidable challenges to naturalism came from G. E. Moore. Moore's critique of naturalism is known as the naturalistic fallacy. This fallacy involves defining good in terms of something else, such as pleasure. For Moore, good was an indefinable quality.

As Karl-Otto Apel points out, normative ethics seems to have been made obsolete by Hume's distinction—norms cannot be derived from facts; an "ought" statement cannot be derived from an "is" statement. The scientific grounding of ethics is impossible. Science deals only with facts. In effect, Hume relegated moral norms to the subjective domain. As a result, modern science will accept objectivity only in the mathematical and empirical sciences—not in morality. Morality is purely subjective, from the point of view of modern science. Since Hume and Max Weber, science has claimed to be value free, only positing technological goals, but one can only ask with Apel: What about the criteria for and desirability of technological goals? Can science really free itself from ethics?

As Apel claims, scientific claims involve arguments. Arguments occur in speech situations, in contexts of communication in which certain ethical norms are, in fact, presupposed. Other persons are recognized as genuine subjects of communication. Involvement in argumentation implies ethical claims such as truthfulness and sincerity. Thus, if Apel is correct, science is not value free and there cannot ever be a purely descriptive ethics.

North Atlantic Treaty Organization

IDENTIFICATION: International alliance initially formed to provide security to Western European nations against a perceived Soviet threat

DATE: Founded on April 4, 1949

TYPE OF ETHICS: International relations

SIGNIFICANCE: During the Cold War, North Atlantic Treaty Organization's (NATO) status as a true alliance of equals, rather than a mere instrument of the United States, was sometimes questioned, raising issues about imperialism and the self-determination of European members. In the post-Cold War era, NATO remains one of the most important organs of military power on the world stage, albeit one with a less coherent sense of purpose.

The North Atlantic Treaty Organization is a defensive and political alliance among twenty-six nations. The alliance was created when twelve nations (Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, Netherlands, Norway, Portugal, the United Kingdom, and the United States) signed the North Atlantic Treaty in Washington, D.C., on April 4, 1949. It was later joined by Greece and Turkey (February, 1952), West Germany (later Germany; May, 1955), Spain (May, 1982), the Czech Republic, Hungary, and Poland (March, 1999), and Bulgaria, Estonia, Latvia, Lithuania, Romania, Slovakia, and Slovenia (March, 2004). The treaty is a military alliance designed to prevent aggression or to repel it should it occur. It also provides for continuous consultation and cooperation among member nations in political and economic matters.

The United States was instrumental in creating NATO and has enjoyed hegemonic status within the alliance; the alliance's commitments consume about 50 percent of the U.S. defense budget each year. American commitment to NATO marked a fundamental transformation of the guiding principles of

U.S. foreign policy; it caused the United States to depart from its traditional policy against entanglement in permanent alliances and from its isolationist foreign policy.

HISTORICAL BACKGROUND

NATO has provided the basic framework for the political and military structure of the West during the postwar period. The idea of a permanent peacetime alliance among North Atlantic nations was conceived when "Cold War" conflict was developing between the United States and the Soviet Union. The Truman Doctrine of March, 1947, for example, acknowledged the disharmony of interests with the Soviet Union and underlined the need to contain the expansion of Soviet communism. The events of 1948—the communist coup in Prague in the spring of 1948 and the Soviet blockade of Berlin in June, 1948—further convinced the United States and its allies that the Soviet Union was an expansionist power and that it was willing to use force and subversion to become involved in the affairs of Western Europe.

NATO, which was a response to the perceived Soviet threat to Western Europe, became the keystone of American security commitments. NATO had two main goals. Its short-term goal was to rehabilitate the war-shattered economies of Western European nations and to maintain their political stability by countering communist-inspired subversions in Europe. NATO's long-term goal was to re-create a European balance of power against the Soviet Union by making Europe strong militarily as well as politically and economically. NATO has succeeded in accomplishing both goals.

STRUCTURE OF NATO

The North Atlantic Council, which is composed of ministerial representatives of member countries, is the chief policy-making body of NATO; it meets at least twice a year. The Council is assisted by several committees. The Military Committee is the highest military authority in NATO. It is composed of the chiefs of staff of all member countries except France (Iceland, having no military forces, is represented by a civilian), and it makes recommendations to the Council and to the Defense Planning Committee on military matters. NATO forces are divided into three commands: Allied Command Europe, the Atlantic Ocean Command, and the Channel Command.

NATO’S FIRST HALF CENTURY

Although the alliance has survived for more than a generation, NATO’s solidarity has varied over time. During the early 1950’s, West Germany’s participation in NATO became an issue and was settled in the Paris Agreements of 1954; West Germany joined the alliance in 1955. The withdrawal of the French forces from the integrated military command structure of NATO in 1966 weakened the alliance (France remains a member of the North Atlantic alliance). As a result of the French action, NATO headquarters had to be moved from Paris to Brussels. In 1974, Greece withdrew (until 1980) from the NATO military command because of Turkish military actions in Cyprus. Yet the political cohesion of NATO has been quite remarkable.

NATO members agreed from the beginning that the primary purpose of the alliance was to be prepared militarily to counter Soviet attack. Their strategy rested in credible deterrence of threats to Western security. For protection against possible Soviet attack on Europe, NATO has relied on the U.S. nuclear umbrella. American nuclear weapons have been deployed in Western Europe, though they have always remained under U.S. command. The deployment of intermediate-range nuclear weapons (Cruise and Pershing II missiles) in 1983 and 1984, however, brought strong opposition from intellectuals, political leaders, and peace activists who feared that the presence of the intermediate-range nuclear weapons in Europe would increase the likelihood of a nuclear confrontation with the Soviet Union.

NATO’s strategy of deterrence has also been questioned on moral and ethical grounds, since it uses civilian populations as potential nuclear targets. Yet, the developments of the late 1980’s—the 1987 Soviet-American INF treaty (supported by all NATO members) on the elimination of a class of intermediate- and short-range nuclear missiles based in Europe, the breaking down of the Berlin Wall in 1989 followed by the reunification of two Germanys in 1990, and the disintegration of the Soviet Union and of the Warsaw Pact (NATO’s communist counterpart)—have radically transformed the political and strategic environment in which NATO operates.

“Not in my backyard”

DEFINITION: Popular objection to the establishment of socially necessary but unattractive or troublesome facilities, such as landfills, prisons, and group homes

DATE: Term first used during the 1980’s

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Both proponents and opponents of unpopular projects utilize moral arguments to support their positions.

“Not-in-my-backyard” (often represented by the acronym NIMBY) objections are often raised to the introduction of an unwanted facility to an area, particularly one in or near a residential area. Almost all members of the society may recognize the need for the facility and support it in principle, while at the same time not wanting it in their own neighborhoods or communities. Citizen groups may form and noisily oppose projects such as prisons, nuclear waste sites, and low-income housing projects. In acrimonious NIMBY debates among project developers and members of the public, all sides may raise ethical arguments. As in other aspects of life, multiple ethical principles often apply and create conflict of moral rules.

ETHICAL ARGUMENTS IN FAVOR OF PROJECTS

The first argument in favor of an unpopular project is that it will serve the common good of society. The project’s utilitarian consequences, it may be argued, will bring health, happiness, and general well-being to the greatest number. Indeed, a community would have a difficult time surviving without facilities to dispose of its wastes, create its energy, and provide its human services. The question is: Where are the facilities necessary to perform these functions to be located?

Abhorrent consequences may follow if NIMBY advocates succeed. The blocked project will simply be relocated elsewhere, to the detriment of another community. Furthermore, there is a possibility that the alternative site may not be as safe or effective as the site initially selected by scientific planners.

Human beings are ethically required not to cause real harm to others. However, they also are not obligated to abstain from conduct that is erroneously perceived as harmful. Protesters are often ill-informed about plans they oppose. For example, many people do not distinguish between hazardous and nonhazardous types of waste, or they may believe false stereotypes about the dangers of people with mental disabilities. The fact that members of a community are psychologically uncomfortable with a plan does not constitute a morally relevant reason for disallowing it.

ETHICAL RULES IN OPPOSITION

In an ideal society, the costs imposed by essential services should be shared equally by all. Unpopular projects, such as waste dumps and prisons, unfairly

burden their closest neighbors. While the community as a whole may be served by having such facilities, the facilities’ nearest neighbors receive no compensation for the extra noise, unpleasant odors, extra dangers, inconvenient traffic, and fall in the value of their properties. Furthermore, a basic rule of fairness requires that all members of a community should clean up their own messes. NIMBY neighbors are blameless; they are not any more responsible for community problems such as nuclear wastes, energy shortages, highway congestion, or prison populations that the unpopular facilities are designed to fix.

In a fair contest, the better competitor should win without cheating. Some NIMBY opposition arguments focus on unethical project planning and marketing. Public land uses should be determined in consultation with the public, as community members should have a say in events affecting their own neighborhoods. However, in NIMBY situations, proposals are typically imposed and implemented by outside bodies. Such bodies may promote projects unethically, break their promises, conceal the truth, and intimidate opponents.

TWO TYPES OF NIMBY PROJECTS

One class of NIMBY projects poses some type of environmental threat, while at the same time providing a needed service. A large subclass is disposal site proposals, including facilities for nuclear wastes and regular landfills. There are also environment-altering NIMBY proposals that do not deal with waste, such as airports, oil refineries, windmill farms, cellular phone towers, and ballparks.

A second major class of projects provides needed human services such as new prisons, group homes for people with drug or alcohol problems or mental disabilities, and nursing homes that admit AIDS patients. Babies and children are not exempt from NIMBY opposition. Even small day-care facilities have been opposed in some residential neighborhoods. The ethical issues raised about these two project types include the points already discussed, as well as variants for each type of project.

ENVIRONMENTAL PROJECTS

When waste disposal sites and polluting farms or factories are planned, the neighbors who are affected are typically poor and nonwhite. The concept of “environmental racism” critiques burdening society’s

Examples of NIMBY Projects

Airports
 Day-care facilities
 Drug rehab centers
 Garbage dumps and landfills
 Group homes for troubled youths
 Halfway houses for alcoholics
 Low-income housing
 Mental hospitals
 Nursing homes
 Oil refineries
 Power plants
 Prisons and jails
 Recycling centers
 Schools
 Sports arenas and other venues that draw crowds
 Windmill farms

least powerful groups, unable to defend themselves, with exposure to unsafe and unpleasant substances. To add insult to injury, the employment opportunities promised to the poor in return for acceptance of the new facilities often do not materialize.

Some ardent environmental activists contend that all the world's neighborhoods deserve protection from exposure. They argue that it is immoral to export toxins to developing countries. Rich nations should not dump their trash on the world's poor. This viewpoint has been nicknamed NOPE, an acronym for "Not on Planet Earth." Activists urge fundamental changes in materialistic societies such as the United States. They argue that Americans need fewer landfills, not more, and suggest that recycling and less wasteful lifestyles are the answers. According to this view, landfills are the evil products of pollution and materialism.

Proponents of new waste sites contend that they will improve public health and safety, especially in communities whose existing dumps are overburdened and leaky. Without larger, leakproof facilities, a town's dumps may remain, and dangerous practices such as late-night dumping of wastes by unscrupulous haulers will continue. Furthermore, it is argued, it is morally unfair to put off permanent solutions to waste problems, leaving them for future generations to solve.

HUMAN SERVICE PROJECTS

A moral community is responsive to the needs of all its members. It is compassionate toward its weakest and most needy. All people should be treated humanely, and in ways that allow them to thrive and develop their abilities. Additionally, both law and morality require that people be treated equally unless there are valid reasons for doing otherwise. There is no morally relevant reason to exclude people with mental disabilities from middle-class neighborhoods. Similar arguments are made by advocates for placing small, moderate-income housing within such neighborhoods. Research has shown that both subgroups are harmed by being segregated off by themselves. Moreover, society as a whole can benefit in that intergroup contact often leads to decreases in intergroup prejudices.

Nozick, Robert

IDENTIFICATION: American philosopher
 BORN: November 16, 1938, Brooklyn, New York
 DIED: January 23, 2002, Cambridge, Massachusetts
 TYPE OF ETHICS: Politico-economic ethics
 SIGNIFICANCE: Robert Nozick made significant contributions to political ethics, epistemology, rational choice theory, and other areas of philosophy. He also provided philosophical justifications for

questioning redistribution of wealth and income in the modern welfare state.

Robert Nozick is best known for his book *Anarchy, State, and Utopia* (1974), which he wrote partly in response to *A Theory of Justice* (1971) by his fellow Harvard professor, John Rawls. Rawls's book had provided a philosophical justification for the welfare state by asking what kind of society rational persons would want if they did not know what their own positions in that society would be. Rawls maintained that this would be a society that provided the most possible resources to its least fortunate members. The ethical implication of this argument was that inequality among people could be accepted as just only to the extent that it was in the interest of those at the bottom.

Nozick responded to Rawls's thesis by arguing that justice requires recognition of the rights of individuals to self-ownership and to ownership of the products of their own labor. Resources, he argued, are created by the things that individuals do, and they are exchanged among individuals. So long as people acquire their possessions through their own work and exchange, they have just and ethical claims to their own property. Redistribution involves taking from some individuals and giving to others. Unless it is redistribution of goods acquired unjustly, through force, this is equivalent to making some people work unwillingly for other people, taking away the right to self-ownership.

The ethical positions of both Rawls and Nozick rejected utilitarianism, the argument that social ethics should be based on the greatest good of the largest number of people. Both philosophers founded ethical principles on individuals. For Rawls, however, this entailed creating the kind of society that would maximize the well-being of an abstract and hypothetical individual who might be placed at the bottom. For Nozick, it entailed as little interference as possible in the lives of individuals.

After publishing *Anarchy, State, and Utopia*, Nozick wrote several books that explored other philosophical questions. His last book, *Invariances: The Structure of the Objective World* (2001), examined issues of the nature of objective truth. While his first book relied on traditional philosophical reasoning, his final book attempted to take into consideration scientific evidence from economics, evolutionary biology, and cognitive neuroscience. Among

other considerations, Nozick attempted to root ethics in the evolution of human consciousness. Arguing that ethics stem from cooperation for the sake of mutual benefit, he described a series of levels of ethics, from the most minimal sorts needed for cooperation, to aid and caring for other people. However, he did not entirely desert his earlier libertarianism, since he argued that the highest levels of ethics must be voluntary and cannot be created by the force of a government or other social agency.

Nuclear arms race

DEFINITION: Rapid competitive expansion of nuclear weapons among rival nations in order to gain military and political superiority

DATE: Began in August, 1949

TYPE OF ETHICS: International relations

SIGNIFICANCE: The increasing numbers of progressively more destructive nuclear weapons in the world has intensified the possibility for human misery and threatens the very existence of the planet.

Arms races have been a major factor in prompting war in modern times, especially since World War I (1914-1918). Demobilization immediately after the end of World War II was quickly followed by rearmament as the Cold War era unfolded. The nuclear arms race began on August 29, 1949, when the Soviet Union tested its first atom bomb, and it intensified when the United States and the Soviet Union first tested hydrogen bombs in November, 1952, and August, 1953, respectively. This led to the strengthening of military alli-

Note: For the years following 1987, approximately 50 percent of the Russian warheads and 75 percent of the U.S. warheads shown were operational. The remaining warheads were held in reserve or had been retired but not yet destroyed.

ances (the North Atlantic Treaty Organization, or NATO, and the Warsaw Pact) and the escalation of threats. In January, 1954, the United States warned that it would meet communist aggression with “massive retaliation” using nuclear weapons.

During the late 1950’s, the Soviet Union improved its ability to produce and deliver nuclear weapons, thus causing the Western bloc to fear a “missile gap” and motivating the Western nations to produce more missiles. Questions regarding the morality of pursuing such a course have received widely varying answers over time, ranging from the rightness of attempting to deter aggression to the position that the arms race is inherently wrong because it protects the power and wealth of the privileged. Nuclear tests aroused worldwide concern about radioactive fallout, but test bans were ignored by France and China, which acquired hydrogen bombs by 1968.

After this occurrence, the nuclear arms race between the United States and the Soviet Union surged ahead. American officials announced in 1974 that the United States was capable of dropping thirty-six bombs on each of the 218 Soviet cities with populations of 100,000 or more.

The arms race between the United States and the Soviet Union slowed somewhat during the 1970’s and 1980’s as a result of arms limitation and reduction treaties. It ended altogether when the Cold War came to an end in 1989. The conclusion of the arms race between super powers did not end the danger posed by nuclear build-up and proliferation, however. When the Soviet Union fragmented, the fate of the weapons which had been under its centralized control was uncertain. Several newly formed states found themselves with nuclear arms they were ill-equipped to maintain or even secure. Moreover, after

A large rectangular box with a thin black border, containing the text "Image not available" centered in the middle.

the 1980's, the focus of nuclear proliferation shifted to the smaller, sometimes less-industrialized countries that regarded nuclear weapons as simply another tool in the struggle for power and survival. North Korea admitted in 2003 that it possessed a limited cache of nuclear weapons, but it subsequently withdrew that admission. India, which had had nuclear capabilities since 1974, officially declared itself to be a nuclear state in 1998 following the underground detonation of five atomic devices. Pakistan responded with its own nuclear tests less than a month later.

These developments pose two separate problems. First, India and Pakistan were still bitter enemies during the early twenty-first century with religious differences at least as deep-seated as the political and economic differences that drove the Cold War. As a result, the brinkmanship between them was potentially even more volatile than that between the United

States and the Soviet Union had been. Additionally, the breakup of the Soviet Union and the development of nuclear technology by Pakistan and possibly North Korea have led to a new and unprecedented concern: that a nuclear power might sell devastating weapons to terrorists or other private individuals. Because such individuals do not necessarily represent, or even reside in, any particular nation, they are unlikely to be concerned about retaliation. Since the threat of retaliation has been the primary deterrent to the use of nuclear weapons since their creation, nuclear combatants who do not fear retaliation are a matter of grave concern.

Nuclear energy

DEFINITION: Production of energy via processes that affect the nucleus of the atom

DATE: Developed during the mid-twentieth century

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: The use of nuclear science to generate power raises ethical issues, because it is unclear whether the significant benefits of atomic power outweigh the actual and potential damage to humans and the environment caused by radioactive materials and nuclear accidents.

The invention and utilization of devices to convert energy from natural forms into readily accessible forms has accompanied the technological progress of humans. Humans are continuously searching for methods that efficiently meet their rapidly increasing energy demands.

The “nuclear age” began in 1938 with the discovery by Otto Hahn and Fritz Strassmann that substantial amounts of energy are released when heavy atoms such as uranium are broken into smaller atomic fragments. This process of nuclear fission is one of three types of nuclear reaction that release substantial amounts of energy. The fission of one gram of uranium 235 can keep a 100-watt light bulb continuously lit for twenty-three years, whereas only eight minutes of light can be generated by burning one gram of gasoline. When controlled, the fission process can be used to generate electric power; uncontrolled, it becomes the destructive power of atom bombs.

PEACEFUL VS. MILITARY USES

Although the peaceful uses of nuclear power cannot be morally equated with the military uses, events such as the accidents at Three Mile Island and Chernobyl demonstrate the conflict between basic ecological priorities and technological accomplishments. Ethical considerations in the past have focused mainly on human beings. People tend to regard themselves as the only beings of inherent value, with the remainder of the natural world being a resource valued only for its usefulness to humans. While the limitations of past technologies have allowed the survival of the natural biosphere, modern technology, with its potential for impact on future generations, requires an ethics of long-range responsibility.

When Hiroshima was bombed, little was known about radioactive fallout. During the 1950’s, it was discovered that the above-ground testing of nuclear weapons introduced radioactive materials into the upper atmosphere to be transported by the winds for deposition in distant places. The strontium 90 produced in these explosions became a concern in 1954. Chemically, it behaves like calcium and is incorporated into the food chain via plants, cows, and milk, ultimately ending up in children’s bones. Another radioactive by-product, iodine 131, incorporates itself into the thyroid gland. The radioactive emissions from these incorporated elements can lead to the development of cancer.

Humans can thrive only in the particular environmental niche to which they are adapted. The fact that human bodies cannot discriminate between species such as radioactive iodine and safe iodine shows that damaging the environment jeopardizes the survival of the human race. Radioactive pollutants are particularly insidious because they remain in the environment for long periods of time—it takes almost four hundred years for the radioactivity of a sample of strontium 90 to degrade to a negligible level. These problems led the United States and the Soviet Union to prohibit the atmospheric testing of nuclear weapons in 1963.

On December 2, 1942, a team of scientists at the University of Chicago produced the first controlled nuclear chain reaction, the experiment that led to the harnessing of the atom for peaceful purposes. Nuclear reactors have since been used to generate electricity, to power ships and rockets, and to power water desalination plants.

SAFETY ISSUES

Although a modern nuclear reactor is not a bomb, because its concentration of radioactive fuel is too low, environmental safety is still an issue. Major accidents, such as the 1957 Windscale, England, disaster in which the reactor core overheated and a significant amount of radiation was released into the atmosphere and the 1986 Chernobyl catastrophe in which ninety thousand people had to be evacuated from a nineteen-mile danger zone and a large amount of radioactive material was ejected into the atmosphere, are examples of the destructive potential of nuclear energy production. Although absolute safety at nuclear reactors cannot be guaranteed, modern

Location of Chernobyl Accident

safeguards have decreased the likelihood of such disasters.

Little attention was paid to the disposal of nuclear wastes during the early days of nuclear power generation. Nuclear waste includes all by-products generated in either routine operations or accidents at any point along the nuclear fuel trail (uranium mining, enrichment, fuel fabrication, spent fuel, and so forth). Since these wastes cannot be detoxified, they must be completely isolated from human contact until they have decayed to negligible levels. For plutonium, the most dangerous species in nuclear waste, this time period is at least 240,000 years.

Is it possible to store such materials in isolation for thousands of centuries? Historically, nuclear waste has not been adequately contained. While scientists predicted that the plutonium stored at Maxey Flats, Kentucky, the world's largest plutonium waste facility, would migrate only one-half inch on-site over a 24,000-year period, it actually migrated two miles

off-site within ten years. More than 500,000 gallons of waste stored at Hanford, Washington, leaked into the soil, introducing radioactive pollutants into the Columbia River and the Pacific Ocean. The worst example of breached storage occurred in the Ural Mountains of the Soviet Union during the late 1950's, when an unexpected and uncontrolled nuclear reaction occurred in stored waste, rendering more than twenty square miles uninhabitable to humans and other species. Thus, the ethics of using nuclear energy until the technology exists for safe storage repositories must be questioned.

Even if safe storage technology can be developed, storing waste for thousands of centuries remains a gamble. Disposal sites must remain undisturbed by acts of war, terrorism, and natural processes such as ice sheets and geological folding, while storage conditions must not allow the waste to become reactive. History discounts the ability of humans to protect their "treasures" for extended periods of time; for ex-

ample, the tombs of Egypt were left undisturbed for less than four thousand years.

How humanity generates the energy needed by its technology is a complex issue. The elimination of nuclear energy generation without a concomitant reduction in humanity's energy requirements would only result in the burning of more fossil fuel. Although this occurrence would avoid future nuclear disasters and end the accumulation of radioactive waste, it would also exacerbate the "greenhouse effect" and the resultant global warming, which also puts the biosphere at risk for future generations. Ultimately, the chance of disaster in the present and the legacy of toxic waste that humans neither have the knowledge to make safe nor the ability to contain must be compared to the risks posed by alternative methods of energy production to present and future generations.

Nuclear Regulatory Commission

IDENTIFICATION: Independent agency of the U.S. government that licenses and regulates the civilian uses of nuclear energy and materials

DATE: Established on October 11, 1974

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: The Nuclear Regulatory Commission (NRC) is responsible for protecting the environment from damage caused by nuclear materials.

The Energy Reorganization Act of 1974 established the Energy Research and Development Administration (ERDA) and the Nuclear Regulatory Commission (NRC) and abolished the Atomic Energy Commission (AEC). One purpose of the act was "to enhance the goals of restoring, protecting, and enhancing environmental quality." The act separated the licensing and regulation of civilian nuclear energy and materials from their development and promotion. These functions had been joined under the AEC. The act directed the NRC to identify possible nuclear-energy sites and to evaluate potential environmental impacts from their construction and operation. In 1977, the ERDA was abolished and its responsibilities were transferred to the Department of Energy.

The NRC regulates the processing, transport, handling, and disposal of nuclear materials and is responsible for protecting public health and safety and the environment. It licenses and oversees the construction and operation of nuclear reactors that generate electricity. Before licensing reactors, the NRC holds hearings to enable public participation in the process. It also inspects facilities for violations of safety standards and investigates nuclear accidents.

Nuremberg Trials

THE EVENT: Series of trials in which Nazi officials were prosecuted for war crimes

DATE: 1945 to 1949

TYPE OF ETHICS: International relations

SIGNIFICANCE: The Nuremberg Trials were a significant milestone in the development of international laws capable of enforcing human rights. They were based upon the principle that a soldier's duty to the state is superseded by the soldier's duty to humanity and to moral laws, even in times of war.

Following the end of World War II, twenty-four Nazi leaders were brought before the International Military Tribunal as war criminals on charges of conspiracy; crimes against peace—planning or waging a war

of aggression; war crimes—“violations of the laws or customs of war,” including murder or ill-treatment of civilians and prisoners of war, killing hostages, plundering property, wanton destruction of cities, and “devastation not justified by military necessity”; and crimes against humanity—“murder, extermination, enslavement, deportation, and other inhumane acts committed against any civilian population, before or during the war, or persecutions on political, racial, or religious grounds in execution of or in connection with any crime within the jurisdiction of the tribunal, whether or not in violation of domestic law of the country where perpetrated.”

THE DEFENDANTS

The tribunal tried twenty-two of the indicted. Hermann Göring, first the head of the Gestapo and later the commander-in-chief of the Luftwaffe, was

Former high-ranking Nazi officials listen to testimony at Nuremberg. The most prominent of the defendants, Hermann Göring (in left front corner of the box) committed suicide before his ordered execution could be carried out. Seated next to him is Rudolf Hess, who became the last convicted Nazi leader to die in prison, in 1987. (National Archives)

considered the major defendant. Rudolf Hess had been deputy leader; in 1941, he flew to Scotland and was imprisoned. Joachim von Ribbentrop served as foreign minister. Wilhelm Keitel took over as the chief of staff of the High Command of the Armed Forces after Adolf Hitler abolished the War Ministry in 1938. Ernst Kaltenbrunner headed the Reich Security Police, including the Gestapo and the security service of the SS. Alfred Rosenberg was the minister for the Occupied Eastern Territories.

Hans Frank, a Nazi Party lawyer, was the governor-general of occupied Poland. Wilhelm Frick was the minister of the interior. Julius Streicher was the leading anti-Semite propagandist. Walter Funk was president of the Reichbank. Hjalmar Schacht headed the Reichbank prior to Funk and the Ministry of Economics prior to the war, where he piloted the financing of war production. Karl Doenitz, as admiral, directed the U-boat battle in the Atlantic and succeeded Erich Raeder as commander-in-chief of the Navy. Raeder was commander-in-chief of the Navy until 1943, when he resigned in a disagreement with Hitler.

Baldur von Schirach built the Hitler Youth organization and later was made governor of Vienna. Fritz Sauckel headed the forced-labor mobilization. Alfred Jodl was chief of the Operations Staff of the Armed Forces. Franz van Papen served as vice chancellor after Hitler came to power. Arthur Seyss-Inquart, an Austrian who assisted in the Nazi takeover of Austria, was Reich governor of Austria, assisted in the Nazi takeover of Czechoslovakia and Poland, and was Reich commissioner for the Netherlands. Albert Speer was Hitler's architect and minister of armaments. Constantin von Neurath, a diplomat, was made the Reich protector of occupied Czechoslovakia. Hans Fritzsche headed the radio division of the Propaganda Ministry. Martin Bormann, Hitler's secretary and head of the party chancellery after Hess fled, had not been captured but was tried in absentia. Robert Ley, leader of the Labor Front, committed suicide before the trial began, and industrialist Gustav Krupp was found to be too senile to stand trial.

The charter (articles 9, 10, and 11) provided that

Summary of Nuremberg Verdicts

<i>Defendant</i>	<i>Verdicts</i>
Hermann Göring	Guilty on all four counts
Alfred Jodl	Guilty on all four counts
Wilhelm Keitel	Guilty on all four counts
Constantin von Neurath	Guilty on all four counts
Joachim von Ribbentrop	Guilty on all four counts
Alfred Rosenberg	Guilty on all four counts
Wilhelm Frick	Guilty on three of four counts
Walter Funk	Guilty on three of four counts
Erich Raeder	Guilty on all three counts
Arthur Seyss-Inquart	Guilty on three of four counts
Martin Bormann (<i>in absentia</i>)	Guilty on two of three counts
Karl Doenitz	Guilty on two of three counts
Hans Frank	Guilty on two of three counts
Rudolf Hess	Guilty on two of four counts
Ernst Kaltenbrunner	Guilty on two of three counts
Fritz Sauckel	Guilty on two of four counts
Albert Speer	Guilty on two of four counts
Baldur von Schirach	Guilty on one of two counts
Julius Streicher	Guilty on one of two counts
Hans Fritzsche	Not Guilty on three counts
Franz von Papen	Not Guilty on two counts
Hjalmar Schacht	Not Guilty on two counts

the tribunal could declare organizations criminal and that individuals could be tried before national, military, or occupation courts of the four Allied powers for membership in such organizations. The indictment charged that the following organizations were criminal in character: the Reich cabinet, the leadership corps of the Nazi Party, the SS (*Schutzstaffeln*, or Black Shirts), the SD (*Sicherheitsdienst*), the SA (*Sturmabteilungen*, or Stormtroopers), the Gestapo (secret state police), and the General Staff and High Command of the Armed Forces.

THE TRIALS

Each of the four Allied powers named a judge and an alternate judge to the International Military Tribunal: Lord Justice Geoffrey Lawrence and Justice Norman Birkett (Great Britain); Attorney General

Francis Biddle and Judge John J. Parker (United States); Professor Henri Donnedieu de Vabres and Conseiller Robert Falco (France); and Major General I. T. Nikitchenko and Lieutenant Colonel A. F. Volchkov (Soviet Union).

The trial began on November 20, 1945, and, after 216 trial days, concluded on October 1, 1946, when the tribunal delivered its judgment. Justice Robert Jackson of the Supreme Court led the prosecution counsel for the United States; Attorney General Hartley Shawcross and David Maxwell-Fyfe for Great Britain; François del Menthon, Auguste Champetier de Ribes, Charles Dubost, and Edgar Fauré for France; and General R. A. Rudenko and Colonel Y. V. Pokrovsky for the Soviet Union. Each defendant was represented by the counsel of his choice.

The tribunal acquitted three defendants (Schacht, von Papen, and Fritzsche). Twelve were sentenced to death by hanging (Göring, von Ribbentrop, Keitel, Kaltenbrunner, Rosenberg, Frank, Frick, Streicher, Sauckel, Jodl, Bormann, and Seyss-Inquart) and were hanged on October 16, 1946. Three were sentenced to life imprisonment (Hess, Funk, and Raeder); two to twenty-year terms (von Schirach and Speer), one to fifteen years (von Neurath), and one to ten years (Doenitz). Göring committed suicide the evening before the scheduled executions. Four Nazi organizations were declared criminal: the leadership corps of the Nazi Party, the SS, the SD, and the Gestapo.

Between October, 1946, and April, 1949, twelve subsequent trials, conducted by American judges primarily from state supreme courts, were held at Nuremberg. In the Doctors' Trial, twenty-three physicians were tried; all but seven were found guilty of experiments on human subjects. Other trials involved judges who were SS members, SS officers who operated concentration camps and committed mass murders, industrialists—including Alfred Krupp (son of Gustav) and the directors of I. G. Farben—who used slave labor, and army leaders who took hostages, destroyed villages, and shot prisoners.

Nussbaum, Martha

DEFINITION: American legal scholar

BORN: May 6, 1947, New York, New York

TYPE OF ETHICS: International relations

SIGNIFICANCE: Nussbaum believes in a universal world morality among nations that controls and binds their actions and argues that a shared sense of ethics should be the driving force behind international dealings, not expediency or force.

International affairs, the evolving nature of education, and the conflict between national culture and world morality are among the subjects that Martha Nussbaum has addressed in voluminous writings and speeches. She has been inspired by the philosophers and political scientists of the late Renaissance and Enlightenment eras, such as John Locke and Jean-Jacques Rousseau. Hugo Grotius, in particular, has powerfully influenced her views. Locke's view that individuals possess inalienable, basic rights (life, liberty, and property, as he defined them) is one of Nussbaum's core beliefs, as is Rousseau's contention that a truly functioning democracy is possible and pragmatic. Grotius, who is Nussbaum's most important philosophical influence, is widely considered to be the first author to deal persuasively with issues such as human rights, the ethical conduct of war, and world peace. Nussbaum has embraced all of these ideas while adding her own thoughts and findings in support of an anticipated rebirth of international moralism.

While fully embracing the right of people to be free and make free choices, Nussbaum accepts the necessity of the sovereign state and its primacy in foreign affairs. This support of state power exists only to the degree that the state governs its citizens justly in accordance with natural rights and conducts itself in a proper, ethical fashion in its dealings with other nations. She further postulates that all nations are immutably tied to one another by a set of moral responsibilities, and these ethical and moral concerns are what should always determine the course of international relationships. Moreover, nation states have the ethical obligation to protect the natural rights of their citizens and to provide them with the basic necessities of life, and the international community has the responsibility of aiding each state in achieving these goals.

Nussbaum firmly opposes cultural relativism, believing that many traditional group beliefs—such as those inspired by religion, race, ethnicity, and class—oppress women. Moreover, such oppression is downplayed or ignored by liberal cultural relativists and supporters of situational ethics. Nussbaum argues that many progressives are quick to point out the injustices inflicted by governments, and rightly

so, but far fewer speak out against the wrongs inflicted by tradition and culture. In Nussbaum's view, the degradation of women leads to a new demand for international morality to establish and protect the natural rights of all. International relations based on consensus building, and not unilateralism, will help create a more just world.

O

Obedience

DEFINITION: Submission to or compliance with the will of someone in authority

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The ethical import of obedience is generally judged by the values of the authority figure to whom one is obedient. It is a virtue when the authority, or the ideals represented by the authority, seem virtuous; it is a serious moral transgression when the authority's commands are deemed immoral.

Obedience is not necessarily bad or good. A sinister example of obedience occurred in World War II, when more than six million innocent people were tortured and killed by Nazis who claimed that they were only following the orders of their superiors. A positive example of obedience is a three-year-old who obeys her parents' commands to play in the yard rather than the road. A sinister example of disobedience is a criminal who disobeys laws. A positive example of disobedience is Rosa Parks, who was arrested in 1955 for disobeying laws that segregated seats on public buses in Montgomery, Alabama. Her disobedience of the law was a landmark in the civil rights revolution in the United States. Whether obedience is right or wrong is determined by the individual, the situation, and others' or history's evaluation of the obedience or disobedience.

Some obedience is necessary. Social groups of any size depend on a reasonable amount of obedience to function smoothly. Society would be chaotic if orders from police, parents, physicians, bosses, generals, and presidents were routinely ignored or disobeyed. The division of labor in a society requires that individuals have the capacity to subordinate and coordinate their own independent actions to serve the goals and purposes of the larger social organization.

Obedience results because people do not feel responsible for the actions they perform under orders

from an authority figure. They believe that the person giving the orders has the responsibility for the results of the actions. At the Nuremberg Trials after World War II, many of the Nazi war criminals stated that they believed their actions were wrong but did not feel personally responsible for them, because they were merely following orders.

The feeling of not being responsible, however, is insufficient to explain why people so readily follow orders, especially in cases in which the behavior far exceeds the scope of the order. For example, the cruelty and savagery of some of the soldiers in the infamous My Lai incident (in which U.S. soldiers killed innocent Vietnamese villagers) was not necessarily demanded in their orders to "pacify the village."

A personal factor that may underlie the willingness to follow orders is ideological zeal, the belief that the required actions are right or in support of a good cause. Another personal factor is gratification; people feel powerful and free upon carrying out the orders. Furthermore, individuals sometimes believe that they will reap material gain or personal advancement by following the specified orders. Another personal factor that influences whether people obey is the role that they are filling. Roles often include rules that people obey the orders of certain others.

SITUATIONAL FACTORS

Situational factors that influence obedience are prestige, proximity, the presence of others who disobey, and reminders of personal responsibility. Prestige means that it is easier to obey the commands of a high-ranking (prestigious) officer than those of a low-ranking officer. Proximity has to do with both the person giving the orders and the victim. Thus, it is easier for soldiers to follow orders given in person rather than over the phone, and it is easier to follow orders to kill others by high-altitude bombing than to follow orders to kill others by stabbing. Also, it is easier to disobey when others present are disobeying

than it is if others are obeying. Finally, obedience diminishes when a person is reminded that he or she will be held personally responsible for any harm that results from his or her actions.

Several other factors may affect disobedience. First, embarrassment hinders disobedience. Many people do not want to rock the boat, make a scene, or be rude. Second, lacking a language of protest hinders disobedience. Many people literally have no words with which to disobey. Third, people may be entrapped into obedience. The first steps of entrapment pose no difficult choices. One step leads to another, however, and the person is ultimately committed to a course of obedience.

Obedience can result from five types of power that individuals and groups can exercise over others. First, coercive power arises from the potential to deliver punishment to force another to change his or her behavior. For example, parents who punish their children for putting their hands into cookie jars are exercising coercive power to induce their children to obey their directives to stay out of the cookie jar. Second, reward power arises from the potential to deliver positive reinforcement to induce another to change his or her behavior. For example, parents who give their children cookies for doing their homework are exercising reward power to induce their children to obey their directives to do their homework. Third, legitimate power arises from being in a particular role or position. Generals, for example, have the authority to give orders to underlings because of their rank. Fourth, expert power arises because others see the person as particularly knowledgeable. Physicians, for example, induce others to obey their directives to quit smoking because they are seen as health care experts. Fifth, reverent power arises because others admire the person giving the orders. For example, Mother Teresa could probably get others to obey her commands because she was greatly admired.

Objectivism

DEFINITION: Philosophical system developed by Ayn Rand that claims that there are objective facts about the world and human beings that should be the basis for philosophical speculations

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Randian objectivism posits that each individual human being has intrinsic value and incomparable worth, and is therefore obligated to act only in his or her own interest. It rejects altruism, communitarianism, and socialism in the name of liberal individualism and egoism.

There is an initial problem with explaining objectivism. Its major developer and proponent, Ayn Rand, did not write a well-reasoned philosophical treatise on her worldview, but used objectivism as a backdrop for the characters in her novels and offered glimpses of it in her frequent lectures. One must be a bit of a detective to piece together her position. Compounding the problem is the fact that a significant segment of the philosophical community does not take her work seriously, because she was not a professional philosopher. It should be said at the outset that objectivism is not only an ethical theory but also an overarch-

Ayn Rand. (Library of Congress)

ing integrated worldview with ethical, metaphysical, epistemological, political, social, and aesthetic elements. What follows is an account of the ethical component of her thought.

REJECTION OF ALTRUISM

Ayn Rand begins by rejecting traditional ethical theory, which she labels “the ethics of altruism.” Whether utilitarian or deontological in nature, the ethics of altruism requires a moral agent sometimes to set her or his interests aside and act for the interests of others. It is even possible, in this view, to be obligated to give up one’s life for the sake of others. To put it another way, the ethics of altruism may require a moral agent to think of herself or himself as without value as compared to others. Individuals can become merely means to others’ ends. Rand finds this result absolutely abhorrent. At the core of her theory is the fact of the absolute moral worth of the individual. Each human being has intrinsic value, and any theory that requires someone to negate that value is wrong.

Egoism, on the other hand, embraces the intrinsic worth of the individual and places the individual’s in-

terests at the heart of the ethical theory. Because it claims that a right action is one that is in the best interest of the individual who is acting, it will never require that an agent sacrifice her or his interests for the interests of others. The worth of the individual is intact.

RAND’S VERSION OF EGOISM

Egoism as an ethical theory has been around at least since the time of Plato. Rand takes the basic framework of the egoistic principle and reworks it in the light of certain moral facts about human beings that she takes as fundamental. These facts can be ascertained by reflecting on the answers to the following questions. What is the end for which a human should live? On what principle shall a human act to achieve this end? Who should benefit from the actions? In other words, what is the ultimate value? What is the ultimate virtue? Who is the primary beneficiary?

According to Rand, life itself is the goal of life. People live in order to live. This is why she says that human life has intrinsic value. A human life is always an end in itself. The principle on which to act is rationality. It is that aspect of human nature that distinguishes humans from other living things. Therefore, it must be the primary virtue. One lives life to the fullest by being rational. Finally, the only beneficiary of an agent’s actions that would meet the criterion of rationality would be the agent. It is this last condition that permits the marriage of these moral facts with egoism. It follows, then, that for a human being to achieve an end, she or he must live according to the ethical principle of rational self-interest. Human beings are under an ethical obligation to do whatever would promote the interests of that individual.

REACTION

Needless to say, objectivism caused a stir. Critics were quick to point out that Rand’s ethical claims were tantamount to selfishness and, since selfishness is not a desirable character trait, ought to be dismissed summarily. Rand did little to dispel this association with selfishness and, in fact, tried to exploit this identification (and controversy) for her own gain. Witness the title of her 1964 book: *The Virtue of Selfishness*.

In point of fact, however, though Rand did use the word “selfishness” often, her theory is much more

sophisticated than her critics allow. She gives selfishness a precise definition, which turns out to be nothing like the imprecise understanding of the term in common usage. For Rand, selfishness is merely the rational pursuit of self-interest. Certainly, it would be in one's rational self-interest to take into consideration, sometimes, the interests of others. The common understanding of selfishness embodies the idea of pursuit of one's interests exclusively without regard to the interests of others. Therefore, Rand's use of the term is different from the common usage. Rand admits that she chose the term "selfishness" deliberately for its shock value and uses the above equivocation for the twofold purpose of undermining the ethics of altruism and championing her brand of ethical egoism.

This ethical component of objectivism, then, stands or falls with ethical egoism. There is nothing inherently wrong with Rand's version. The other components of objectivism, however, do not stand up well to philosophical criticism, and this is another reason objectivism is held in low regard.

On Liberty

IDENTIFICATION: Book by John Stuart Mill (1806-1873)

DATE: Published in 1859

TYPE OF ETHICS: Modern history

SIGNIFICANCE: *On Liberty* has been a central focus of liberal ethics and philosophy for well over a century, and it continues to be a major work for those interested in questions of individual freedom.

In *On Liberty*, John Stuart Mill provided a powerful defense of individual freedom of thought and action. Mill's ideas have been a source of inspiration for those concerned with civil liberty and individual freedom for more than one hundred years, but his assertions in this volume were not in accord with the rest of his substantial body of work. The popularity of *On Liberty* was the result of a combination of Mill's substantial reputation and the work's contents, which, while popular with the general reader, have been frequently criticized by professional scholars and reviewers.

MILL'S BACKGROUND

John Stuart Mill was the son of Scottish philosopher James Mill, who, under the influence of Jeremy Bentham, reared the boy to be a prodigy. At the age of three, the young Mill was studying Greek, and throughout his youth, childish pleasures were denied him in favor of intellectual activities. At twenty, he fell into clinical depression, apparently caused by the lack of emotional support in his upbringing, but he recovered and ultimately had a successful career as a bureaucrat in the India Office and as a philosopher. Among his important works are *System of Logic* (1843), *Principles of Political Economy* (1848), and *The Subjection of Women* (1869). In 1830 he met Harriet Taylor. They conducted an intense though, according to themselves, chaste courtship until 1851, when, Taylor's husband being two years dead, they married. Harriet Taylor proved to be an important influence on Mill's thought. It was thanks to his wife that Mill came to regard "the woman question"—that is, women's social, political, and economic equality—as one of the most important issues of the mid-nineteenth century. This attitude appears to have been decisive in the development of *On Liberty* (1859), Mill's most popular work.

ON LIBERTY

Mill opened his consideration of the question of liberty by asserting that he was making one simple, straightforward proposition: Society had no warrant by legal sanction or moral suasion to limit the individual's freedom of thought or action for any reason except to prevent harm to another person or property. Even should an action be clearly shown to be harmful to the individual, Mill insisted, any restriction other than fair warning was wrong.

In the realm of ideas, Mill believed that free discussion was necessary if the truth was to be determined. To deny any idea currency was to deny the possibility, however faint, that it might be true and to deny it the opportunity of challenging other ideas to test their truthfulness. To set standards of logic or taste or scholarship or of any kind was to set up a censor. Who was to set the standard and enforce it? One of Mill's great fears was that the community might attempt to do so, thus establishing a tyranny of the majority.

While certainly extreme, Mill's position concerning freedom of expression was far from unprecedented, though he did not take the case so far in any of his other writings. His argument that action too should be unfettered as long as it posed no threat to anyone but the actor, however, was quite unusual. In *On Liberty*, it is clear, though not really explicit, that Mill was concerned much more with physical and material harm than with moral or spiritual harm when he asserted that society might restrain the individual from harming others. As truth emerged from the forum of free debate, the development of truly individualistic character in a person arose from the process of choosing types of conduct. For many of Mill's contemporaries, this was little more than advocacy of anarchy. Within the liberal tradition, freedom of action was regarded as good but not without limits. Free speech would lead to changes in those limits (laws, custom, and so forth) so that acceptable behaviors might be enlarged. Mill's emphasis on diversity and individual, unfettered, development was one of his significant contributions to liberalism.

The absolute nature of Mill's view of liberty left him with a number of difficult questions to confront. For example, what about indirect harm such as that caused by drunks to their dependents? Does experience ever establish a moral truth so clearly that society should insist that it be observed? Mill insisted that

beyond teaching rationality to children (the principle of liberty did not apply until an individual reached maturity), society had no right to require a standard of conduct. When society tried to do so, it usually simply insisted on the standard of the majority. Unfortunately, the examples provided in *On Liberty* tend to be issues such as religious beliefs, which had already been largely agreed upon as inappropriate for society to impose.

Another problem for Mill was the source of individual morality. He had long since rejected the possibility that humankind's moral sense was intuitive or innate. In the end, he asserted that moral sense was "natural" in that it was a "natural outgrowth" of human nature. Although this conclusion was not very satisfactory, Mill went further with the question.

Not only did the ideas in *On Liberty* not coincide with those contained in Mill's other work, but there were two issues that Mill was unwilling to leave to the workings of the principle of liberty: education and population control. He was willing to insist that parents be required to educate their children and that the growth of population be restrained. These matters were too critical for the welfare of humankind to be left to be developed, like truth, from debate; therefore, the state should intervene. This lack of consistency within his complete oeuvre and even within *On Liberty* itself seems to have been a result of the influence of Harriet Taylor Mill. Not only was she more inclined toward single-issue, simplistic thought than was Mill, but she also pressed Mill to pursue the issue of women's equality ever more vigorously. *On Liberty* reads as if it came from an extremely repressive society, but aside from what was called the "woman question," nineteenth century England was not such a society. Part of the purpose of *On Liberty* seems to have been to universalize the issue of feminine equality so that men had a stake in it and would take it seriously. This purpose apparently led Mill into a position more extreme than the one that he generally took.

IMPLICATIONS FOR ETHICAL CONDUCT

Mill's established reputation meant that *On Liberty* had an immediate and large audience. Although many reviewers and scholars took issue with some of its ideas, the book was enormously popular with undergraduates and the general reading public. Not only did it broaden the liberal attitude about freedom

of speech, but it also led to a much greater support for freedom of action. Its influence continued to be strong during the early twenty-first century.

On War

IDENTIFICATION: Book by Carl von Clausewitz (1780-1831)

DATE: *Vom Kriege*, 1832-1834 (English translation, 1873)

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: In *On War*, Carl von Clausewitz argued that war is not an end in itself but always a means to the achievement of a political end, and it must therefore be understood through the lens of politics and conducted by political rather than solely military leaders. He also advocated a policy of total war, in which all available resources are used to attack and destroy all resources available to the enemy. Only total war, von Clausewitz argued, can achieve total victory.

Carl von Clausewitz's purpose in analyzing war is purely theoretical and not prescriptive. To the ques-

tion "What is war?" he answers: "War is an act of violence to compel our opponent to fulfill our will." War is not an isolated act; it is an extension of *Politik*—a blatant instrument of such policy. The decision to go to war and the proposed goal beyond victory are political, not military. Theory must, however, be analyzed in the context of real events. A paper war is not a real war; a real war is subject to influence by chance and circumstance. Real war is dangerous for its participants and is a test of their exertion.

War is not only "an elaborate duel" ("*ein erweiterter Zweikampf*"), a vast drama—a comedy for the victor, a tragedy for the loser. From another point of view, war is a game ("*ein Spiel*") and a "gamble" ("*ein Glücksspiel*"), both objectively and subjectively. A theory of war must be an analytical investigation that later might prove beneficial to reason and judgment. It must consider the ends and means of warfare, which consist of strategy and tactics. Tactics are the uses to which the army is put to achieve victory. Strategy has to do with the plan for achieving victory. The real activity of war lies in the tactical aspect of battle, since tactics govern fighting. The immediate object of battle is to destroy or overcome the enemy, but the ultimate object is to subject the enemy to one's will in a political sense. Toward this end a combatant may desire to enforce whatever peace it pleases; it may occupy the enemy's frontier districts and use them to make satisfactory bargains at the peace settlements.

Oppression

DEFINITION: Systematic subjugation or domination of a relatively disempowered social group by a group with more access to social power

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Oppression is a function of collective, social, and structural configurations of power. Therefore, those who seek to resist perceived patterns of oppression often have trouble communicating about it effectively within the context of a liberal individualist society which insists that in-

dividual actions and individual choices are the only proper objects of moral judgment.

Within a given society or subculture, groups are often either accorded or denied access to rights and privileges, relative to other groups, based on specific socially constructed categories. This system is based on a belief in the inherent superiority of one group over all others and its right to dominate. While it is true that one individual can harass, intimidate, violate, molest, and brutalize another, in the broadest sense, “oppression” as a concept is generally discussed within a larger historical, social, and political context.

Oppression is composed of two key elements: prejudice and social power. “Prejudice”—from the Latin *praejudicium* (“previous judgment”)—involves holding an adverse opinion or belief without just ground or before acquiring sufficient valid information. “Social power” can be defined as the ability to get what one wants and to influence others. “Target group” is the term given to those oppressed groups that are denied access to the rights and privileges enjoyed by other groups. Group members are oppressed simply on the basis of their target group status. (Synonyms for “target group” include “minority group,” “oppressed group,” “disenfranchised group,” “subordinate group,” and “stigmatized group,” among others.)

Examples of target groups in the United States are people of color—African Americans, Asian Americans, Latinos, Native Americans or “Indians” (race); immigrants (ethnicity or national origin); Jews, Muslims, atheists (religion); women (biological sex); gay, lesbian, and bisexual people (sexual orientation or identity); transgenderists (gender identity); working class and poor people (class); the very old and the very young (age); people with mental and physical disabilities (ability); and fat people (appearance). “Dominant group” is the term given to groups with access to rights and privileges that are denied to target groups. (Synonyms for “dominant group” include “majority group” and “oppressor group.”)

Examples of dominant groups in the United States are white people or “Caucasians” (race); people of European, especially Anglo-Saxon, ancestry (race, ethnicity, national origin); Christians, and especially Protestant sects (religion); males (biological sex); heterosexuals (sexual orientation or identity); middle

and “owning” class (class); people generally between the ages of twenty-one and fifty (age); and people considered “able bodied” physically and mentally (ability, appearance).

Most people find themselves both in groups targeted for oppression and in those dominant groups that are granted relatively higher degrees of power and prestige. Some examples of such situations are a white middle-class woman, a Jewish man, an African American Christian man, a white lesbian, and a blind thirty-five-year-old white man.

FORMS OF OPPRESSION

There are as many names for the varieties of oppression as there are for the categories of target and dominant groups based, for example, on race (racism), ethnicity or patriotism (ethnocentrism, chauvinism, imperialism, xenophobia), religious affiliation (religious prejudice, anti-Semitism), biological sex (sexism, misogyny), sexual orientation or identity (homophobia, biphobia, heterosexism), economic status (classism), age (ageism), and mental and physical ability (ableism).

This does not mean that all groups experience forms of oppression similarly. The experiences of victims of racism, for example, are not identical to those of the victims of homophobia. The forms of oppression, however, run parallel and at points intersect. All involve negative prejudgments whose purpose is to maintain control or power over others. Oppression can be the result of a deliberate, conscious act, or it may be unconscious and unintentional yet still have oppressive consequences.

Oppression involves negative beliefs (that may or may not be expressed), exclusion, denial of civil and legal protections, and, in some cases, overt acts of violence directed against target groups. The many forms of oppression can be said to operate on four distinct but interrelated levels: the personal, the interpersonal, the institutional, and the societal (or cultural). The personal level refers to an individual’s belief (bias or prejudice) that members of target groups are inferior psychologically or physically.

The interpersonal level is manifested when a bias affects relations among individuals, transforming prejudice into its active component—discrimination. The institutional level refers to the ways in which governmental agencies; businesses; and educational, religious, and professional organizations systemati-

cally discriminate against target groups. Sometimes laws, codes, or policies actually enforce discrimination. The societal (or cultural) level refers to social norms or codes of behavior that, although not expressly written into law or policy, nevertheless work within a society to legitimize prejudice and discrimination. This often involves epithets and stereotypes directed against target groups. Oppression is said to be “internalized” when target group members take on the shame that is associated with their target group status.

FUNCTIONS OF OPPRESSION

Dominant groups maintain oppression over target groups for a number of reasons: to gain or enhance economic, political, or personal rewards or to avoid the potential loss of such; to protect self-esteem against psychological doubts or conflicts; to promote and enhance dominant group value systems; to better comprehend a complex world by categorizing or stereotyping others.

Although oppression clearly serves many functions, it can also be said to hurt members of the dominant group. Frederick Douglass, a former slave and an abolitionist, said at a civil rights meeting in Washington, D.C., on October 22, 1883, that no person “can put a chain about the ankle of [another person] without at last finding the other end fastened about his neck.” His words remain relevant, for everyone is diminished when anyone is demeaned.

Organ transplants

DEFINITION: Replacement of worn-out, diseased, or injured organs and tissues with healthy substitutes

DATE: Begun in early twentieth century

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Organ transplantation and substitution raises ethical issues regarding the definition of death, the equitable distribution of scarce resources (including the ethics of selling body parts), and the quality of life of the transplant patient.

For centuries, humans have longed to be able to replace the diseased or injured parts of the body with healthy organs. Stories abound from ancient civilizations of attempts at organ and tissue transplantation, but until recently these seem to have been mostly dreams. Finally, during the early nineteenth century, there were successful skin grafts. These were autografts in which a patient's own tissue was used, and thus there was little danger of rejection. When material was taken from one member of a species and placed in another (an allograft), however, it was rejected by the recipient.

This was not the only problem faced by these early medical pioneers. Before organ transplantation could be done on a routine basis, it was necessary to develop better methods of tying up weakened arteries, aseptic surgery, anesthesia, and tissue typing. By 1913, the French physician Alexis Carrel transplanted a kidney from one cat to another and later de-

veloped a perfusion machine that drenched a removed organ in blood, thus sustaining its life.

However, a major obstacle remained; namely, the rejection of the transplanted organ. The mechanics of this little-understood process were discovered by Peter Medawar at Oxford University during the 1940's. He found that this process was caused by the immune system's rejection of the body's lymphoid organs. Thus, the recipient's system recognized the donor tissue as foreign and responded by destroying the transplant. The amount of genetic disparity of the two individuals determines the degree and speed of this rejection. Attempts to limit the activity of the immune system eventually led to the use of a combination of a

corticosteroid (prednisone) with the antileukemia drug (azathioprine). A third medicine, cyclosporine, discovered in 1972, was particularly important because it took less of a scattergun approach than the others. Rather than suppressing the entire immune response, cyclosporine targets the T cells, the particular parts of the system that attack alien tissues. The most effective treatment of transplant patients includes daily doses of these three drugs.

TYPES OF ORGAN TRANSPLANTS

The human body contains twenty-one different transplantable organs and tissues, including the heart, liver, kidneys, lungs, pancreas, cornea, bone marrow, and blood vessels. In 1954, a team of Boston physicians led by Joseph E. Murray successfully transplanted a kidney from one twin brother to another. Cardiac transplantation began in 1967, when Christiaan Barnard performed a human-to-human operation, but the first fully successful heart transplant was done by Norman Shumway in the United States. Although lung transplants were attempted as early as 1964, because of problems with infection that are peculiar to this organ it was not until the 1980's that John D. Cooper of Toronto made the process feasible. The work of Thomas E. Starzl led in 1967 to successful transplanting of the liver. Also during the decade of the 1960's, the pancreas, bone marrow, cornea, and blood vessels were transplanted with increasing frequency.

By the turn of the twenty-first century, more than 16,000 kidney, liver, pancreas, heart, heart-lung, and lung transplants were being performed each year in the United States alone. These operations seem to be the only treatment that can transform individuals from a near-death condition to a relatively normal life in a matter of days.

ETHICAL CONCERNS

Such procedures raise a number of ethical and moral problems. Those that concern organ donation often result from

Image not available

A doctor prepares a human heart for transplant at the Cleveland Clinic in Cleveland, Ohio, in July, 2003. (AP/Wide World Photos)

worry that individuals will not receive adequate treatment if they sign donor agreements.

An understanding of the modern definition of death can deal with much of this confusion. Until the 1960's, cessation of brain function inevitably followed cessation of cardiopulmonary function. Individuals did not live for extended periods with the heart and other organs functioning after the brain activity ceased. New medical techniques such as the use of respirators made this condition possible. Machines could maintain blood and oxygen circulation even when the body could never again operate on its own.

The notion of "brain death" was therefore proposed. In 1966, Pope Pius XII defined death as the departure of the spirit from the body through the cessation of brain function rather than the loss of pumping action of the heart. The United States and other countries have passed laws that have given legal sanction to this definition. Patients who are brain dead may be kept alive for a few days, but not permanently. A physician can confirm this situation beyond a doubt through neurological examination. Public support for this position has gained wide acceptance, and currently very few people oppose organ donation.

More difficult problems remain that involve the recipient. Some of these concern the selection of those who are to receive transplants. Despite the thousands of operations performed in 1991, there were still more than 30,000 individuals listed by the United Network for Organ Sharing (UNOS) who needed one or more of the major organs. In an attempt to alleviate this shortage, UNOS, an organization of transplant centers, was founded. It has established a national waiting list to ensure equitable organ allocation according to policies that forbid favoritism based on race, sex, financial status, or political influence. The only considerations are the medically determined conditions of the patients. This organization has been quite successful in raising awareness of the need for donor organs.

Even if a person receives a transplant, there is a continuing need for a more healthy lifestyle and the constant cost and bother of daily medication. Finally, the entire situation of the expense and availability of transplants is a microcosm of the macrocosm of health care for everyone. How can scarce resources be allocated? Who is wise or caring enough to decide

who will die and who will have a chance at a new life? Such questions must be addressed by the general field of medical ethics.

Ortega y Gasset, José

IDENTIFICATION: Spanish philosopher

BORN: May 9, 1883, Madrid, Spain

DIED: October 18, 1955, Madrid, Spain

TYPE OF ETHICS: Modern history

SIGNIFICANCE: A metaphysics professor and existentialist, Ortega y Gasset helped to bring Spain into contact with the thought and culture of the rest of Europe. He was the author of *The Revolt of the Masses* (1929).

José Ortega y Gasset was a professor of metaphysics at the University of Madrid from 1910 until 1936. He had traveled and studied in Europe, especially in Germany, and when he returned, he brought European philosophy and political thought that had been ignored in Spain for centuries. An excellent and pro-

lific writer, he wrote scores of newspaper and magazine essays and articles on philosophy and on general cultural topics. He studied and taught metaphysics, because he was interested in questions about the fundamental nature of reality.

Ortega y Gasset's quest for an ultimate reality led him to questions about the nature of knowledge and the nature of society. Ortega y Gasset's social theories made him an international figure. In *The Revolt of the Masses*, he argued that society is always ready to topple and that humankind is always ready to slip back into barbarism. Only by bowing to an elite class can people keep their societies going. This small, elite group thinks and plans and holds the power—it gets things done. So long as everyone else is willing to accept this leadership, human societies can stand firm.

Orwell, George

IDENTIFICATION: British novelist and essayist

BORN: Eric Blair; June 25, 1903, Motihari, Bengal, India

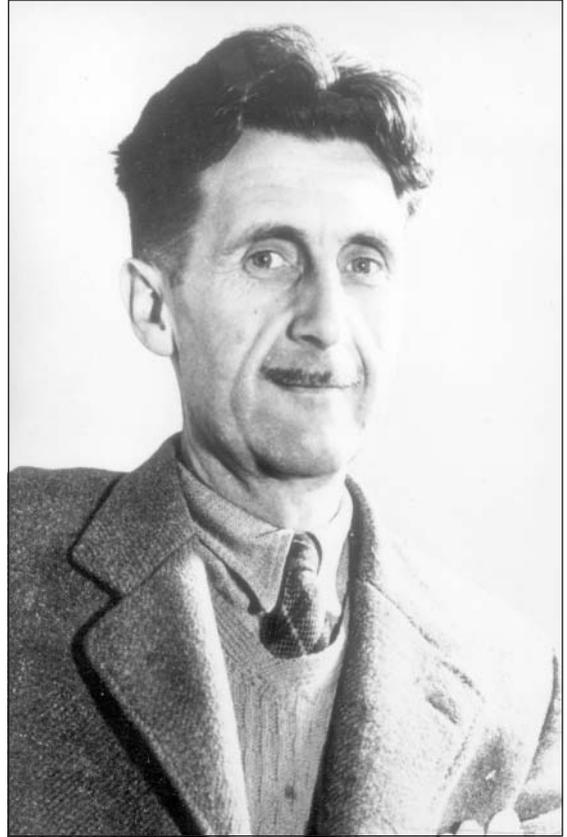

DIED: January 21, 1950, London, England

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Despite his belief that states could never be restrained from tyranny by ethical or religious codes, Orwell remained committed to the belief in an essentially socialist state, based on democratic principles, under which individuals enjoyed equality and justice under the law.

Best known for the political fable *Animal Farm* (1945), a satirical examination of the Russian Revolution, and the dystopian novel *Nineteen Eighty-Four* (1949), which provides a broader indictment of totalitarianism, George Orwell infused all of his writing with a keen moral sense. Spurning the traditional morality of religious institutions, he championed humanistic values rooted in the fundamental decency of human beings.

Orwell's essay "Reflections on Gandhi" (1949) evaluates the Indian nationalist leader Mohandas K.

George Orwell. (Library of Congress)

Gandhi's appeal to Western leftist movements, despite what Orwell calls the "otherworldly, antihumanist tendency of his doctrines." He argues that groups as varied as anarchists and pacifists fail to recognize that "Gandhi's teachings cannot be squared with the belief that Man is the measure of all things, and that our job is to make life worth living on this earth, which is the only earth we have." It is the power of the average person, working toward a common good with honesty and integrity, that Orwell identified as the principal hope of humanity.

Orwell's abhorrence of totalitarianism, expressed in varying degrees in all of his major works of fiction, nonfiction, and journalism, stemmed chiefly from the tendencies of governments to suppress individual liberties. In "Literature and Totalitarianism" (1941), Orwell wrote, "We live in an age in which the autonomous individual is ceasing to exist—or perhaps one ought to say, in which the individual is ceasing to have the illusion of being autonomous." The physical

suppression of individual liberty is no less dangerous in Orwell's view than the suppression of personal opinion or will. Totalitarianism seeks the submission of the individual to the state. Troublesome people could be removed, as Winston Smith discovers in *Nineteen Eighty-Four*; but more dangerous still, troublesome ideas or facts could also disappear by revising or simply erasing them. In such a world, the nature of truth becomes subservient to the state, the power of individuals to effect change is eliminated, and the equality of all people becomes impossible.

Perhaps the closest thing to an ethical or religious maxim in Orwell's thought is the concept of decency. In "The English People" (1944), Orwell tries to provide a sense of the typical morality of the English. "They have the virtues and the vices of an old-fashioned people. To twentieth-century political theories they oppose not another theory of their own, but a moral quality which must be vaguely described as decency." Orwell's idea of decency covers a multitude of social and political qualities, from a strict code of honesty in words and actions to the preservation of basic human freedoms by the state. It is this old-fashioned idea of decency that embodies Orwell's love of all things English, from a simple cup of tea to the beauty of the common toad, and that sustains his belief in the ability of common individuals to make life worth living.

The Other

DEFINITION: Term used to signify a negative object for the sake of positive identification

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: In its function as negative object used for positive identification, the concept of the other serves as a conceptual placeholder to elicit ethical responsibility.

Using the "other" as a term to orient discourses on ethics is a relatively recent development. However, as an ethical issue, the general concept of the "other" has been in play as long as humans have tried to account for the strangeness of existing in the world and as a way to control their particular environments.

Specifically, in assigning orientations for individuals' ethical relations, the issue of the other has evolved from signifying relationships of negative identification to that of ordering relationships of supporting the continued existence of the other, as other. In the former mode, human beings have traditionally taught themselves to identify all that is other as that which does not belong to the same kind, group, or set grounded on the propositional claims made by authoritative (or authoring) subjects. The result has historically been politically and socially to attempt to eliminate each other, indeed all others, in efforts to substantiate one's own identity claims or to secure material possessions for the sake of survival.

To judge the prevalence of this need to control or destroy the other to secure and maintain individual and group self-identity, one can find evidence in social narratives. People create grand narratives to justify the accounting methods they use to educate their young into forms of society that replicate earlier patterns of survival over others. Accordingly, modernity can be understood as chronicling the emergence of humans from the dark ages of authoritarian control, maintained by the exercise of violent force by some beings over others, to a process of rediscovering the other and reassessing institutional patterns based on structural relationships of dominance and subjection.

This new relationship with other beings of the world resulted in hundreds of years of progressive enlightenment and liberation, marked by revolutionary upheavals and forms of transforming social and environmental relationships. However, such transformations were accompanied by the application of

historical patterns of hegemonic control with newly developed instruments of industrialization that also resulted in the highly efficient and logically ordered business of efficiently eliminating other human beings. This trend culminated in the Holocaust of World War II, in which tens of millions of “other” human beings were killed.

Three modern French intellectuals whose writings have explored this phenomenon are Albert Camus, Simone de Beauvoir, and Emmanuel Levinas. Camus wrote popular stories about modern alienation. Beauvoir defied the historical “othering” of women as inferior by men in her famous book, *The Second Sex* (1953), and Levinas reversed ideas about the other, claiming that “the other is that one for whom I am most responsible.”

Ought/can implication

DEFINITION: Philosophical principle which states that anything one is morally obligated to do, one is necessarily capable of doing

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: If the ought/can implication is valid, then one’s inability to do something stands as proof that one was not required to do it, or that one is not morally accountable for failing to do it. The principle presupposes that the world makes sense, and it arguably contradicts the Christian doctrine of Original Sin.

The “ought-implies-can” principle has practical and theoretical importance in ethics. In particular cases, it provides a defense against the charge of wrongdoing, not by providing an excuse for the wrong, but by denying that any wrong was committed. Assuming the principle to be true, if one can never act otherwise, then any time one thinks that one did not act in such a way as to fulfill an obligation is really a time when one did not have that obligation. In other words, assuming the truth of the principle and that one can never act otherwise, one can never do wrong.

The root idea of the moral “ought” seems to be that something is morally necessary or morally owed. “Ought” is supposed to imply “can” in the sense that if it is not true that one can do *x*, then it is not true that one is obligated to do it. Some people think that the principle is, like the statement “Bachelors are males,” true simply because of the meanings of the words. It is self-contradictory, however, to say “Bachelors are not males,” and it is not self-contradictory to say “I know what I ought to do, but I cannot do it.” Therefore, the principle does not seem to be a conceptual truth.

R. M. Hare, in chapter 4 of his *Freedom and Reason* (1963), claims that people use “ought” in moral contexts to prescribe or advise, and that it makes no sense to advise one to do something that is impossible. Even if such advice is pointless, however, it does not follow that the principle is true. One does not show that “believing *X*” implies that “*X* is true” by pointing out that in certain contexts it makes no sense to advise one to believe something that is false.

A defender of the principle may say that people do not blame a person for failing to do something once they realize that it was impossible for that person to do it. The suggestion is that people do not blame in such cases because the person’s inability to do something meant that the person was not, after all, obligated to do it. It seems, however, that people might not blame in such a case because they accept the person’s inability as an excuse for failing to fulfill the obligation, not because they accept the inability as a reason for saying that the person was not obligated.

CULPABLE POWERLESSNESS

A person may have inappropriate feelings and be unable to control them. Even then, it may be reasonable to say that that person ought to feel ashamed,

grateful, disturbed, or remorseful, and that there is something wrong with anyone who cannot have these feelings. One may say that the “ought” in such cases expresses an ideal, as does the “ought” in the statement “Everyone ought to be able to live like a king.” An “ought” that expresses an ideal does not imply “can,” but not every case in which “ought” does not imply “can” seems to involve an ideal “ought.”

Consider, for example, cases of culpable powerlessness. Imagine that Smith promises to meet Jones in two hours, then changes his mind and takes a powerful sedative. At the time of the promised meeting, Smith cannot be there, but it still seems that he ought to be there. Defenders of the principle may say that Smith’s obligation to be there ceased once he could not be there, but that he did wrong in making it impossible for himself to be there. If people should be blamed for failing to fulfill an obligation, however, then Smith was obligated to be there, since one would blame him for not being there as well as for making it impossible for himself to be there. To hold to the principle in cases of culpable powerlessness seems to make it too easy for people to cancel their obligations.

Alvin I. Goldman, in chapter 7 of his *A Theory of Human Action* (1970), considers rewriting the principle as follows to avoid such cases: If a person ought to do x at time t , then there is some time, at or before t , at which he or she is able to do x at t . In that case, there is no reason to say that Smith is not obligated to keep his appointment, since before he took the sedative he was able to keep the appointment he had made for time t .

Now, however, cases of powerlessness that should rule out obligation will not do so. For example, if before Smith could take the sedative he was struck with complete paralysis while alone in his apartment, his obligation should terminate. It will not terminate given the revised principle, however, since according to it, he *can* still keep his appointment.

There is, however, the following basis for believing that at least one interpretation of the principle is true. If a person ought to do x , he is properly subject to moral judgment if he fails to do it. If he is properly subject to moral judgment if he fails to do x , then it is physically possible for him to do it. (Something is physically possible if it is consistent with the laws of nature. Being able to fly is inconsistent with those

laws, and that is why not being able to fly is not properly subject to moral judgment.) Therefore, if a person ought to do x , it is physically possible for him to do it. If “ought” also implies a sense of “can” that rules out causal determination, the principle provides some reason for believing that determinism is incompatible with freedom and moral responsibility.

Outsourcing

DEFINITION: Business practice of having important company services performed by other companies or individual persons outside the firm

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Changing conceptions of corporate efficiency have reconfigured divisions between in-house functions and those that are subcontracted to external agencies, raising new ethical questions about the treatment of employees.

Corporations were once largely self-contained and comprehensive collections of functions, some of

which might be outsourced, that is, subcontracted to other companies or to individual freelance workers. Keeping functions in-house removed the need to generate profits, and therefore generally saved money; however, costs could easily outweigh savings. Moreover, units of a company that are not expected to generate profits have less reason to use resources effectively. Thus, the same considerations supporting competition in the marketplace would seem to favor competition within the corporation.

In effect, extensive outsourcing brings the competitiveness of the marketplace inside individual corporations, as functions are contracted out to more specialized companies or individual workers. The decade of the 1990's witnessed dramatic developments in this direction, as corporations downsized and otherwise re-engineered their way to being more cost-effective and thus more profitable. Automobile manufacturers do not need to do their own landscaping or package delivery, so one might legitimately ask what other functions such companies could outsource—design, production, sales, accounting, perhaps even management.

One logical result of this line of thought is a distributed, or networked, organization, which has been called the “virtual” corporation. The enterprise becomes a kind of dormant network that can be brought to full life when the need arises, much as a Hollywood film-production company expands its activities when it launches a new film.

GLOBALIZATION AND ITS DISCONTENTS

Increasingly easy, cheap, and reliable communications and transportation systems make a distributed approach to business possible for corporations.

In the government sphere, the same approach is known as privatization. As American manufacturing jobs have moved overseas in search of cheaper labor, other functions, such as software design and financial services, can be imported as needed. An ethically positive consequence of this new globalized flexibility is increased possibilities of productive, synergistic linkages among people, resources, and opportunities. This can mean a constant stream of better and cheaper products and services. Ethically negative consequences include destabilization of companies, greater insecurity for employees whose jobs are being reconfigured or eliminated, and the domination of everyday life by the ceaseless scramble for continuous quality improvement in a world in which everything is new and improved, but nothing is ever good enough.

P

Pacifism

DEFINITION: Moral opposition to war or to violence in general

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Pacifism is often seen as a virtue, especially in discussions of famous pacifists such as Jesus Christ or Mohandas K. Gandhi. It may also be judged immoral, however, when it involves the refusal to take up arms against evil or terror.

One of the most ethically troubling aspects of human existence is the problem of war, because of its connection with killing. Given the moral aversion to killing found in most ethical theories, war has been the subject of much ethical reflection and analysis in an attempt to provide either a justification for or a critique of war. Pacifism results from the belief that war can never be justified and is always immoral. Although pacifism may take different forms, moral opposition to war is a common theme. One of the questions that pacifists have tried to answer is whether pacifism also implies opposition to all forms of violence in addition to war.

HISTORY AND SOURCES

While pacifism has a philosophical grounding, its main source is religion. The Jain tradition in India practices pacifism by avoiding killing even insects. Buddhism also has a pacifist dimension. The dominant source for pacifism in Western culture, however, has been the Christian tradition.

Employing elements of the Hebrew scriptures, such as peace, righteousness, and compassion, along with an image of Jesus as nonviolent, early Christians began to raise ethical questions about war and participation in the military. The basis for these concerns centered on two factors. First, the Roman army had its own gods and religious rituals that contradicted both the Christian emphasis on one God and Chris-

tian forms of worship. Participation in the Roman army for a Christian would therefore be equivalent to idolatry or false worship. The second factor was based on more explicit ethical concerns about the morality of killing. Using the statements of Jesus, especially those taken from the Sermon on the Mount, some early Christians developed a moral framework that opposed the shedding of blood and, by extension, participation in war. Warfare was seen as a denial of the message of Jesus regarding love of enemies as well as a rejection of the kind of life that Jesus demanded of his disciples. The question thus arose whether a person could be both a Christian and a warrior.

This ethical issue of Christian participation in war increased as Christianity came more and more to be the established religion of the state following the proclamation of toleration by Constantine in the year 313 C.E.. Christians faced the dual changes of subsiding persecution and more direct involvement in the affairs of state, including war.

The ethical concern over war turned on the conflict between two principles: not harming others and protecting the innocent. Sometimes protecting the innocent might entail harming others, even killing them. War also became a matter of loyalty to the state. Moral qualms about killing were often resolved by means of a separation between public and private ethics. Christians could kill and participate in war as a consequence of the public duty of being soldiers, but not as private individuals. In addition, the development of the just war theory began to be the dominant ethical perspective on war in Christianity. There was still a strong pacifist element within the Christian tradition, however, and it surfaced most dramatically in the Protestant Reformation during the sixteenth century.

The Radical Reformation, or the Anabaptists, viewed war as directly antithetical to the Christian message. The Anabaptists sought a return to what

was described as the New Testament Church, which they understood to be completely opposed to war and violence. One of the major documents of the Anabaptist movement, the Schleitheim Confession of 1527, holds that the use of the sword is outside the perfection of Christ. The Anabaptists thus rejected the distinction between public and private ethics and the justification that it provided for war. As a consequence, they also sought to limit the demands of the state and to call into question the claims of value made on behalf of the state. The Anabaptists are the ancestors of the Historic Peace Churches, such as those of the Mennonites, Quakers, and Amish. Pacifism is a central component of their views of Christian ethics.

Pacifism was also defended on humanistic and philosophical grounds. Desiderius Erasmus, the sixteenth century Christian humanist, argued that war was wasteful and impractical. It offered nothing from which humanity could benefit and only revealed the horrors that human beings could visit upon one another. The eighteenth century philosopher Immanuel Kant emphasized the impracticality and irrationality of war. His famous dictum to treat people as ends and never as means also created a strong argument against the morality of war, since it seemed that war did treat people as a means. These religious and philosophical views have combined to give pacifism its focus and variety. John Howard Yoder lists eighteen types of pacifism in his book *Nevertheless* (1976).

MORAL FOUNDATIONS

The moral basis of pacifism usually has several dimensions: a view of God, a normative understanding of humanity, and the importance of love. A philosophically based pacifism may not fully develop a view of God. If God is part of the pacifist ethic, God is seen as underlying creation, which imparts a moral structure to the world in the direction of sustaining creation. War, which is destructive, denies the divine relationship to creation and becomes immoral. Humanity is characterized by a fundamental unity.

Beneath the differences that qualify human existence is an explicit humanness that extends beyond differences such as race, religion, or ethnic origin. Pacifism seeks to uphold the basic unity by refusing

to allow the differences to become justifications for war and killing. As a result, love is often the central moral feature of pacifism in a practical sense. A pacifist would claim that love, as the basis for human actions, entails the rejection of war and possibly even all forms of violence. For this reason, the goals of pacifism are more than simple opposition to war; they involve finding alternatives to the use of violence to resolve conflicts and an emphasis on peace research and education.

Pain

DEFINITION: Fundamentally unpleasant physical or emotional sensation; suffering

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Pain names the broad class of experience which all sentient beings are conditioned to avoid. It is the most primal negative influence on behavior, as pleasure is the most primal positive influence. In many ethical systems, to intentionally cause pain in another is among the most serious moral transgressions, and to alleviate the pain of another is among the most morally admirable acts.

The treatment and relief of pain is often considered to be a central goal of the medical profession, at least by those who seek care. People usually think of pain as a warning sign that something has gone wrong in the body's systems; however, not all pain serves this function, and not all pain is indicative of physical malfunction.

PHYSIOLOGY

Pain is usually separated (somewhat arbitrarily) into two diagnoses: acute and chronic. While chronic pain is often defined clinically as acute pain persisting longer than six months, there are differences in perception and meaning that go beyond merely temporal distinctions.

Acute pain is also of two types, classified by the speed with which the actual nerve impulses reach the brain. When an event, such as a burn, triggers signals to be sent to the brain, one set of signals travels much faster. These are the initial impulses, "fast" pain, that travel on myelinated (sheathed in a protein-lipid layer) A delta fibers. These impulses reach the brain in a fraction of a second, while the "slow" pain, which travels on unmyelinated C fibers, takes up to a couple of seconds to register in a person's consciousness. The further the site of stimulus is from the brain, the greater the difference in the times these signals register. Fast pain is sharp and bright. Slow pain is dull and aching, and ultimately more unpleasant.

In addition to the nerve impulses sent to the brain, for which the chemical neurotransmitter seems to be substance P (for pain), chemicals are released at the site of stimulus. Prostaglandins draw blood to the area to gain the healing and infection-fighting power

of white blood cells. Prostaglandins also increase the sensitivity of the nerves in the immediate vicinity of the injury, as do bradykinins and leukotrienes, which are also released.

PSYCHOLOGICAL COMPONENTS OF PAIN

Pain cannot, however, be relegated to mere physical perception. The knowledge of the consequences of pain is inextricably entwined with the feeling and assessment of pain. In a now-famous study published in 1946, Henry K. Beecher found that men who were severely wounded in battle reported far less pain (and some no pain at all) than did civilian patients with comparable wounds caused by surgery. The reason for this seems clear: For men in battle, severe wounds are the ticket home. Pain cannot be separated from the personal and social consequences of its presence.

Many people take pain and suffering to be synonymous, yet they are different and distinct. Pain can occur without causing suffering, as does the pain that athletes endure during competition. There can certainly be suffering without pain, either physical, such as severe itching, or mental, as in grief. (Some authorities do not distinguish between physical and mental suffering, believing them to be so linked as to be inseparable.) Pain is usually taken to be a physical perception, while suffering is psychological distress. Intrinsic to suffering is a threat to the integrity of a person as a whole. The anticipation of pain and loss can cause as much suffering as the actuality thereof.

MEANINGS OF PAIN

Pain has had different interpretations in different cultures and periods of history. While today Western culture ostensibly reaches toward the eradication of pain, this has by no means always been the case. Aside from medical inability to eliminate pain in the past, pain and suffering have themselves been considered valuable in many cultures. The Christian religion, in particular, has traditionally deemed experiencing pain, in some circumstances, a virtue.

Suffering, especially suffering for others, is considered one of the highest forms of sanctity, as can be seen from the litany of saints by martyrdom throughout the ages. In other religious traditions, pain and suffering are, or can be, due punishment for sins or wrong actions committed either in this life, as in Judaism and Islam, or in past lives, as in Hinduism and

Buddhism. The word “pain” in English is derived from the Latin word *poena*, meaning “punishment.” The English word for one who seeks medical care, “patient,” also comes from the Latin. Its root, *pati*, means “the one who suffers.” Underlying these derivations, and extending beyond the words themselves, is the cultural acceptance that pain and suffering are an inevitable part of life and as such are not intrinsically evil. This attitude is the basis for medical hesitancy to consider pain a problem to be treated in and of itself, rather than simply as a symptom of other disease or injury.

TREATMENT OF PAIN

Because of these deep-rooted cultural attitudes toward pain and those who suffer, only recently has aggressive treatment of pain become an issue in medical ethics. Studies have shown surprising underutilization of pain-relieving medication for sufferers of severe pain, especially among terminal cancer patients. This seems to be because of fears of addiction to narcotics and a lack of knowledge of proper use. The use of heroin for terminal patients has long been accepted in Great Britain but continues to be prohibited in the United States.

Alternative forms of treatment are becoming more acceptable, although the efficacy of some remains to be substantiated. Biofeedback techniques, chiropractic, hypnosis, and TENS (transcutaneous electrical nerve stimulation) are generally accepted to be of value for many patients. Acupuncture is gaining ground in the United States. For millions of people, however, effective pain relief still lies in the future.

Pan-Africanism

DEFINITION: Global nationalist movement aimed at uniting peoples of African descent

DATE: Term coined in 1900

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: Pan-Africanism seeks through racial unity to find solutions to the problems of flagrant injustice, economic deprivation, and discrimination based on skin color. Despite operating across existing political boundaries, it raises many of the ethical issues raised by nationalism generally, and it has been both celebrated and vilified as a species of nationalism.

The European discovery and partitioning of Africa was a classic story of gold, glory, and God, compounded by greed, adventure, and missionary zeal. In the process, imperialist invaders squeezed the continent of its wealth, while announcing to the world that they were bringing the benefits of civilization to backward peoples. Pan-Africanism awakened a new spirit that rejected patience and the acceptance of suffering and inferiority. The emotional impetus for its concepts flowed from the experience of a widely dispersed people—those of African descent—who believed themselves either physically, through dispossession or slavery, or socially, economically, politically, and mentally, through colonialism, to have lost their homeland. With this loss came enslavement, persecution, inferiority, discrimination, and dependency. It involved a loss of freedom and dignity. This realization, bolstered by an awareness of their common heritage, led to a desire among black people for some link with their African origins. It became a vehicle for the struggle of black people to regain their wealth, pride, strength, and independence as emotions were converted into ideas and ideas into slogans. Above all, however, the ideals of

Pan-Africanism grew from the desire to regain dignity and equality for all black people.

GROWTH IN DIASPORA

Originally, Pan-Africanism was dominated by the leadership of black people residing in the United States and the West Indies. During the late 1870's, following the era of Reconstruction, African Americans in the United States were alienated by growing racism and economic depression. Some among them began to think in terms of returning to Africa. Marcus Garvey, who was of Jamaican origin, would later ex-

plot this discontent by preaching a back-to-Africa message to the black people of the New World during the early 1920's. His idea of exodus to Africa was embedded in the prospective creation of an exclusively black race, an idea that earned him the endorsement and eventually the open support of the Ku Klux Klan, who, although for different reasons, welcomed his desire to expatriate all blacks to Africa.

Another pioneer spokesman for Pan-Africanism in the diaspora was W. E. B. Du Bois. His main concern was achieving absolute equality for the entire black race, an idea that had been born out of his con-

Pan-Africanism Time Line

<i>Date</i>	<i>Place</i>	<i>Event</i>
1900	London	Henry Sylvester Williams calls first Pan-African Conference.
1920	New York	Declaration of the Rights of the Negro Peoples of the World is read at a conference held in New York. During the conference, Marcus Garvey is elected provisional president of Africa.
1919-1927	Europe and the United States	W. E. B. Du Bois calls four Pan-African Congresses.
1945	Manchester, England	Fifth Pan-African Congress is the first organized by Africans.
1958	Accra, Ghana	First conference of Independent African States is held.
1959	Ghana	Ghana-Guinea Union is declared by its signatories to be the beginning of a Union of Independent African States.
1960	Addis Ababa, Ethiopia	At Second conference of Independent African States, Pan-African movement splits into two factions over ideological rifts.
1960	Brazzaville, Congo	Brazzaville Group (also known as the Union of African States and Madagascar) convenes and makes public its moderate views on African unity and related issues.
January 3-7, 1961	Casablanca, Morocco	Casablanca Conference announces that it favors a political union that will eventually lead to a "United States of Africa."
May 8-12, 1961	Monrovia, Liberia	Taking its cue from the Brazzaville Group, the Monrovia Conference announces that it favors a form of unity that allows for the preservation of national sovereignty.
July 1, 1961	Accra, Ghana	In response to the Brazzaville Group, Ghana, Guinea, and Mali issue the Charter for the Union of African States.
May 25, 1963	Addis Ababa, Ethiopia	Organization for African Unity, which unites the two camps, is founded.

viction that the “favored few” had no moral right to prosper at the expense of the toil of the “tortured many.”

THE NATIONALIST DIMENSION

The second stage of Pan-Africanism began with the gradual decolonization of Africa after World War II, when the character and leadership of the movement became more Africanized. Educated Africans who had come to study in universities in Europe and America had come to know firsthand about racial intolerance and the economic subjugation of blacks. Three of those students, Kwame Nkrumah of the Gold Coast (later Ghana), Nnamdi Azikiwe of Nigeria, and Hastings Banda of Nyasaland (Malawi), all of whom had been exposed to the Pan-Africanist movement of the diaspora, would later become presidents of their respective countries at independence.

The African nationalist leaders gave a new meaning to Pan-Africanism—African solidarity and unity—for it was believed then (and now) that the process of political and economic emancipation that had begun during the nationalist days could be consolidated only through a cohesive and united continental Africa. The dreams of African unity that they had so nurtured and cherished would run into all kinds of problems, however, and by 1960, ideological differences had sharply divided the newly independent nations into rival camps, a division that was further aggravated by superpower rivalry. While some insisted on a political union that would require giving up some sovereignty, others favored a simple association of states. This proved to be harmful for the continent’s much-needed economic development and political stability, and it was not until 1963 that they finally found a common ground with the establishment of the Organization of African Unity (OAU).

The OAU’s charter sought to “promote unity and solidarity of African states” through “political, economic and scientific cooperation.” Ever since, the continent has been plagued by a series of problems ranging from political instability to outright economic disasters. Allegations of human rights abuse are widespread, and in many cases, the prospects for majority rule have been dampened by the installation of military regimes, which usually are corrupt and morally bankrupt. Civil wars and cases of mass starvation are rampant, while the whole continent con-

tinues to be haunted by the discriminatory policies of South Africa. Many of these problems have been blamed on, among other things, the lack of a sound guiding philosophy for development as well as the absence of a leadership code of ethics.

Panentheism

DEFINITION: Belief that all reality is a subset of the being of God

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Panentheism attempts to reconcile the belief that God is everything and the belief that God transcends reality by positing that both statements are true.

To understand panentheism, one must also become familiar with pantheism, for both philosophies consider God, this world, and the universe, and both try

to explain how the three are related. The older of the two is pantheism, which posits that God and the universe are one and the same. Despite apparent diversity and disorder in the cosmos, the universe is ordered and unified, and that order and that unification are expressions of God. Because pantheists give no place to the transcendence of God, however, that philosophical position eventually gave rise to panentheism, whose advocates hold that all reality is part of the being of God and that God transcends all reality. God is the universe, but he is also much more. Although the philosopher who first coined and defined the term “panentheism” was the German Karl Christian Friederich Krause, various early Greek philosophers (such as Thales, Xenophanes, and Parmenides) held many views that were consistent with panentheism.

PANENTHEISM

In developing their philosophical “system,” modern panentheists usually follow Krause, who attempted to mediate between theism and pantheism. Panentheists believe that God (absolute being) is primordial, a being without contrariety who is one with the universe but is not exhausted by it (God is bigger than the universe). All individuals are part of a spiritual whole, a league of humanity. For the human being, self-consciousness provides the starting point of panentheism, for it allowed, Krause held, the ego to learn that it was both mind and body and also to learn that it was part of God.

Because God is good, humankind should share in the goodness, and humankind’s inner union with God becomes the foundation of ethics, with ethics becoming the heart of religion. Just as a living cell has certain freedom within a living body, however, so, too, do humans have a degree of freedom. Krause viewed all individuals as part of the divine, and he became a crusading reformer who, for example, argued against capital punishment; he also believed that republican government was the only political system that was worthy of the divine. Regarding all “organized” religion as oppressive, he criticized theocracy, religious censorship, and religionists’ disdain for the world.

Closely related to both pantheism and panentheism is the doctrine of “emanation,” which asserts that an overflowing superabundance of the divine God resulted in the production of the universe. All reality, then, flows from a perfect and transcendent

principle. The first gift of the divine overflow was intelligence, which allowed humans to understand their world, their reality. Opposed to evolutionism, emanationism is timeless, and its source (God) remains undiminished.

PANENTHEISM: ITS CRITICS AND ITS SUPPORTERS

Most critics hold that both pantheism and panentheism fail to account for the individuality, the personality, and the freedom of each human being. Likewise, both beliefs fail to account for evil, ignorance, and error on the part of some people. Thus, negatives exist in the world and the universe—negatives that could not emanate from a perfectly good God. Using acquired knowledge and the powers of observation, critics also deny that the universe contains total unity. Indeed, the idea of a unified universe is actually devoid of content, because diversity obviously exists. Likewise, modern scientific progress is not in accord with a unity theory. Charles Darwin’s evolutionary theory, for example, stands opposed to both pantheism and panentheism. Organized religion also remained most critical of both pantheism and panentheism; one religionist called both beliefs “worms” of heretical “perversity” and inventions of the devil.

Some critics of panentheism attack the philosophic reputation of Krause, who gave the doctrine its most complete explanation. During his lifetime, for example, his ideas were so suspect that he was denied professorships at such prestigious universities as Göttingen and Munich. Furthermore, he coined many words that had meaning only for him (and that confused later scholars). Likewise, he also produced bizarre neologisms that were too much for the German language, as well as being untranslatable.

Over time, supporters of panentheism—such as Krause’s disciples Julian Sanz del Rio of Spain, Heinrich Ahrens of Belgium, and Hermann von Leohardi of Germany—attempted to answer the critics, but in doing so they raised more questions. For example, while grappling with the problem of evil, some supporters argued that evil resulted only when an individual organism—because of ego—tried to tear itself away from the harmony of the whole (which is part of God). Yet such a defense actually raises the question about the goodness of God. Why would God create organisms that ultimately try to tear away?

Although panentheism has shown a remarkable ability to survive, such survival is no indication that—especially in view of the criticisms—it has any basis in fact.

Pantheism

DEFINITION: Belief that God and reality are coextensive

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Pantheism holds that God is everything and everything is God. Its effects upon ethics are paradoxical and potentially controversial, since it would seem to require respect for all life and nature, but it also raises difficult questions about how suffering, evil, and injustice can be part, not merely of God's plan, but of God himself.

Pantheism is older than civilization. Some see its origins in animism, the primal religious conviction that

everything has a soul or spirit. Popularized during the Enlightenment, the English word "pantheism" is from two Greek roots, *pan* ("all") and *theos* ("god"), meaning that "God is everything." This term suggests that God is the totality of all things—real and imagined, actual or potential. As a being "apart" or "separate" from nature, God does not "exist." Within the Western tradition, Pantheism was a powerful moral force for the Stoics, the Neoplatonists, and such modern thinkers as Baruch Spinoza. Within the Eastern traditions, Pantheism is evident in Islamic mysticism (Sufism), certain types of Daoism (urging conformity to the *Dao*, or "rhythm of the world"), and Hinduism.

Paradoxes in ethics

DEFINITION: Formal arguments that prove the truth of contradictory propositions

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The existence of paradoxes in ethics may demonstrate that reason and rationality alone are insufficient tools for making ethical decisions.

Ethical questions deal with the correct values one should use in making individual and collective decisions. The dilemma for recent ethical thinkers has been to agree upon a set of values that may form the basis for collective decisions, given the increasing pluralism of many societies and the global environment. A common response has been that even though all individuals may not agree on value issues, if all individuals agree to behave rationally—that is, to act in a consistent manner in pursuing their individual self-interests—then collective goals can be reached and collective decisions can be made. Unfortunately, two problems show that ethical paradoxes arise even when the only assumption one makes about individual motivations is that all individuals are acting to maximize their own utilities. These paradoxes cast doubt on the idea that rationality is a sufficient means of reaching collective decisions or goals.

LOGIC OF COLLECTIVE ACTION

Two political theorists, Brian Barry and Russell Hardin, define a paradox as a set of conflicting or contradictory conclusions to which one is led by apparently sound arguments. The first paradox of rationality to be discussed is the problem of collective action. This problem states that a self-interested individual may not be able to work with others toward a collective good even when all individuals involved realize that their individual interests would be served if all cooperated in the venture. A “collective good” is defined as a benefit in which all in a group may share, even if all do not contribute to its creation or maintenance. Examples of collective goods include clean air, which all may breathe even if all individuals did not help clean up the environment, or public television, which all may watch even if all did not send in contributions during a pledge drive.

It has been generally assumed in the social sciences that self-interested individuals will contribute to collective goods if they feel that they receive more in benefits than the cost of contribution; hence, the common appeal from public television that “if you feel the entertainment on PBS is worth more than \$100 a year, please pledge this amount to the station.” The logic of collective action, however, disputes this claim.

Assume that one individual does believe that the benefits received will outweigh the costs of contributing. If the individual contributes to the goal and the goal is reached, that individual’s profit is the worth of a share of the collective good minus the cost of contribution. If the individual does not contribute to the goal, however, and the goal is reached, that individual’s profit is the worth of his share of the collective good with no deductions. Under these circumstances, the self-interested individual should “free-ride” on the work of others and not contribute. If the individual contributes to the goal and the goal is not reached, the individual’s profit is negative and is equal to the cost of contribution, since there is no collective good to share. If the individual does not contribute to the goal and the goal is not reached, the individual’s profit is zero.

Under these circumstances, the self-interested individual should once again not contribute. Hence, the individual should not contribute regardless of whether the goal is reached; the only exception to this

rule occurs when one individual’s contribution will make the difference between success or failure in the venture. Given that the chances of such a situation are very small in large groups, no large-scale collective action should be possible. One may ask, of course, “what if all persons acted that way?” The sting of the problem is that all self-interested persons should be expected to act this way, so that goods such as clean air, public television, and others should not be created by voluntary contributions.

ALTRUISM

Some people have argued that a sense of altruism might lead individuals to contribute to a collective good. There are two problems with this argument. First, even if one is motivated by humanitarian concerns, it still might not be reasonable to contribute to a large-scale collective effort if that effort might not succeed because of the logic of collective action; one would be better off giving the money to a homeless person. Second, there remains a great deal of behavior that humanitarian motives cannot explain. Individuals do not join interest groups such as the National Organization for Women or the National Rifle Association out of altruism; they join out of self-interest. It is there that the paradox of collective action arises: An individual’s self-interest may prevent him or her from participating in collective action that would serve his or her self-interest if all individuals participated in it. Furthermore, all persons involved may realize that this situation exists and still be unable to do anything about it.

CYCLICAL VOTING PATTERNS

The second paradox involves cyclical voting patterns. It shows how three individuals, ranking three alternative choices, may not be able to assemble a transitive ranking for the whole group. Consider three individuals, *A*, *B*, and *C*, and three policy choices, *X*, *Y*, and *Z*. Assume that the three individuals rank these choices in the following manner.

	A	B	C
First preference	x	y	z
Second preference	y	z	x
Third preference	z	x	y

Note that all individuals' preference orderings are transitive—that is, if X is preferred to Y , and Y is preferred to Z , then X is preferred to Z . How does the group rank these preferences, using majority rule? Since A and C prefer X to Y , the group prefers X to Y by majority rule. Since A and B prefer Y to Z , the group prefers Y to Z by majority rule. Since the group prefers X to Y and Y to Z , one would assume that the group prefers X to Z . B and C prefer Z to X , however, so by majority rule, the group prefers Z to X . One arrives at two results, one in which the group prefers X to Z , and another in which the group prefers Z to X .

PROPOSED SOLUTIONS

Several solutions to this problem have been advanced, but none is entirely satisfactory. One answer states that all three choices are equally preferred by the group, but that is not true; in fact, any given choice may be beaten by another choice as the top preference. Another answer suggests changing the voting rules so that more than a majority is needed to reach a group preference. Kenneth Arrow has shown in a general proof, however, that *any* decision rule based upon individual choices may fall victim to this problem, if three or more choices and three or more individuals are involved. Another answer suggests that one should merely use the first result derived, but this solution leaves the result dependent upon the order in which alternatives are considered. For example, if the group considers X and Y first, X is preferred to Y ; if the group then considers Y and Z , Y is preferred to Z , and hence, the group prefers X to Y and Y to Z . If the group considers Z and X first, however, Z is preferred to X ; if the group then considers X and Y , X is preferred to Y , and hence, the group prefers Z to X and X to Y .

The ordering of these alternatives has been changed entirely simply by changing the sequence in which the alternatives were considered. For those who value majority rule as an ethical means of reaching decisions, this problem gives dictatorial power over voting results to the individuals who decide the sequence for voting on alternatives.

Finally, one may simply say that it is impossible to reach a decision. One may then, however, define this as alternative W and rank it as the least preferred alternative for all three members. Hence, all three persons would wind up with gridlock, their last choice. Majority rule thus may prevent individuals

from reaching a majority decision; indeed, if one goes back to the original three-person problem, any given ordering of X , Y , and Z would mean that one of the three individuals (A , B , or C) will get his or her way despite the disapproval of a majority of the other group members.

PROBLEMS AS “PARADOXES”

The paradox in both of these problems is evident. In the first case, self-interested action prevents the creation of collective goods that would serve all individuals' self-interests. In the second case, majority rule may result in decisions that violate the majority will or in gridlock, which is the alternative least preferred by all. By pursuing self-interest or majority rule, one arrives at conclusions in both cases that contradict one's original rules. The ethical problem here is evident: In both cases, individuals follow the rational pursuit of their own self-interests and discover that rationality alone is insufficient grounds for taking group action or reaching a group decision. These paradoxes illustrate that rationality alone cannot bear the burden of generating an ethical consensus about the correct forms of action or decisions in a society.

Parenting

DEFINITION: Legal and moral obligations that parents have with respect to their own children

TYPE OF ETHICS: Children's rights

SIGNIFICANCE: Several important ethical issues concern the moral dimensions of parent-child relationships, including the amount of control parents should exercise over their children, the amount of state and social intervention into the parent-child relationship that is permissible, and what special rights and obligations parents possess.

Explorations of the moral dimensions of parent-child relationships are motivated, in part, by the widespread physical and emotional abuse of children. Some philosophers, such as Jan Narveson, hold the view that children are the property of their parents. This sort of view has an affinity with the belief that parents should be able to do nearly anything to their children, free from the intervention of others.

Some of the modern philosophical interest in exploring the parent-child relationship is also motivated by the value of parenthood for those adults who are or who want to become parents. At the beginning of the twenty-first century, several debates were going on among philosophers and other professionals involved with children and family life concerning the justification of the paternalistic treatment of children, the level of permissible intrusions into parent-child relationships, and what it is that makes for good parents.

PATERNALISM

The most prevalent view on parenting, voiced by philosophers such as John Locke and John Stuart

Mill, is that parents must treat their children in paternalistic ways. That is, parents must often make choices on behalf of their children that go against their children's wishes or limit their freedom, but which are intended to benefit them. Paternalistic treatment of children is said to be justified by the children's lack of knowledge, experience, and moral development.

In contrast, some authorities, such as Richard Farson, believe that children should be granted the same legal and moral status that adults possess. That is, children should have the same freedoms and responsibilities as adults.

PRIVACY AND FAMILY LIFE

Family relationships are like other relationships, insofar as part of what makes them valuable is that they are intimate interpersonal relationships in which individuals share themselves with those who are close to them. Parents and children can greatly benefit from the goods that arise within family life. In order to secure these goods, some level of freedom from outside interference may be required. Some amount of privacy may be necessary so that families can enjoy the intimacy and meaning that family relationships are able to provide.

The state may have an interest in allowing for diverse parenting styles and creating a social system in which families can flourish. Difficulties arise, however, when respect for family privacy allows parents to engage in physical and emotional abuse or neglect, leaving many children at risk of being harmed, often in very serious ways. Much controversy surrounds the issue of how best to respect the privacy of families while also minimizing possible risks to children. Some, such as Narveson, argue that the state should generally refrain from intervening in the lives of families. In contrast to this view, William Irvine argues that parents should be required to obtain parenting licenses before being allowed to raise children. David Archard argues that closer monitoring of families by state and local agencies is desirable.

THE RIGHTS AND OBLIGATIONS OF PARENTS

Most parents believe that they have obligations to protect and provide for their children by giving them basic care and providing for their basic needs. Parents who abuse or neglect their children arguably fail to fulfill their obligations as parents. Irvine is repre-

sentative of many philosophers in his belief that parents should see themselves as stewards of their children, and that parents who see themselves this way are altruistic with respect to their children, as they place their children's interests before their own. They thus tend to see themselves as having many parental duties but few parental rights.

According to Irvine, parents are morally obliged to help their children develop their talents, skills, and abilities; to prevent harm from coming to them; to educate them; to help them develop into autonomous beings; and to provide them with as much freedom as possible regarding their future lives.

Many psychologists say that parents who love their children should pursue intimate and honest relationships with them and seek to impart to them some vision of a good life. Children, at least at a young age, need this sort of care and guidance. It may include encouraging children to understand and adopt the political, moral, and religious beliefs of their parents. One limit that is often imposed on this aspect of the parent-child relationship is that parents must not indoctrinate their children. That is, it is wrong for parents to force their beliefs on their children. Instead, parents will ideally explain and perhaps even advocate their own political, moral, and religious views, while at the same time respecting the rights of their children to choose different paths. This is generally thought to be important because parents must respect the autonomy of their children, accepting the possibility that their children may adopt and pursue a different view of the good life. However, when this occurs, the general view of psychologists is that parents should continue to pursue loving relationships with their children, given the fact that most children need such a relationship with their parents.

Parole of convicted prisoners

DEFINITION: Conditional release of prisoners who are serving indeterminate or unexpired sentences, usually based upon their good behavior during their incarceration

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: The early release of convicted criminals back into society presents a variety of ethical problems relating to the rights of both members of society and the parolees themselves.

Convicts who are let out of prison before serving their full sentences may pose dangers to society, and they themselves may believe that they will not be held fully accountable for their actions because of their early release. Moreover, the victims of their crimes and their relatives may feel that justice is not being served when the convicts are released early and may also feel endangered by the convicts' freedom.

Public concerns about dangers posed by paroled convicts are not without foundation. Studies of former convicts indicate that parolees released from prison have a high probability of ending up in prison again. Recidivism rates toward the end of the twentieth century were close to 80 percent—in other words, four out of every five prisoners released from prison either violate the terms of their paroles or commit new crimes and are returned to prison.

At least three factors contribute to the high rates of recidivism. First, prisons are mislabeled as correc-

tional institutes, when in fact they are often breeding grounds for crime. New prisoners learn more about crime from veteran convicts inside prison walls. Secondly, parolees often cannot find satisfactory employment after they are released from prison. As a result, they tend to return to criminal activity, which in turn returns them to prison. Finally, some parolees simply cannot adapt to society, in which they are stigmatized and stereotyped.

TOUGHENED LAWS

As a result of growing public weariness with increasing crime rates during the last decades of the twentieth century, a number of states took tougher stances against crime. Some states adopted “three-strikes” laws, which impose mandatory twenty-five-year-to-life sentences on persons convicted of their third felony offense. Other states have adopted “truth in sentencing” laws that require convicts to serve most of their full sentences, regardless of whether they are model prisoners or not.

These tougher laws have led to significant increases in U.S. prison populations, which totaled more than one million inmates in 2003. In the midst of the “get tough” climate, a number of federal courts have begun ordering early-release programs because of prison overcrowding. These court interventions have combined with economic downturns in state economies to lead to early-release programs.

The growing numbers of parolees have focused increasing attention on the question of whether it is ethical to release prisoners who have not served their full terms, especially when their victims and their relatives believe that justice is not being fully carried out. At the same time, equally valid questions may be asked as to whether it is ethical to keep convicts in prison indefinitely when they have been model prisoners and might become productive members of society outside prison.

Pascal, Blaise

IDENTIFICATION: French philosopher

BORN: June 19, 1623, Clermont-Ferrand, France

DIED: August 19, 1662, Paris, France

TYPE OF ETHICS: Renaissance and Restoration history

SIGNIFICANCE: The author of *The Provincial Letters* (*Lettres provinciales*, 1656-1657) and *Pensées* (1670), Pascal developed persuasive arguments against compromising one's moral values in order to attain political or social influence.

Although Blaise Pascal was an important mathematician and physicist, he has remained famous above all for his eloquent writings on the moral obligations that accompany a commitment to Christianity. Pascal believed that an acceptance of divine authority enables people to develop an objective foundation for moral values. The problem of ethical subjectivity disappears once one accepts the revealed and liberating truths to be found in the Bible and in the exegetical works of respected church fathers such as Saint Jerome and Saint Augustine. Because of the clarity and the depth of his analysis of ethical questions, Pascal has remained one of the most influential and controversial French writers, even several centuries after his death in 1662.

THE PROVINCIAL LETTERS

Beginning in 1646, Pascal and his sister Jacqueline Périer became very interested in the Catholic religious movement associated with the monastery, convent, and school at Port-Royal. The priests and nuns at Port-Royal were referred to as Jansenists because a major influence on their view of Christian spirituality had been a 1640 book on Saint Augustine by a Dutch theologian named Cornelius Jansen. The

Blaise Pascal. (Library of Congress)

Jansenists encouraged personal spiritual development and denounced all attempts to allow worldly values to interfere with the purity of a total commitment to Christian values.

Books by such important Jansenist theologians as Antoine Arnauld and Pierre Nicole provoked an intense controversy with French Jesuits, who were then very influential at the court of King Louis XIV and with French bishops and priests. The basic disagreements between the Jesuits and the Jansenists dealt with the theological concept of grace and the use of casuistry, which is the practice by which a priest applies general moral standards to individual cases in order to determine if a specific action was sinful or if a repentance was sincere.

Between January, 1656, and March, 1657, Pascal published eighteen anonymous letters that were addressed “to a Jesuit provincial by one of his friends.” Ever since its creation during the 1540’s by Saint Ignatius Loyola, the Jesuit order has been administratively divided into broad geographical areas called provinces whose spiritual leaders are called provincials. The eighteen *Provincial Letters* are masterpieces of polemic rhetoric. Pascal sought to diminish the growing influence of French Jesuits by attribut-

ing to the entire order rather extreme positions taken by certain Jesuit theologians such as Antonio Escobar y Mendoza and Luis de Molina, who had argued that specific actions that most Christians would consider to be patently wrong would not be considered sinful if the motivations of the people who did those things were taken into account.

Pascal believed that such an approach to ethics was very dangerous because it could lead people to justify actions that were clearly incompatible with God’s teachings. In his seventh Provincial Letter, for example, Pascal denounced efforts by Escobar y Mendoza and Molina to justify dueling. A duelist might well claim that his intention was not to kill his adversary but to defend his own honor, but Pascal ridiculed such convenient and insincere excuses designed to disregard God’s straightforward commandment: “Thou shalt not kill.” Although Pascal was clearly unfair in associating all Jesuits with the radical positions of such theologians, his *Provincial Letters* did denounce very effectively the danger of moral laxism and the pernicious belief that “the end justifies the means.”

THOUGHTS

During the last few years of his life, Pascal was writing “an apology for the Christian religion,” but extremely poor health required him to rest frequently and this prevented him from writing for extended periods of time. He was, however, able to compose eight hundred fragments that were discovered and edited after his death by his nephew Étienne Périer, who called these fragments *Thoughts (Pensées)*. Despite the uncompleted nature of *Thoughts*, it contains profound insights into the myriad relationships between ethical and religious problems. Unlike his fellow mathematician and philosopher René Descartes, who had argued in his 1637 book *Discourse on Method* that logic alone sufficed to explore moral problems, Pascal was convinced that only an acceptance of the revealed truths of Christianity could enable him to recognize the moral foundation for a just society.

Pascal stated that there were basically two ways of dealing with moral problems. By means of “the spirit of geometry” (“*l’esprit de géométrie*”) one examines in a purely logical manner the many steps that are involved in resolving ethical questions. “The spirit of insight” (“*l’esprit de finesse*”) helps one to

recognize intuitively that certain actions are morally wrong whereas others are morally correct. Although he did not deny the importance of logical reasoning for discussions of ethical problems, Pascal sensed that most moral decisions are inspired by intuitive feelings that are formed by one's religious training and by the diversity of one's experiences. In *Thoughts*, Pascal appealed to the deep emotional and psychological reactions of his readers in order to persuade them that an acceptance of "the grandeur of man with God" and "the misery of man without God" will lead people to embrace those religious and ethical values that are presented in the Bible.

Passions and emotions

DEFINITION: Irrational, subjective, deeply felt, partly mental, and partly physical sentiments or sensations; feelings

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The passions and emotions are often contrasted with reason and rationality as the two

forces influencing moral decisions. Their ethical import is a matter of controversy: For some, the emotions are deceptive, and dispassionate reasoning is the only way to discern moral truth. For others, passion constitutes moral truth and the denial of emotion in the name of reason is a dehumanizing and immoral act.

Emotions add color to the world of experience. They motivate people to approach or avoid something, generally in an energetic way. They are made up of four components: conscious or subjective experience, bodily or physiological arousal, characteristics or overt behavior, and changes in thoughts or cognitions.

On the feeling or subjective level, emotions have elements of pleasure (or displeasure), intensity, and complexity. Pleasant or positive emotions tend to enhance an individual's sense of well-being and promote constructive relationships with others. Unpleasant or negative emotions, in contrast, tend to decrease an individual's sense of well-being and create disturbed relationships with others. Intensity is often reflected in the words used to describe emotions; for example, uneasy, fretful, tense, apprehensive, tremulous, agitated, panicky, and terrified. The complexity of emotions means that one person's sense of joy is different from another's. Thus, emotions have a private, personal, and unique component. They are complex subjective feelings.

On the physiological level, emotions are accompanied by bodily sensations or physiological arousal. The physiological arousal occurs mainly through the actions of the autonomic nervous system, which regulates the activity of glands, smooth muscles, and blood vessels. The autonomic responses that accompany emotions are ultimately controlled in the brain by the hypothalamus, the amygdala, and the adjacent structures in the limbic system.

PHYSIOLOGICAL AND BEHAVIORAL CHANGES

There are several different types of physiological changes that accompany emotions. One change is in galvanic skin response, the electrical conductivity of the skin that occurs when sweat glands increase their activity. A second change is in the pulse rate. When a person is very angry or afraid, for example, his or her heart may accelerate from about 72 beats per minute to as many as 180 beats per minute. A third change is

in the blood pressure, which may rise alarmingly when a person is angry or afraid. A fourth change is in the breathing rate, which typically becomes rapid and uneven when a person is experiencing strong emotion. A fifth change is in muscular tension, which is particularly prominent when the emotion is intense fear or anger.

Other changes that accompany emotions include inhibition of salivation, pupil dilation, and inhibition of digestive processes. The physiological changes that accompany love, joy, or other emotions may be smaller and more subtle than those accompanying anger and fear.

On the behavioral level, people reveal their emotions through characteristic overt expressions, such as smiles, frowns, furrowed brows, clenched fists, slumped shoulders, and changes in posture and tone of voice. When people are sad, for example, they tend to slouch and to speak in a lower, less variable pitch than the one they use when they are angry or afraid. People reveal their emotions in their body language, or nonverbal behavior. Some researchers argue that no body movement is accidental or meaningless. Rather, one communicates something in the slightest movement, even though one may be unaware of it.

On the cognitive level, emotions are accompanied by changes in thoughts, beliefs, and expectations. When happy, people become more optimistic; when sad, they are likely to see the negative sides of situations. In general, people's thoughts are guided by and consistent with their emotions.

THE BASIC EMOTIONS

Like colors, emotions cover a wide spectrum. There are six basic emotions: love, joy, surprise, anger, sadness, and fear. Three dimensions on which these basic emotions vary are evaluation (positive or negative), potency (strong or weak), and activity (relatively high or low in arousal). Some theorists include disgust and contempt as primary emotions. Others add shame, contempt, interest, guilt, anticipation, acceptance, and distress as primary emotions. Still other theorists reject the concept of basic emotions altogether. People experience many different emotions. Some theorists propose that many emotions are produced by blends and variations in intensity of primary emotions, like colors on a color wheel.

What causes emotions? Several theories have been

developed to answer this question. One theory is that they result from specific physiological changes, with each emotion having a different physiological basis. Proposed independently during the late nineteenth century by William James and Carl Lange, this theory stood common sense on its head. Everyday logic suggests that when a person stumbles onto a rattlesnake in the woods, the conscious experience of fear leads to visceral arousal (the fight-or-flight response). This theory, in contrast, asserts the opposite: The perception of visceral arousal leads to the conscious experience of fear. Thus, this theory asserts that the person becomes afraid because the sight of the rattlesnake causes muscles, skin, and internal organs to undergo changes. Fear is simply the awareness of these changes. The James-Lange theory of emotions emphasizes the physiological determinants of emotion.

The James-Lange theory of emotions has two overall criticisms. First, anger, fear, and sadness seem to share similar physiological patterns of arousal, although recent research has detected some subtle differences in the patterns of visceral arousal that accompany basic emotions. Second, people with severe spinal cord injuries are deprived of most feedback from their autonomic nervous systems, yet they still experience emotions. Physiologists generally agree that physiological arousal influences the intensity of emotions, but not the emotions themselves.

A second theory of emotions asserts that when a person is emotional, two areas of the brain, the thalamus and the cerebral cortex, are stimulated simultaneously. Stimulation of the cortex produces the emotional component of the experience, whereas stimulation of the thalamus produces physiological changes in the sympathetic nervous system. Accordingly, emotional feelings accompany physiological changes; they do not produce them. This theory of emotions holds that they are physiologically similar to, and occur sooner than, changes in the internal organs.

Proposed by physiologists Walter Cannon and Philip Bard during the 1920's, this theory has two criticisms. First, physiological changes in the brain do not happen exactly simultaneously. Second, people often report that they have an experience and then later have physiological and emotional reactions to it. For example, they have a near-accident in a car, and only later become very frightened.

FACIAL FEEDBACK

A third theory of emotions is that they are caused by facial feedback. The idea is that sensations from the movement of facial muscles and skin are interpreted by the brain and result in emotion. According to this somatic view, smiles, frowns, and furrowed brows help to create the subjective experience of various emotions. Consistent with this view, research shows that if people are induced to frown, they tend to report that they feel angry. Furthermore, people who have been blind since birth smile and frown much like everyone else, even though they have never seen a smile or frown. Also, infants only a few hours old show distinct expressions of emotions that closely match those of adults, and infants recognize facial expressions in others at a very young age. Thus, infant and cross-cultural similarities in emotional expression support the facial feedback or evolutionary theory of emotions.

Originally proposed by Charles Darwin, this theory asserts that emotions developed because they have adaptive value. They signal an intent to act and prepare the individual to act. Fear, for example, would help an organism avoid danger and thus would aid in survival. This view of emotions is that they are a product of the evolution of facial expressions, which were our ancestors' primary mode of communication before language developed.

This facial feedback theory of emotions suffers from the criticism that there is little evidence that specific facial feedback initiates specific emotions. Researchers generally agree that facial feedback and physiological arousal influence the intensity of emotions, but not the emotions themselves.

OTHER THEORIES

A fourth theory of emotions is that interpreting or appraising a situation as having a positive or negative impact on one's life results in a subjective feeling that is called emotion. The idea is that a stimulus causes physiological arousal. The arousal creates a need for an explanation of some kind, which the person makes from the situational cues available and from his or her cognitive processes, such as thoughts, interpretations, and appraisals. This explanation results in emotion. This theory of emotion stresses that there are two components to emotions: a cognitive component and a situational component.

This theory of emotion, which can be traced to

psychologists Stanley Schachter and Jerome Singer during the early 1960's, was revised by Arnold Lazarus in 1991 to recognize the fact that emotions may initially occur without physiological arousal. Lazarus also believed that each emotion has its own specific relational theme, or person-environment relation, which involves benefit in the case of positive emotions and harm in the case of negative ones.

To test this theory of emotion, Schachter and Singer conducted an experiment in which they told volunteers that they were testing the effects of a vitamin supplement. Instead, these volunteers were injected with epinephrine, a powerful stimulant that increases physiological arousal. The volunteer students were unaware of the typical bodily effects of the adrenaline. To see if the setting in which the volunteers experienced their arousal influenced how they interpreted their emotions, Schachter and Singer hired undergraduates and paid them to act either happy and relaxed or sad, depressed, and angry. These hired students, called stooges, pretended that they were volunteers in the same drug study. Instead, they were given injections of saltwater, not epinephrine. Their emotional behavior was strictly an act.

The happy stooges shot wads of paper into a wastepaper basket and flew airplanes around the room. The unhappy stooges complained about the questionnaire they had to fill out and voiced their dissatisfaction with the experiment. All the volunteers showed increased physiological arousal. Those with happy stooges reported that the drug made them feel good; those with the sad, angry stooges reported that the drug made them feel anger. Schachter and Singer concluded that the physiological feelings that accompanied both joy and anger were the same, but the label attached to the emotion depended on the person's situation.

These theories of emotions may all be partly right, but no one theory fits all the data. Physiological and cognitive influences interact in complex ways to produce emotional experiences.

FUNCTIONS OF EMOTIONS

Emotions have three main functions. One function of emotions is that they help people adapt and survive. For example, crying alerts others that one is in pain or discomfort, and being in love fosters social interactions. A second function of emotions is that they signal that something important is happening

and rouse one to action. In an evolutionary sense, some emotions are part of an emergency arousal system that increases the chances of survival by energizing, directing, and sustaining adaptive behaviors. For example, being afraid may motivate one to run away from a dangerous bear that is running toward one, and being angry may cause one to work harder to reach one's goals. Other emotions, such as sadness, relief, and contentment, may involve an integrated pattern that includes a decrease in arousal and behavioral intensity.

Although rousing people to action may be positive, it may also be negative, so that emotions may disrupt behavior. The relationship between physiological arousal that accompanies an emotion and task performance is known as the Yerkes-Dodson law, which states that performance on a task depends on the amount of physiological arousal and the difficulty of the task. In general, for many tasks, moderate arousal helps performance. For new or difficult tasks, low arousal facilitates performance; for easy or well-learned tasks, high arousal facilitates performance. For example, high arousal would interfere with performance on a difficult test, but it facilitates signing one's own name legibly. In contrast, low to medium arousal would result in better performance on a difficult test, but it might lead one to sign one's name illegibly.

Emotions rouse people to action in another sense as well: The expectation of pleasant emotions serves as an incentive. Many purposeful, motivated behaviors are designed to induce feelings of happiness, joy, excitement, or pride.

A third function of emotions is to help people communicate by sending social signals. They inform others about one's internal state and intentions. Many facial expressions, such as happiness, anger, sadness, fear, disgust, and surprise, are recognized as emotional expressions by people in widely varying cultures. In fact, emotional facial expressions are strikingly similar in different cultures. Yet different cultures encourage or discourage the expression of some emotions more than others. Adults in all societies learn to suppress some of their emotional responses or to mask them with voluntary control of facial muscles. This masking is never perfect, and other facial muscles can give away true feelings.

INFLUENCES ON EMOTIONS

Different factors influence emotion. Personality and motivational factors affect emotion by influencing what situations people expose themselves to and how they think about those situations, as well as physiological and behavioral responses. Therefore, personality variables can predispose people to experience certain kinds of emotions. For example, extroverted people are likely to experience strong positive emotions in response to positive events but less-intense reactions to negative events. In contrast, people who are high in neuroticism experience weak positive emotional responses to positive events but strong negative responses to negative events.

Learning also influences emotion. Cultures have different standards for defining the good, the bad, and the ugly. For example, physical features that provoke sexual arousal and feelings of infatuation in one culture (such as scars) may elicit feelings of disgust in another culture.

Biological factors also influence emotion. The concept of preparedness suggests that people may be biologically primed to experience fear in response to certain stimuli, such as heights or snakes.

Intrapsychic factors may also predispose people to certain emotions. For example, anger that has been stored up since childhood may be released if a situation reminds one of that internal conflict. Also, psychological defenses sometimes predispose people to transform one emotional response into another, more acceptable one. Thus, anger may be transformed into sadness, or sexual feelings into fear.

Emotions do not occur in a vacuum. Rather, they always have objects. People are not simply angry, afraid, proud, or in love. They are angry at something or someone, afraid of something or someone, and so forth. Furthermore, the stimuli that trigger emotional responses are not always external. Sometimes they are internal, occurring in the form of images and memories. Usually, people can identify the eliciting stimuli, but not always.

Emotions are shaped by one's biological and psychological predispositions, by what one learns in one's environment, and by one's personality and motivations. One experiences them in response to internal or external objects. They give life color.

Paternalism

DEFINITION: Use of coercion or deception to interfere with or frustrate the choices and actions of underlings for their own good

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Although aimed at protecting or promoting someone else’s own good, acting paternalistically may compromise the individual’s moral autonomy.

The word “paternalism” connotes attitudes that are fatherly or parental, combining the element of looking out for the interests of a child with the further

element of doing so over the wishes of the child. Paternalism is the extension of such paternal concern toward children to other relationships, usually involving those in some position of authority. Paternalism may appear in the relation of government officials to citizens but can also extend to employer-employee and doctor-patient relationships.

John Stuart Mill provided the classic discussion of the issue of paternalism between society and the individual in *On Liberty* (1859). Mill argued that the only sound reason for society to coerce an adult to do or refrain from some action is to prevent harm to others. The person's own good is not a good reason to justify societal interference with a person's liberty of action. Mill stated that individuals should be "sovereign" over their own bodies and minds.

Mill was ready to accept the implications of his antipaternalist position. He thought that adults should be free to engage in conduct that endangered themselves, such as drunkenness or using addictive drugs such as opium. Society may warn individuals of the harm and even seek to persuade them to refrain from such dangerous activities, but should never resort to force. By extension, a strict opponent of paternalism would oppose such safety measures as laws requiring people to wear seat belts while riding in automobiles or safety helmets while riding motorcycles.

Opponents of paternalism use a variety of arguments. Mill thought that a free society that left individuals to decide matters relating to their own good would lead to greater social progress and individual well-being. Some have argued that human freedom and autonomy are importantly valuable in themselves, and that undue interference involves a kind of disrespect to human dignity, similar to treating adults as children. Most defenders of paternalism counter that at least limited forms of paternalistic interference are both reasonable and beneficial. It is difficult to confine the costs of dangerous and self-harmful behavior to the individuals involved. Also, even adults can use guidance and pressure from society in order to avoid the sometimes serious and irreversible harms that may follow lapses in judgment and the taking of foolish risks.

Although most discussion of paternalism takes place within the context of interference with liberty, it can be an important issue in other contexts as well. In medical practice, for example, a dominant model for the physician-patient relationship was histori-

cally paternalistic, with the implication that doctors might withhold information or even deceive patients for their own good. The paternalistic model in medicine, in the workplace, and in colleges and universities has waned due to increased autonomy concerns on the part of patients, employees, and students.

Patriotism

DEFINITION: Love of, or loyalty to, one's own country

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Patriotism's moral status is a matter of controversy on two levels. First, its traditional theoretical status as a virtue has been questioned by modern philosophers. Second, there is significant debate over what genuine or authentic patriotism actually entails in practice.

The moral significance of patriotism may be approached in the first instance by asking this question: Is patriotism the positive form of an emotion or ideology whose negative form is nationalism? Or is patriotism simply a euphemism for nationalism? If patriotism is merely a polite term for nationalism, then it is difficult to defend as anything other than an unreasoning prejudice. If, on the other hand, nationalism is actually the corrupted form of the properly noble emotion of genuine patriotism, then it may be appropriate to think of patriotism not only as a virtue, but as a socially vital value.

What, then, would constitute a noble and virtuous form of nationalism? Patriotism is most often defined as love of country. Such a definition is deceptively simple, however. Indeed, it is quite ambiguous. What

kind of love should one feel for a nation? Is it the same sort of love that one feels for a sports team one supports, or a food one likes to eat? Is it the sort of love that one feels for a friend? A family member? Whatever explicit answer one may give to this question upon considered reflection, it is too often the case that the implicit and unconsidered answer evident in the behavior of professed patriots is that a country is like a sports team. Sports fans know the faults of their teams better than anyone, and they are perfectly happy to list them in private, among like-minded fans. If confronted by external criticism, however, everything changes. Suddenly, the team can do no wrong, and even minor criticisms, however accurate, become unjustified attacks upon the honor and dignity of the team and all its true supporters. Loyalty to a team is measured by the loudness of one's cheering and the staunchness with which one refutes the team's critics, whatever the merits of their criticism.

Now consider the sort of love one feels for a friend. It is intimate, based on a genuine interaction between both participants in the relationship, and because of that, it comes over time to be quite nuanced. Interpersonal love and loyalty are difficult values to negotiate. They do not admit of the simple formulas of fandom. One might say of an errant friend, as a patriot would of a nation, "He's my friend, right or wrong." That statement, however, would be the beginning of a conversation, not the end of one. It would be an expression of reassurance to prepare the way for the hard work of friendship, for the rigors of determining and then fulfilling the specific and complex obligations imposed by one's loyalty.

It is unclear whether patriotism can ever be accounted a virtue. It certainly seems necessarily to entail treating one's fellow citizens as superior to other people. It seems, moreover, almost always to involve the foreclosure of at least some avenues of national reform and improvement, such as just distribution of resources in a capitalist nation, or separation of church and state in a theocracy. If there is moral value in patriotism, however, it is to be found in the analogy to friendship. If one could take one's patriotism as an impetus to explore one's relationship to one's nation, rather than as itself constituting a given and immutable relationship, patriotism could provide a basis for moral practice, thereby acquiring moral worth.

Peace Corps

IDENTIFICATION: Independent federal agency that promotes international friendship by supplying trained personnel to other countries

DATE: Founded in 1961

TYPE OF ETHICS: Human rights

SIGNIFICANCE: While the theory behind the Peace Corps seems morally unobjectionable, and even laudatory, the organization's practical actions in the service of its goals have at times been controversial.

The Peace Corps of the United States is an independent agency of the federal government that sends volunteers to countries throughout the world to help staff schools and hospitals, and to share agricultural and technical knowledge. The Peace Corps was founded in 1961 while John F. Kennedy was president. He asked young people to volunteer for two-year terms, and many recent college graduates seeking adventure and a chance to serve accepted the offer. At first, anyone who was willing to volunteer was accepted and given something to do.

President John F. Kennedy (right) greets some of the first Peace Corps volunteers at a White House reception. (Library of Congress)

By the 1980's, Peace Corps volunteers tended to be older and more highly trained in technical areas. In the wake of the Vietnam War and Watergate, a growing cynicism about the government caused fewer volunteers to join. In 1983, the Ronald Reagan administration revived the program, hoping to use the volunteers to spread conservative ideas worldwide. By the 1990's, opinion about the Peace Corps was divided. Many people believed that the Peace Corps was primarily a means for a wealthy nation to share its prosperity, and to promote world harmony. Others saw an insidious form of interventionism in the program.

Nevertheless, in 2004, more than seventy nations were hosting more than 7,500 Peace Corps volunteers. These nations included nine former Soviet republics and four other Eastern European nations. Between 1993 and 2004, even the People's Republic of China hosted more than 230 Peace Corps volunteers.

Peace studies

DEFINITION: Interdisciplinary course of academic study that explores alternatives to war while promoting a progressive agenda including national and international social justice, human rights, conflict resolution, and activism

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Frankly and unapologetically political in orientation, peace studies attempt to educate future thinkers, activists, and leaders to create a more just and less violent world.

Peace studies is an emerging discipline that affirms that peace is more than the absence of war; peace is harmony among people and countries based on respect for oneself and others. The study of peace weaves together three major threads. Peace studies as an academic discipline examines war, relations among nations, conflicts and their resolution, and proposals for peace; peace education identifies effective methods used to teach peace in a family, a classroom, or a community setting in order to develop civic and global citizenship and world peace; and peacemaking focuses on the values by which one lives one's life and cares for others in the family, for the community, and for the planet. Unless these three threads are woven together in theory and practice, the goal and meaning of peace studies are lost.

Desire for peace and the elimination of war can be traced to the ancient oral and written histories and literature of diverse peoples from all continents. A modern study of peace can be traced to the establishment of the World Peace Foundation in 1910. The advent of atomic warfare in World War II increased the demand for the study of foreign policy, development, international conflict, and alternatives to war. Early in U.S. history, George Washington called for the establishment of a United States Academy for Peace, a proposal that was reconsidered by every Congress until 1986, when the United States Institute for Peace was established.

ACADEMIC PROGRAMS

Peace studies emerged slowly as an academic discipline. During the 1960's, there were few courses in higher education that addressed peace issues, although peace studies formed the basis of education in several colleges run by the historic Peace Churches, notably the Brethren, Quaker, and Mennonite churches. Peace studies received an impetus during the Vietnam War, when growing numbers of war protesters raised issues of war and alternatives to war in classrooms and institutions of higher learning around the world.

The Institute for World Order (now the World Policy Institute) was among the first organizations (1966) to link and address issues of war, development, gender and racial inequality, human rights, and ecological balance with issues of world peace. As terrorist activities and the nuclear threat escalated during the late 1970's, the leaders of most of the

world's religions added their voices to the call for the study of peace and justice issues. By 1983, at the peak of the International Nuclear Freeze Campaign, public and private campuses worldwide began including one or more courses related to the study of war, the nuclear threat, conflict management, global cooperation, and world peace in their curriculums. Ten years later, hundreds of campuses worldwide offered peace studies programs. Students can now receive a minor or major at the undergraduate level, a master's degree, and, at several universities, a doctoral degree in peace studies.

Academic programs in higher education, which often focus on the historical or theoretical, hold an important place in peace studies, for it is in the academy that the various disciplines provide for the examination of diverse topics that are related to war and peace. Two acknowledged dangers in the academy include the failure to study issues of peace from a cross-cultural or interdisciplinary perspective and the failure to link the theoretical and historical perspectives of peace with personal, family, and community lifestyle choices. A growing number of scholars have suggested that peace studies must move beyond theory; it must be values based, address domestic and global issues, be relevant to all age groups, and lead to education for responsible global citizenship.

Peace education programs at the elementary and secondary levels, developed during the Vietnam era, do promote values, as well as attitudes and skills related to affirmation, communication, cooperation, respect for diversity, nonviolent resolution of conflict, and skills for critical thinking and decision making. Three of the most notable in the United States are the Children and Non-Violence, Children's Creative Response to Conflict, and Peacemaking for Children: Alternatives to Violence programs. The Nuclear Freeze Campaign of 1982 expanded international awareness of the nuclear threat and generated new calls for peace education. Milwaukee's public schools became the first major school system in the United States to respond to this call, implementing a K-12 peace education curriculum in 1985.

PEACEMAKING

Peacemaking for Families educational programs, developed in 1976 by Jacqueline Haessly, evolved from a belief that the values, attitudes, and skills of peacemaking are first shaped in the home. Five years

later, the National Parenting for Peace and Justice Education Network was established by James and Kathleen McGinnis. Family Life Education for Peace, initiated by Nona and Carroll Cannon, is an emerging field in the academy. All three programs link peace with values education.

Peacemaking as a way of life occurs when individuals and societies make the link between the personal and the political. Julia Sweig and Sharon Boggs are among those who remind peace educators that issues of domestic and community violence must be addressed and skills for community building must be taught if peace is to be achieved in a community and the world.

Organizations that promote peace studies in the United States include Children's Creative Responses to Conflict; Council for Peace and Conflict Studies; Consortium for Peace Education, Research, and Development; Educators for Social Responsibility; Fellowship of Reconciliation; Global Education Associates; Jane Addams Peace Association; the Milwaukee Peace Education Resource Center; Parenting for Peace and Justice Network; the United Nations University for Peace—San Diego; the United States Institute for Peace; and the World Policy Institute (formerly the Institute for World Order). Many of these organizations also have international affiliations.

Peacekeeping missions

DEFINITION: International military interventions, usually authorized by the United Nations

DATE: First mission launched in 1956

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: Increasingly utilized tools of preventive diplomacy aimed at managing conflict and preventing wars from starting or spreading, peacekeeping missions are typically justified on humanitarian grounds, even when they are at odds with the deeply entrenched principle of state sovereignty.

Although individual countries have historically intervened in the affairs of others, unilateral military intervention became a highly dangerous means of addressing conflicts in the bipolar world that emerged after World War II. With each alliance headed by a superpower armed with a growing nuclear capability, the avoidance of both war and superpower confrontation became ever more important. Alternative means of managing international hot spots were needed.

United Nations (U.N.) peacekeeping missions became one of the more effective alternatives developed to prevent conflicts from escalating during the Cold War years (1947-1992). Simultaneously a code of conduct developed to ensure the neutrality of these operations and improve their effectiveness. After the

collapse of communism in the Soviet Union and Eastern Europe, peacekeeping missions became a more common means of managing communal violence, defusing civil wars, and containing other forms of conflict in an increasingly turbulent world.

The first United Nations peacekeeping mission was launched in 1956 to defuse an awkward military and diplomatic situation. Without consulting Washington, France and Great Britain had joined Israel in a military operation that left them in control of Egypt's Suez Canal but on the receiving end of criticism from the United States and the Soviet Union for their invasion of Egypt. Although it initially pitted both superpowers against two of the closest allies of the United States, it also threatened to expand into a broader Arab-Israeli conflict that would have placed the United States and the Soviet Union on opposite sides.

Into this morass stepped U.N. secretary-general Dag Hammarskjöld with a proposal designed to let every faction down gently. In return for Egypt's agreeing to guarantee international access to the Suez Canal, its occupiers agreed to withdraw. To prevent a recurrence of hostilities, Egypt also agreed to allow the deployment of a U.N. peacekeeping contingent in the Sinai Peninsula, between Israel and Egypt's army. The force soon became the model for the deployment of peacekeeping missions elsewhere during the Cold War years—a human shield placed between potential combatants to prevent conflicts from occurring, expanding, or rekindling where cease-fires have been achieved.

ENSURING NEUTRALITY

For peacekeeping missions to succeed, it is imperative that the peacekeepers be perceived as neutral by the parties involved in the conflicts. During the Cold War, it was also important to keep the superpowers out of the conflicts as far as possible. The rules of deployment that evolved out of U.N. peacekeeping missions prior to the end of the Cold War were intended to do both. They emphasized the multilateral nature of peacekeeping, the inclusion of forces from Third World states, and the exclusion of troops from either superpower or their military allies. Also, peacekeeping troops themselves were to engage in combat only to defend themselves when fired upon. Finally, mindful of the admonition in the U.N. Charter against interfering in the domestic

affairs of any member state, U.N. troops were to be deployed only with the consent of the host governments.

POST-COLD WAR CONFLICTS

Within this framework U.N. peacekeeping missions were highly successful during the Cold War years. Out of the approximately twenty missions launched between 1956 and 1990, the United Nations failed only once to maintain order—during the civil war that erupted in the Congo in 1960-1961. That failure was due largely to superpower involvement and the fact that there was no peace to keep when the mission began.

Beginning in the 1990's, however, internal civil wars became a greater source of instability in the international system than international conflicts, such as the Arab-Israeli conflict. Clan warfare in Somalia, genocide in Rwanda, and wars in the former Yugoslavia, with their atrocities, high casualty figures, and discharges of numerous of refugees into adjacent states, far more resembled the challenges faced by U.N. peacekeepers in the Congo than in those arenas where the U.N. peacekeepers successfully deployed during the Cold War. The existing U.N. peacekeeping model had to be modified in two important ways to adapt to this changing world setting.

First, because in the more recent conflicts it was often necessary to establish a peace for the peacekeepers to keep, peacekeeping missions came to depend on the exercise of substantial military assets. In the post-Cold War world, that has meant assigning a major role to the United States or the North Atlantic Treaty Organization (NATO) in the peace-making and peacekeeping process, and using military forces to end ongoing conflicts. These departures from the original model have frequently made it difficult for peacekeeping missions to retain the image of neutrality.

Second, in many conflicts there has been either no government in sufficient control of a country to request peacekeeping assistance or no government willing to do so. Politicians opposed to peacekeeping missions have normally cited the concept of state sovereignty and the internal nature of their civil wars as placing them beyond U.N. jurisdiction. Hence, the legal basis for peacekeeping operations has had to be found elsewhere.

PEACEKEEPING MISSIONS AND “JUST WARS”

That justification has been found in the concept of the just war, largely as articulated by Michael Walzer in his *Just and Unjust Wars* (1977). According to his thesis, in order to maintain a secure environment in which human rights can be guarded and people protected, it may become necessary to intervene in a state's affairs, especially when the action of the state's leaders violates prevailing international law or when the conflict sends so many refugees into neighboring states that it loses its domestic nature. In such instances, intervention becomes an ethical imperative, so long as it conforms to the rules designed to ensure its neutrality in establishing and keeping the peace and focuses on the humanitarian goals of the mission rather than on having an impact on the distribution of power in the area to which the forces are dispatched.

Peirce, Charles Sanders

IDENTIFICATION: American philosopher

BORN: September 10, 1839, Cambridge, Massachusetts

DIED: April 19, 1914, near Milford, Pennsylvania

TYPE OF ETHICS: Modern history

SIGNIFICANCE: One of the founders of pragmatism and one of the most original philosophers of the nineteenth century, Peirce attacked traditional conceptions of truth and knowledge and made significant contributions to the fields of logic, semiotics, and epistemology.

From 1864 to 1907, Peirce served as an occasional lecturer at Harvard and Johns Hopkins University on the topics of logic and pragmatism. His genius and potential on pragmatic theory were never fully realized or publicly appreciated, however, because of his personal difficulties, eccentricity, and opposition to traditional philosophical thought. Peirce believed that it was a mistake to accept a priori reasoning, or absolute truth, without first examining its results.

In an article published in *Popular Science Monthly* in 1878, Peirce attempted to answer the question “How to Make Our Ideas Clear” by stating that an idea's utility and results or effects give it meaning, not some inherent absolute truth or a priori reasoning. One's conception of these effects becomes one's conception of the object. Peirce interpreted every subject, including philosophy, almost entirely from a logical (pragmatic) perspective. Peirce emphasized that pragmatism is a principle of method—not of metaphysics. Using this principle, he claimed that scientific laws were statements of probabilities only and subject to evolutionary change. Unlike his disciple and benefactor William James, however, Peirce never discarded his beliefs in an Absolute or in universals. Scholars consider Peirce's work an important intellectual foundation for twentieth century progressivism.

Peltier conviction

THE EVENT: Criminal conviction of Leonard Peltier (1944-) during the 1975 shooting deaths of two Federal Bureau of Investigation (FBI) agents

DATE: Convicted April 18, 1977; sentenced June 1, 1977

TYPE OF ETHICS: Race and ethnicity; legal and judicial ethics

SIGNIFICANCE: Peltier's conviction is a source of bitter disagreement between law enforcement advocates and agents—who see Peltier as nothing more than a common murderer—and Peltier's followers and sympathizers—who see him as nothing less than a political prisoner punished for his beliefs by a tyrannical and unjust government.

On June 26, 1975, two FBI agents were killed in a shoot-out on the Lakota Indian Reservation in Pine

Ridge, South Dakota. Leonard Peltier, a member of the American Indian Movement (AIM), was found guilty of the killings. Peltier declared himself innocent and appealed his conviction many times. During the appeals, the court found that the government had acted improperly in arresting and trying him. Federal authorities admitted to falsifying affidavits used to extradite Peltier from Canada. Witnesses in the original trial had been coerced, and evidence supporting Peltier's claims was suppressed.

In spite of the irregularities, the courts refused to overturn Peltier's conviction. Peltier's case became known throughout the world. Many people believed that, even if he were guilty, he had not been granted a fair trial. Amnesty International declared him a political prisoner, and important religious leaders spoke out on his behalf. A book and three films were made about the case.

In 1992, a "Mr. X" confessed to the killings.

Marchers use the occasion of Thanksgiving Day in 2001 to proclaim a "National Day of Mourning" and call for the release of Leonard Peltier in a demonstration in Plymouth, Massachusetts—a place of special symbolic significance as the site of the first Thanksgiving celebrated by settlers and Native Americans. (AP/Wide World Photos)

Peltier's supporters continued to hope that they could win him a new trial, or at the very least a parole hearing. The United States Parole Commission, however, repeatedly refused to grant Peltier such a hearing until December, 2008, at the earliest. Peltier's supporters claimed that he was being required to wait twice as long as the average convict in his situation before being considered for parole.

Pentagon Papers

IDENTIFICATION: Classified documents at issue in *United States v. New York Times Company*, which the U.S. Supreme Court held the federal government could not restrain *The New York Times* from publishing

DATE: Court ruling made on June 30, 1971

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: The Pentagon Papers case dealt with the issue of prior restraint, that is, censorship before the fact which prevents the censored material from ever seeing the light of day. Prior restraint is the most extreme form of censorship, and the Supreme Court ruled that the government must meet a heavy burden of justification before it can prevent the press from publishing even top secret information.

Popular sentiment against the Vietnam War was on the rise in the spring of 1971, when Daniel Ellsberg, a former U.S. Department of Defense employee, and his friend, Anthony Russo, Jr., stole copies of two massive volumes that have come to be known as the Pentagon Papers. These volumes, "History of U.S. Decision-Making Process on Vietnam Policy" and "Command and Control Study of the Gulf of Tonkin Incident"—which were classified "Top Secret-Sensitive" and "Top Secret," respectively—together constituted a history of American involvement in Vietnam since World War II.

Ellsberg and Russo passed the filched documents on to *The New York Times* and *The Washington Post*. In its June 13, 1971, edition, the *Times* began publishing a series of excerpts from the government studies.

GOVERNMENT ATTEMPTS PRIOR RESTRAINT

After the *Times* had published two more excerpts on June 14 and 15, 1971, the federal government filed a motion in the U.S. District Court for the Southern District of New York requesting that the court restrain the *Times* from publishing more passages from the Pentagon Papers. Although the court refused to issue an injunction against the paper, it did grant the government a temporary restraining order, which prevented the *Times* from publishing portions of the Pentagon Papers while the government prepared its case. On June 18, *The Washington Post* also began publishing excerpts from the Pentagon Papers, and the government moved to restrain it, too, in federal court in the District of Columbia. The legal action in the case, however, remained focused on New York City.

On June 18, the district court in New York heard the case, in which the government claimed that the publication of the documents in question would compromise the nation's war effort. Nevertheless, the government's request for an injunction was denied, although the temporary restraining order was extended until the government's appeal to a higher court could be heard. This appeal also was rejected, and on June 24, the government filed a petition with the Supreme Court.

SUPREME COURT REJECTS GOVERNMENT CASE

The parties appeared before the Court on June 26, 1971, and the Court delivered its opinion on June 30: The entire litigation had lasted slightly longer than two weeks. Like the lower courts, the Supreme Court rejected the government's attempts to rationalize prior restraint of the press by appealing to national security, dismissing the cases against both the *Times* and the *Post*. The Court was not unanimous in its decision, voting six to three, but writing for the majority, Justice Hugo L. Black delivered a stinging rebuke to the administration of President Richard M. Nixon: "the Solicitor General argues . . . that the general powers of the Government adopted in the original Constitution should be interpreted to limit and restrict the specific and emphatic guarantees of the Bill

of Rights. . . . I can imagine no greater perversion of history.”

Although the dissenters, Chief Justice Warren E. Burger, Justice Harry A. Blackmun, and Justice John M. Harlan II, argued that the Court should defer to the executive branch’s concerns, Justice Black’s opinion reaffirmed the Court’s role as interpreter of the Constitution and guardian of individual rights: “Madison and the other Framers of the First Amendment . . . wrote in language they earnestly believed could never be misunderstood: ‘Congress shall make no law . . . abridging the freedom . . . of the press. . . .’”

CONTINUED PROSECUTION

The government continued, nevertheless, to prosecute Ellsberg and Russo, gaining indictments against them for theft of federal property and violations of the federal Espionage Act. The two defendants were tried in the U.S. District Court for the Central District of California, where the Pentagon Papers were allegedly stolen. Unlike the original Pentagon Papers litigation, the Ellsberg and Russo prosecution dragged on for many months. Although the government had first obtained a preliminary indictment against Ellsberg in June, 1971, the trial of the two defendants did not commence until more than a year later.

The trial was halted almost immediately after it began, however, when it was revealed that the government had been secretly taping the defendants’ confidential communications. After the parties had gone through the process of selecting a new jury, the trial recommenced in January, 1973. Shortly thereafter, however, the entire Pentagon Papers case was colored by news of the Watergate imbroglio, which began with the September, 1971, government-sponsored burglary of the offices of Lewis Fielding, Ellsberg’s psychoanalyst, committed in an effort to uncover other Ellsberg accomplices. When further revelations of the government’s continuing illegal wiretaps of Ellsberg’s conversations reached the court, the entire criminal prosecution of Ellsberg and Russo was dismissed. The Nixon administration had not only undermined its reputation and its case against the defendants but had also ensured that future administrative attempts to restrain the press from exercising its First Amendment rights would be more difficult.

People for the Ethical Treatment of Animals

IDENTIFICATION: Animal rights organization

DATE: Founded in 1980

TYPE OF ETHICS: Animal rights

SIGNIFICANCE: Known for using controversial tactics to draw attention to the view that animals do not exist to serve humans, People for the Ethical Treatment of Animals (PETA) is an aggressive organization that follows the principle that animals are not for humans to eat, wear, experiment on, or use for entertainment.

PETA was founded in 1980 by Ingrid Newkirk, an animal-control officer in the District of Columbia, and Alex Pacheco, a student at George Washington University. Both men were influenced by Peter Singer’s book *Animal Liberation* (1975), which argued that animals should have the same basic rights as humans. In 1981, Pacheco recorded an incident of

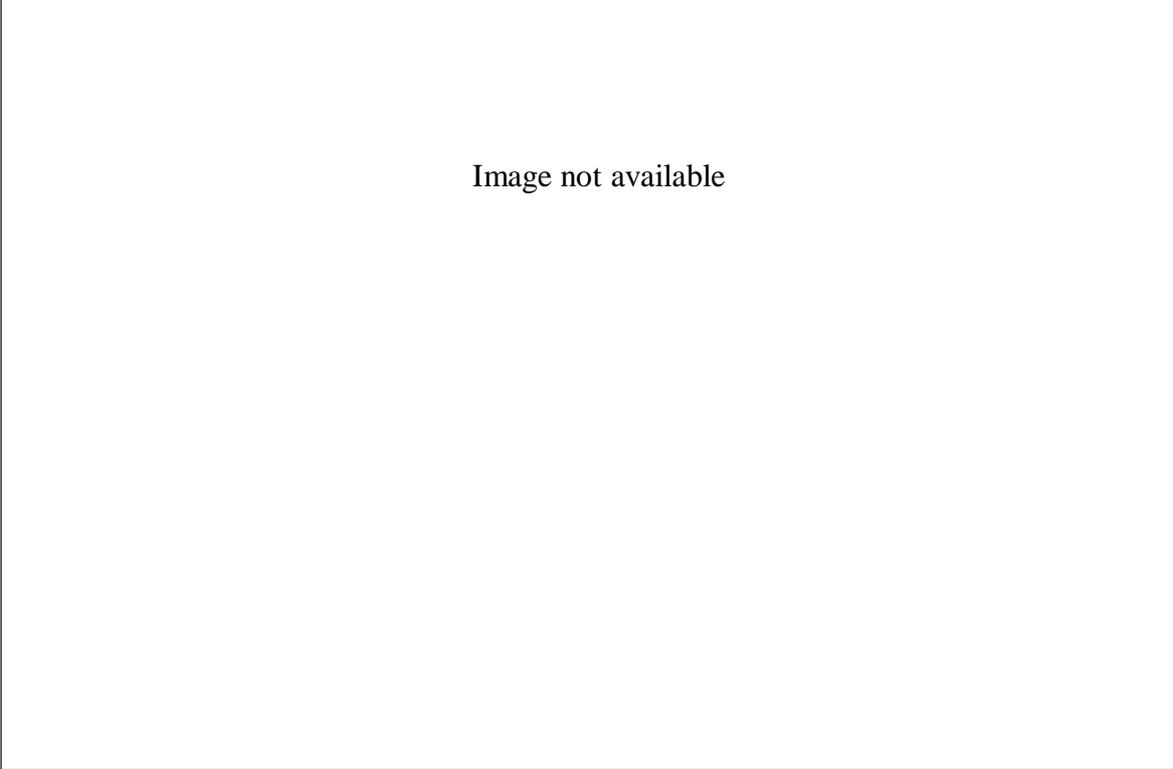

Image not available

PETA members demonstrating against leather goods near the White House in Washington, D.C., in late 2001. (AP/Wide World Photos)

cruelty to animals in a Silver Springs, Maryland, research laboratory. PETA's investigation led to the first police raid, the first arrest, and the first conviction of a researcher for animal cruelty. The incident afterward became known as the Silver Springs Monkeys case. PETA also documented cases of animal cruelty in university laboratories and publicized the harsh living conditions of ducks that were being raised to make liver pâté and chinchillas that were being electrocuted to harvest their fur.

In addition to documenting and publicizing cases of animal cruelty, PETA is well known for publicity campaigns involving celebrities who have posed for advertisements in its "I'd Rather Go Naked than Wear Fur" campaign. In 1994, three PETA members dressed in rabbit suits and chained themselves to a flagpole in front of the Gillette headquarters in Boston, Massachusetts, to protest the company's use of testing of animals.

Many PETA actions have been designed to win publicity by attracting controversy. For example, the

organization targeted college students in "Got Beer?" advertisements in college newspapers that were modeled on the milk industry's "Got Milk?" advertising slogan. PETA took the position that beer was healthier for humans to drink than milk and that cows should not be imprisoned in order to benefit human beings. Critics of PETA have charged that the organization has ties with more violent animal rights groups, such as the Animal Liberation Front. That charge has gained apparent credence when self-described PETA members have poured red paint, symbolizing blood, on women wearing animal furs.

Perfectionism

DEFINITION: Tendency to set unrealistically high standards for oneself or others

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Perfectionism may affect the way in which one views and responds to one's own moral transgressions, as well as the transgressions of others. To the extent that it can cause emotional pain, or result in the achievement of excellence, perfectionism may itself become the object of ethical judgments.

Although originally believed to be a unidimensional concept involving only the self, perfectionism is now thought to be a multidimensional construct that has three components: self-oriented perfectionism, other-oriented perfectionism, and socially prescribed perfectionism. Self-oriented perfectionism is intrapersonal (within the self) and involves being strongly motivated to be perfect, setting and holding unrealistically high goals for oneself, striving compulsively, thinking in an all-or-nothing manner in which only total success or total failure exist as outcomes, focusing on flaws and past failures, and generalizing unrealistic self-standards across behavioral domains. For example, self-oriented perfectionism is expecting oneself to be Atlas and hold up the world without dropping anything, and thinking of oneself as a failure if one errs in any way.

Other-oriented perfectionism is interpersonal and involves beliefs and expectations about significant others. It entails setting unrealistically high standards for others, placing great importance on whether they attain these standards, and rewarding them only if they meet these standards. For example, other-oriented perfectionism is expecting a significant other to be Atlas and hold up the world and giving no positive reinforcement if anything at all is dropped.

Socially prescribed perfectionism is also interpersonal and involves the need to meet the standards and expectations that are perceived by significant others. Its essence is the belief that significant others have unrealistic standards and perfectionistic motives for their behaviors, and that they will be satisfied only when these standards are met. For example, socially prescribed perfectionism is thinking that significant others expect one to be Atlas and hold up the world and believing that they will be utterly

disappointed if one fails in any way. Self-oriented, other-oriented, and socially prescribed perfectionism are three separate but related aspects of perfectionism.

POSITIVE AND NEGATIVE ASPECTS

Perfectionism may be positive or negative. On the positive side, most employers would rather have employees who take pride in their work, who consistently work to the best of their ability, and who try to make their results as perfect as possible. Likewise, most teachers would rather have students who are exact and precise in their work, who do all their assignments as instructed, and who consistently operate at their maximum capacity. In other life situations as well, perfectionism can be a very positive quality. On the negative side, there are intrapersonal and interpersonal costs associated with perfectionism.

Intrapersonally, perfectionists are never satisfied with their efforts, no matter how hard they try. They consistently fail to meet their goals, so their lives can be quite frustrating and their self-esteem quite low. They can fail to produce a whole picture of the forest because they are so thoroughly examining the trees. They fail to understand that there are times when an adequate job is all that is required. Interpersonally, perfectionists can be difficult persons with whom to live, work, and interact. Their exacting standards can lead to rigidity and make interpersonal relationships fraught with disappointments and recriminations. Therefore, perfectionism may be a positive or negative personal characteristic.

THE PERFECTIONISM SCALE

During the late 1980's and early 1990's, Paul Hewitt and Gordon Flett and colleagues in Winnipeg, Canada, developed the Multidimensional Perfectionism Scale (MPS), a forty-five-item measure of self-oriented, other-oriented, and socially prescribed perfectionism. Respondents rate such statements as "When I am working on something, I cannot relax until it is perfect" (self-oriented perfectionism), "I have high expectations for the people who are important to me" (other-oriented perfectionism), and "People expect nothing less than perfection from me" (socially prescribed perfectionism) on a seven-point Likert scale from 1 = Strongly Disagree to 7 = Strongly Agree. Respondents receive scores for all three dimensions of perfectionism.

The MPS is a strong instrument. In terms of reliability, the MPS is internally consistent as well as consistent over time. In terms of validity, the MPS is correlated with related concepts such as high self-standards, self-criticism, fear of negative evaluation, and social importance goals. In terms of multidimensionality, factor analysis has produced results that are consistent with the three dimensions of the MPS. Furthermore, it is not substantially influenced by response biases. Thus, the MPS is an experimentally sound instrument.

Using the MPS, researchers have shown that perfectionism is correlated with anxiety, suicide, alcoholism, eating disorders, and personality disorders. It is also correlated with feelings of failure, guilt, indecisiveness, procrastination, shame, and low self-esteem. Thus, perfectionism is associated with psychopathology. General research on perfectionism has adopted a diathesis-stress approach that highlights the role of mediators between perfectionism and adjustment. According to this approach, problems of adjustment are elevated considerably when self-oriented perfectionism is combined with such mediating variables as negative life stressors, an internal attributional style, emotion-focused coping, and ego-involving conditions.

Perjury

DEFINITION: Crime of testifying falsely while under oath

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Perjury interferes with the ability of judicial systems to ascertain the truth and mete out justice. It is therefore commonly thought to be a violation of the general interests of a given society. Perjury, rather than lying in general, is a violation of the Ninth Commandment.

The essence of the crime of perjury is giving false testimony under oath regarding a matter that is being considered by a court or other tribunal. "False" does not mean mistaken, however great the error; it means that the witness believes his or her own testimony to be false and makes false statements willfully in spite of taking an oath to tell the truth.

Perjury is a serious crime. It was punishable by death in England in ancient times; later, the punishment became banishment or mutilation of the tongue. Penalties are still severe; in the United States during the 1990's, perjury was still punishable by life imprisonment in a few states and by a long term of years in all the others. However, there are few perjury prosecutions. It is a difficult crime to prove, because the prosecution has to show that the witness knew the testimony to be false. In the United States a person who has been acquitted of a criminal offense is now protected by the double-jeopardy clause from being charged with perjury for testimony given in his or her own defense.

Permissible acts

DEFINITION: Actions whose performance does not constitute a moral transgression

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: One way to conceive of the goal of ethics is as dividing all human actions into permissible and impermissible acts. Such a conception leads to the portrayal of duty as a negative rather than a positive concept.

The concept of a permissible act is one that is typically learned very early in life. One learns that there are certain requirements that are binding upon one's behavior, and permissible acts are recognized as those acts that do not violate any of these requirements. Because most of these requirements are actually requirements to refrain from certain types of acts, one quickly identifies certain courses of action as being impermissible. Permissible acts, then, are acts one knows one can perform without violating these requirements.

More precisely, the relation between permissibility and duty is the following: If one has a moral duty to perform a particular act, then it is permissible for one to perform the act but not permissible for one to refrain from performing the act. If one has a moral duty to refrain from a particular act, then it is permissible for one to refrain from the act but not permissible for one to perform the act. If one does not have a moral duty either to perform or refrain from a particular act, then it is permissible for one to perform the act and permissible for one to refrain from the act.

Ethicists have distinguished four different categories of morally permissible acts. First, some morally permissible acts are neither morally praiseworthy nor morally blameworthy. These acts tend to be somewhat inconsequential as far as morality is concerned. For example, raising one's hand in the air or clearing one's throat is a morally neutral act (under most circumstances). It is neither praiseworthy nor blameworthy, and hence it cannot be the violation of duty.

Second, there are morally permissible acts that one has a moral duty to perform. Indeed, all instances of carrying out one's moral duty are permissible; it can never be impermissible to carry out one's duty.

Third, some morally permissible acts are morally praiseworthy but not the fulfillment of duty. That is, it is sometimes possible to act in a way that goes be-

yond moral duty, and it is always permissible to perform such acts. This category includes so-called acts of supererogation, acts whose performance is praiseworthy but not obligatory and whose omission is not blameworthy.

Fourth, some morally permissible acts are morally blameworthy. These acts, known as acts of offense, are blameworthy without constituting a violation of duty. They are bad enough to warrant blame but not bad enough to be classified as forbidden. Of all the acts that are permissible, these are the only ones whose performance has a negative ethical status. A significant number of moralists are skeptical as to whether acts of this type are possible.

ABSOLUTISM VS. RELATIVISM

There is considerable disagreement in ethics between those who defend an absolutist approach and those who defend a relativist approach. The concept of permissibility is thought of quite differently by the defenders of these two approaches.

Defenders of an absolutist approach follow Plato in thinking that there are standards of morality that are eternal, absolute, and unchanging. They are the same for everyone and are discovered, not made. From this it follows that what is morally permissible is also the same for everyone in relevantly similar circumstances. What is permissible does not depend upon one's culture or the period of history in which one lives.

Defenders of a relativist approach believe that people draw up standards of morality to govern their lives; before there were any people, there were no standards of morality. Different cultures have different conceptions of what is permissible, and that is exactly what one should expect. Someone from one culture might become quite alarmed at discovering that adultery, for example, is considered permissible in a different culture. That is not to say, however, that one culture is right and another is wrong, for in this view there are no moral absolutes. All that one can say is that different things are permissible in different cultures, and there is no question of one culture's being better or more correct than another.

Some ethical traditions place such emphasis upon duty as to virtually eliminate the possibility of permissible acts other than those that consist in doing one's duty. For example, in certain theological traditions, the demands of God or of other deities are so

all-encompassing as to leave few occasions in which, with respect to the same act, it is both permissible to perform it and permissible to omit it. One is virtually always in a position of having a duty either to perform an act or to refrain from performing it, depending upon the will of God.

Another example is act utilitarianism. Roughly speaking, act utilitarianism is the view that one ought always act in such a way as to bring about the greatest benefits for the greatest number of persons. Thus, at any given time, one has a duty to choose the act that maximizes benefits and a corresponding duty not to choose any act that does not. In this view, it is hard to see how there can ever be an act that is both permissible to perform and permissible to omit.

Other ethical traditions place a high premium on the possibility of permissible acts and of the importance of learning how to choose between two or more permissible acts. Learning to make such choices is not possible within the confines of act utilitarianism. There is good reason to believe, however, that people attain moral maturity in situations in which decision making is more than following the stark demands of duty. Sooner or later, people must learn how to make wise decisions regarding courses of action that are permissible but not uniformly prudent from a moral point of view. This is especially true with respect to acts that are blameworthy but permissible; moral maturity will teach one to avoid these when possible, even though they violate no moral duties.

Perry, R. B.

IDENTIFICATION: American philosopher

BORN: July 3, 1876, Poultney, Vermont

DIED: January 22, 1957, Cambridge, Massachusetts

TYPE OF ETHICS: Modern history

SIGNIFICANCE: The author of *General Theory of Value* (1926) and *Realms of Value* (1954), Perry developed a general, systematic theory of value.

Ralph Barton Perry enjoyed a distinguished career as a professor of philosophy at Harvard from 1902 to 1946. He was the leading authority of his time on psychologist-philosopher William James, and his book *The Thought and Character of William James* (1935) earned him the 1936 Pulitzer Prize. Perry is best known, however, for his value theory, which he saw as an extension of modern science to human life.

Perry's definition of value was "any object of any interest." The word "interest" captured that aspect of human psychology of being for some things and against others and included desire, feeling, and will. Thus, objects acquire value when someone seeks or favors them. Perry notes his affinity with the Dutch philosopher Baruch Spinoza, who had said in his book *Ethics* (1677) that human beings never strive for anything because they deem it to be good but deem something to be good because they strive for it. This view contrasts with that of the Greek philosopher Aristotle, that because something is good it is an object of rational desire.

For Perry, the central aim of morality is the harmonizing and integration of interests. A morally good object is one the interest of which meets the requirement of harmony, by aiming at another person's interest or at harmony itself. Perry's theory about right action is consequentialist; namely, an action is right if it is conducive to moral good.

Perry's theory is a type of ethical naturalism and cognitivism. He analyzes value and moral terms into naturalistic ones, employing the psychological concept of interest. He thereby rejects the nonnaturalism of English philosopher G. E. Moore. For Perry, moral judgments are empirical and cognitive, contrasting with the emotivism of English philosopher A. J. Ayer and the American philosopher Charles L. Stevenson.

Personal injury attorneys

DEFINITION: Lawyers who specialize in representing persons who have been injured against those responsible for the injuries

TYPE OF ETHICS: Legal and judicial ethics

SIGNIFICANCE: Considered outlaws within the legal profession, personal injury attorneys contribute to negative public perceptions of the ethics of attorneys generally.

Among the least flattering images of unscrupulous lawyers is that of the ambulance chaser, the lawyer who arrives shortly after an accident to find among the injured and bleeding a new client. In fact, ambulance chasers are outlaws among attorneys, subject to disbarment for their unethical solicitation of clients. However, people who have been injured in some way nevertheless frequently need legal representation, and personal injury attorneys specialize in such cases. Personal injury lawyers may handle cases as varied as those involving relatively minor traffic accidents and those involving the injuries and deaths produced by an airliner crash.

Personal injury lawyers usually rely on a particular kind of fee arrangement, called a contingency fee agreement. This agreement provides that the personal injury attorney will not recover a fee in a case unless the attorney obtains some recovery for the client. In addition, personal injury attorneys generally pay the expenses needed to prepare a case for trial and deduct these from any ultimate recovery. These expenses, which include the fees of expert witnesses and the cost of pretrial discovery of facts about the case, can be very substantial and would be beyond the means of most individuals. However, by setting aside money from prior successful cases, personal injury attorneys are able to keep a reserve of cash for use on the expenses of subsequent cases. Consequently, by using the contingency fee agreement and by paying litigation expenses up front, personal injury attorneys are able to provide representation to individuals regardless of their financial standing.

But these financial aspects of personal injury practice are also controversial. The first and perhaps most important element of a successful personal injury practice is obtaining cases involving personal injury plaintiffs. This need to find clients causes some personal injury lawyers to engage in television or radio advertising, which is viewed as demeaning to the profession by more conservative lawyers. Furthermore, the need to find clients also tempts some personal injury lawyers to violate established rules against soliciting clients: in short, to engage in ambulance chasing.

Even after personal injury attorneys find their clients, they may be tempted to provide funds to these clients to cover medical and living expenses prior to trial or settlement. Personal injury clients are sometimes lured into accepting artificially low settlements for their injuries because they lack the financial resources to survive the lengthy period of time it normally takes to win a verdict at trial and sustain it on appeal. However, the law has long disfavored allowing persons to encourage litigation by offering support or other encouragements to litigating parties. The legal doctrines of champerty and maintenance, for example, make it a crime in many jurisdictions for persons to offer such support. Furthermore, rules of legal ethics prohibit attorneys from providing medical or living expenses to their clients.

Personal relationships

DEFINITION: Intimate associations or bonds among two or more persons

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Philosophers since antiquity have posited that humans are fundamentally social beings and that without interpersonal relationships they cannot be considered fully human. Close personal relationships, moreover, are often considered to create ethical obligations between people, but they may also enable one person to coerce another into committing immoral acts.

The Old Testament tale of Adam and Eve's expulsion from the Garden of Eden opens the theme of a personal relationship that leads to disaster for both parties. Philosophy, religion, law, and social institutions have sought to structure personal relationships in marriage and the family to bring the conduct of individuals in line with the good of others and social stability. Monogamous marriage and a nuclear family are believed to have conferred an evolutionary advantage on the human race by increasing the probability of survival for children born and reared in such unions.

The family is not only a biological survival unit, a haven, and a refuge. It is also a school for moral sentiments: Parents experience moral growth and socialize children according to community norms, and natural affection among family members generates altruistic emotions. The traditional duties of a husband and father were to furnish security and economic support and to exercise moral authority within the family. The wife and mother managed the household, nurtured children, and owed her husband fidelity. Children were to obey and respect parents and elders, and to help and be loyal to one another.

ANCIENT GREECE AND CHRISTIANITY

Plato questioned the ethical value of marriage and the family and championed other forms of personal relationships. Athenian women were often uneducated and did not move in society, even in the company of their husbands. Wealthy aristocrats enjoyed the company of cultivated women prostitutes, and some courted male adolescents as protégés. In the *Symposium*, Plato maintains that an erotic relationship between a mature and a younger man, when inspired by philosophy, enables each to progress to the highest levels of human moral and intellectual development and creativity. Since the first step in moral progress is to admire another for qualities of mind and character, rather than physical attractiveness, "Platonic love" has come to mean nonsexual friendship between any two persons with shared ideals of beauty, truth, and goodness. This nonsexual Platonic ideal enriches many teacher-student relationships and associations between those who dedicate themselves to science, art, and philanthropic activities.

In *Republic*, Plato's ideal state abolishes marriage and the family because they constitute "exclusive centers of private joys and sorrows" that distract citi-

zens from the common good and prevent women from developing their talents and serving the whole community. Plato proposes eugenic matches between men and women of reproductive age and the communal rearing of children, so that neither parents nor children know their biological relationships. By law, all children call one another brother or sister and all adults father or mother; adults call each child son or daughter. In this way, Plato theorized, each person would develop for others in the community the bonds of affection and loyalty ordinarily limited to a few.

Aristotle (fourth century B.C.E.) claimed that *Republic's* personal ties would be "watery" and morally ineffectual. He insisted that the friendly relationships of private life should promote both individual happiness and communal harmony. There is friendship when two persons mutually desire the good of the other for the other's own sake and each does some kind of good for the other. He distinguishes more transient "imperfect" friendships, in which the good achieved is pleasure or utility, from permanent "perfect" friendships based on appreciation of each other's character, in which the two join in pursuing noble goals, as in Platonic love. By maintaining that perfect friendship may exist between husband and wife, Aristotle defended the moral potential of marriage, whose family life combines daily virtuous activities, pleasure, and utility.

Christianity introduced new moral elements into personal relationships: It demanded love for those without attractive or useful qualities and love for those who do wrong or offend one. Being modeled on divine love, Christian love is generous, compassionate, and forgiving; it chastises but does not abandon a wrongdoer, seeking instead the person's moral regeneration.

Viewing sexual appetite as a source of evil, Christian ethics required fidelity of both husband and wife and prohibited both premarital and extramarital sex. The relationship of Dante Alighieri to Beatrice in Dante's *Divine Comedy* reflects the medieval ideal of noble love, a model for the Christian relationship of man and woman. Dante's vision of the beautiful young Beatrice draws him heavenward: She personifies divine, loving concern for his weakness and inspires him to transcend carnal desires in order to achieve a loving union with her.

ROMANTIC LOVE AND THE SEXUAL REVOLUTION

The plays of William Shakespeare portray the popular modern ideal of romantic love. In them, a man and a woman feel erotic passion for each other and believe that they are perfectly suited for life together. Shakespeare is realistic in depicting the ambivalent potential of romantic love for happiness or misery: In the comedies, the lovers' ingenuity and constancy enable them to overcome obstacles, including the objections of kin, and they end in socially approved marriages. Impulsiveness, jealousy, or imprudence, however, lead to tragedy for the naïve adolescent lovers of *Romeo and Juliet* (pr. c. 1595-1596), the military hero of *Othello* (pr. 1604) and his bride Desdemona, and the sophisticated older lovers of *Anthony and Cleopatra* (pr. c. 1606-1607).

The romantic ideal of marriage based on mutual attraction prevails in American society. When romance fails or attends a third party, divorce is a resort. In the case of a couple with young children, remarriage and custody arrangements alter the tenor of family life and complicate parent-child and sibling relationships. The sexual revolution of the 1960's and 1970's liberalized sexual morality and legitimated various consensual forms of personal relationships.

Premarital and extramarital sex, children born out of wedlock, homosexuality, lesbianism, and abortion no longer have the social stigma that once was attached to them. In common speech, a "relationship" connotes two unmarried persons who engage in consensual sex and are constant companions. The social norms of "recreational sex" are mutual consent and avoidance of pregnancy and sexually transmitted diseases. These limited norms do not address romantic feelings, which may exist on one side but not the other, and the consequent dangers of misunderstanding, deception, and exploitation of one by the other.

MALE BONDING

Films such as *The Deer Hunter* (1978) celebrate the phenomenon of "male bonding." Men who come together in often arduous activities of war, sports, work, leisure, or even crime develop comradeship that leads them to undertake dangerous tasks for the sake of one or more of their number. Male bonding is a source of strength and mutual support; it is ennobling and useful to society when it inspires men to behave courageously and selflessly. In the absence of

moralizing influences such as the family, however, male bonding in urban gangs incites violent behavior and often is destructive to the individuals themselves. Gang members rely on money, power, and intimidation in relationships with outsiders and sometimes with intimates as well.

Some feminists consider male bonding, marriage, the family, and romantic love stratagems as elements of a patriarchal social organization that is designed to keep men in positions of power and women in subordination. Feminism has profoundly affected all forms of personal relationships by attacking the ideal of feminine submissiveness: Instead, feminism promotes self-assertion and independence for women both within and outside marriage and the family; it has opposed male domination in sexual harassment and employment practices. Some feminists condemn pornography on the grounds that it leads men to view and treat women as sex objects.

MODERN ETHICS

Modern "justice" ethics, represented by John Rawls's *Justice and Fairness* (1971), confers on consensual personal relationships equal legitimacy with marriage and family ties. Rawls does not accord marriage and family their traditional status of objective values to be endorsed by the moral principles of a just society; he categorizes them as subjective preferences, optional elements in an individual's life plan. Family partiality for the economic security of its members impedes a more egalitarian distribution of wealth. The assignment of special moral weight to the needs and well-being of family members is improper, for the moral attitude in justice ethics is one of rational impartiality toward individuals.

The morality of personal relationships in justice ethics is rights-based and contractual: Since autonomy, the power of the individual to act in accordance with his or her life plan without interference from others, is an objective value, intimates may not intrude upon it. One is obliged to respect the autonomy of all others and not to violate their basic human rights; other ideals or duties are matters of mutual agreement or subjective preference. Impartiality requires one to translate legal bans against racial, ethnic, and sexist discrimination into personal conduct by not showing bias in personal relationships with others.

Psychologist Carol Gilligan, in *In a Different*

Voice (1977), theorizes that justice ethics embodies a masculine ethical perspective: Men value autonomy for the freedom it affords them to pursue power and prestige in the social organization without the burden of personal relationships. Women articulate a different ethical voice that reflects the nurturing functions that they fulfill in human life and that values “relatedness.” In ethical dilemmas, men apply universal moral principles impartially in order to secure justice in society; women seek a detailed narrative of the situation in order to resolve it without impairing valued relationships.

CRITICS OF JUSTICE ETHICS

Other philosophical critics of justice ethics say that it overlooks the moral power of friendship and family ties. They formulate a “care” ethic in which the well-being of particular persons has independent moral weight. Their ethical attitude is one of attentive solicitude to particular persons. A person’s moral responsibility is to be sensitive to the needs of intimates and anticipate threats to their well-being, to be receptive to their interpretation of a situation, and through dialogue to seek resolutions that respect each person’s integrity. Some feminists hear the feminine ethical voice as calling them to lives of self-abnegation and devotion to others, threatening the gains of women’s liberation.

Existentialist philosophers Martin Heidegger and Jean-Paul Sartre see personal relationships as being inextricably connected with personal identity and social structure. One’s personal identity depends on what one is to others and what they are to one; these interpretations of self and other in turn are determined by how each plays his or her social role, which is defined by the social organization.

According to Heidegger’s *Being and Time* (1927), one’s everyday mentality is so task-oriented that one tends to lose sight of the particular human beings for whose sake one does the work. Individuals relate to others in three different ways: The prevalent way is to distance oneself from others, hiding oneself or putting on a disguise in order to get along smoothly with them and get on with one’s work. When another’s affairs demand attention, one steps into the other’s life, managing matters for the other so as to “remove” the other’s own care. This way makes one dominant and the other dependent; both lose their freedom. In authentic solicitude, one stands by the other, looks to

what the future has in store for both, and helps the other to understand the shared situation and to be resolute in making his or her own place in the world. In this way, each gains authentic selfhood without losing freedom.

According to Sartre’s *Being and Nothingness* (1943), sexual relationships model all personal relationships in a capitalist society, which values power and promotes competition among individuals. The “battle of the sexes” reflects the battle of egos in all forms of personal relationships. One seeks to inveigle or force the other to surrender freedom and acknowledge one’s own superiority. This incessant struggle for domination is self-defeating and turns into masochism and sadism. Personal relationships cannot be self-affirming, Sartre suggests, until a restructuring of society enables each to will the freedom of all others.

Heidegger’s and Sartre’s theories point out undesirable ways of caring for others, which render personal relationships mutually self-destructive. Personal sexual relationships involve power, not only pleasure. Evils in personal relationships are the short-sighted, callous, or cruel exercise of power and authority, and the manipulation and exploitation of another for personal advantage. Modern ethics stresses the evils of sexual harassment and the violation of another’s rights, autonomy, and dignity.

It is agreed that each person in a relationship should be honest, sincere, and compassionate toward the other, respecting the other’s individuality and integrity. Although a relationship should foster moral development, there is debate regarding whether one should be “the conscience of others,” in Heidegger’s phrase, or withhold forgiveness from an intimate on moral grounds. Most controversial is the primacy of autonomy, especially in close personal relationships. Joint decision making by spouses, for example, on matters of common interest is desirable yet may compromise autonomy; on occasion, one’s own good, the good of another, or the preservation of the relationship itself may involve some yielding of autonomy. Because autonomy honors commitments based on rational choice and can change according to circumstances, it does not support biological family ties, and every personal loyalty, including marriage, is revocable. Yet constancy amid changing circumstances is the ethical and emotional heart of enduring personal relationships.

UNFINISHED BUSINESS

Anglo-American ethics, with its emphasis on individual rights and autonomy, has largely neglected the philosophy of personal relationships. Social changes since World War I—such as the entry of women of childbearing age into the work force, the liberalization of sexual relationships, divorce and remarriage of those with young children, increase in life span, and government social programs—have altered traditional forms of personal relationships and created new ones. The dynamics of intimacy and personal moral character for traditional relationships in these changed social conditions and for newer forms of relationships require further study.

A major issue is the reevaluation of the social importance of the family. The disintegration of the family contributes to, or makes intractable, social problems of drug addiction, child abuse and neglect, learning and educational deficiencies, juvenile crime, and homelessness. It is estimated that 40 percent of violent crimes take place between persons who know each other—often, between family members or persons with consensual relationships. Training and support in family life help an individual to deal with anger and frustration toward intimates and to develop the self-discipline needed to succeed in education and employment.

A second issue is the reexamination of ideals and standards of conduct in marriage, the family, and consensual relationships. Family life needs not only to embody justice but also to be fulfilling to adults and attentive to the well-being and moral development of children. Although fear of AIDS has led to more circumspection in sexual relationships and negative features of the “single-parent” family prompt measures to prevent pregnancy among teenagers, attention should go beyond health to the impact of consensual personal relationships on the characters and overall well-being of the individuals concerned and others caught in their relationships.

Gender differences in personal relationships make a difference. Whether women and men have divergent ethical perspectives is still being debated, but there is agreement that the goals and expectations of men and women differ in heterosexual relationships: Women usually look for trust, security, and companionship, while men more often seek immediate pleasure and are content with less emotional involvement. Gender differences also operate in problems

of sexual harassment in and out of the workplace.

Finally, there are ethical differences between parity and nonparity personal relationships. In relationships between friends, spouses, coworkers, and siblings, there is rough parity between two persons in terms of power, knowledge, talents, and moral authority. In contrast, parent-child, employer-employee, doctor-patient, and teacher-student relationships involve an imbalance so that the obligations, ideals, and goals of one are in some respects not the same or commensurate with those of the other. Achieving the ideals of the relationship and the avoidance of manipulation and destructive dependency may take different forms in parity and nonparity relationships.

The physician-patient relationship provides a model of how modern ethics has changed ideals in interpersonal relationships. In traditional medical paternalism, a doctor made decisions about how to treat and what to tell a patient and often withheld from a patient knowledge of the seriousness of his or her medical condition. Biomedical ethics has modified this nonparity relationship: A physician is now required by law to obtain informed consent for treatment from a competent patient; a patient has the moral obligation to participate in decision making and to take into account interests of his or her intimates. A patient needs to know the truth about his or her future prospects, in part because they affect the lives of his or her intimates. By extending and applying the insights and ideals of justice and care ethics, the philosophy of personal relationships may analyze and reform more intimate one-on-one intercourse.

Pessimism and optimism

DEFINITION: Pessimism: tendency to expect the worst or to favor the grimmest possible interpretation of events; optimism: tendency to expect the best or to favor the most positive possible interpretation of events

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: To outside observers, both pessimism and optimism may seem to pervert a person's ability to see the world clearly. To the pessimist or optimist, failure to see the world as they do may constitute a failure to see the world clearly. In either case, pessimism and optimism may have significant ethical consequences, since they either

represent or interfere with the ability to understand the true ethical significance of a given state of affairs.

Pessimism and optimism are cognitive explanatory styles (stable tendencies to make particular kinds of attributions concerning positive and negative events). A pessimistic explanatory style looks at uncontrollable events as internal ("It is my fault"), stable ("I will always be this way"), and global ("This is an overall characteristic of mine"). An optimistic explanatory style looks at uncontrollable events as external ("It is someone else's fault"), unstable ("It will be different in the future"), and specific ("Other aspects of myself are different"). When confronted with stressful situations, pessimists believe that they can never gain control, whereas optimists believe that they can maintain control.

Pessimism and optimism are typically measured by means of either self-report scales or content analysis of written or verbal materials. Scales that measure pessimism and optimism are the Life Orientation Test and the Coping Orientations to Problems Experienced (COPE). The COPE has thirteen subscales in three general categories: problem-focused (active coping, planning, suppressing competing activities, restraint, and seeking instrumental social support), emotion-focused (seeking emotional social support, positive reinterpretation and growth, acceptance, turning to religion, and denial), and maladaptive (focusing and venting emotions, behavioral disengagement, and mental disengagement).

HUMAN NATURE

Pessimism and optimism carry differing views of basic human nature. Pessimists view humans as basically selfish, aggressive, and cruel. They believe that people are governed by aggressive, even death-seeking instincts. Optimists view humans as basically good, helpful, and cooperative. They believe that people are basically decent and life-affirming. Pessimists assume that nothing will work out, because people cannot be trusted; optimists assume that everything will work out, because people will ultimately behave well.

Pessimism and optimism are related to psychopathology. Pessimism is associated with depression, suicidal ideas and actions, hopelessness about the future, helplessness about the present, feelings of alien-

ation, anxiety, neuroticism, irrational beliefs, and hostility. In contrast, optimism is related to high self-esteem, achievement, and internal locus of control. Thus, pessimism is linked to psychological illness and optimism is linked to psychological health.

Pessimism and optimism are associated with different coping strategies. Pessimists are more likely to cope with stress by focusing on and venting emotion, giving up, disengaging, or denying the stress. Furthermore, pessimists are at relatively greater risk for helplessness and depression when they confront stressful events.

Optimists are more likely to cope with stress by acting, focusing on problems, and seeking social support. Furthermore, optimists are more likely to emphasize the positive in their appraisals of stressful events. For example, when faced with a problem such as a risky operation or a serious continuing struggle with a competitor, they focus on what they can do rather than on how they feel. They have a relatively higher expectation of being successful, so they do not give up at the first sign of setback. They keep their sense of humor, plan for the future, and reinterpret the situation in a positive light. They acknowledge their problems and illnesses but have confidence that they will overcome them.

PRACTICAL IMPLICATIONS

These coping differences have practical implications. For example, optimistic beginning insurance agents sold 37 percent more insurance than did pessimistic agents in their first two years on the job and were more likely to persist through the difficulties of the job and stay with the company.

Pessimists are at increased risk for illness, suicide attempts and completions, and other types of death. For example, in one 1987 study by Christopher Peterson and Martin Seligman, pessimists had twice as many illnesses and made about twice as many visits to doctors as did optimists. In another study of recent heart bypass surgery patients, optimists employed more adaptive coping strategies, recovered faster, returned to normal activities sooner, and attained a higher quality of life than pessimists did. Longitudinal studies suggest that pessimists may suffer more illnesses over their lifetimes and die younger than optimists.

Optimists are relatively more likely to be physically healthy and to live longer. For example, in one

study by Sandra Levy and colleagues, women who came to the National Cancer Institute for treatment of breast cancer were followed for five years. On the average, optimists died later than pessimists did, even when the physical severity of the disease was the same at the beginning of the five-year period. In another study, baseball Hall-of-Famers who had played between 1900 and 1950 were rated on their cognitive explanatory style. Optimists were significantly more likely to have lived well into old age than were pessimists. Perhaps pessimists are more likely to become ill because they stir up negative emotions rather than acting constructively, they have passive rather than active coping efforts, and they have relatively poor health habits.

Optimism and pessimism are learned or developed early in life. In one study it was found that third-graders had already developed a habitual explanatory style. Furthermore, third-graders with a more pessimistic explanatory style were more prone to depression and performed more poorly on achievement tests compared with those with a more optimistic style.

Pessimistic explanatory styles may be altered—at least optimists think so. Cognitive therapy has been successful in teaching depressed, pessimistic people new explanatory styles. This therapeutic approach involves teaching people to replace pessimistic thoughts with more realistic ones. Following this kind of therapy, Aaron Beck and colleagues found that changes in explanatory style were still evident after one year. Thus, a pessimistic explanatory style may be learned at an early age but can be changed with long-lasting results.

Phenomenology of Spirit

IDENTIFICATION: Book by Georg Wilhelm Friedrich Hegel (1770-1831)

DATE: *Die Phänomenologie des Geistes*, 1807 (*The Phenomenology of Spirit*, 1868; also known as *The Phenomenology of Mind*, 1910)

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Hegel's *Phenomenology* represented his attempt to complete what he saw as Immanuel Kant's incomplete philosophical system. It portrayed the teleological development of consciousness into self-consciousness, self-consciousness into social consciousness, social consciousness's incarnation in a social and ethical community, the historical evolution of different forms of community, and finally, the perfection of consciousness, society, and reality and the realization of the ideal ethical community at the end of history. The structure of Hegel's argument and his philosophy of history were crucial influences upon Karl Marx and the development of Marxism.

Phenomenology of Spirit occupies a crucial place in the development of Hegel's thought. It marks his maturation as a philosopher of the highest rank and anticipates within its own unique format every aspect of his later work. Hence, it is important to understand

the overarching themes of the book before turning to its examination of ethics.

A major aim of Hegel in *Phenomenology* is to renew classical Platonic and Aristotelian philosophy from within the modern philosophical tradition. It was only through examination and critique of everything that had been thought since the Greeks that a worldview modeled on theirs could become a practical framework from within which modern people could think and act. In striving to fulfill that aim, Hegel developed a view of the subject who experiences, knows, and acts, which was in conscious opposition to any and all views of subjectivity that were empirical (for example, John Locke), naturalistic (for example, much of the thought of the Enlightenment), or transcendental (for example, Immanuel Kant). His view was that the acting and experiencing subject is both self-transforming over time (hence, historical) and fundamentally social (in opposition to any and all individualist models).

Thus, in the book's first major section, "Consciousness," Hegel demonstrates that consideration of even the apparently most basic forms of knowing, such as sense perception, produces in the knowing subject an awareness of both itself as knowing and of other knowing subjects. Out of these experiences arises self-consciousness. In Hegel's famous examination of the master-servant relationship in the section "Self-Consciousness," he graphically describes the social yet divided character of human experience.

In the remainder of *Phenomenology*, Hegel depicts the experiences of this divided human self. In doing so, he examines what are for him the key movements in the development of consciousness in Western culture from the Greeks to Hegel's own time. Stoicism, skepticism, the unhappy consciousness of religion, the development of modern philosophy from René Descartes to Kant, the opportunities and perils of freedom in the era of the French Revolution, the phases of religious development in human history—all these are subsumed into Hegel's story of the development of *Geist*, or "spirit." *Geist* is the larger rational plan of which all phases of the development of human consciousness are instances. Each phase is therefore a partial revelation of *Geist*.

RELEVANCE TO ETHICS

Chapter 6 of *Phenomenology*, in which Hegel examines the development of *Geist* from the Greeks

down to his own time, is the section of the book that is germane to ethics. It is structured around a distinction crucial to Hegel's thought, that between morality (*Moralität*) and ethical community (*Sittlichkeit*). Morality is that arena of human life in which the individual is thought of as a subject who is responsible for his or her actions. For Hegel, however, moral life attains its highest realization only within the larger life of a society; this is the realm of ethical community. To be truly morally free therefore requires a society within which that freedom can be expressed.

Here, Hegel's historical reconstruction of Western consciousness becomes crucial. Once there *was* a historically existing ethical community—that of the ancient Greeks—in which the city-state provided for its citizens the essential meaning of their lives. This primal *Sittlichkeit* was lost forever in its original form, however, because of developments within Greek culture itself. Hegel's profound discussion of the tensions between divine law and human law in Sophocles' play *Antigone* (c. 441 B.C.E.) exemplifies his view that the Greek ethical world had within it the seeds of its own destruction.

Such a natural ethical system, arising spontaneously out of the early developments of Greek cultural life, was inevitably going to be destroyed, Hegel thought, because the ongoing development of *Geist* toward greater self-consciousness would show such a system to be restricted. Socrates' inquiries initiate the transformation of this first natural *Sittlichkeit*: its original unity was shattered by developments within it as Greek thinkers restlessly searched for universal standards of reason and morality—that is, standards greater than the framework of polis life.

Hegel then went on to describe the standpoint of morality as characteristic of the modern spirit. It is crucial to emphasize that the moral standpoint is, for Hegel, an individualist model of human action. Even when this modern individualist morality is developed to its highest point, at which the individual moral self is seen as identical with the universal law of reason, as in the philosophy of Kant, it is still partial or one-sided in Hegel's view.

Thus, *Phenomenology* contains a tension in Hegel's ethical thought as it had developed to this point: From a historical point of view, modern morality was superior to Greek ethical community because it was a later, higher stage of *Geist*'s ongoing self-revelation; if modern morality is an advance, how-

ever, it is nevertheless a one-sided and partial one, doing scant justice to the social aspects of human communal life. What Hegel would later attempt in *Philosophy of Right* (*Grundlinien der Philosophie des Rechts*, 1821) was the construction of a modern notion of ethical community that would be historically as well as philosophically superior to both Greek ethical life and modern individualist moralities. The reader of *Phenomenology of Spirit* thus catches the development of Hegel's ethical thought in process and will be led to turn to *Philosophy of Right* to encounter his resolution of the tension that so provocatively animates the discussion of ethics in *Phenomenology*.

Philo of Alexandria

IDENTIFICATION: Early Egyptian philosopher
BORN: c. 20 B.C.E., Alexandria (now in Egypt)
DIED: c. 45 C.E., Alexandria (now in Egypt)
TYPE OF ETHICS: Religious ethics
SIGNIFICANCE: The author of *The Creation of the World, That God Is Immutable*, and *On the Ten Commandments* (all early first century C.E.), Philo combined Old Testament theology with Greek philosophy, especially that of Plato and the Stoics.

Philo of Alexandria, also known as Philo Judaeus, is best remembered as an allegorist who attempted to bridge the gap between Greek philosophy and Hebrew Scripture. For example, he harmonized Plato's *Timaeus* with the scriptural account of creation by articulating a view that the Logos, or the world of intelligible ideas, existed first as God's thoughts and then as the way in which God leads creatures to know him. Philo wished to reconcile natural knowledge and prophetic knowledge, laws of nature and miracles, and causality and free will.

Philo's attempt to blend Greek and Jewish ideas affected his moral philosophy. On one hand, his writings are filled with expressions of Jewish piety. In his personal life, he practiced renunciation of the self and sought immediate communion with God through the Logos. On the other hand, much of Philo's teaching shows clear signs of Stoic origins; for example, in the attention that he gives to virtue.

Philo differed from the Stoics in that he did not believe that emotions needed to be rooted out. Again harmonizing Greek philosophy with Hebrew Scripture, Philo held that most people were neither completely virtuous nor completely wicked. God's grace led people to improve. Also, based upon his reading of Scripture, Philo included faith; *philanthropia*, or giving help to those in need; and repentance in his list of virtues. Moreover, he held that God would reward virtuous acts in the spiritual hereafter.

Photojournalism

DEFINITION: Profession of news photographers
TYPE OF ETHICS: Media ethics
SIGNIFICANCE: As the tellers of visual stories in the news, photojournalists have special ethical and legal responsibilities to create pictures that are honest reflections of reality.

Photojournalism is the journalistic side of photography that visually captures and documents moments in time. Photographers create still-life documentaries that tell stories about politics, sports, disasters, wars, crime, and other situations that involve human emotions, and supplement the written stories of the news. The profession dates back to the mid-1800's, when photographs began being used as the bases for engraved illustrations in news publications. By the end of the century, the halftone process, a technique that enabled printing something closer to true photographs, alongside text, was used worldwide. During the 1930's, candid photography was brought to the masses and photojournalism, as it later became known, was born. During that decade, many picture magazines flourished, most notably *Life*, which then set the world standard for photojournalism. As the profession grew, so did the need for ethical standards.

THE RIGHT OF PRIVACY

During the mid-nineteenth century, the journalism profession underwent a major change after two lawyers, Samuel D. Warren and Louis D. Brandeis, argued for the right for privacy in an article published in the *Harvard Law Review*. Their article stemmed from the insensitive coverage by Boston newspapers of a woman's private social life. As a result of the law review article, privacy doctrines were established in journalism that set standards for both writers and photojournalists.

The first principle, called appropriation, forbade the unauthorized commercial use of private individuals' names or identities. This principle protected the property interests people have in their own names and images. Examples of forbidden behavior included photographing formally staged creative performances without permission, photographing images for editorial purposes and then using them for advertising without obtaining written permission, and manipulating and deliberately distorting photo-

graphic images without labeling them as “photo illustrations.”

The second principle, intrusion and trespass, pertains to the offensive physical, electronic, or mechanical invasion of other people’s solitude or seclusion. Historically, this principle has been frequently violated by aggressive photojournalists, who trespass on private property to get their pictures, and photographers of celebrities known as “paparazzi,” who are notorious for their intrusiveness and disrespect for the privacy of their subjects.

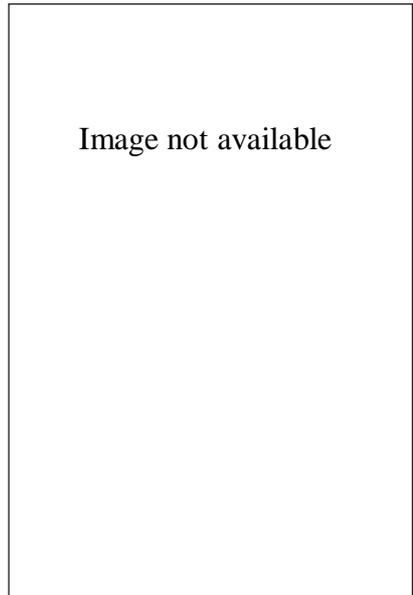

The second principle is closely related to the third, the prohibition against public disclosure of private information that is offensive or that is of not legitimate concern to the public. Examples include photographing undressed celebrities sunbathing on their private yachts, eavesdropping with telephoto lenses, and shooting pictures with hidden cameras. Another prohibition is falsely portraying, distorting, or fictionalizing a subject’s characteristics, conduct, or beliefs, in reckless disregard of the subject’s privacy and reputation.

Although all persons are protected under these principles, violations by photojournalists have been common. The subjects of photojournalists who receive the least respect for their privacy are criminals, followed by public officials (both elected and appointed), other public figures, celebrities, short-term heroes in news stories, innocent victims of tragedies, and relatives of prominent people. Photojournalists who adhere to their profession’s ethical standards respect the principles of privacy and try to get signed releases from subjects not considered public figures before publishing their pictures.

PROFESSIONAL CODE OF ETHICS

The National Press Photographers Association, a professional society of photojournalists, has created a code of ethics for its members. The foundation of the ethical code is built on truthfulness, honesty, and objectivity. The code also calls for photojournalists to maintain sympathy for humanity and to remember their duty to society. The code advises photojournalists to use common sense and good judgment in situations not covered in the code.

A policy on handling electronic images issued by the Associated Press in 1990 states that photographs should not be manipulated or changed in any way, so that journalistic pictures always tell the truth. The

O. J. Simpson’s unretouched police mug shot. (AP/Wide World Photos)

Doctored Photos

In 1994, *Time* magazine used a manipulated police mug shot of murder suspect O. J. Simpson on its cover. The fact that the photograph had been altered was immediately evident to anyone who compared it to the cover of *Newsweek* magazine, which used an unaltered version of the same shot. *Time* had altered its cover photograph to such a degree that it made Simpson’s face look darker, blurry, and unshaven, thus making him appear to be more sinister. The person who altered the photograph justified his manipulation, saying that he had wanted to make the picture “more artful, more compelling.”

photojournalists’ code of ethics does not answer all the questions faced by photojournalists. For example, some of the most frequently occurring issues, including publication of graphic images of nudity, obscene behavior, severe injuries, dead people, and other forms of human suffering, are the focus of many newsroom debates. Even ostensibly innocent photographs of children playing under sprinklers on hot summer days might result in ethical and legal problems.

Physician-patient relationship

DEFINITION: Association between a doctor and client

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Ethical aspects of the physician-patient relationship are governed both by codes of professional conduct and by statutory law. The relationship raises issues involving paternalism, autonomy, confidentiality, and informed consent.

The two parties to any physician-patient relationship are polarized in numerous respects, which normally include (but are not limited to) educational status, economic status, social status, and health status. The presence of any combination of these differences in status, and the extent to which they prevail, in any particular physician-patient relationship has a decided effect on the relationship itself. This is so be-

cause it is precisely these kinds of differences in status that translate into differences in the interests, goals, values, and expectations of the patient and of the physician. Ultimately, these latter differences all too often serve to undermine the success of the physician-patient relationship.

While physician-patient relationships can involve anything from preventive medical examinations of patients whose health status is not noticeably diminished to the treatment of terminally ill patients who are suffering from a significantly diminished health status, Western medical orthodoxy has evolved in such a way as to treat disease and illness after the fact rather than to promote measures and practices that might prevent the onset of disease or illness. Consequently, the vast majority of people in Western cultures who find themselves in a physician-patient relationship as the patient do so only after recognition of their own diminished health status. This, too, has a decided effect on the relationship in question. This is true because the severity of the symptoms of the patient's disease, illness, or injury determines the extent to which the patient has also fallen victim to physiological and/or emotional pain, impairment of the cognitive and reasoning abilities, fear of the unknown, and a perceived loss of control over oneself, one's body, and one's world as one knows it.

For all these reasons, it is not atypical for the physician-patient relationship to engender a very one-sided imbalance of power, and it is precisely this imbalance of power that raises the following fundamental ethical issues that are inherent in the physician-patient relationship: paternalism, autonomy, and informed consent.

PATIENT'S RIGHT TO CHOOSE

Whenever a physician restricts or otherwise impedes a patient's freedom to determine what is done by way of therapeutic measures to herself or himself and attempts to justify such an intrusion by reasons exclusively related to the welfare or needs of the patient, the physician can be construed to have acted paternalistically. To the extent that a physician engages in such paternalistic practices with respect to a patient, the physician is failing to respect that patient's autonomy; that is, the patient's moral right to self-determination.

In spite of the fact that the primary goal of both the physician and the patient should be the restoration of

the patient's optimal health status, any differences between the interests, other goals, values, and expectations of the patient as compared to those of the physician within the context of the very same therapeutic relationship set the stage for paternalistic practices on the part of the physician at the expense of the patient's autonomy. Furthermore, the very presence of any or all of the aforementioned by-products of the symptoms of disease, illness, or injury serve only to exacerbate the problem.

For example, an old patient with several major medical problems, the combined effects of which indicate that she has only a couple of weeks to live, decides that she wants her kidney dialysis (which is her lifeline because of chronic renal failure) discontinued. Any additional week or so of her life that may be gained by continuing the dialysis is, in her mind, far outweighed both by her own poor quality of life and by the emotional trauma being caused to her loved ones. The attending physician, however, who is committed to a profession that is dedicated to healing and to the sustaining of life, believes firmly that any means of prolonging the life of this patient is justified and should be pursued.

In this case, there would appear to be a conflict of values, if not of expectations and interests, between the physician and the patient, the result of which is paternalistic practices on the part of the physician at the expense of the patient's autonomy. When asked to justify his position, the physician might argue that the patient's cognitive and reasoning abilities have been impaired by the combined symptoms of her many and varied medical problems to the extent that her capacity for effective deliberation concerning her own medical treatment is significantly compromised and that, consequently, the patient is no longer capable of autonomous decision making.

The central question in such a case is whether the patient's decision is consistent with the types of values, interests, and goals that she has expressed throughout her life, or, failing that, whether the patient's decision is the reasonable outcome of a prudent reassessment of her own values, interests, and goals in the light of her present circumstances. The answer to this question should determine whether the patient is any longer capable of autonomous decision making, and consequently, whether questions concerning the transgression of the patient's autonomy should even arise.

When Physicians May Breach Patient Confidentiality

Whether physicians or genetic counselors should breach patient confidentiality in order to inform at-risk relatives of their risks of developing genetic diseases is an area of great controversy. The American Society of Human Genetics has argued that professional disclosure of familial genetic information to at-risk relatives, against a patient's expressed wishes, is permitted when all these criteria are met:

- the physicians cannot persuade the patients to disclose the information
- the harm of not disclosing the information is serious and foreseeable
- the patients' at-risk relatives are known
- the diseases are preventable or treatable, or early monitoring will reduce genetic risks
- the harm of not disclosing the genetic information is greater than the harm of disclosure

Informed consent is intended to be both a moral and a legal safeguard to respect the patient's autonomy and to promote the welfare of the patient. In the medical context, "informed consent" refers to a patient's agreement to and approval of, upon obtaining an understanding of all relevant information, a recommended treatment or procedure that is intended to be of therapeutic value to the patient. The very concept of informed consent raises the following ethical questions.

Given the previously mentioned by-products of the symptoms of disease, illness, or injury (up to and including the impairment of cognitive and reasoning abilities), what percentage of patients, either in the physician's office or in the medical institution, are truly competent to provide their *informed* consent? Given the various respects, already mentioned, in which physicians and their patients are polarized, what constitutes the proper quantity and quality of information necessary for a patient's consent to be truly informed? Given the imbalance of power that normally exists in the physician-patient relationship and

the extreme authority status typically afforded physicians, which together pose a serious threat of manipulation of the patient, when, if ever, is a patient's informed consent truly voluntary?

In response to these and other ethical questions that arise within the context of the physician-patient relationship, various models of the relationship have been proposed; however, each of these models has been shown to be flawed (some more than others). Suffice it to say that any model that is proposed for any personal relationship, including that of physician and patient, will fail to the extent that it does not adequately appreciate the singular importance of the individual character of both parties to the relationship. In the final analysis, any attempt to legislate morality is doomed to fail.

Plagiarism

DEFINITION: Unauthorized and unacknowledged appropriation of other persons' work in work that one presents as one's own; usually takes the form of writing but may also occur in such other forms as music, art, computer programming, and even data collection

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: Plagiarism can call into question the unspoken contract between writer and reader, rob original producers of the credit they deserve, and fundamentally disrupt academic integrity and the learning processes. Nonetheless, because definitions of, and reactions to, plagiarism vary across time and cultures and even among academics themselves, its ethical ramifications are often disputed.

The word "plagiarism" derives from *plagiarius*, a Latin word for kidnapper. Despite plagiarism's violent etymology and the fact that plagiarism itself is often regarded as theft, plagiarism is a practice that robs its victims of nothing material. It is related to copyright violation and fraud but should not be confused with those practices, which differ from plagiarism in being offenses that are punishable under legal statutes. For professional writers, journalists, and scholars found guilty of plagiarism, however, the practice can be grounds for dismissal and public disgrace. Most universities have policies warning students that if they plagiarize in their course work, they will fail their courses. Repeat plagiarism violations usually result in expulsion from universities.

Around the turn of the twenty-first century, plagiarism was receiving considerable attention, both in the mainstream media and among educators. Famous—and sometimes controversial—cases included accusations of plagiarism against Martin Luther King, Jr., historian and scholar Doris Kearns Goodwin, and *New York Times* reporter Jayson Blair.

Plagiarism was becoming increasingly recognized as a widespread and growing problem, made easier by such new information technologies as the Internet, that allow for both easy research and source retrieval and easy ways to cut and paste without attribution.

PROBLEMS WITH DEFINING PLAGIARISM

Statistics about the pervasiveness of plagiarism have revealed certain contradictions. For example, some reports have suggested that anywhere from 45 percent to 80 percent of high school students have admitted to “cheating,” while some 15 percent to 54 percent say that have plagiarized from sites on the Internet’s World Wide Web. These wide variations in statistics, and the evident discrepancies between cheating and plagiarism rates, may suggest that some students do not consider plagiarism to be “cheating” or that they do not consider what they do to be plagiarism. Indeed, in a 2003 survey conducted by Rutgers University professor Donald L. McCabe, approximately half the students surveyed declared that they did not think it was cheating to copy up to an entire paragraph of text from the Web.

Most of those students’ teachers would disagree, although they, too, vary in how they define this problem. Any sort of blatant fraud—such as downloading or purchasing entire term papers or articles and presenting them as one’s own work—is generally reviled as an extreme form of dishonesty. It is also usually considered plagiarism to include in one’s paper literal word-for-word copies of substantial portions of others’ work when the original sources are not acknowledged.

Plagiaristic practices can also include the failure to credit sources when presenting other writers’ ideas, even when they are merely paraphrased or summarized. However, this view is complicated by the fact that what people consider to be “common knowledge”—which usually does not need to be cited—varies from discipline to discipline and among student levels within a discipline. Sometimes, using quotation marks but not citations, or listing sources only at the end of a paper, without providing appropriate footnotes within the text, may be considered plagiarism, though this might more accurately be called improper citation.

IMPORTANCE OF CITATION

Because plagiarism involves a failure to provide acknowledgment, it is useful to understand why academics consider citation important. As with the definition of plagiarism, there

are multiple rationales. Many people focus on the moral issues, believing that citing is the fair or ethical thing to do because it gives recognition to others whose ideas are important to one’s own work. They believe that to deny credit is tantamount to stealing another person’s ideas.

Other people focus on the social ethics involved, explaining that citations work to build a community of scholars. They believe that all knowledge is ulti-

Image not available

*After it was revealed that the New York Times’ rising star reporter Jayson Blair had filled his news stories with plagiarized material and pure fiction, he was fired, and there was a shakeup in the newspaper’s top editorial staff. Afterward, Blair published a memoir, *Burning Down My Master’s House: My Life at “The New York Times”* (2004), that was filled with revelations about shoddy practices at the newspaper but which failed to justify his own actions. (AP/Wide World Photos)*

mately collaborative and want all persons involved in its creation to be recognized as contributors to the process. Such a rationale, like the first, relies on notions of fairness to earlier producers.

Citations also serve an intellectual purpose, showing the history of ideas and how they have developed over time. At the same time, they also help ensure the accuracy of one's work, as the listed sources can be tracked, traced, and corroborated. Of little ethical significance, though important rhetorically, citations help bolster a writer's authority. Through citation, writers exhibit knowledge of the field on which they are writing and show the supporting evidence for their ideas, thus giving their work as a whole more credibility and legitimacy in the eyes of their readers.

Finally, there is what may be called the amoral rationale, which considers citations one of many social and genre-specific conventions that writers must emulate in order to demonstrate proficiency in their particular realm of writing. For example, while academic essays demand extensive attribution, a magazine article may rely on paraphrasing or summarizing with few or no references listed. Some workplace writing, especially anonymous or bureaucratic forms, use no citations at all, and even the direct transcription of sources may be acceptable.

Even among educators, however, the understanding of the ethical issues surrounding plagiarism may vary according to one's academic, theoretical, or methodological framework.

APPROACHES TO PLAGIARISM

The traditional approach calls on universal moral standards in casting all sorts of plagiarism as cheating. It decries plagiarism as fundamentally immoral, equivalent to theft or lying, because it violates tenets of authorial originality. It may place the blame for plagiarism on permissive social values or moral relativism. There are concerns that this sort of cheating is becoming an acceptable part of the student culture of high schools and colleges. Illustrated in most university policies, this approach fails to distinguish between types of plagiarism or the differing conventions governing writing tasks. It also may not factor in intentionality—whether or not writers purposely set out to deceive their teachers—or deficiencies in understanding the norms of citation use.

In the historical approach, those studying the his-

tory of plagiarism view the concept—and its ethical ramifications—as developing in specific and disparate cultural contexts. They assert that plagiarism is not a universally despised example of “theft” or “dishonesty.” Instead, they see it as a set of practices that carries diverse moral inflections and receives various ethical treatments. Unacknowledged copying, in other words, may be normative in one era and decried in another. For example, Renaissance writers esteemed imitation, seeing it as a way of exhibiting one's learning and expressing one's debt to earlier writers. Knowledge was believed to be shared, and inspiration was seen as a gift from God.

With the rise of the print marketplace in the eighteenth century, however, the financial stakes were raised. The first copyright law was passed in 1709 at the urging of booksellers; the notion of individual artistic originality developed over the next half century. With a vested interest in seeing their writing as property, a new class of professional writers began representing plagiarism as a pressing moral and artistic concern.

Literary historians are thus careful, when discussing plagiarism, not to present it as a concept that is “naturally” or “normally” understood as a timeless social ill, but one that bears the imprint of the cultural expectations of specific times and places. Practitioners of this approach have been charged with conveying a dangerous moral relativism, though most do not condone cheating, copying, or fraudulent authorship in an academic environment.

IMPACT OF TECHNOLOGY

As the World Wide Web has increasingly become many students' primary research tool, new technology-based forms of plagiarism have proliferated. Not only can students easily download or cut and paste from a variety of legitimate information sites, but digital “paper mills”—online businesses that sell completed student papers—make the most egregious forms of plagiarism easier than ever. Some observers believe that the only way to combat the increased opportunities for “cyber-plagiarism” provided by these new opportunities is to turn to technology itself. Web-based search engines such as Google can often track down, in seconds, the Web sources copied into student papers.

Furthermore, services have been created that provide online plagiarism-detection software; Turnitin

.com is one of the most widely used. Many universities or their individual departments subscribe to such services, knowing that their doing so deters student cheating, even when individual teachers do not use these services themselves. Nonetheless, ethical questions have been raised about possible violations of student privacy—every paper submitted becomes part of the business's database—and the propriety of responding to all student work with suspicion.

Another way of understanding Internet-specific plagiarism, however, suggests that these may be futile—or even reactionary—responses. They see the ease with which students can copy from the Internet not as a temptation, but a new way of thinking about creating texts. Much information on the Web, after all, is collective or anonymous. Web pages often contain chunks of other pages, and graphics freely circulate—mostly without attribution. The Web's ephemeral nature is thought to be fundamentally incompatible with the fixity of text required for “real” plagiarism. Supporters of these ideas draw on historical studies to highlight the different practices of writing supported by modern communication technologies in contrast to those based in market- and property-driven print forms. They believe that new media bring with them a new ethos, and that popular notions of the morality of plagiarism are outdated. Others, however, decry what has been termed the “Napsterization of knowledge” and urge a continuation of print-based ways of understanding and regulating the copying of texts.

PEDAGOGICAL APPROACH

Many of those concerned about student plagiarism—whether they draw on conservative, historical, or technological approaches to understand it—assert that a large part of the ethical responsibility for the problem lies with educators themselves. Many composition instructors, for example, believe that while academic dishonesty should be condemned, proper research methodology, source use, and citation practices should be more rigorously taught to students. Indeed, many believe that “patchwriting,” as Rebecca Howard terms the linking together of several paraphrases from unacknowledged sources, is an important stage in the evolution of student knowledge and rhetorical skill.

Such critics may also view plagiarism as a problem in the development of “voice,” a reflection of a

student's lack of confidence in his or her own opinions and authority, or a misunderstanding of the very purposes of academic writing. Because they see plagiarism as a complex learning issue, these educators question the morality of “prosecuting” students for their ignorance or lack of ability, and they resent the negative effects that the “policing” of plagiarism has on teacher-student relations. Many policy statements written by this camp thus classify plagiarism into two tiers, distinguishing purposeful fraud from accidental source misuse.

The pedagogical approach goes beyond the teaching of writing skills, however. It also focuses on ways instructors can structure classrooms actively to prevent plagiarism. Some insist that academic integrity itself not be taken for granted, but should be routinely explained to, and discussed with, students. Others suggest that teachers should develop more assignments that are difficult to plagiarize because of their specificity, their reliance on course materials, or their relevance to student lives and individual opinions.

ETHICAL IMPLICATIONS

Clearly, plagiarism is a complex issue with a rich history. There are a variety of ways to define and respond to it. Perhaps the most urgent ethical responsibility of students and educators alike, then, is that they continue to explore together the complicated questions engendered by these multiple approaches.

Plato

IDENTIFICATION: Ancient Greek philosopher
 BORN: Aristocles; c. 427 B.C.E., Athens, Greece
 DIED: 347 B.C.E., Athens, Greece
 TYPE OF ETHICS: Classical history
 SIGNIFICANCE: One of the most significant figures in the history of philosophy, Plato wrote numerous dialogues which either preserved the words of Socrates or employed Socrates as a fictional character.

In *Republic (Politeia, 388-368 B.C.E.)* and other writings, Plato developed a theory of justice based upon a division of the soul in which each part performs a distinctive function.

Plato’s writings are in a dialogue format. He discusses philosophical topics through question-and-answer sessions conducted by Socrates. The Socrates of the Platonic dialogues is very closely modeled after the historical Socrates, whose life and death had a tremendous influence upon Plato. The Socrates of the dialogues is, however, at least in part, a fictional character used to impart Platonic themes.

Plato’s dialogues are divided into three groups: the early, or Socratic, dialogues; the dialogues of middle age; and the dialogues of old age. The early dialogues employ a particularly rigorous dialectic form. These dialogues frequently deal with ethical topics. In *Protagoras (399-390 B.C.E.)* and *Meno (388-368 B.C.E.)*, Plato asks whether virtue can be taught. In *Protagoras* and *Euthydemus (388-368 B.C.E.)*, he argues both for and against the supposed Socratic doctrine that virtue and knowledge are identical. In *Gorgias (399-390 B.C.E.)*, Plato considers whether it is better to do a wrong than to suffer one. In *Protagoras*, he accepts the hedonistic position that one ought to seek pleasure, but in *Gorgias*, he argues against it. Plato also considers definitions of major ethical terms. He questions the nature of courage, justice, temperance, and piety.

THEORY OF FORMS AND IMPORTANCE OF KNOWLEDGE FOR ETHICS

Plato is perhaps best known for the theory that true reality belongs to eternal, immutable forms. All other things are poor copies of these realities. According to Plato, there are two “worlds”: the world of being and that of becoming. Physical objects and copies of these objects (for example, a horse and the shadow of a horse) belong to the two levels of the world of becoming. These things change, come into being, and perish. Forms (such as beauty and justice) and mathematical concepts belong to the world of being. These entities are eternal and possess more reality than do mutable objects. Everything is made possible by the form of the good.

The theory that more knowledge can be had at higher levels is central to Plato’s epistemology and ethics. One important aspect of Platonic ethical the-

ory is that the moral individual strives to obtain more knowledge and thus to come closer to the good.

Two important points are illuminated through this discussion of the moral individual's movement toward the good. The first of these is the Platonic/Socratic doctrine that "to know the good is to do the good." Plato argues that a failure to do good is simply a lack of knowledge. Ignorance causes one to behave wrongly.

Plato also argues that reason is more important for ethics than is pleasure. Reason is primary because one must determine which things bring more or less pleasure. Again, the moral individual is the knowledgeable individual.

DEFINITION OF JUSTICE

In *Republic*, Plato puts forward his conception of the ideal state. In book 1, Socrates is concerned with the definition of justice. He believes that justice is preferable to injustice but needs support for this conviction. He moves the discussion to a different level. If one can discern justice in the larger context of a state, then one should be able to understand the meaning of justice at the level of the individual. Plato thus develops a political model for his theory of justice.

In the same way that the just state is the state in which each individual is doing what he or she does best, so the just soul is the soul in which each "part" is performing its unique function. The soul, according to Plato, has three parts: reason, spirit, and appetites. It is, as he explains in *Phaedrus* (388-368 B.C.E.), like a charioteer (reason) trying to control two horses, a wayward one (the appetites) and one that can take orders (the spirited one). The charioteer can reach his goal only when the horses are in control. Likewise, the soul is in harmony only when reason controls and sets the goals, the spirited element moves toward the goals, and the appetites are in control.

Plato explains that there is a virtue that corresponds to each division of the soul. Properly functioning reason has wisdom. The spirit that moves in accordance with reason has courage. The appetites, which are under the control of reason, have temperance. All three parts of the soul working in harmony exhibit the virtue of justice. These four cardinal virtues are an important part of Plato's ethical theory. His concern is more with what kind of person one

should be than with what kinds of things one should do. Again, to *be* wise is to *do* good.

PLACE IN HISTORY

Plato develops an absolutist ethical theory. There is a "right" and a "good" toward which to aspire. He develops this theory to respond to the skepticism and the relativism of the Sophists. One person may be more or less just than another, but each is just in that he or she copies or participates in the form of justice. This form is eternal and unchanging—an absolute.

Alfred North Whitehead claimed that all philosophy after Plato is a series of footnotes to Plato. This is especially true with regard to ethics. Aristotle (384-322 B.C.E.) developed a virtue-based theory of ethics similar to that described above and yet with its own peculiarly Aristotelian slant. Other ethical theories are patterned after that of Aristotle and, thus, that of Plato. Furthermore, any ethical theory insisting upon absolutes is Platonic.

Platonic ethics

DEFINITION: Moral system put forward by, or modeled on that of, Plato, primarily concerned with ideal ethical forms and with the most ethically beneficial form of government

TYPE OF ETHICS: Classical history; theory of ethics

SIGNIFICANCE: Plato's ethics have influenced moral philosophy for millennia by framing the questions that have occupied ethicists and by securing the place of reason in the resolution of ethical issues.

The key ethical topics of Plato's dialogues may be listed as follows: the definition of the virtues, most prominently justice, moderation, courage, wisdom, and piety; the so-called Socratic paradoxes (first, that no one sins knowingly, and second, that virtue is knowledge); the inseparability of virtue and happiness (*eudaimonia*); the relation of the virtues to political life; the virtues as subspecies of the idea of the good; and the denunciation of hedonism—that is, the rejection of the popular notion that pleasure is that which produces happiness.

Beyond these topics, which are explicitly identified by Plato, the dialogues address numerous areas of ethical import. These include the existence of the soul, immortality, and life after death (in the dialogue *Phaedo*); rewards and punishments; education; the value of the fine arts; men's duties to the gods, to other men, to their cities, to their families, and to themselves; the rights and duties of women; and in the story of Gyges and his invisibility ring (*Republic*), the question of whether the moral status of one's conduct should depend on the consequences of that conduct.

HISTORY

The event that more than any other turned Plato from politics to philosophy was the trial and condemnation of his teacher, Socrates, in the year 399 B.C.E. In his *Phaedo*, written while he was still in his twenties and poignantly close to the memory of Socrates, Plato described Socrates as the best, most intelligent, and most moral man of his time. After that, Plato determined to take no active part in the radically democratic Athenian judicial or governmental system, which he came to define as the government of those least qualified by temperament and intelligence to rule.

Plato's antidote to what he felt to be the rule of the mob was his concept of government by philosopher-kings, people prepared by lifelong education to be good rulers. In his most famous dialogue, *Republic*, he stated that "Unless philosophers become kings of states or else those who are now kings and rulers become real and adequate philosophers . . . there can be no respite from evil for states or, I believe, for the human race."

This idea antedated by many years the appearance of *Republic*. According to Plato's "Seventh Letter," the search for a king whom he might train in philosophy led him in about 389 B.C.E. to Syracuse, Sicily. Having failed in this attempt to turn the Syracusan tyrant Dionysius I into a philosopher-king, Plato returned to Athens in 387 and in the latter 380's founded his Academy, which J. E. Raven called "a training ground for future statesmen." *Republic* was most likely produced soon afterward, during the early 370's.

Any study of Plato's ethical thought must begin with Socrates' attempts to refute the moral relativism of the sophists. Plato's ethics seems to have evolved beyond his master's, for Plato continued to explore the field in his mature and in his latest dialogues, including *Republic*, *Philebos*, and *Laws*.

The sophists had said that the only ethical standards that were morally binding on an individual's behavior were those that all people agreed to or that followed the laws of nature (*physis*). Most of the rules people live by are, they said, really only local norms or customs (*nomos*) that hold little or no moral force. In most cases, therefore, each person is the judge of what is good for himself or herself, and ethics (the ethical measure of *physis*) does not really come into play. Where it is simply a matter of *nomos*, the operative rule was "man is the measure"; that is, what seemed to each individual to be good was, for him, good.

A prime example of a natural law (*physis*) prevalent universally in the world and thus binding on humanity was that of the sophist Thrasymachus, who in *Republic* argued that "might makes right." In the *Gorgias*, Plato makes Callicles of Acharnae articulate the corollary sophist view that local laws were artificial and conventional (mere *nomos*) and framed by the many weak men as a means of keeping the strong under their control.

DEFINITION OF THE VIRTUES

Socrates responded (as is known from Plato's earlier, or Socratic, dialogues) that individual virtues such as courage (discussed in *Laches*), moderation (*Charmides*), piety (*Euthyphro*), and justice (*Republic*) could be defined for all to understand, so as to place most or all ethical activity under the umbrella of universally accepted standards. The realm in which each person was to be judge of the ethical quality of his own actions was much reduced; sophist ethics was defeated.

The Socratic contribution to ethical thought—essential in Plato's system—was identified by Aristotle, who credited Socrates with laying down the principles of “universal definition and inductive reasoning”; that is, arriving at the universal definition of each virtue by means of a discussion and analysis of particular actions (inductive reasoning).

THE SOCRATIC PARADOXES

In developing his own ethical program, Plato took his point of departure from the so-called Socratic paradoxes. The first paradox argues that all men naturally seek to do good but often act wrongly because they mistake evil for good. Men thus commit sin involuntarily and out of ignorance (*Protagoras*). This paradox allows Plato, with Socrates, to define all sin or evil as ignorance and, conversely, to assert that all virtue is knowledge or wisdom: the second paradox.

This knowledge is available to men in general, but ordinary men occasionally err. It thus behooves the best men to acquire knowledge about the virtues, understand their nature, and act on a foundation of knowledge. This is no easy matter and requires a lifelong pursuit of wisdom (*Republic*). Thus, philosophers (seekers of wisdom) will be the wisest and, seeking the good (as all men do), will be less likely to err.

John Gould, in *The Development of Plato's Ethics* (1955), strongly asserts that the goal of Plato's ethical system (virtue, or *areté*) was always to lead to virtuous activity or behavior—for example, justice in the soul will express itself in just action—not merely to arrive at a valid ethical theory. This too was inspired by Socrates, as Plato dramatically demonstrated in the *Crito*, in which his teacher put his ethics into action by accepting the sentence of death as legally binding, refusing to escape from

prison when he had the opportunity to do so, and refusing to disobey the state's command that he take poison.

THE TEACHABILITY OF VIRTUE

Since virtue is knowledge and all men possess an innate capacity for knowledge, then virtue can be taught, and teaching and guidance may direct an individual toward good. On this point Plato seems initially to have wavered, for in the *Meno* Plato has Socrates say that virtue comes rather by chance, while in the *Protagoras* he suggests its teachability. Thus, the moral and political education of youths depends on the identity of virtue with knowledge and therefore on the teachability of virtue.

PLATO'S THEORY OF IDEAS OR FORMS AS RELATED TO ETHICS

When one comes really to know the virtues, it is the immutable, stable, and abiding idea, form, or universal definition of the virtue that one comes to know. In the *Gorgias*, Plato has Socrates make the point that belief or opinion (which Gorgias, as a sophist, teaches) is not a sufficient standard for guiding moral and political life. The idea (or definition) of a virtue is learned by induction from particular case studies of the virtue in action.

In *Republic*, Plato lays out the course of lifelong study whose goal is the attainment of knowledge of the ideas and of the highest of the ideas, which Plato variously calls the idea of beauty, truth, or the good. Intimate knowledge of the ideas of the different virtues allows the guardians of the state to recognize the virtues and their opposites in every action in which they are present.

After a primary education (to age eighteen), the citizens, especially those who will emerge as guardians of the republic, are made to dwell in beautiful surroundings so as to attain a love of the idea of the beautiful-in-itself. They next serve two years of military service. This is followed by the citizens' higher education, which consists of ten years in “propaedeutic” (preparatory) studies for those who will become the guardians or philosopher-kings of the state. The subjects studied in this phase are arithmetic, geometry, astronomy, and harmonics (music). The purpose of this scientific quadrivium is to lead the mind away from material and changing objects of the realm of opinion (for example, two apples,

two cubes) to immaterial and immutable realities (for example, the concept of “two” and “cubeness”).

Plato had derived from Pythagoras a respect for abstract numbers as unchanging realities. Numbers are akin to the unchanging ideas of the virtues, and this training in correct thinking about numbers, Plato thought, prepared the mind to recognize virtue and vice in action. Many aspiring guardians would be left behind during this phase of education.

The final level of higher education consisted of five years of training in dialectic, also known as the Socratic *elenchos*. Dialectic is the process of repeatedly proposing hypotheses and drawing out consequences, used by Socrates in his conversations with his pupils. By this means of interlocution, the pupils were drawn ever closer to the irrefutable and true hypothesis that it had always been the purpose of the session to achieve. Thus, the pupils, future guardians, were trained to brainstorm, together or privately, in the quest for the form or idea that defined and produced knowledge about the virtue in question. This knowledge enabled the guardians to know which human actions claiming to share in the virtue in question were virtuous and which were not. No doubt, other citizens would, at this final plateau, fail to qualify for the ranks of the guardians. Completion of training in dialectic brought the guardians to age thirty-five.

THE OVERRIDING IDEA OF THE GOOD

Some Plato scholars are troubled that in the minor dialogues (*Laches*, among others), the definitions of the virtues sometimes break down when Socrates tests them for their production of happiness in an individual or city. That Plato may have done this deliberately in these early dialogues is indicated by the hints of dramatic purpose as opposed to an air of tentative inquiry in their structure and logic.

In *Republic*, Plato himself warns that these early definitions of virtues are not final. The utility of virtue must be related to an ultimate standard or ideal of the good. He devotes much of *Republic* and *Symposium* to achieving this.

For Plato, the forms of the virtues are themselves subcategories of the idea of the good. In reality, moderation, justice, and all the other virtues, including knowledge, are virtues because they participate in goodness. Plato is clear about this in *Republic*, where he calls the good the ultimate aim of life, the final ob-

ject of desire, and the sustaining cause of everything else. The virtues, whether severally or united under the paradox that all virtue is knowledge, themselves aim at the good.

It is the guardians' vision of the good that enables them to inculcate right opinion, teach virtue, and mold character and institutions in the light of a reasoned concept of goodness in private and public life.

The *Symposium* and other dialogues provide parallels to the idea of the good as final cause by looking, for example, at a hierarchy of friendship, passion, and love culminating in the apprehension of the idea of beauty, which is depicted by Plato as practically identical to the good.

THE RELATIONSHIP OF UTILITY AND PLEASURE TO ETHICS

Plato is clear in rejecting Protagoras's dictum that pleasure is to be identified with the good. He denies as well the notion that utility is the source and goal of morality. In *Lysis* and *Symposium*, Plato rejects the theory that the good is desired as a remedy against evil because that would make the good merely a means to an end. For the same reason, he explicitly rejects the hope of immortality as the origin of and reasons for people's morality. In *Republic*, he strenuously opposes the view of Thrasymachus and Callicles that justice is an artificial convention devised by the weak in their conspiracy to neutralize the strong.

In his article “Plato's Ethics,” Paul Shorey believes Plato's whole ethical thrust to be a polemic against hedonism: “This doctrine of the negativity of what men call pleasure is the fundamental basis of Plato's ethics.” On this basis, Shorey continues, rests Plato's demonstration that virtue and happiness are one. Moreover, pleasures are never pure but always mixed with desire or pain. Finally, Shorey adds, “Pleasure and pain, like confidence and fear, are foolish counselors.”

The dialogues devote much space to analyzing the concept of pleasure, which arises in some form in more dialogues than does any other issue. The *Gorgias* and *Philebos* directly oppose the sophist doctrine that defines the good as pleasure and that asserts that true happiness comes from gratifying the sensual appetites. This repudiation of hedonism also appears in *Phaedo* and *Republic*. In *Republic*, where Plato presents the idea of man's tripartite soul, plea-

asures are ranked as intellectual, energetic, and sensual. Plato allowed the thesis of the *Protagoras* that a surplus of pleasure is good, but only when the pleasure is kept in perspective and is free from all evil consequences. Only in the sense that it suited his ethical system to argue that the virtuous life is the most pleasurable did Plato make Socrates identify pleasure and the good at the end of *Protagoras*. Rather, it is wisdom (*sophia*) that delivers happiness, for wisdom always achieves its object, wisdom never acts in error, and absence of error entails happiness.

FINAL DEVELOPMENTS IN PLATO'S ETHICS

In Plato's last years, his ethical approach underwent a change little noticed in discussions of mainstream Platonism. John Gould remarks that in his last work, *Laws*, "Plato the aristocrat, Plato the constructor of systems, Plato the lover of the aesthetic are all represented in their final and most convincing forms, while the ghost of Socrates . . . is no longer present even in the *dramatis personae*."

In *Laws*, the thrust is still the perfection of the individual, but now no longer through the personal acquisition of virtue. Instead, the individual is to be improved by means of ideal legislation whose explicit goal is the control and obliteration of nonvirtuous behavior in the interest of the perfection of society. In this last dialogue of Plato's corpus, the primary virtues are given their own separate existence as *sōphrosynē* (moderation or temperance), *dikaïosyne* (justice), *phronesis* (wisdom), and *andreia* (courage), and possession of only one of them is not sufficient.

Plato's thinking has, in fact, undergone a change from that of his Socratic period. In his new ideal state, the legislator will guide his people to virtue by manipulating the distribution of honor and dishonor and by using the pleasures, desires, and passions that motivate people: a kind of nascent behaviorist theory. By using a system of repetitive propaganda to work on popular emotions, he will steer them to virtue (*areté*). Plato's goal was ever the same. What changed in his latter years was his attitude toward human nature, which became more pessimistic. The mistakes of Athenian democracy, rule by the masses, had convinced him that a more thoroughgoing system of controls had to prevail, and this he intended to provide in his new "second-best" state, governed not by philosophers but by law.

“Playing god” in medical decision making

DEFINITION: Concept based on the idea that in making decisions—particularly those relating to matters of life and death—medical practitioners and researchers exercise godlike powers

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: The idea of “playing god” may arouse opposition from some individuals and groups who do not believe that human beings should intervene in what they see as a divine plan—either to save life, to allow death, or to engage in research that violates what is perceived as the natural order of things, thus making such activities unethical.

In 1982, theological representatives of three major religions advised the President’s Commission for the Study of Ethical Problems in Medicine and Biomedical and Behavioral Research. They concluded that the abilities to carry out treatment and research and to make related decisions raise issues of responsibility, rather than simple prohibition based on purely moral grounds. In fact, they asserted that human beings may actually have a responsibility to pursue that which can improve and benefit human life, and to refuse to do so may be unethical in itself.

Theologically, human beings, having God-given powers, can be seen as co-creators with the Supreme Creator. Many religions therefore respect and support the acquisition of knowledge about nature that has great potential both for improving human life or endangering it and thus stresses responsibility for its use. The ability to “play God” may then reflect not an

objection to action, but an expression of awe and concern not only from religious institutions, but from secular institutions as well.

Plessy v. Ferguson

THE EVENT: U.S. Supreme Court decision that gave legal sanction to racial segregation in the United States by affirming that separate-but-equal accommodations for blacks and whites were constitutional

DATE: Ruling made on May 18, 1896

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: The Court’s decision in *Plessy* rendered racial segregation legal in the United States for almost sixty years, until it was overturned by a much more progressive Court.

Plessy v. Ferguson was provoked by an African American challenge that argued that an act of Louisiana’s legislature was unconstitutional because it violated the Thirteenth and Fourteenth Amendments to the U.S. Constitution. The act in question required all railroads to provide “equal but separate” accommodations for blacks and whites and also forbade intermingling between the two groups.

The Supreme Court’s majority opinion concentrated on the Fourteenth Amendment. The Court acknowledged that “the object of the amendment was undoubtedly to enforce the absolute equality of the two races before the law,” but the majority opinion also underscored that “in the nature of things, it could not have been intended to abolish distinctions based upon color, or to enforce social, as distinguished from political equality.” The effect of this decision was to give legal sanction to segregation in the United States.

Significantly, the Court’s decision was not unanimous. There was a lone dissenter, Justice John M. Harlan, whose minority opinion argued that the U.S.

Constitution is “color-blind, and neither knows nor tolerates classes among citizens. In respect of civil rights, all citizens are equal before the law.” Justice Harlan’s opinion later became the unanimous opinion of the Court in *Brown v. Board of Education*, which overturned the separate-but-equal principle.

Pluralism

DEFINITION: Theory that there is not only one valid set of values and principles, but rather a plurality of such sets

TYPE OF ETHICS: Theory of ethics; beliefs and practices

SIGNIFICANCE: Pluralism takes a middle path between moral relativism on one hand and moral absolutism on the other. Absolutism holds that there is a single, universal moral law that applies to everyone in all situations, and all other moral values are invalid. Relativism holds that all moral systems are equally valid and no set of values is better than any other set of values. Pluralism, or perspectivism, holds that some value systems are indeed superior to other value systems, but there will always be at least two different, mutually exclusive systems which are equally valid.

Pluralism as it is associated with ethics has had a long history. One can find a precedent in Aristotle for the view that there is no master principle, no moral principle that applies unequivocally to all concrete situations and circumstances. A rule that might apply in one situation might not apply in another. For example, although it may ordinarily be wrong to lie, it could be right to lie if doing so will save someone’s life. The moral principle that determines the right thing to do, therefore, is dependent upon the circumstances, and since there are many concrete situations and circumstances, there is a plurality of ways of doing the right thing. As Aristotle would put this, there is a plurality of ways to achieve the good life, and each of these ways entails the actualization of different values and moral principles.

Pluralism is to be distinguished from both monism and relativism. A monist argues that there is an overarching moral principle that unambiguously prescribes what to do in any and every circumstance. An example of such a principle is the utilitarian greatest-happiness principle, which holds that, in every action, one ought to act so as to create the greatest amount of happiness for the greatest number of people. The relativist, however, although agreeing with the pluralist that values depend upon circumstances, claims that there is no objective reason for what is right or wrong other than simply what the people in a given culture or circumstance do.

The pluralist believes that there is such an objective reason; thus, even though there is a plurality of ways to achieve the good life, Aristotle nevertheless argues that each way is objectively right precisely because it does achieve the good life. The pluralist, therefore, agrees with the monist that there is to be an objective criterion whereby moral values are to be judged but disagrees with the monist in that the pluralist argues that there is no unique set or system of values that is the only one that satisfies the criteria. Likewise, the pluralist agrees with the relativist that there is a plurality of values but disagrees with the relativist’s claim that such values are not legitimated by an objective criterion.

Amélie Rorty, in her essay “The Advantages of Moral Diversity” (1992), argues for a version of Aristotelian pluralism. Like Aristotle, she claims that there is no unique and single conception of what everyone ought to do to achieve the good life. Furthermore, Rorty argues that learning to live and cooperate with others who have different values from our own is beneficial to achieving the good life. A deontologist, who argues that the consequences of an action are not to be considered when determining the moral worth of an action, and a utilitarian, who claims that the consequences are to be considered, will, Rorty believes, when living and cooperating together, keep each other in line; and this keeping each other in line is precisely what Rorty believes to be beneficial for the attainment of the good life.

John Kekes, in his book *The Morality of Pluralism* (1993), holds a position similar to those of Rorty and Aristotle. He also argues that there is a plurality of ways to achieve the good life and that each way requires the realization of often radically different types of values. He also claims that having radically

different values present in a society is, as Rorty argued, beneficial both to society and to individuals.

VARIATIONS

Pluralism is not, however, without its variations. Peter Wenz, for example, in “Minimal, Moderate, and Extreme Moral Pluralism” (1993), accuses the pluralist who argues for the advantages of having radically different, if not contradictory, values coexisting together of promoting incoherence and inconsistency in ethics. This brand of pluralism he labels “extreme pluralism.” Rorty and Kekes, however, although calling for the coexistence of radically different values in society, do not call for an individual to hold contradictory values. An individual, they maintain, should sustain a consistent and coherent system of values, whereas society ought to maintain a plurality of values. For this reason, Rorty and Kekes are not to be seen as pluralists of the type that Wenz criticizes.

Christopher Stone, an environmental ethicist who argues for moral pluralism, does hold that an individual ought to maintain radically different values. A father, for example, could be a utilitarian at work but a Kantian deontologist at home with his family. It is this view that, referring explicitly to Stone, Wenz criticizes in his article. Stone’s pluralism does promote inconsistency and incoherence and is, by Wenz’s definition, “extreme pluralism.”

A less-extreme pluralism, or moderate pluralism, as Wenz defines it, is roughly the view that Aristotle, Rorty, and Kekes hold; that is, there is a plurality of ways of achieving the good life, yet each way is in itself consistent and coherent. Minimal pluralism, Wenz believes, is true of every ethical theory. In other words, there is no true monistic theory, for monistic theories (such as utilitarianism) do not give a uniquely correct and unambiguous answer in every situation to the question of what one ought to do. There is always a plurality of possible answers, and hence these theories are minimally pluralistic. All ethical theories, Wenz concludes, are to some degree pluralistic.

There are other important philosophers with whom pluralism is associated—most notably, the pragmatists. William James, in *A Pluralistic Universe* (1909), and Richard Rorty, in *Philosophy and the Mirror of Nature* (1979), argue, for example, that what is considered true is simply what is necessary to survive. Truth does not express a relationship of correspondence to reality; instead, truth is determined

by the particular goals and needs associated with survival, and because there is a plurality of ways to satisfy these needs, there is a plurality of truths. Truth, like morality, is not one; it is plural.

Pogroms

DEFINITION: Organized massacres of Jews and destruction of their property by Russian mobs, acting with the tacit approval of political authorities

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: The Russian pogroms represented an example of racial violence bordering on ethnic cleansing. While elimination of Jews from Russian soil was not their primary purpose, they did result in the emigration of many thousands of Russian Jews around the turn of the twentieth century.

In modern Russian history, pogrom-like attacks were initially leveled against the Armenians, Tatars, and the Russian intelligentsia. As it is employed in many languages specifically to describe the pillage, murder, and rape of Russian Jews, however, the term “pogrom” denotes three large-scale waves of devastation between 1881 and 1921. Each of these pogroms surpassed the preceding one in scope and savagery and occurred during periods of severe social and political upheaval in Russia. For example, the first pogroms of the 1880’s followed the assassination of Czar Alexander II as a result of false rumors about widespread Jewish involvement in the assassination plot. Mobs from more than two hundred towns, inspired by local leaders acting with official support, took part.

Pogroms greatly influenced Russian Jewry and history. In their wake, the Russian government adopted systematic policies of discrimination, harassment, and persecution of the Jews. The murder of innocent individuals and whole families was commonplace. This led numerous European anti-Semites to conclude that violence was legitimate and thus helped to pave the way for pogroms to be carried out later in Poland and Germany.

Police brutality

DEFINITION: Police misconduct involving the unnecessary use of force or the excessive use of force, up to and including fatal force

TYPE OF ETHICS: Civil rights

SIGNIFICANCE: Consistent patterns of police brutality tend to cause fear and distrust of the police among the very segments of the population most in need of police protection. Thus, beyond representing individual instances of injustice, they can lead to the spread of injustice in society as crimes go unreported and potential victims go unprotected.

From the beginning, Americans have never fully trusted their government or its officials, even though they must rely upon both. The Fifty-first Federalist Paper argued, “If men were angels no government

would be necessary.” Human beings are definitely not angels, and they succumb to both good and bad activities. Although checks and balances were written into the U.S. Constitution to limit the “abuse of power” by distributing it between competing branches of government and among federal, state, and local authorities, no comparable safeguards exist to protect citizens against police misconduct. Perhaps this is because the first official U.S. police force was formed in New York in 1844, long after the government was established.

A national police force that would prevent local police misconduct has never been established, because of the fear that a U.S. president could use it as a private army or to spy on citizens. Almost all of the twelve thousand police forces in the United States are local. Their power is virtually absolute and often goes unchallenged. This situation creates a police culture that believes that it is above the law, an attitude that fosters abuse. Therefore, although citizens rely upon the police, they also mistrust them in the belief that informed criticism is the best way to correct misconduct, incompetence, and arbitrariness as well as to encourage a healthy police culture to do its job fairly.

NIETZSCHE, THE WILL TO POWER, AND THE POLICE

Friedrich Nietzsche argued that the human “will to power” makes people seek power and control over others. Those who succeed in this struggle become the master class. They value courage, strength, pride, risk-taking, directness, and sports. Morality, or what is correct in their opinion, becomes associated with the traits possessed by the ruling elite. Morality, for the master class, is not a set of abstract principles.

There is also a slave morality that is based upon values such as humility, justice, self-denial, prudence, and altruism. The slave’s morality is reactive; that is, whatever the master class values as good the slave defines as bad. Slaves reject the morality of the master class because they associate it with oppression, evil, and injustice, and they resent the power of the master class. From the slave morality comes not only the concept of justice but also those of guilt and conscience.

POLICE CULTURE AND BRUTALITY

Police have a unique culture that has its own internal values. When young officers go through training

at a police academy, they typically have every intention of becoming exemplary officers. Seasoned officers consider such young officers naïve. They are ritually introduced to “real police work” by their field training officer. By custom, the training officer’s first words to the rookie must be, “Forget everything they taught you at the Academy. This is the real world.”

Police culture glorifies the visible symbol of police power: the gun. Target practice becomes a fetish for many officers. Citizens are dehumanized and may become viewed as targets or potential targets rather than human beings. Peer pressure encourages police to socialize together. This isolates them from average civilians and creates an insulated mentality. Most officers ride in patrol cars and ride from one distress call to another over a large area. This gives them a jaundiced view of citizens, because for eight hours a day many of the citizens with whom they interact are either criminals or suspected criminals. In time, some officers begin to view most citizens as either criminals or suspects. They see themselves as besieged, beleaguered, and misunderstood.

Out of this view develops the idea that it is “us” against “them.” Some sadistic officers use this atti-

tude to divert attention away from their misconduct and to increase group morale. A sense of common identity forms that is based on the degrading of outsiders. Police especially devalue outsiders whom they consider hostile. These people are considered more “them” than others. When stress develops between insiders and outsiders, violence is more likely to occur.

The police believe, understandably, that they are abused and called names often yet receive little money or status from society, despite the danger of their job. This resentment can lead to feelings of anger and powerlessness. One way to regain a sense of power is by exercising elemental power over other human beings. When making arrests, the desire for power may lead police to force suspects to restrict their movement or to stand where they are told to stand. Failure to obey may be swiftly met with violence in an effort to gain power and control. Once such violence starts, it can easily escalate out of control.

Some police view themselves as a tight-knit, elite “thin blue line” that protects society from criminal chaos and lawlessness. Such police fear that they are losing the battle against crime and that a nationwide breakdown of ethical standards and morals forces them to close ranks with fellow officers by developing a cult of secrecy that they call the “code of silence.” Confrontational attitudes develop, they claim, in self-defense. Whistle-blowers are rare in this culture. Virtually everyone tries to be a “stand-up cop.” In addition, in some departments, if an officer reports witnessing brutality carried out by a fellow officer, both officers are suspended without pay. This practice discourages officers from informing the department of misconduct and strengthens the code of silence.

Police chiefs who make it clear that they respect the code of silence and ignore charges of brutality leveled against police, so long as there is peace and order on the street, reinforce this culture and invite brutality. Officers

During the trial of four New York City police officers charged with brutality, demonstrators outside the Albany courtroom dramatized their protest by carrying a door on which they had painted a human body and numerous bullet holes to symbolize what they regarded as the officers’ use of excessive force. (AP/Wide World Photos)

are reluctant to arrest or even fine fellow police. For many police officers, “good” is whatever makes their jobs less dangerous and easier, even if it involves the unjust violation of others’ rights.

THE RODNEY KING CASE

Thousands of cases of police brutality are filed annually, but the King case is unique because some of the events were captured on videotape. On March 3, 1991, the Los Angeles police stopped a twenty-four-year-old black male motorist named Rodney Glen King after a difficult and dangerous high speed (115 m.p.h.) car chase. Police ordered King to get out of his car, then several officers brutally assaulted King. Four officers in particular took turns clubbing, kicking, and shocking the unarmed King with Taser stun guns, while other officers watched. The officers clubbed King at least fifty-six times, breaking his skull in nine places, breaking his leg, and inflicting many other injuries. Any one of the officers who stood by and watched this beating could have stepped in and stopped it, but none did. Each conformed to group norms and police culture by observing the code of silence.

In such a situation, normal judgment, reasoning, and critical thinking are abandoned. This is made possible by the anonymity of the individual in the crowd. The notion of individual responsibility that normally restrains behavior is gone. Members of the group act rapidly on impulse. In a crowd, behavior gravitates to the lowest common level. Members focus upon what is different—“them.” Nothing else matters, and the members attack the outsider. Bystanders who observe such violence and do nothing are in pain but often deny it and cover it up by justifying the violent behavior.

Each act such as the King beating changes all who participate in it or witness it. Those who do the beating tend to grow more aggressive. The officers appear to have become prisoners of the master mentality.

In most cases, an officer’s word carries more weight than does a civilian’s, as is indicated by the fact that in 1990 the Los Angeles Police Department received more than 2,500 complaints of police brutality, but fewer than fifty cases—less than one-half of one percent—went before a grand jury. In 1987, more than eight thousand complaints of police brutality were filed, yet not one officer broke the code of silence by offering incriminating evidence about an-

other officer. In almost all cases, the victims of police brutality have previously violated some law that has brought them to the attention of the police. Therefore, their credibility is not easy to establish. King was a convicted felon, even though that should not have mattered in the beating case. In reality, police who engage in misconduct have little to fear under the current system. Police can cover up misconduct by alleging that a suspect was “resisting arrest.” King did not plan to press charges, for fear that it would be difficult to prove his case.

Little did either side know that George Holliday had captured more than seven minutes of the savage beating on videotape from his balcony. He sold the tape to television stations, and the beating was seen in millions of homes worldwide. There was definite evidence of police misconduct in this case. Because the arresting officers were white and King was African American, the case became very volatile, and attorney Warren Christopher was asked to head a commission that was established to investigate this case.

The Christopher Commission listened to computerized tapes of police transmissions on the night that King was beaten and discovered that the officers were so confident that police culture would protect them that they recorded messages saying, “Capture him, beat him, and treat him like dirt,” and “What, did you beat another guy?” Christopher was troubled by the officers’ flagrant confidence that “nothing would be done” and that such brutality would be tolerated.

Other messages recorded by the commission betrayed open contempt for racial and ethnic minorities and homosexuals. One message recorded during the King incident made reference to “gorillas in the mist,” an obvious racial slur. Hospital nurses who treated King stated that the officers who beat him followed him to the hospital to threaten and tease him.

In the face of irrefutable evidence of police misconduct and brutality, the Christopher Commission sided with the slave morality and called for justice. It noted that, although the problem of police brutality is widespread, a handful of “problem officers” create most incidents. To settle police brutality claims against the city of Los Angeles between 1970 and 1980, the city paid more than \$65 million in damages, and the tension created within communities by these cases caused even greater damage. Riots erupted following the trials of the officers who beat Rodney King. These riots destroyed billions of dol-

lars worth of property and cost dozens of people their lives.

Immanuel Kant would have appreciated this appeal to principle, even though Nietzsche would have been appalled. Unless or until the values cherished by police culture and those embraced by civilian culture are more closely aligned by establishing civilian review boards for police departments and rewarding police for preventing crimes through community service programs, then these two value systems will clash, and the result may too often be police brutality.

Political correctness

DEFINITION: Attitude that language and ideas that offend political sensibilities should be avoided

DATE: Term coined during the late 1980's

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Initially a self-deprecating term used by the Left to poke fun at its own orthodoxies, political correctness became a label employed by the Right to vilify an informal set of attitudes about what sorts of language and ideas are appropriate—particularly in an academic setting.

During the early 1990's, colleges and universities became politically polarized places. Multiculturalism, identity politics, feminism, and other progressive movements seeking academic reform brought about significant changes in curricula and in academic life generally. These changes were met with dismay and anger by conservatives, and many institutions of higher learning became intellectual battlegrounds. Discussions of race, class, gender, sexuality, and other categories of identity took place frequently, and the divergent values of participants in those discussions formed barriers to effective communication.

Often, both progressives and conservatives demonstrated utter contempt for those whose viewpoints differed from their own. As a result, each side developed key words that it would use to dismiss speakers from opposing camps as wrongheaded and unworthy of attention, thus bringing discussions to abrupt conclusions. For example, a progressive wishing to silence a conservative might call the conservative a "racist," and a conservative wishing to silence a progressive might call that person "politically correct." Each term indicated that the person in question was hopelessly blind to his or her own prejudices and was simply beyond the reach of rational argument.

THE LEFT VS. THE RIGHT

The term "political correctness" first developed as a result of intolerant attitudes on the part of the Left toward perceived insensitivity on the part of the Right. Members of the Right often spoke of political correctness, or "PC," as though it were a formal code of conduct. However, with rare exceptions, no such codes existed on any college campuses. Rather, it was often the case that people whose speech was per-

ceived to be racially insensitive or homophobic, for example, would be harshly criticized by their interlocutors. Because the values dominant on college campuses were often radically different from the values dominant in public life as a whole, such strong negative reactions greatly surprised those who expressed traditional, mainstream ideas. Conservative students who were criticized by progressive students would often respond by censoring themselves in the future to avoid further criticism. They would then claim that they had been censored by others. Thus the myth of political correctness as a formal orthodoxy rather than the de facto result of informal attitudes began to emerge. Peer pressure was thus interpreted as policy.

The ethical import of a value system as controversial as political correctness is obviously very much in dispute. Those who support political correctness tend to favor self-determination, arguing, for example, that members of minorities should have the right to choose their own labels, rather than having names imposed upon them by others. They also argue that speech is a form of power that should be respected

and perhaps even regulated, just as are physical forms of power.

Those who oppose political correctness argue that names and other forms of speech are, in themselves, harmless, do not admit of ethical evaluation, and therefore should not be regulated. They advocate free speech and claim the right to say whatever they want, free from any negative consequences that would inhibit the open exchange of ideas. Orthodoxies of judgment, they say, whether formal, or informal, amount to nothing less than censorship.

Their opponents respond that anti-PC people *are* allowed to say whatever they want but must accept the fact that their utterances will be judged morally by those who hear them. Speech should be free, progressives argue, but that does not mean that it should be free from consequences. It is unrealistic to demand, in effect, the right to express controversial ideas and yet to remain free from controversy. Indeed, no matter what one believes, it will always be dangerous to speak one's mind, because *anything* worth saying is going to be controversial to someone—a fact about which people on both sides of the PC issue can agree.

Andy Perry

Examples of Politically Incorrect Terms

<i>Politically Incorrect</i>	<i>Politically Correct</i>
Negro, black	African American
Indian	Native American, American Indian
Oriental	Asian American
Mexican American	Chicano/Chicana, Latino/Latina
colored people	people of color
homosexual	gay or lesbian
disabled	differently abled
handicapped	physically challenged
reverse racism	ethnocentric revitalization
reverse discrimination	affirmative action

Political liberty

DEFINITION: Freedom from coercion or constraint by government or its agents

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: In liberal democracies, political liberty is generally understood to include civil rights and liberties such as freedom of expression, as well as the right to vote and otherwise participate in representative government.

As defined above, “political liberty” is to be conceived of as a negative freedom—that is, a freedom *from* external coercion or constraint. It is this conception of political liberty that has been fundamental to the tradition of such Western ideas as individualism and liberalism in both political philosophy and political theory. The classic expression of this conception of political liberty is John Stuart Mill’s *On Liberty* (1859).

In practice, however, political liberty almost always refers to a positive freedom—that is, a freedom *of* some specific kind of good or some specific type of activity. Examples of the latter include some of the basic democratic liberties: freedom of thought, freedom of expression, freedom of assembly, freedom of religious pursuits, freedom of political participation, and so forth; freedom of property acquisition and disposal is an example of the former. Although this second conception of political liberty is dependent on the initial one, every particular freedom that can be associated with this positive conception involves some form of individual or social activity with respect to which the right to *choose on one’s own* is acknowledged as both socially and morally significant.

It is important not to confuse the two very different ideas of human abilities and political liberties. To conflate what one *can* do with what one is *at liberty*

to do makes little or no sense. The fact that a member of a particular society is unable to vote on election day because of, for example, major medical surgery is irrelevant to whether that same individual, as a member of that society who satisfies all voting eligibility requirements, is at liberty to vote. In other words, just because this individual was unable to vote and, in fact, did not vote does not in any way mean that this individual was not free to vote.

This same irrelevancy between what one can do and what one is at liberty to do also holds true for a member of a particular society who is, in fact, able to vote, but who is not allowed to vote merely because this individual happens to be a member of a particular segment of the society each of the members of which is systematically prohibited from voting. That is, just because this individual was not at liberty to vote—that is, not allowed to vote—does not in any way mean that this individual was not able to vote. In neither of these cases does one’s ability (or lack thereof) to vote have anything to do with one’s freedom (or lack thereof) to vote.

LIBERTY VS. AUTHORITY

Fundamentally, political liberty must be construed as a balance between the exercise of authority of the society over its members, on one hand, and the liberty of choice and of effectual action that individual members of the society are allowed to exercise, on the other. That is, individual liberty and governmental authority are the two sides of the same political coin; the more there is of either one, the less there must be of the other. Within this framework, questions of conflict concerning the political liberties of the individual, justice, and the well-being of the society as a whole naturally arise.

In political theory, both the kinds of particular political liberties and the degree to which each ought to be acknowledged by the government to be granted to individuals depend upon a whole host of factors, such as one’s conception of both human nature and human rationality, one’s conception of the relationship between an individual’s right to autonomy and a sense of the appropriate degree of latitude to be granted to governmental authority, and one’s conception of what ought to be the purpose of both the government itself and its social and political institutions (for example, whether the fundamental reason for the very existence of government and its social and political

institutions is to promote human happiness or satisfaction; to provide for the peace, security, and any or all associated rights of each member of the society; or to provide for the development in each member of the society of some particular conception of human excellence).

In practice, too, both the kinds of particular political liberties and the degree of which each ought to be acknowledged by the government to be granted to individuals depend upon a vast array of circumstances, not the least of which is the form of government that has been established. For example, the differences between both the number and the extent of political liberties granted to individuals under a totalitarian regime as compared to a democracy are usually obvious.

POLITICAL LIBERTY IN THE REAL WORLD

Even in representative democracies according to which individual members of the society are allowed a wide latitude of autonomy, however, it is possible for political leaders to engage in a more insidious type of political coercion than that typically found in totalitarian societies. In order for a democracy to be effective, its individuals need access to more, rather than less, and accurate, rather than inaccurate, information relevant to political decision making.

To the extent that those in positions of political power, presumably for reasons of self-interest, deny to members of the society the quantity and quality of information necessary to well-informed political decision making (for example, through manipulation of the media of communication and distortion or denial of relevant information), however, to precisely that extent is that democracy being undermined and to precisely that extent are the members of such a society being denied their political liberties. In the final analysis, political liberty means liberty of choice and of effectual action; consequently, to the extent that this insidious type of political coercion is perpetrated against the members of such a society, the menu of practical options available to them is artificially diminished, which, in turn, diminishes their freedom both of choice and of effectual action, and ultimately denies them at least some of their political liberties.

Political realism

DEFINITION: View that leaders of nations should disregard considerations of morality and should instead act in their own best interests in order to gain and maintain power

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Political realism rests upon the assumption that there is a contradiction between reality and ethics. In other words, it implies that it is unrealistic to expect those in positions of power to behave morally, that reality and morality are in some sense mutually exclusive. It therefore portrays ethical conduct as a luxury which political leaders simply cannot afford.

Critics of political realism say that a leader who is a political realist is likely to be a tyrant who is uninterested in the welfare of the citizens of her or his own

nation and other nations. Such a leader is also likely to gain support by using political rhetoric to trick others into believing that her or his actions do serve their interests. Such a leader abdicates the responsibilities of considering the interests of others and telling them the truth. Defenders of political realism say that a realistic reading of history shows that practicality rather than ethics is the principle guiding the behavior of governments and leaders. For example, leaders have always used cruelty in order to make people fear and obey them. Some defenders of political realism say that ethics are simply not relevant to government and that behaving ethically would hamper a leader's ability to get things done. Other defenders say that political realists follow a competitive ethic, wherein those who are best at the games of power are the most successful leaders.

Politics

DEFINITION: Art of governing

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Politics is the practical attainment and exercise of power over other people. As such, it may be seen theoretically as the realm of human behavior most in need of ethical regulation, and it appears to many people empirically to be the realm least subject to actual moral constraint.

The standard view of politics' relation to ethics is captured in H. B. Acton's famous aphorism: "Power tends to corrupt, and absolute power corrupts absolutely." The first part of Lord Acton's aphorism identifies a danger inherent in the political process. Since political ends can be achieved only by the exercise of power, power is concentrated in the hands of politicians. Unfortunately, as much of history illustrates, politicians have often diverted power away from its proper use, despite the institution of checks and balances to prevent abuses.

The second part of Acton's aphorism makes the more cynical claim that the political process is inherently immoral. Since power is the ability to do work,

however, it follows from that claim that the ability to do work is immoral. From this conclusion follows the odd conclusion that only the completely impotent are moral. The conclusion is odd because it creates a paradox: While most people think that governments do perform valuable functions, Acton's aphorism would lead one to believe that governments are immoral to the extent they are able to perform those functions.

This paradox indicates that the relationship between ethics and the political process involves more than simply the existence or nonexistence of power. Power is central to government, but the questions of exactly how much and what types of power governments should have and to what ends that power should be put have generated a number of political theories. Many of those theories have been put into practice, and although the political arena contains many instances of hypocrisy, lying, disloyalty, and thievery, there is evidence that in both theory and practice politics has been and continues to be influenced greatly by ethics.

THE INFLUENCE OF ETHICS

Aside from the amount of corruption that exists in governments, part of the difficulty in seeing the influence of ethics is the diversity of opinions about what in fact is ethical. Debates exist about whether morality is essentially religious or secular, relative or universal, altruistic or egoistic. Such differences of opinion make it easy for those on one side of a debate to see those on the other as immoral. Another part of the difficulty is that even those who agree about what is ethical may disagree about the proper methods to be used to achieve it. Some may believe that the end justifies the means—that is, that it is justifiable to lie about a political rival if doing so achieves a good goal—while other advocates of the same end may reject that premise.

The complex relationship between ethics and politics can be captured in three pairs of related questions: questions of ends (What is good? What does this politician think is good?), questions of means (Does the end justify the means? Does this politician think the end justifies the means?), and questions of integrity (Is this politician or system practicing what is good? Is this politician or system practicing what he, she, or it thinks is good?). A judgment about the influence of ethics on politics is a result of answers to these questions.

ETHICS AND GOVERNMENT

Government is a social institution that formulates and enforces rules. In both the content of its rules and its method of enforcing them, government is unique. Other social institutions formulate rules, but the rules that they formulate apply only to those who participate in that institution. For example, a baseball league is a social institution that formulates rules, but its rules apply only to those who play in the baseball league. A government's rules, by contrast, apply to all members of the society. Other social institutions also enforce their rules, but the maximum penalty for violating a rule is to be disassociated from the institution. If, for example, one violates the rules of baseball, one may be kicked off the team. A government, by contrast, is the only social institution that enforces its rule by the use of physical force. If one violates a government's rules, it may confiscate one's property, restrict one's liberty, or even kill one.

Since government is the only social institution that makes universal rules that are backed up by the use of physical force, the content of those rules is of special importance. What rules are so important that everyone should follow them? What rules are so important that if they are violated the drastic resort of physical force is appropriate?

The only way to answer these questions is by appealing to ethics. Politics, accordingly, is an institutionalization of an ethics. This fact is easier to recognize in political theories: Plato, Thomas Hobbes, and John Locke, for example, appeal to (conflicting) ethical principles and moral evaluations of human nature in defending their political theories. Despite corruption, however, most political practice also illustrates the application of ethics.

THREE HISTORICAL EXAMPLES

The influence of ethics on political practice can be seen in the three systems that dominated the twentieth century: Marxism (or international socialism), fascism (or National Socialism), and capitalism (or constitutional democracy). Each system has had enormous practical influence on political theory and practice, and each puts into practice a set of explicit principles that its advocates believe to be moral.

COLLECTIVISM

Marxism and fascism are versions of collectivism. Collectivism defines morality socially, holding

that the welfare of the group is primary and, accordingly, that individual interests are subordinate to those of the group. Collectivists admonish individuals not to be self-interested; that is, not to put their personal interests above group interests but to sacrifice their interests for the welfare of the group.

Depending on how the group is defined, versions of collectivism arise. Some versions hold that the family is the proper group and that individuals should devote their lives to serving their families. Other versions hold that the group to which individuals should sacrifice is the tribe, the nation, the race, the working class, or the ecosystem. The common denominator in all these versions of collectivism is that individuals are not ends in themselves.

Largely through the influence of Georg Wilhelm Friedrich Hegel, collectivism dominated nineteenth century German philosophy. The two most prominent versions of collectivism to arise after Hegel were Marxism and fascism.

MARXISM

"From each according to his ability, to each according to his need." Karl Marx's slogan, from his *Critique of the Gotha Program* (written 1875; published 1891), is the clearest statement of the fundamental ethical principle of his version of collectivism. According to the principle, individuals are not ends in themselves. They should see themselves as servants of the needs of others, and they should devote their lives to serving others' needs to the best of their ability. As long as someone has an unfulfilled need and I, for example, have the ability to fill it, I have a duty to sacrifice my personal interests and devote myself to fulfilling that need. To the extent that I shirk my duty, I am acting unethically. To the extent that the society I live in allows me to shirk my duty, the society is unethical.

Marx noted that Western societies often pay lip service to altruistic principles; in practice, however, they encourage the pursuit of self-interest, the profit motive, and capitalism. What is needed to make society ethical, Marx argued, is a radical shift away from the individual to the collective, from the private to the social.

In defining "social," Marx takes the broadest possible view. Society, he argued, should not be conceived along familial, racial, religious, or ethnic lines. If, for example, I define the moral society ra-

cially, then I will see myself as a servant of my race; if service to my race is of the highest moral significance, then I will view members of other races as having less moral significance. Such attitudes can only foster racial conflict. If I define myself as an individual, then I will hold my own interests to be of the highest significance, but this will lead me into conflict with other individuals and will lead to a competitive society. To prevent these conflicts, Marx argued, individuals must learn not only to define themselves primarily as social, not individual, beings but also to conceive of society as including the entire human race. Only then, Marx believed, would socialism be realized. Marxism, accordingly, defends socialism by appealing to collectivist ethical principles, which it hopes to apply internationally.

FASCISM

During the twentieth century, “fascism” was the name adopted by a group of Italians to designate their new version of socialism. The leader of this group, Benito Mussolini, had for many years been a Marxist socialist before deciding that substituting “the Italian people” for “the working class” would give socialist ideas a better chance of success in Italy, for then they would be able to draw upon the nationalistic loyalty of most Italians. “Fascism” also labels the political system of Germany during the 1930’s and 1940’s, under Adolf Hitler’s National Socialism. In both countries, fascists applied collectivist ethical principles to politics.

The core doctrine was expressed clearly by Alfred Rocco, a leading Italian fascist. Fascism stresses, he said, “the necessity, for which the older doctrines make little allowance, of sacrifice, even up to the total immolation of individuals, in behalf of society. . . . For Liberalism [i.e., individualism], the individual is the end and society the means; nor is it conceivable that the individual, considered in the dignity of an ultimate finality, be lowered to mere instrumentality. For Fascism, society is the end, individuals the means, and its whole life consists in using individuals as instruments for its social ends.”

In their insistence upon the morality of collectivism, the fascists agreed with the Marxists. “There is more that binds us to Bolshevism [the dominant Russian version of Marxism] than separates us from it,” declared Hitler. Like the Marxists, the Italian and German fascists believed that capitalism was evil be-

cause of its individualism, its tolerance of the profit motive, and its emphasis on pursuing private interests. Hitler defined National Socialism as “idealism,” as the system in which each individual “willingly subordinates his own ego to the life of the community and, if the hour demands it, even sacrifices it.”

The fascists disagreed with the Marxists about some important points. While the Marxists defined the moral community internationally and economically, the fascists defined it nationally and racially. While the Marxists attacked all religions, the fascists focused their attacks almost exclusively on Judaism. Despite these differences, the fundamental thesis of Marxism and fascism is the same: Both have the same collectivist view of the relationship between the individual and the society. Both Marxists and fascists could accept the following statement from *Mein Kampf*: “each activity and each need of the individual will be regulated by the party as the representative of the general good.”

Italian leader Benito Mussolini is credited with coining the term “fascist.” (National Archives)

NATIONAL SOCIALISM

By the mid-1930's, years before the beginning of World War II, the National Socialists had put into practice many standard socialist economic policies. Medicine was socialized, a modern welfare system was instituted, and the goal of complete equality of income was being sought. German industrial production was regulated and directed by the central government; while owners maintained legal possession of their enterprises, government bureaucrats set production goals and controlled wages, prices, and interest rates. Additionally, since private interests were not to be trusted to serve the public good, the Reichskulturkammer instituted a sweeping censorship covering what was taught in schools, what books were published, and what appeared on radio and in films, plays, and newspapers. The important point is that all these policies were instituted by appealing to collectivist ethical principles: *Gemeinnutz vor Eigennutz!* ("The common interest before self-interest") was the standard slogan justifying Nazi policies.

Since socialism requires that individuals subordinate their private interests to the good of the group, and since under Hitler the designated group was the German nation, "National Socialism" was an appropriate name for Hitler's political program.

It is sometimes argued that dictators such as V. I. Lenin and Joseph Stalin in the Soviet Union and Hitler and Mussolini in Germany and Italy were simply cynical power seekers who mouthed collectivist and socialist slogans without really believing them, but this idea is not plausible. If one is young, cynical, and seeking power, the most likely route to power is by infiltrating the established, already-powerful political parties (or the military). The least likely route to power is to join a fringe political group, since fringe groups rarely have any influence. Fringe groups attract only people who are committed to the causes for which the group stands. Yet the Communist and National Socialist Parties were, when Lenin, Stalin, and Hitler joined them, tiny and far from power. Therefore, it is likely that these men believed in the principles that they preached.

While collectivist ideas were most influential in eastern Europe, in Italy, and later in Asia, they also had an impact in the West. During the late nineteenth and early twentieth centuries, it was common for intelligent American and English students to spend

some time studying in Germany, which was at the time the world's leading intellectual nation. While in Germany, the students were naturally exposed to the latest collectivist theories. As Friedrich Hayek noted, "Many a university teacher during the 1930's has seen English and American students return from the Continent uncertain whether they were communists or Nazis and certain only that they hated Western liberal civilization."

INDIVIDUALISM AND CAPITALISM

In the West, however, classical liberal ideas had retained a strong hold. Classical liberalism emphasizes the importance of the individual and tends to see social institutions as valuable to the extent that they leave individuals free to pursue their values. Individuals are ends in themselves, according to this view, and not means to the ends of other individuals or to groups.

By deemphasizing or rejecting collectivism, individualists tend to reject or at least be suspicious of any claims upon the individual to sacrifice life, liberty, or well-being. In politics, this individualist ethic leads to the view that the role of the government is not to exact sacrifices from individuals to serve a collective good, but to protect the lives and liberties of individuals as they pursue their personal conceptions of the good life. In economics, individualists tend to advocate a free market, since a free market decentralizes political power, leaving investment, buying, and selling decisions in the hands of private individuals. In this way, advocates of capitalism's limited government and free markets have tended to appeal to individualist ethical principles in support of their political policies.

CONCLUSION

Ethics has had a broad influence in the history of modern and contemporary politics. Many conflicting ethical theories have contributed to that influence, but in terms of their influence on modern and contemporary political affairs those ethical theories fall into two major categories: individualist and collectivist. The moral slogan of individualism, "Every individual is an end in himself," stands in contrast to the moral slogan of collectivism, "From each according to his ability, to each according to his need." The principle of individualism provides moral support for capitalism; the principle of collectivism provides moral support for socialism.

Historically, it can be seen that to the extent that the politicians in power were committed to an ethic that holds individual interests to be immoral or at least subordinate to collective interests, they believed it to be improper to leave economic and political power in private hands. Accordingly, their ethics dictated that power must be concentrated in public hands, and therefore a centralization of political and economic power resulted.

By contrast, to the extent that the politicians in power were committed to an ethic that holds individuals' pursuits of their own interests to be moral, then the politicians believed it to be proper to leave power in hands of those private individuals and to see their role as politicians as secondary and supportive. Accordingly, their ethics dictated that power must not be concentrated in public hands, and therefore a decentralization of political and economic power resulted.

Poll taxes

DEFINITION: Form of capitation, or head tax, which people must pay before being allowed to vote

DATE: Abolished in the United States in 1964

TYPE OF ETHICS: Civil rights

SIGNIFICANCE: Poll taxes raise the ethical questions of whether it is proper to make people pay for the right of voting and whether such taxes disfranchise the poor.

Poll taxes existed in the United States from the earliest colonial times. They were usually quite small and did not act to discourage many people from voting. In the years following the U.S. Civil War, the poll tax system was refined in the southern states for the purpose of disfranchising black voters. The tax remained small, but it had to be paid for every election in which the potential voter might have voted. This tax effectively disfranchised nearly all black voters. Because the election laws in the United States are made by state governments, a constitutional amend-

ment was needed to do away with poll taxes. In 1964, the Twenty-fourth Amendment abolished the payment of such taxes as a condition for voting in federal elections.

Pollution

DEFINITION: Environmental contamination with human-made waste

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Pollution has effects on many different levels, from causing people minor inconvenience and aesthetic displeasure up to and including mass human illness and death, and the extinctions of other species.

Pollution must be viewed in the light of natural versus human-based events. A natural event is part of the fundamental cycle of Earth processes that maintain a balance of building up and wearing down, of destruction and recovery. A volcano may spew tons of ash into the atmosphere and darken the sky so much that weather patterns are changed. Mudflows precipitated by loose debris and rapidly melting glaciers clog waterways on which nearby ecosystems rely. Lava kills everything in its path. Despite these drastic, destructive changes, natural processes will clear the air to reestablish customary weather patterns, will create more glaciers whose runoff will establish new river ecosystems, and will produce fertile soils to support life in areas where it was destroyed.

Pollution is the introduction of agents by humans into the environment in quantities that disrupt the balance of natural processes. Its possible detrimental effect on human life is not part of pollution's definition. Neither are human ignorance or lack of foresight, which may greatly influence the course and severity of pollution.

Ethics is a dimension specific to pollution that is not characteristic of natural processes. Humankind has the intellectual capacity to affect its course, and is itself affected morally by pollution's existence.

Pollution started when humans began manipulat-

ing the environment. Although pollution is usually characterized as chemicals or by-products of synthetic processes, this characterization is not entirely accurate. Waste from herds of domestic animals, for example, is a natural product, but it causes many environmental problems. Introducing aggressive non-native species into an established ecosystem is also pollution, since such species frequently overwhelm the natural system's balance and displace native species. It has even been asserted that the human species itself is a pollutant, since it is both an aggressive species and nonnative to many habitats that it occupies and exploits.

In considering pollution created by manufacturing and daily human activities, there is no uncontaminated ecosystem. Even beyond Earth's known biosphere, humankind sends objects into outer space, and those that become defunct or were never intended to return are dubbed "space junk." Invisible pollutants cannot be overlooked. Various types of synthesized and concentrated radiation—from ultra-low-frequency sound waves to sonic booms; from artificial lighting in classrooms, offices, and along highways to nuclear radioactivity—bombard and vibrate the molecules of the land, the air, and the inhabitants. As a result of all these different contaminants, plant and animal species suffer from aborted embryos, deformed offspring, poor health, shortened lives, and death. Among those suffering is the human species.

HISTORY

Since pollution has an ethical dimension, why has humanity not exercised its moral strength in preventing or halting it? Part of the answer is ignorance. It is not until environmental damage is recognized—usually by detecting injury to some species of plant or animal—that humankind realizes that pollution has occurred.

When gasoline-powered cars were introduced, it never occurred to proponents of modern transportation that the admittedly malodorous exhaust could possibly place large numbers of people in dire respiratory straits, let alone cause Earth to face global warming. Even when auto exhaust was recognized as a major contributor to the unsightly haze of smog, scientists had not yet developed sensing and testing equipment that would give them knowledge of the scope of the air pollution problem.

Another reason that humankind's moral capacity has not been a force in preventing pollution is lack of foresight. This issue illustrates two kinds of humanity's arrogance. Many people assume that humankind has the power and intelligence to solve every problem it recognizes. Many people also have the unrealistic, erroneous belief that there are segments of society that cannot be affected by the dangers that everyone else faces.

When nuclear power plants were developed, the designers were aware that lethal by-products would be generated, and planners incorporated holding ponds and other storage areas in the building complexes. They had not yet developed any means for the safe disposal of nuclear waste, assuming that they would be able to do so as necessary at some future date. Since these designers recognized most of the possible problems of such facilities, did they assume that they were invulnerable to those problems?

Another factor in the pollution situation is the human population's exponential growth. The relationship between technological development and increased human survival has so far been linked in an endless circle. If the human population was only one percent of what it is now, with a corresponding ratio of contaminants in the environment, pollution would be no less real, though it might not seem as serious.

DISCUSSION

The ethics of the survival of life on Earth are shaped by the immediate danger presented by environmental pollution. Most people presume that the survival of the human species is the most important issue. Some reject this conclusion as blatant homo-centric speciesism and argue that the survival of human life is inherently no more urgent or legitimate than the survival of any other species. Many people realize, without making claims for the necessity of human survival, that it is dependent on uncountable plant and animal species surviving and upon an environment unsullied enough to support them. All these considerations are based on human acceptance of responsibility for the future. Is humankind responsible for the future? Should humankind assume any responsibility for it?

Perhaps human arrogance causes humankind to presume that such a responsibility exists. Could it be that human history is merely a natural part of evolution on Earth? Are humankind's effects on the envi-

ronment part of the natural scheme of things to which the environment will eventually adapt? Will that adaptation include mass extinctions and the subsequent development of other life-forms capable of tolerating the changes that humankind has wrought?

Is humankind responsible for all future generations of life? Is humankind morally liable for the future of Earth itself? If humankind does accept any of these responsibilities, what are the exigent considerations?

Given the history of discovering pollution by hindsight, it would seem logical that humankind should not introduce any further agents, unknown or known, into the environment. If additional contamination by known pollutants is to be stopped, it cannot be done without accepting the moral consequences of the human misery and death that will follow as a result of the loss of jobs and the decreased availability and less efficient distribution of food and other human necessities.

As with most moral issues, the pollution dilemma has no easy answers. Yet if humankind is to persist, there can be no avoiding the ethical considerations involved in a possible solution to the problems of pollution.

Pollution permits

DEFINITION: Governmental exemptions that grant industries the right to release defined amounts of pollution into the environment

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Although pollution permits have proven to be an effective means of controlling and reducing pollution, thus benefiting society, their critics argue that it is ethically wrong to give any industry the right to cause pollution.

Pollution is a problem of the common resources that are used by all members of society. Such “commons” include air, water, and the oceans. The problem in protecting these resources is how to deal with the external costs, including environmental degradation and injury to human health. The external costs of pollution are borne by those using the common resources and not by the polluters.

Early proposals to control pollution included taxation, which was favored by economists, and command and control, which was favored by politicians. In the latter method, regulatory agencies determine acceptable levels of pollution and impose the implementation of new technologies to reduce it. Both solutions have difficulties, however. Another mechanism for reducing pollution has been the issuance of marketable or tradable pollution permits, a system that relies on free market forces and economic efficiency. The use of pollution permits has resulted in the elimination of lead additives in petroleum refining, in major reductions of sulfur dioxide (which are responsible for acid rain) and particulate emissions, and in lesser reductions of chlorofluorocarbons and nitrogen oxides. The U.S. Congress incorporated pollution permits in the provisions of its 1990 Clean Air Act.

HOW POLLUTION PERMITS WORK

Employing cost-benefit analysis, a regulatory agency determines a permissible level of pollution and allocates permits to the industries producing the

pollution. Those able to reduce emissions inexpensively may then sell their unused permits to those less able to afford reductions of their emissions. Unlike the command-and-control approach, the pollution permits system allows polluters to determine how best to reduce pollution.

Many economists prefer the pollution permit system because it allows free market forces to act, while environmentalists like it because it does reduce pollution. However, the system presents ethical difficulties. First, the common resources, such as air and water, belong to all members of society but appear to be treated as private property under the pollution permit system. Defenders respond that the permits only authorize use of the commons, not ownership of some part of it.

Critics also argue that polluting is morally wrong and that the pollution permit systems allows favorites—the permit holders—to do something that no one should be permitted to do. Sellers transfer the right to pollute and thus cause harm, something no one should have the right to sell. Others assert that holders of permits should have no right to sell them, as permits should be given away. Defenders of the system responding to these criticisms argue that the goal of the permits is the benefit of humanity, and that studies of health and the environment determine permissible levels of pollution. In addition, the permissible levels should gradually be lowered until pollutants such as leaded gasoline are eliminated or further reductions in pollution cost more than the benefits accrued from the total elimination of the pollution.

Finally, critics argue that pollution permit practices that produce “hot spots”—areas where higher concentrations of pollution develop—often in economically poorer neighborhoods, must be banned.

Poona Pact

IDENTIFICATION: Agreement guaranteeing members of the casteless untouchables joint legal representation with the general population of colonial India

DATE: Announced on September 25, 1932

TYPE OF ETHICS: Civil rights

SIGNIFICANCE: The Poona Pact drew attention to the plight of the untouchables, whose lives were severely circumscribed by the strictures of the Hindu caste system.

The independence movement in India accelerated when Mohandas K. Gandhi returned from South Africa to India in 1915 and brought with him the weapon of *satyagraha*, or “truth force.” He had developed *satyagraha* to protest nonviolently the Boers’ refusal to recognize the validity of traditional Indian marriages. He also used moral force to attempt to end the oppression of East Indians by the South African white minority government.

Gandhi joined the Indian National Congress, a Hindu-dominated independence movement, and persuaded others in that organization to join forces with Mohammed Ali Jinnah, whose Muslim League also wanted independence for all of India under a policy that Jinnah labeled *khilafat*. Gandhi persuaded both groups to boycott British-made products, to strike, and to engage in a general policy of noncooperation with Britain. The British initially responded with force to suppress this movement. In 1932, when this response failed, British prime minister Ramsay MacDonald announced constitutional proposals known as the Communal Award, which were viewed as conciliatory measures.

The Communal Award provided for separate electorates for Muslims, Europeans, Anglo-Indians, Sikhs, Christians, upper-caste Hindu Indians, and untouchables. For several thousand years Hindus have been divided into four major castes. Each caste performs specific jobs that its members monopolize.

Members of a caste tend to marry within their caste. The *Brāhmins*, who are considered the highest caste, tend to be priests, rulers, landowners, and intellectuals. At the very bottom of this social hierarchy are the untouchables. They are outcastes who are considered so low and vile that to touch them pollutes a person. They are stigmatized, held in contempt, discriminated against, and assigned the least desirable work, housing, and food.

Gandhi believed that the British were using the classic strategy of “divide and rule,” viewing the attempt to segregate untouchable voters in the Communal Award as a bid to divide the Hindu community and to grant power to either the Muslim or the European minority. Either scenario would have fragmented the independence movement and delayed independence. Gandhi believed that communal separatism could be avoided if a secular government were created. Gandhi vowed to fast until he died unless the Communal Award’s establishment of separate electorates for various classes of Indian society was rescinded.

GANDHI’S CHALLENGE

Gandhi was a *Vaiśya* (a member of the merchant caste); therefore, his vow to resist, with his life if necessary, segregating untouchables on a separate election roll was revolutionary. No member of a privileged caste had ever proposed such an act. Gandhi’s action threatened the caste-based system of segregation, discrimination, and exclusive privilege. He fasted until separate representation for untouchables was rescinded. The key to the victory was Indian unity, which Gandhi forged through the Poona Pact. By means of this pact, the entire Hindu community voted on each candidate. As a result, untouchables were also guaranteed their fair share of seats in schools and representation throughout Indian society.

For decades, Britain had denied colonial subjects the right of self-determination on the grounds that they were racially and mentally inferior, and thus incapable of enlightened self-rule. Gandhi’s Poona Pact, coupled with his noncompliance campaign, constituted a direct challenge to the colonial order. Both assumed that all people had certain basic rights, and that assumption defied the British notion of native inferiority. Gandhi was able to unite Muslims and Hindus by appealing to the Hindu doctrine that

each individual must find his or her own path to God. Gandhi also effectively utilized the Muslim tradition of tolerance for neighbors who practiced different religions, as long as peace was maintained. This appealed to Jinnah and the Muslim community, who wanted Pan-Indian unity. Although Gandhi did not wish to abolish the caste system entirely, because it had so thoroughly permeated Indian society, his efforts on behalf of the untouchables pointed out the unfairness of the concept of untouchability.

Population Connection

IDENTIFICATION: Organization established to fight for social and economic stability by advocating that population growth be limited to accord with available resources

DATE: Founded in 1968; renamed on May 1, 2002

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Population Connection not only focuses on encouraging individuals to do their part to improve living conditions for all peoples of the world but also mounts political campaigns intended to change national policy in order to limit population growth and destruction of the environment.

With a membership during the 1990's of more than forty thousand and an annual budget of more than two million dollars, Population Connection (originally known as Zero Population Growth) promotes protection of the environment through reduction of population growth. Because 1990 figures reflect an increase of 95 million people per year worldwide, scientists fear that the ability of the earth's resources to support the population will be seriously undermined. Population Connection works in several ways, both within the United States and internationally, to educate legislators, organizations, teachers, and individuals regarding the massive negative impact of the burgeoning population and its consequent demands upon the earth's resources because of in-

creasing food and energy demands, as well as lifestyle choices that result in the wasting of resources and pollution. Among the organization's activities are political action to ensure reproductive rights, including making available safe, reliable family planning information and services and legal abortion when contraception fails; enhancing the economic and social status of women worldwide through both governmental and private efforts; and, most important, educating people regarding the crucial link between continued population growth and environmental degradation, pollution, poverty, and political and social unrest.

Population control

DEFINITION: Attempt to limit human population by various means

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Population control is generally driven by ethical concerns about the effects of human overpopulation upon both the environment and the quality of life of individual members of the human race. Some methods of population control raise ethical concerns of their own, however, about paternalism, the right to privacy, and basic human rights.

The human population, like that of other creatures, is limited in growth by its biotic potential, the maximum rate at which a species can produce offspring given unlimited resources and ideal environmental conditions. At this rate of growth, the population would at first grow slowly only to increase rapidly to produce an exponential curve. Neither humans nor any other species in a given ecosystem can indefinitely grow at their biotic potential, since one or more factors always act as limiting agents. The maximum population size an ecosystem can support indefinitely under a given set of environmental conditions is called that ecosystem's carrying capacity.

The exponential and ongoing rise in the globe's human population makes the need for high-yield, dependable food crops ever more compelling.

Source: Data are from U.S. Bureau of the Census International Data Base and John Clarke, "Population and the Environment: Complex Interrelationships," in *Population and the Environment* (Oxford, England: Oxford University Press, 1995), edited by Bryan Cartledge.

GROWTH POTENTIAL

Human population has continued to grow as Earth's carrying capacity for humans has been extended as a result of human cleverness, technological and social adaptations, and other forms of cultural evolution. People have altered their ecological niche by increasing food production, controlling disease, and using large amounts of energy and material resources to make habitable those parts of the world that are normally not so.

Observers believe a wide range of populations is possible. Some observers believe that people have already gone beyond the carrying capacity point at which all the earth's inhabitants can be fed, sheltered, and supported. Estimates on the low end of population are that only 1.2 billion people can be supported to U.S. dietary standards and only 600 million at the

U.S. rate of energy consumption. These numbers are likely low, since the U.S. rate of food and energy use is high. The higher estimate for human carrying capacity is 45 billion people on a diet similar to U.S. dietary standards, made possible by cultivating all available land, using nuclear power for energy, and mining much of the earth's crust to a depth of 1.6 kilometers for resources. An even higher estimate for human carrying capacity is 157 billion if diets are based solely on grains.

The human population continues to grow, regardless of what the carrying capacity may be. The world population doubles every thirty-five years at growth rates of the 1970's and 1980's. If the population were controlled to zero population growth, the world population would continue to grow for several generations because of decreasing death rates.

ETHICAL CONCERNS

Ethically, most nations favor stabilized or low population growth, because problems of peace, poverty, racism, disease, pollution, urbanization, ecosystem simplification, and resource depletion become harder to solve as the population increases. At the same time, many less-developed nations feel that population control, coupled with the continued status quo of international economic order, poses a dire threat to already oppressed people. These nations insist that for population control to become accepted, there must be a reorganization of economic and political power. These nations argue that people are the most vital of the world's resources and that problems of resource depletion and pollution can be solved by human ingenuity and technology. It is argued that the more people there are, the more likely it is that these problems will be solved. Economic growth would be stimulated because with more people there would be more production.

In contrast, others argue that, ethically, the world population should be limited because most people would be added to the least-developed countries, where education, health, and nutrition levels are so low that continued rapid population growth would condemn millions to an early death. Although technological advances do not come only from people who are well educated or well paid, nations that favor limited population growth feel that encouraging rapid birth rates in the hope that someone may be born to solve the world's pollution and resource problems is an inhumane way to preserve the lives of people who already exist. Nations that encourage better education, nutrition, health care, and work opportunities for a smaller population feel that, ethically, that approach has a greater chance of making needed technological breakthroughs without adding to human suffering.

METHODS OF POPULATION CONTROL

Most nations favor limiting population growth by controlling birth rates. Two approaches to controlling birth rates are economic development and family planning. It is argued that economic development may not be able to help the least-developed countries lower their birth rates, since economic development for these nations is more difficult than it is for those nations that developed in the nineteenth century. In these least-developed countries, expanded family planning

programs may bring a more rapid decrease in the birth rate than can economic development alone.

Family planning is a purely voluntary approach whereby information and contraceptives are provided to help couples have the number of children they want when they want to have them. Between 1965 and 1985, family planning was claimed to be a major factor in reducing the birth rates of China, Mexico, and Indonesia. In the same period, moderate to poor results of family planning occurred in the least-developed countries, such as India, Brazil, Bangladesh, and many countries in Africa and Latin America. India started the world's first national family planning program in 1952. Its population then was 400 million; by 1985, it had grown to 765 million, and it topped 1 billion during 2000.

Many people believe that effective population control must include a combination of economic development and the use of methods that go beyond voluntary family planning. Among these methods are voluntary abortion and increased rights, education, and work opportunities for women.

Pornography

DEFINITION: Explicit representations of sexuality intended to cause arousal

TYPE OF ETHICS: Arts and censorship

SIGNIFICANCE: The moral status of pornography is a source of considerable controversy not only between ideological movements, but also within them. Some feminists, for example, attack pornography as a tool of women's oppression, while other feminists embrace it, or even produce it, as a celebration of female sexuality. In the legal arena, U.S. law distinguishes between indecent material—which may be regulated, but is still protected by the First Amendment—and obscene material, which has no constitutional protection and may be banned altogether.

Supreme Court Justice Potter Stewart made the comment in *Jacobellis v. Ohio* (1964) about obscenity that “I know it when I see it.” While many scholars and laypersons have made light of the statement, his famous words encapsulate the problematic nature of the debate about pornography. Since pornography eludes common definition, its impact on society and individuals is also passionately debated.

Conflicting perspectives on pornography from conservative, libertarian, and feminist standpoints reflect in condensed form broader societal, political, and legal debates on modern-day issues relating to morality, censorship, and women's rights.

In the United States, where the First Amendment to the U.S. Constitution assumes preeminent status to expression as a “preferred freedom,” the pornography debate is strongly tied to jurisprudential arguments about the limits of free expression. Jurisprudence in this area raises questions about the correct “balance” between freedom and equality and the appropriate emphasis on individual rights versus community values and morality.

The terms “pornography” and “obscenity” are sometimes used interchangeably. Some scholars, however, distinguish between obscenity, which is the legal term, and pornography, which is a broader term. Obscenity refers to nonwholesome sexually explicit materials that contradict societal norms. Pornography may include both socially unacceptable, lewd material and sexually explicit erotica consisting of

materials that are sexually explicit but not necessarily “offensive” to societal values.

HISTORY OF REGULATION

Excavations of ancient Greek artifacts reveal art depicting sexually explicit and even violent sexual acts. In Greek and Roman times and in England until the seventeenth century, censorship was practiced primarily to control objectionable religious (blasphemous) and political (heretical) writings. While norms in most societies have shunned open displays of sexuality, written materials of any kind have been largely unavailable to the masses except in the last several centuries.

The English case *King v. Sedley* (1663) is often cited as a precursor of modern obscenity law. While the case did not deal directly with the distribution of obscene materials, it provided the legal and theoretical basis for modern obscenity law. Sir Charles Sedley was penalized by the court for standing nude and drunk on a tavern balcony. He spoke to a crowd below, using profane language, and poured urine on the bystanders beneath him. For offending public morality, he was fined and jailed.

Obscenity regulation was rare until the beginning of the nineteenth century, when government regulation of sexual morality became more common. By one estimate, there were approximately three obscenity prosecutions yearly in England between 1802 and 1857. By the mid-1850's, urbanization, expansion of the market for popular books, and Victorian moral standards combined to explain increased interest in and dissemination of sexually explicit materials. The regulation of such materials likewise increased. In 1857, for example, Lord Campbell's Act, which banned the dissemination of obscene works, was enacted.

DEFINING “OBSCENITY”

In the English case of *Regina v. Hicklin* (1868), the court provided a definition of obscenity that shaped English, Canadian, and American law in this area well into the 1950's. The obscene publication *The Confessional Unmasked* was invidiously anti-Roman Catholic, purporting to describe the sexual depravity of Catholic priests. Chief Justice Alexander Cockburn's obscenity test in this case struck at any materials, including those devoid of religious or political assault, that “deprave and corrupt those

whose minds are open to such immoral influences, and into whose hands a publication of this sort may fall." This test is generally viewed as extremely restrictive, since it regulates materials that "corrupt" even the most susceptible members of society, as opposed to restricting materials that corrupt the mythical "average" person used in later tests.

An 1815 Pennsylvania case was the first obscenity case decided in the United States. Generally, very little obscenity regulation occurred in the United States until passage of the Comstock Act in 1868 by the New York legislature, which prohibited the dissemination of obscene literature. A federal law regulating mailing of obscene works was passed in 1873, and most states passed antidissemination laws during the late nineteenth century.

Judges applied the Hicklin test until about 1933, when most U.S. jurisdictions relied upon a modified test devised by federal court judges in the case of *United States v. One Book called Ulysses*. Judges in the *Ulysses* case, which did not reach the Supreme Court level, declared obscene only those sexually explicit works that, on the whole, had a prurient effect on average readers. This less-restrictive definition protected some sexually explicit works with literary merit.

LANDMARK COURT CASES

Two major Supreme Court decisions have shaped obscenity law. In 1957, the landmark case of *Roth v. United States* established that obscene materials are outside of limits of First Amendment protection. Since the First Amendment holds that "Congress shall make no law . . . abridging freedom of speech or of the press," *Roth* constituted an important ruling on the issue, suggesting the limits of protected content. The decision defined obscenity in terms of "whether to the average person, applying modern community standards, the dominant theme of the material taken as a whole appeals to the prurient interest."

In 1973, the Supreme Court refined its definition in *Miller v. California*. Regulation of hard-core pornography was the primary aim of the decision, which specified "patently offensive representations or descriptions of ultimate sexual acts, normal or perverted, actual or simulated," and "patently offensive representations or descriptions of masturbation, excretory functions, and lewd exhibition of the genitals."

The Court's guidelines for judging obscene work,

set down in *Miller*, are: "(a) whether 'the average person, applying modern community standards' would find that the work, taken as a whole, appeals to the prurient interest (Roth), (b) whether the work depicts or describes, in a patently offensive way, sexual conduct specifically defined by the applicable state law, and (c) whether the work, taken as a whole, lacks serious literary, artistic, political or scientific value."

The *Miller* case raised questions about why government should be able to decide which material has value. Some scholars argue that such decisions about value should be left to the marketplace and to individual consumers. Critics, including dissenting justices, also expressed concern about *Miller's* definition of obscenity, which they viewed as insufficiently precise and clear.

In contradistinction, the regulation of child pornography is almost universally accepted. Because of the special vulnerability of children, the legal system has allowed greater protection for children from the harms of pornography. In *New York v. Ferber* (1982), the Supreme Court upheld a statute banning pornography in which children are used as models or actors. The Court accepted broader regulation of child pornography in comparison with other forms, permitting government prohibition of works that only in incidental part (not as a whole) are graphic as well as materials that may possess "serious artistic, literary, scientific or educational value," and works that may not arouse "prurient" thoughts in average individuals.

CONSERVATIVE VIEWS ON PORNOGRAPHY

Clear justifications for allowing government regulation of obscenity are often lacking in Supreme Court decisions on the subject. Stated definitions and rationales for obscenity regulation, however, suggest underpinnings in conservative thought.

Conservatives, who support strong regulation and enforcement of obscenity law, seek to preserve societal values and morals in the interest of the general welfare. From the 1960's through the 1980's, support by conservatives for obscenity regulation was grounded in a commitment to traditional family roles and values. From the conservative standpoint, pornography threatens those values, since it depicts, and may arguably promote, sexual relationships outside of marriage as well as unusual and societally condemned sexual practices depicted in pornography.

For example, the 1986 *Final Report of the At-*

torney General's Commission on Pornography suggested that "it is far from implausible to hypothesize that materials depicting sexual activity without marriage, love, commitment, or affection bear some causal relationship to sexual activity without marriage, love, commitment or affection."

Thus, obscenity, in the conservative view, compromises the integrity of the community by precipitating a decline in religious and moral values among its members.

Support for pornography regulation by conservatives also rests on the assertion that pornography degrades human relationships and depreciates the individuals depicted by the pornography. Sexual acts in pornography are reduced to their purely physical dimensions; they are depicted as animalistic rather than presented in the context of consensual and loving human relationships.

Pornography regulation is also justifiable when expression harms individuals, according to the conservative view. The 1986 *Attorney General's Report*, for example, documents many cases in which individuals, usually women, were adversely affected by pornography—as participants in its production or victims of its effects. Possible links between pornography and violence against women and children have been investigated by social scientists, who have reached mixed conclusions in experimental studies.

LIBERALS' SUPPORT FOR FREE EXPRESSION

Conservatives' support for obscenity regulation in the interests of society and community often conflicts with liberals' support for individual freedom of consenting adults to self-expression and choice in what they read or see.

Generous free speech rights are also defined within the framework of the "marketplace of ideas" wherein ideas compete for acceptance. Theoretically, weak or harmful ideas will falter within the marketplace and lose acceptance. The theory places faith in individual citizens to judge astutely the merits of the ideas presented.

Free speech rights may also be justified by democratic aims. Free speech and expression are particularly valued in democratic societies, such as the United States, in order to promote effective citizenship and participation in government. Confidence in the ability of individuals to make wise choices is an essential part of democratic society.

Some scholars also support maximum expression rights as a function of the need for tolerance in a democracy, particularly one with a diverse, pluralistic, and multicultural population. Unusual, unpopular, and abhorrent ideas should be tolerated with the expectation that tolerance will be reciprocated. Thus, from this perspective, citizens must tolerate some obnoxious, even harmful, expression.

Obscenity regulation is sometimes defended on the basis that, unlike vilified, objectionable speech with political significance, obscenity is "low value" expression, outside the ambit of the political and intellectual expression intended to be protected by the First Amendment.

Others justify pornography on the basis of overlooked positive functions that it might provide, including a possible sexually therapeutic effect for inhibited or sexually dysfunctional individuals or couples. Pornography may also provide informational benefits. The norm of sexual privacy impedes dissemination of information about sexuality, which may hamper self-expression and understanding of sexuality.

While mindful of the potential harms of pornography, liberals contend that the harms must reach a high threshold to justify regulation. Liberals are, therefore, skeptical of social scientific evidence suggesting harms of pornography. They support regulation only when nearly definitive proof of harm can be mustered.

The National Commission on Obscenity and Pornography (1970) embraced libertarian views that pornography's harms are relatively limited. At that time, available social scientific evidence suggested the absence of a connection between pornography usage and violence. This finding has been modified by subsequent studies.

ANTI-PORNOGRAPHY FEMINIST POSITION

While in virtual agreement that pornography degrades women, feminists are divided in their views about the regulation of pornography.

During the 1980's, feminist scholars reconceptualized pornography as a civil rights issue, thus juxtaposing the values of equality for women against the free expression rights of individuals. Feminists such as Catharine MacKinnon, who, with Andrea Dworkin, wrote a civil rights ordinance that addressed the pornography issue, contend that liberals' preoccupation with free speech rights is myopic in that it underestimates the harms of such expression to

women. In 1986, the MacKinnon-Dworkin ordinance was declared unconstitutional in federal courts.

Defining pornography in terms of its harms to women, feminists, such as MacKinnon, have also pointed out that while the analogy of the marketplace of ideas with regard to free expression might be appropriate if all citizens had equal access to and voice in the marketplace, the analogy fails when the distribution of power in society is unequal. Socially, politically, legally, and economically, according to this argument, women have less power and voice than do men within a patriarchy, and therefore their arguments are less likely to be viewed as credible.

In feminist “dominance” theory, MacKinnon argues that because men have defined social reality and legal theory, issues such as pornography, sexual assault, and sexual harassment may be defined and viewed differently by women and men, yet the male perspective on these issues is more frequently the preferred one.

Furthermore, concepts such as neutrality and objectivity, which are integral tools in legal interpretation, have been characterized in feminist and post-modern theory as, in practice, upholding the views of the socially powerful. For example, the “contemporary community standards” guideline in *Miller* is rejected by MacKinnon as irrelevant to feminist concerns because women are pervasively devalued and dehumanized as sex objects, making such subordination of women an accepted part of the culture—befitting “contemporary community standards.”

Specific harms attributable to pornography are cited in the civil rights ordinance as well as in feminist literature. The cited harms primarily affect women. For example, the ordinance recognizes the potential for women and children to be coerced into performing in pornography productions as well as abused, beaten, threatened, and tortured. Linda Marchiano, who appeared in the pornographic film *Deep Throat*, contends that she performed in the film under duress and that she was severely beaten and abused while making the film.

The 1986 *Attorney General’s Report* also contains numerous examples of victim testimony citing the use of coercive and misleading tactics to force women and children to perform in the production of pornographic materials.

Feminists have also rekindled the argument that pornography use is linked with sexual assault. Such

causal connections are supported by anecdotal evidence that some assailants model their crimes on ideas found in pornographic materials. In addition, certain findings by social scientists suggest that pornography exposure can affect attitudes toward women and that, in laboratory settings, exposure to sexually violent pornography is correlated with increased aggression toward women.

The most pervasive harm of pornography to women, as presented in feminist theory, is that it reinforces the subordination of women by men. In pornography, women are depicted as sexual objects whose purpose is to provide pleasure to men. MacKinnon and Dworkin argue that pornography asserts that women desire to be battered, humiliated, and beaten. It eroticizes male domination of women, including violence against women. A common theme of pornography involves a woman who is raped and at first resists, but later enjoys it. Social science research cited in the 1986 *Attorney General’s Report* shows that nonoffender college males, who were not generally aroused by sexually aggressive pornography, were aroused by rapes in which the victim appeared to enjoy the assault. Furthermore, such arousal was shown to be correlated with acceptance of rape myths.

The objectification of women in pornography mirrors societal attitudes about women, whose importance is judged on the basis of sexual attractiveness and availability. From this standpoint, pornography is symptomatic of women’s situation, limiting women’s opportunities and making it difficult for women’s full capabilities to be equally recognized.

SUMMARY

Divergent perspectives on pornography derive from different emphases on the values of community, individual freedom, and equality. The conservative perspective places primary emphasis on morality and the general welfare, while increasingly demonstrating additional concern for the harms to individuals correlated with exposure to pornography or its users. The concern over harm is shared by feminists, who place strong emphasis upon the need for equality and women’s rights. Liberals stress the value of individual free expression rights, which are central to a democratic society, suggesting that these rights be cautiously balanced against the claims of harms to individuals or the general welfare.

Post-Enlightenment ethics

DEFINITION: Ethics influenced by or following in the tradition of the Enlightenment of the eighteenth century

TYPE OF ETHICS: Modern history

SIGNIFICANCE: In a very real sense, all formal scholarly ethics written in Europe and the United States after 1800 could be said to be post-Enlightenment ethics. The terms and methods created by Enlightenment philosophers, especially by Immanuel Kant, have constituted the basic parameters of the field ever since, and any contemporary work of moral philosophy must either accept those terms and methods, or argue directly and explicitly against them.

The term “Enlightenment” took its place in the English language in the seventeenth century. Its frequent employment did not occur, however, until the twilight of the movement to which it is applied. Im-

manuel Kant's 1784 essay *What Is Enlightenment?* made the term applicable to the philosophical movement that was centered in France and Germany from the middle of the seventeenth century to the dawn of the nineteenth century.

The Enlightenment has bequeathed to succeeding ages the methodical study of human relations. The social sciences became the offspring of the Enlightenment. Although these disciplines were not a part of the movement proper, they were spawned by the Enlightenment *philosophes'* struggle to improve society.

The Enlightenment was a sharp break with the dominant view of life that was prevalent during the Middle Ages. In medieval society, belief was the chief means by which humanity operated. Thus, both the church and superstition held unquestioned authority in most circles. The Enlightenment, however, introduced a rejection of traditional doctrines, whose validity largely rested upon their longevity. The Enlightenment's questioning and probing method was conducive to the growth of science and its application to the political and social realms.

Generally, the Enlightenment tended to reject the restraints that had been placed on medieval thinking. The movement's free thinking not only expanded beyond metaphysical constraints but also dismissed them as being irrelevant and incomprehensible in determining what is ethical. The narrow focus of medieval Scholasticism was replaced by an interdisciplinary pursuit of knowledge. Philosophy became the medium through which Enlightenment thinkers examined history, politics, science, and other fields.

CHIEF TENETS

The Enlightenment set forth the employment of free reason, which involved the analysis and evaluation of existing institutions and doctrines. This movement subjected traditional authority to examination and interrogation. The motive behind the probing was a belief in progress. Unlike the thinkers of the *ancien régime*, thinkers of the post-Enlightenment era believed that human effort was the chief contribution to progress. Some *philosophes* believed in it so fervently that they conceived of a heaven on Earth that was a product of humanity's designs.

Immanuel Kant called the statement *sapere aude* ("dare to know") the Enlightenment's motto. Indeed, a chief objective of the movement was self-

knowledge. The way to knowledge, according to the *philosophes*, was through experience. Since humanity was a part of nature, experience through that medium was possible. Hence, for Enlightenment thinkers, nature became the great teacher. This belief in experiential knowledge became known as empiricism.

The focus on the knowledge of humankind put a new emphasis on humankind's motivation and nature. Instead of taking the medieval view of humankind's preoccupation with otherworldly rewards, the *philosophes* conceived of humanity as being motivated by such temporal concerns as appetite, fear, and pride. This view ushered in the era of rational scientific materialism.

Thus, post-Enlightenment ethics have sought to reform society. It is believed that societal redemption will improve individuals who are influenced by the social environment in which they live. Hence, the Enlightenment and its following generations have focused their attention on life in the present rather than a life to come.

There is a temptation to dismiss the Enlightenment as being atheistic, but to do so would be inaccurate. Only in a few extreme cases were attempts made by Enlightenment thinkers to disprove the existence of a Supreme Being.

Instead, the *philosophes* were areligious. Although religion did not hold sway over them as it had over the medievalists, most of the Enlightenment's leaders did ascribe to various elements of religious teachings in their personal faith. For example, many of them were Deists and therefore believed in God as creator but not in divine immanence in history.

INFLUENCE ON RELIGION

Many post-Enlightenment Protestant theologians have synthesized this movement with orthodoxy to form a theology that is at odds with John Calvin's doctrine of predestination and Martin Luther's bondage of the will. Modern Protestantism accentuates personal accountability. The individual is believed to be able to exercise choice regarding his or her eternal destiny. Such a view was readily accepted by Puritan New England. The American colonists were rebelling against the authority of the Church of England. Their belief in the freedom of conscience was confirmation of a crucial link with an important tenet of the Enlightenment.

New England continued to abide by Calvinism's belief in hard work and thrift. The region also, however, came to incorporate the Enlightenment's teachings. As a result, American Protestantism, so far as salvation was concerned, moved toward an Arminian theology in which human individual freedom of choice was stressed.

The Enlightenment's view of humanity called for something other than a metaphysical solution to the problem of bringing into being a moral society. The *philosophes* devised a system that emphasized human choice. Providing a quasi-link with the rigidity of medieval theology, however, the Enlightenment did believe that laws could be found in nature. They believed that the laws that brought order to the physical environment could be studied and used in the social arena to form a moral society.

Thus, although the Enlightenment did emphasize individual freedom, it did not advocate anarchy. Natural law was believed to contain principles that would ensure societal advantages that included the recognition of the equality of human beings and the right to pursue happiness. While it was individualistic in its accentuation of freedoms, it was at the same time a submission to natural laws that called for order and continuity in both the physical and the social environment.

The *philosophes* believed that it was possible and even desirable that society should exist without religious supervision. They did not, however, advocate the abolition of religion as a necessity. Instead, they called for religious tolerance. Arguments in favor of this position particularly were characteristic of the English Protestants. Consequently, the post-Enlightenment United States (a former English colony) has adopted an official stance of separation of state and church. By not having a state religion, the country attempts to tolerate all faiths and to ensure personal freedom of religion.

INFLUENCE ON SCIENCE

With its probing nature, the Enlightenment was conducive to scientific investigations. Its rejection of unquestioned authority created a climate for scientific explorations, experiments, and resulting discoveries and inventions. This ushered in the Industrial Revolution, which has not only transformed but also expanded the world's economies. Out of this technological growth came the belief that human

beings were capable of shaping life's conditions. The optimistic view of progress swayed the post-Enlightenment world away from a reliance upon fate.

The post-Enlightenment world has come to depend more on human ingenuity to explain the causes of phenomena, including explanations for destructive storms, floods, and other natural disasters. The modern world is not inclined to attribute such events to acts of divine justice or the inevitable. Instead, it looks for causative factors and preventive measures that will deter or minimize future damages. Thus, the post-Enlightenment world depends on human effort rather than on religion or superstition to explain the unknown.

Unfortunately, post-Enlightenment manipulators have applied some of the *philosophes'* scientific cataloging to justify classism, racism, and ethnocentrism. By classifying humanity into various segments, these individuals have used the *philosophes'* efforts to bring about order to create disunity among human beings. By going beyond the species of *Homo sapiens* and classifying humans into races and classes, the post-Enlightenment manipulation introduced a stratified chain of being for humanity. This doctrine subverted the Enlightenment's attempt to recognize the equality that nature had decreed. Hence, scientific racism became a perverted use of the Enlightenment's doctrines.

INFLUENCE ON PHILOSOPHY

During the Middle Ages, philosophy and theology were one. Because of the Church's domination, it was considered sacrilegious to conduct speculative thinking that was independent of religious dogma. The few medievalists, such as Peter Abelard, who exercised some degree of free thought were ostracized and persecuted. The Enlightenment's philosophy, however, exemplified human reason as the avenue to truth. In fact, the Enlightenment's *philosophes* were also scientists; that is, they studied nature in the belief that it contained laws that brought order to the universe. This concept led them to classify and organize information into a system. As a result, the *philosophes'* most important form of publication was the encyclopedia, in which they cataloged scientific and philosophical knowledge. Natural law was perceived as governing not only the physical environment but also society.

This was a clear divorcement from medieval thinking. The *philosophes* did not believe that ethics could be mastered by studying metaphysics or religion. Thus, for ethics to be comprehended, it was believed that the student had to abandon metaphysics and religion. The Enlightenment viewed these disciplines as explanations for the imponderable.

The *philosophes*, again unlike the medievalists, did not concern themselves with otherworldly rewards and punishments. Instead, their focus was humanity's present situation. Thus, they attempted to discover natural laws that spoke to human behavior, government, and individual freedoms.

Because of this emphasis, the post-Enlightenment world has turned its attention toward the improvement of society. Disciplines such as sociology and psychology came of age because of the Enlightenment's scrutiny of humanity's problematic situation. The systematic study of these problems was a fundamental component of the development of the social sciences. The post-Enlightenment world has been much more understanding and helpful in treating mental disease. While the medievalist was prone simply to dismiss a disturbed person as one possessed by a demon, modern science has searched for the physical and psychological causes of mental disturbance. The net result of the advent of such social sciences has been the emergence of a more humane way of dealing with such patients.

The *philosophes'* views were widely dispersed. Their philosophy reached far beyond western Europe. The United States was particularly receptive to the positions expostulated by Montesquieu, Voltaire, Locke, and others. These Enlightenment thinkers came to have a basic and profound impact upon the American Revolution and the democratic government that was formed in the aftermath.

INFLUENCE ON POLITICS

The Enlightenment had a tremendous impact in the governmental sphere. Its philosophy of natural law became the basic argument for individual freedom, including the pursuit of happiness. Thus, the Enlightenment declared that the governed did not exist for the benefit of the governor. Jean-Jacques Rousseau espoused the view that government was really a contract between the governed and the governor, who had reciprocal responsibilities. Opposing arbitrary authority and the divine right doctrine, the

philosophes held that a citizen had rights that included expectations of the government.

Furthermore, the Enlightenment gave credence to the doctrine of the right to revolt. Whenever the government infringed upon citizens' individual freedoms, the citizens were justified in overthrowing that government.

While this doctrine legitimated the American and French revolutions in the eighteenth century, it was paradoxical to its contemporary practices of slavery and colonialism. Thus, while the Enlightenment ushered in a new era that was characterized by emphasis upon individual freedoms, it did not provide a clean break with the despotic past. Many of the violations that subverted the human being's pursuit of happiness would continue for many years, even in lands where the Enlightenment's principles had been formally adopted as the basis for government. These continued violations illustrated that many of the *philosophes* were overoptimistic. Their hope for an earthly utopia has continued to elude humanity even though reforms and democratic ideals have become diffused throughout the post-Enlightenment world.

INFLUENCE ON SOCIAL STRATIFICATION

Among the doctrines set forth by the Enlightenment was the equality of human beings. This idea was a radical departure from the medieval practice of feudalism. Under the *ancien régime*, a vassal would swear his fealty to a nobleman. The vassal was subservient to the nobleman in every way imaginable. His major assignment was to render service and obedience unto his lord (the nobleman). In no way did the serf consider himself to be on an equal basis with his master.

The Enlightenment was an integral part of the modernization of the Western world. As the growth of the middle class occurred, feudalism's structure of nobility and serfdom was challenged. Thus, the Enlightenment challenged this archaic stratification and at the same time served as an apologetic mechanism for the emerging middle class. In this way, the Enlightenment helped to pave the way for the spread of both democracy and capitalism. The Enlightenment's teachings regarding natural law and equality undermined the feudal structure. Thus, socially, post-Enlightenment society tended to be fluid. In modern democratic society it is reasonable to expect social and economic mobility. American optimism espe-

cially made the modern citizen believe that economic and social improvement is a reasonable expectation and perhaps even a right.

Yet despite the post-Enlightenment world's optimistic expectations, social stratification continues. Certainly, modern stratification in the industrialized countries is not as drastic as the plight of the medieval serf as contrasted with the comfortable life of the aristocratic nobility. Yet the dream of a classless society has proved to be an unrealistic aspiration. Even communism's imposition of a uniform dress code (as in the case of China) has not proved to be successful in producing a totally egalitarian society. Thus, the unattainable goal of a utopia free of classism again demonstrates the unrealistic expectations of some of the *philosophes*.

In fact, the post-Enlightenment world has not completely obliterated feudalism. The remains of this medieval institution can certainly still be found in the military and in the business world's corporate culture. Despite this structure, however, the Enlightenment has influenced these modern organizations. There are rules that the rulers are expected to follow, and if they do not, they can be replaced. Thus, despite the military and corporate hierarchy, the post-Enlightenment world does demand personal accountability from all.

CONTRIBUTION

Post-Enlightenment ethics are characterized by an appreciation for individual freedoms, democratic government, and an optimistic belief in human progress. As a result, society has become less staid and evasive of human accountability. Post-Enlightenment ethics do not ascribe blame for accidents and disasters to God or fate. Instead, human ingenuity and negligence are cited as factors in bringing about either success or failure. Such thinking has given birth to two opposing positions. Fatalists have used aspects of the Enlightenment to classify humanity into groups that range from the primitive to the most advanced. By doing so, they have maintained the inequities that were part of the *ancien régime*. Such misuse of the Enlightenment has subverted its aspiration for a totally reformed society. Yet the Enlightenment has also helped to inspire democratic ideals and universal fraternity. Since these noble ideals are not fully attained, it might be said that the Enlightenment is still in progress.

Postmodernism

DEFINITION: Group of aesthetic and theoretical responses to late twentieth century political, economic, and social life

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Postmodernism is a largely celebratory movement, advocating and enjoying the chaos, fragmentation, and commodification endemic to contemporary capitalist society. Its embrace of ethical ambiguity has been criticized both by those who advocate a return to traditional ethical values and by those who see it as inappropriately upholding traditional capitalist values such as individual choice and personal preference.

In 1907, Pope Pius X wrote an official letter condemning what he called “modernism.” His letter

charged that modernists were denying the Church’s ancient traditions. In fact, modernism often implies the sense of an antitradition, and the pope feared that modernist ideas would necessitate a devaluation of papal authority and historical legitimacy.

Modernity, that is, the era beginning with the Industrial Revolution and ending some time in the second half of the twentieth century, was a time of rapid scientific, technological, and economic development in much of the world. The values both of tradition and of progress were constantly at issue and constantly questioned. There were two responses to this movement, one positive and one negative. On the positive side, during the modern period, there was a general feeling of impatience with the past and a popular optimism toward the future. There was a sense that perfection is possible for human society. Science, technology, and human reason could create a utopia for the world in which people would live good lives in peace and harmony. Ancient traditions no longer provided the means of future progress and advancement, and so had to be left behind.

On the negative side, however, many writers, artists, and intellectuals responded to this conception of technology and reason with skepticism. Their work decried the mechanization and rationalization of human society. They saw humans being replaced by machines and, even worse, a tendency to see the human as a type of machine. These “modernists” believed that the problem with modernity lay in the invention of a new sort of culture, mass culture, which produced artworks, as well as electronic, automotive, and other products, on a mass scale. Mass culture was seen as a culture of technology and the rational marketplace, rather than a culture beauty and artistic value. Modernism was a largely pessimistic reaction against modern mass culture, an attempt to “rescue” the category of high art from the “degradations” of the masses.

POSTMODERN SKEPTICISM

The modernist skepticism toward traditional models of progress that had led to the creation of mechanized, mass culture was amplified in the late twentieth century. As capitalism developed and became global, modernity developed into postmodernity. The general public began to believe that their earlier optimism had been unwarranted. Science and technology did have good effects, but there was a dark side for

every advance. With new technology came pollution, for example, and more advanced means for conducting war.

At the same time, the globalization of mass culture brought radically different value systems into intimate contact with one another. The result was a heightened awareness that not all races and nationalities thought the same way. Knowledge which once had seemed objective and universal was revealed to be the perspective of one particular group. Postmodernity, then, brought about a popular acceptance of the skepticism that had been expressed only by individual intellectuals in modernity. The notion of a universal ethics that would apply to all people came to seem implausible.

Ironically, some creators of art and literature in postmodernity began to celebrate the very fragmentation of traditions and values that had seemed so foreboding to the modernists. New kinds of aesthetic movements developed which, far from “rescuing” art from mass degradation, celebrated mass culture and denied that there was any difference between high art and popular culture. These movements were identified as examples of “postmodernism.” Modernism and postmodernism thus tended to agree as to the nature of reality, identity, and values—but where modernism resisted the death of tradition, postmodernism reveled in it.

EXAMPLES OF POSTMODERN ETHICS

Postmodernism views ethics as something which has to be decided by the individual or group. Various races and cultures, for example, have diverse ways of living and speaking, thus making it difficult to state uniformly what is right and wrong. In postmodernity, there is an explosion of diversity in all aspects of life, and postmodernism celebrates that diversity. From one point of view, heterosexuality is normal, whereas from another, homosexuality seems right. The American desire to bring democracy to the world seems to some to be a lofty and honest goal. But a postmodernist view states that this is merely one story that can be told about the role of the United States in the world, and others may be equally valid.

Changing roles for men and women provide another example of diversity. In modernity, women were the housekeepers and men were the breadwinners. Role reversals have brought about confusion and disorientation as to what vocational choices to

make. In postmodernity, it is not possible to state, in principles that hold for all people, what is right and wrong, ethical or unethical.

Potsdam Conference

THE EVENT: Final meeting of the Allied leaders of Great Britain, the Soviet Union, and the United States during World War II

DATE: July 17 to August 2, 1945

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Over the course of the Potsdam Conference, long-standing ideological and ethical differences between the United States and the Soviet Union emerged to solidify the territorial and economic dismantling of Germany and lay the foundations of the Cold War.

In the Berlin suburb of Potsdam, the Allied powers met from July 17 to August 2, 1945, to strengthen their resolve to defeat Japan and to decide how to put the world back together after the shattering experience of World War II had ended. Joseph Stalin, who had been cunning and brutal in securing control at home, was bent on exploiting the Soviet Union's victory after the war. President Harry S. Truman, the

naïve idealist who believed implicitly in his country's innate goodness, had faith in the principle of international cooperation. Great Britain sided with Truman, who demanded that free elections be held in eastern European countries that, it was charged, had unfairly been made satellites of the Soviet orbit of control. Stalin refused.

War damages, or reparations, were another crucial issue. The Soviets wanted to rebuild their war-torn economy with German industry; the United States feared that it would be saddled with the entire cost of caring for defeated Germans. Each side ended up taking reparations from its zone of occupation, and Germany was divided in two without input. The growing antagonism between the United States and the Soviet Union resulted in the Cold War.

Poverty

DEFINITION: Condition of having insufficient resources or income to meet such basic human needs as nutrition, clothing, shelter, and health care

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Political philosophers and social activists often appeal to competing moral bases to ground their arguments about alleviating poverty. Arguments and rationales include individual rights to life and property, mutual and intergenerational obligations of citizens, legitimacy of the state, and obligations of affluent nations to poverty-stricken nations.

Welfare provision as a matter of charity is based on the notion that individuals have no moral right to what they receive because no one has a right to another's charity. People have a right to acquire and retain goods and resources by initial acquisition or by voluntary agreement. Welfare provision as a strict obligation for those with resources implies that those in need have moral claim on more affluent persons. One's right to life means more than the right not to be killed unjustly. It implies a moral claim compelling more affluent persons to relinquish part of their surplus wealth on behalf of poor persons. However, the principle generally assumes that poor persons do all they legitimately can to meet basic needs.

In the absence of strict moral claims, poor persons are dependent on others' beneficence, which may or may not be forthcoming. A duty to be benevolent, based on welfare as charity, obligates those with resources only to assist people whom they choose to assist. It cannot be enforced under equal rules for all, and it favors private, nonstate forms of provision. The role of the state is residual. Government acts as a safety net when private sector welfare is inadequate. Conversely, the strict obligation view of welfare implies that individuals have a right to such provisions. The state not only must ensure that such rights are protected and applied equally, but it also should be instrumental in welfare provision. The state's legitimacy in part derives from its welfare providing functions.

ETHICS OF RELIEF

The ethics of relief obligate charitable organizations and governments to assist those who cannot meet their own basic needs. Political philosopher James Sterba argues that poor persons have a moral claim on the surplus resources of the more affluent. Sterba's argument that the needs of the poor take priority over the liberty of the affluent persons to meet luxury needs conflicts with the views of libertarian and liberal political philosophers. For example, Robert Nozick maintains that the only claims to welfare help that can be justified are from those whose poverty has resulted from some form of social injustice, such as discrimination.

ETHICS OF PREVENTION

The ethics of prevention concern what must be done to reduce future poverty. Economist Gordon Tullock has suggested that if income were redistrib-

uted to alleviate poverty in the United States, one of the effects would be to slow the rate of economic growth by approximately 2 percent annually. After about fifteen years, the consequent reduced economic growth would leave people at the lower end of the income scale worse off than if no transfer of income had taken place. Likewise, if affluent countries were to redistribute wealth to the poorest countries, the consequent reduction in the rate of economic growth in the United States would reduce the rate of growth in the recipient countries because the United States would be consuming less of the world's goods. Over time the cumulative effects would worsen poverty in the poor countries.

The ethics of relief and of prevention are affected by the closeness of the relationship between providers and receivers. There is much less moral ambiguity around alleviating poverty among more immediate family members, other relatives, or close friends. More distant family members, acquaintances, or strangers are more ethically problematic. As Sterba notes, however, no one is morally required to do either what is beyond their power to do or what would entail too great a sacrifice. Setting limits on efforts to alleviate poverty is permissible to the extent such efforts result in immense personal or social sacrifice on those who are not poor.

Poverty and wealth

DEFINITION: Poverty: lack of sufficient material resources to sustain oneself, or of extraneous or luxury possessions; wealth: abundance of material resources and riches

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: The extreme disparity of wealth levels between industrialized and developing nations may raise significant ethical issues relating to social and distributive justice, especially since the wealth of industrialized nations is largely maintained and increased at the direct expense of developing nations. Many members of the industrialized world, however, would disagree with this statement, arguing that the poverty of others creates no obligation on the part of the wealthy and that global free markets are in the long-term interests of all people.

Nonindustrialized, or developing, nations cover 60 percent of the world's land surface and include 70 percent of the world's population. They form a much less homogeneous group than do the major industrialized nations, since they represent a wide variety of social, economic, cultural, political, and geographical environments. Unfortunately, what developing nations do have in common is a marked socioeconomic disadvantage that manifests itself in weak economies, overpopulation, and widespread poverty.

In developing nations, poverty is pervasive both relative to industrialized nations and on an absolute level. State welfare systems are either inadequate or nonexistent, and for that reason millions of people are malnourished and die in periodic famines. Housing and shelter are often inadequate.

Developing nations are characterized by weak economic systems; low agricultural productivity; an undeveloped industrial base; limited technology; limited purchasing power; overreliance on a small number of export products, making their economies particularly vulnerable to fluctuations in supply and

demand; and reliance on foreign investments and the importation of industrial equipment.

Developing nations also have demographic deficiencies, such as low life expectancy at birth, high rates of infant mortality, large families, rampant disease, and high rates of infection. These countries also tend to have incompetent governments that are characterized by poor administration, widespread corruption, lack of opportunity and high unemployment, glaring inequities between social classes, a disproportionate concentration of wealth and power in the hands of a ruling elite, and insufficient resources devoted to social programs and education (impoverished sub-Saharan countries continue to spend two to three times as much on armaments as on education). Because of such inequities, the best-educated segment of the population may leave; for example, during the 1980's, one-third of Africans with a post-secondary education emigrated to Europe.

It is obvious that there is an enormous disparity between the developed and the underdeveloped world in terms of the distribution of wealth and power, and this disparity appears to be growing according to reports of the United Nations Development Program. Income disparities between the richest and the poorest 20 percent of countries more than doubled between 1960 and 1990. As of 1992, the average income gap was more than 140 to 1 (\$22,808 to \$163). In terms of control over economic activity, in 1989, the richest 20 percent of nations controlled between 80 and 95 percent of total gross national product, world trade, commercial lending, domestic savings, and domestic investment. The poorest 20 percent of countries controlled between 0.2 and 1.4 percent of economic activity.

ETHICS AND THE WEALTH OF NATIONS

Most developing nations are in a relationship of unequal exchange with the countries of the developed world. One theory maintains that the way to decrease this inequality is to redistribute wealth. Central to this strategy is the belief that economic interaction is a zero-sum game; that is, that as one nation acquires more wealth and becomes richer, another nation loses wealth and becomes poorer. As Marjorie Kelly put it: "Wealth is made on the backs of the poor." Therefore, if the developed countries are hoarding all the wealth and this wealth is generating poverty in the undeveloped nations, poverty can be

wiped out by redistributing the wealth from developed to undeveloped nations. Examples of this theory being put into practice include the Peace Corps, foreign aid, and low-interest loans or grants that are provided by the World Bank and the International Monetary Fund.

The concept of redistribution may be ethically laudable, but it has not worked in practice, as is indicated by the growing disparity between developed and undeveloped nations. The zero-sum theory says that significant improvement in the well-being of nonindustrialized countries can occur only if a significant decline in the well-being of industrialized countries occurs simultaneously. A similar rationale works on a smaller scale for the powerful interest and economic groups within nonindustrialized countries that have monopolized the wealth of those countries. Clearly, these nations and groups have not been willing to undertake such a level of redistribution. In fact, the data suggest that they are accumulating an even greater share of the wealth. According to Jacob Needleman, "The outward expenditure of mankind's energy now takes place in and through money." Marjorie Kelly observed that one of the consequences of this single-minded accumulation of money is that "we have come to lack a sense of financial obesity: a cultural consensus that enough is enough and too much is grotesque . . . we lack any . . . revulsion to vast sums of money."

Kelly argues that a solution to this problem may be to recognize that equality of wealth is impossible to achieve. Kelly suggests that one solution might be to encourage the creation of wealth that does not cause poverty, creating a win-win situation, an ethically earned prosperity that also makes others prosperous. For example, a product is sold by a company to customers who become prosperous by using the product. Kelly's idea is interesting, but it is not clear on what scale a win-win situation could operate globally. In addition, the success of such a strategy hinges on—as Kelly noted—a duty on the part of the wealthy to care for those who do not have wealth. The fact that affluent nations are becoming wealthier while developing nations sink deeper into poverty suggests that Kelly's sense of duty has not yet achieved recognition or high priority.

Power

DEFINITION: Ability to produce effects

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Power is arguably the thing which ethics is designed to regulate: One's actions and even one's existence are morally significant only to the extent that one has recognizable effects upon oneself and others. For philosophers like Michel Foucault and Friedrich Nietzsche, power—that is, the sum total of one's effects—is synonymous with existence.

Power is often confused with authority, but power is distinct from authority. In general, power implies an ability or capacity of some sort. More particularly,

power implies an ability or capacity to exercise influence, control, or dominion over others. Authority is the legitimate right to use power. Not everyone, however, believes in the separation between power and authority. Despots, tyrants, and dictators eschew legitimacy and wield authority like a sword. Vladimir Ilich Lenin viewed the rule of the Communist Party, the dictatorship of the proletariat, as being based on brutal force, unlimited by any laws or rules. Mao Zedong identified power with authority. One has authority because one has power to rule. "Political power grows out of the barrel of a gun," said Mao. This article will focus on the sources and nature of power.

POWER AS KNOWLEDGE

Power has been identified with knowledge, freedom, justice, and political authority. In Plato's allegory of the cave, knowledge is likened to the power that emancipates slaves of sensory perception from the darkness of ignorance to the bright light of intellectual knowledge. Francis Bacon claimed that knowledge is power. In the *Advancement of Learning* (1605), he wrote, "For there is no power on Earth which setteth up a throne or chair of estate in the spirits and souls of men, and in their cogitations, opinions, and beliefs, but knowledge and learning."

POWER AS FREEDOM

Thomas Hobbes, Baruch Spinoza, Immanuel Kant, and Jean-Paul Sartre understood freedom to be the source of power. Hobbes argued that the social contract came about by means of the surrender or alienation of natural freedom to society. Hobbes wanted to place all power in the hands of the sovereign. Spinoza identified freedom as power—power to act, power for self-preservation. Spinoza defined power as *conatus*, the special propensity or capacity of a thing to perform; in short, the freedom of self-preservation. Kant postulated that human beings have free will to impose laws upon themselves; that is, human beings have moral autonomy or freedom, which is the source of power. Sartre believed that freedom was the power of self-determination.

POWER AS POLITICAL AUTHORITY

The Greek Sophist Cratylus, a skeptic and relativist, claimed that the law of right is the law of the strongest; in other words, power is right, power is jus-

tice. This ethic was taken over by the argumentative Sophist Thrasymachus. Plato's *Republic* opens with a discussion between Socrates and the aged Cephalus over the meaning of life, which leads to the question of the just life. Having asked for a definition of justice, Socrates receives a reply from Polemarchus, son of Cephalus, who argues on the authority of the Greek poet Simonides that justice is to give to each what is owed. In the course of the discussion, a frustrated and impatient Thrasymachus charges into the debate. Justice, he argues, is whatever brings advantage to the stronger or to established rule. At the end of the argument, Thrasymachus winds up defending injustice as being more valuable than justice, because injustice can be used to the advantage of the stronger. In effect, Thrasymachus defines justice as power.

JOHN LOCKE AND KARL MARX

John Locke identified political power with legitimate authority. In the *Second Treatise of Government* (1690), Locke differentiated political power and despotical power. The difference consisted in the fact that political power is legitimate authority, whereas despotical power is arbitrary. Political power is founded on the social contract, in which self-rule is willfully handed over to society for the common good and for protection. Despotical power is simply arbitrary power over other persons.

Karl Marx claimed that political power can be explained in terms of economic relations of property ownership; therefore, he viewed power in capitalist society as exploitation. For Marx, private property is the source of social power. Marx believed that private property ownership patterns created asymmetrical relations of power resulting in the development of two classes: the exploiting class and the exploited class. The property-owning classes are the exploiting classes because they exploit the labor power of the non-owning classes. Workers must enjoy freedom from servitude and must be propertyless. The reason that capitalist power is exploitative is that capitalist society must constantly renew its conditions of existence by ensuring that a sizable percentage of the population remains propertyless and therefore subordinate to the dominant class. The worker has no choice, if he or she wants to survive, but to appear on the labor market as a commodity to be bought and sold. Power over others, therefore, grows out of unequal property relations.

Max Weber, unlike Marx, found sources of power outside the economic realm. Power may flow from the possession of economic or political resources. High positions may also confer power.

MACHIAVELLI

Niccolò Machiavelli wrote *The Prince* (1513) and dedicated it to Lorenzo de Medici, hoping to attract the attention of the Medicis. *The Prince* has been called a grammar of power, and for good reasons. The book was written about the acquisition of absolute power. *The Prince* was taken from the *Discourses*, which set forth several principles: the superiority of the democratic republic, reliance upon mass consent, organic unity, the role of leadership in achieving cohesiveness, the imperative of military power, the use of national religion to unify the masses and to cement morale, the will to survive and ruthless measures, and the cyclical rise and fall caused by the decadence of the old and reinvigoration of the new. Although *The Prince* can be studied in the context of the Mirror of Princes Literature, a genre that flourished during the Middle Ages and depicted princely virtues, it signified a revolutionary turn in political thinking by rejecting ethics and metaphysics and espousing political realism.

Machiavelli refused to imagine human beings as they ought to be; instead, he employed as his starting point the realistic acknowledgment of human beings as they are. Machiavelli believed that ideals and ethics were ineffective in government. Chapters 15 through 19 of *The Prince* are the most radical. These chapters deal with the qualities that a prince ought to possess. The prince is advised to disregard the question of whether his actions should be called virtuous or vicious. The choice of action, Machiavelli claims, depends not upon ethics but upon circumstances. Machiavelli was not concerned with good or evil, but with effective government; not with virtues, but with *virtù*, or vitality. Chapter 14 stresses the primacy and necessity of brute power being employed for strategic ends—in other words, war. For Machiavelli, the prince has no other aim but war. The prince is counseled to learn war through action and study and to know and defend even in peacetime.

THOMAS HOBBS

Thomas Hobbes defined the nature of political power in *Leviathan* (1651), which contains a power-

ful argument on behalf of strong government. Hobbes wrote *Leviathan* while exiled in Paris from the English Civil wars. Hobbes's aim was to unite Church and state into one powerful structure. Holding to a mechanical view of the universe, he naturally constructed his theory of human nature on the basis of mechanistic principles. For example, he depicted the human mind as a function of the nervous system. Chapter 13 contains the famous passage called the "Naturall Condition of Mankind." Hobbes claimed that the state of nature is a state of war because of human equality (for example, a small man could kill a big man with a rock). Human life in this natural state is "solitary, poore, nasty, brutish, and short." Power is socially and equitably distributed. In order to gain mutual protection, and because human beings enjoyed a natural rational propensity to seek peace, a commonwealth was in order. Such a commonwealth would be formed by a compact in which each individual agreed to allow as much liberty to others as he or she would expect to enjoy. By forming a compact and mutually renouncing individual freedom and power, the members of society would grant absolute power to the sovereign. Only the government, then, could assign rights and determine justice.

FRIEDRICH NIETZSCHE

Friedrich Nietzsche, in *The Dawn* (1881), *The Gay Science* (1882), *Beyond Good and Evil* (1886), *The Will to Power* (1901), and *Thus Spoke Zarathustra* (1883), made power an interpretative principle of human behavior and morality. The will to power is at the heart of his philosophy. He pointed out a dualistic morality—a slave morality, or herd morality, versus a master morality. The slave morality was guided by resentment against the successful, wealthy, and powerful. The superman (*Übermensch*) appears as the Nietzschean hero who affirms life and recalls Wolfgang von Goethe's Faust, who symbolized the ever-striving, never satisfied power of the human spirit. "Dead are all gods; now we will that superman live." Superman is the goal of history. In *The Antichrist* (1895), Nietzsche defined the good as power. "What is good? Everything that heightens the feeling of power in man, the will to power, power itself."

MICHEL FOUCAULT

Foucault was one of the brightest luminaries to grace the French firmament of intellectual thought in

the twentieth century, and his influence can be felt throughout the academic world of the West. His major contribution to social thought was the stimulation of new thinking about power. This concept is central to his social and political critique. In it, he thinks he has found the Archimedean point with which to understand the systems and structures of rationality, political authority, and science. However one may conceive of Foucault's use of the concept of power, there is no way to interpret his project of contemporary historical analysis without tackling the ineluctable idea of power.

Power for Foucault is not some kind of substance. It is neither an essence composed of definable qualities nor an ontological category representing some real entity. Instead, power is an abstract configuration, an abstract possibility of relations of force. Foucault conceives of power in essentially nominalistic terms. "Power in the substantive sense, *le pouvoir*, doesn't exist. . . . In reality power means relations, a more-or-less organized, hierarchical coordinated cluster of relations." Relations within the social body make the presence of power ubiquitous. This is the case because Foucault views power coterminously with the conditions of social relations. What is revolutionary about Foucault is his localization of the mechanisms of power in the apparatuses outside the state. He locates power, or "micro-powers," on the mundane, quotidian level of familial relationships, kinship systems, local administrations, and so forth. He cautions, therefore, that unless the mechanisms of power that function outside the state are changed, nothing in society will be changed. Foucault then locates power at every point of society. In fact, he contends that the functioning of the state depends on concrete power relations diffused throughout the social body. Power functions at myriad points of social contact and has myriad effects.

Foucault thinks of power as having "capillary" forms of existence—the capillaries being the points at which power enters and invests itself in individuals. It is at this level that power becomes productive of social knowledge.

The functioning of power creates new bodies of knowledge. Power and knowledge are inexorably connected. One cannot exist without the other. Power is constrained to produce knowledge, and knowledge cannot escape engendering more power. Foucault does not mean the same thing by power/knowledge

that members of the Frankfurt School meant by reason/domination. Foucault is not trying to unmask the oppressive systems of the dominant classes. Instead, he is attempting to locate the points of intersection of power and knowledge as they are dispersed strategically throughout the social body.

THE INDIVIDUAL IN SOCIETY

What part does the individual play in the process of the determination of power within the social body? Foucault seems rather ambiguous concerning the individual subject and the problem of subjectivity. On one hand, he says that it is the position of the subject that exercises power, not the individual; on the other, he says that power is exercised in the very bodies of individuals. The effects of power invest themselves in the bodies of individuals. Biopower (also called political technology) and biopolitics refer to the control of species and the control of the body. Political technology leads to the categorization of human species and converts the human body into an object to be manipulated (disciplinary power). The aim is to create a docile and productive body. Biopolitics depicts the individual as an object of political concern for the purpose of normalization.

In *Discipline and Punish* (1979), Foucault presents power as the force of normalization and the formation of knowledge. Normalization and knowledge invest the body, the individual, the masses, and the body politic. "The soul is the effect and the instrument of a political anatomy; the soul is the prison of the body." Through knowledge, power moves to a new level. Knowledge is power over people that ends up normalizing people and standardizing them in the factory, school, prison, hospital, or military.

Power is not built up of individual wills. Individuals and subjects are not particular powers, they do not possess power, and power does not emanate from them. Yet all individuals are subjects in a universal struggle in which everyone fights everyone else. There is, for Foucault, no such thing as an oppressor/oppressed polarity such as the Marxist class struggle between the proletariat and the bourgeoisie. Forms of rationality other than the economic enmesh themselves in the institutions and domains of society, engendering effects such as sexism and racism.

At his inaugural address at the Collège de France, France's most distinguished academic institution, Foucault presented a discourse about discourse enti-

tled "L'Ordre du discours." In it, Foucault argues that the production of discourse is controlled by procedures of exclusion, sexual and political prohibition, taboo, ritual, and the right to speak. The will to knowledge leads to a system of exclusion that relies on institutional support. Procedures arise for the control of discourse, systems of restriction, conditions, and rules of access. The number of those allowed to participate is small. Ritual defines qualifications, gestures, behavior, and circumstances. Societies of discourse preserve discourse within a restricted group.

For Foucault, then, power is a heuristic principle, or explanatory rule, for understanding social practices. He corrected the too-long-held view that power is exclusively repressive or constraining. In fact, what Foucault demonstrated was the insidious way in which power produces conformity, legitimizes political power, and creates exclusionary forms of knowledge.

Michael Candelaria

FURTHER READING

Allen, Amy. *The Power of Feminist Theory: Domination, Resistance, Solidarity*. Boulder, Colo.: Westview Press, 1999. A feminist critique and theorization of power, focusing on the work of Foucault, Judith Butler, and Hannah Arendt.

Foucault, Michel. *Discipline and Punish: The Birth of the Prison*. Translated by Alan Sheridan. New York: Vintage Books, 1979. This work concerns itself with the expression of power in penal institutions and the development of disciplinary techniques that can convert the body into a docile instrument.

_____. *Power/Knowledge: Selected Interviews and Other Writings, 1972-1977*. Edited by Colin Gordon. Translated by Colin Gordon et al. New York: Pantheon Books, 1980. Essays and interviews that concentrate mostly on the issue of power and its pervasive presence in every area of human life, especially in human bodies. It also deals with penal institutions, the Panopticon of Jeremy Bentham, health institutions, and the history of sexuality.

Hobbes, Thomas. *Leviathan*. Edited by Richard Tuck. Rev. student ed. New York: Cambridge University Press, 1996. This masterpiece of political literature contains a powerful argument for a strong authoritarian government. Its subjects include social contract theory, the state of nature, the mechanistic view of human nature, naturalistic ethics, and the unity of Church and state.

Kaplan, Laura Duhan, and Laurence F. Bove, eds. *Philosophical Perspectives on Power and Domination: Theories and Practices*. Atlanta: Rodopi, 1997. An anthology of essays on power written from a wide variety of perspectives. Explores such issues as the relationship of individual identity to global networks of power, and the relationship of theory to practice.

Machiavelli, Niccolò. *The Prince*. Edited and translated by Angelo M. Codevilla. New Haven, Conn.: Yale University Press, 1997. This masterly analysis of power was written during a time when there was a growing need for the centralization of the Italian city-states, an increasingly nationalistic ethos, and a restoration of the Medicis to power in Florence. Although *The Prince* was written to gain favor with the Medicis, its aim was to describe how principalities are won, held, and lost.

Nehamas, Alexander. *Nietzsche: Life as Literature*. Cambridge, Mass.: Harvard University Press, 1985. A superb explication of Nietzsche's philosophy. Chapter 3 is one of the best readings extant of Nietzsche's doctrine of the "will to power."

Nietzsche, Friedrich. *The Portable Nietzsche*. Edited and translated by Walter Kaufmann. New York: Viking Press, 1984. Most of the works contained here are new translations by Kaufmann. Included are the entire text of *Thus Spoke Zarathustra* and selections from works such as *Beyond Good and Evil*. Also includes letters and notes.

SEE ALSO: *Beyond Good and Evil*; Dirty hands; Foucault, Michel; Freedom and liberty; Hobbes, Thomas; *Leviathan*; Locke, John; Machiavelli, Niccolò; Marxism; Nietzsche, Friedrich; Politics.

ETHICS

Revised Edition

This page intentionally left blank

Practical reason

DEFINITION: Justification for taking action

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Theories of practical reason try to answer such questions as why one should be moral, whether it is always rational to act on moral requirements, and if human beings are inherently selfish.

The difference between practical and theoretical reason rests on a distinction between two types of reasons. A practical reason—such as the need to help people in trouble—gives one a reason for doing something. A theoretical reason—such as “ $7 + 5 = 12$ ”—gives one a reason for believing something. Some argue that by nature people act only for selfish reasons. Thomas Hobbes, the founder of modern egoism, is the most influential defender of this view. Most theories of practical reason attempt to refute egoism by proposing standards for moral decision making. These standards are supposed to show that human beings have reasons to be moral that are not based exclusively on self-interest.

Each of the three dominant theories of practical reason defends a conception of practical reason that can be traced back to its founder. The ancient Greek philosopher Aristotle argued that a virtuous person is someone who knows how to act in ways that promote the virtuous life. A benevolent person, for example, knows that it is good to help others in need. The practical reasoning of a benevolent person is motivated by the desire for beneficence and the knowledge that beneficence is a virtue. Practical reasoning thus involves putting moral knowledge into practice by acting morally.

The eighteenth century English philosopher David Hume argued that practical reason is always motivated by desire. For example, having a desire to relieve someone's suffering counts as a reason for acting. Moreover, unless a desire is present a person cannot have a reason for action. Hume and his followers believe that the reasons people have for acting morally are usually not selfish reasons. Because people are generally believed to have a natural sympathy for the plights of others, they have a natural desire to act morally.

The late eighteenth century German philosopher Immanuel Kant claimed that it is possible to act from

a reason even if one has no desire to do so. According to his view, a moral reason is a requirement of rationality; a moral reason is also a practical reason because it specifies an action that a person should perform. Rational people, so far as they are rational at the moments of action, will know that they have a duty to assist those in need. Kant therefore rejects the claim that a reason for action presupposes a desire. For Kant and his followers, sometimes morality requires acting on reasons that conflict with human desires. Contemporary ethicists usually defend a version of one of these positions.

Pragmatism

DEFINITION: School of philosophy which asserts that ideas should be understood as practical entities

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Pragmatism holds that thought is essentially a guide for action. Therefore, ideas acquire their meanings from their practical consequences, and truth is defined as whatever it is useful to believe. Pragmatist ethics tends to be situational and consequentialist, since it focuses on the useful effects of moral values in particular contexts.

Pragmatism was initiated by Charles Sanders Peirce and William James and developed by John Dewey and George Herbert Mead; it has been revived since the 1970's. Responding to Darwinism, Peirce and James viewed thought as a process within the whole context of life-activity. In his foundational essays

“The Fixation of Belief” (1877) and “How to Make Our Ideas Clear” (1878), Peirce argued that thinking arises from a disturbance in action and aims at producing a belief that more successfully guides future action. Beliefs are not mental states but organic dispositions or habits. James popularized the term “pragmatism” first in 1898 and then in the famous lectures published as *Pragmatism* (1907).

For Peirce, pragmatism was a general theory of meaning, while James stressed the view that “truth” means “workability.” Mead explored the implications for social psychology. John Dewey developed it into a rich theory of human existence and conduct, including ethical, social, and political philosophy, often known as “instrumentalism” but more correctly called “Cultural naturalism.” (Instrumentalism, the theory of intelligent inquiry, is part of Dewey’s general theory of experience, ranging from prereflective feelings to refined aesthetic and religious meanings.)

Dewey begins by seeing humans as living organisms acting within and responding to their environments. People are neither predetermined mechanisms nor purely independent. Action is a feedback process of learning, operating within certain constraints but capable of a variety of developments. As cultural beings, people also live in a social environment in which the experience of others shapes their own conduct. The process of learning, then, offers a third alternative for moral theory. “Morals means growth of conduct in meaning,” says Dewey. “It is learning the meaning of what we are about and employing that meaning in action.”

For Dewey, ethics deals with all human action. It legitimately involves obtaining reliable information; broad experience; skills in communication, cooperation, and deliberation; educational and political organization; and the creation of new values and ideals. Ethics, in short, is the art of rendering human existence as meaningful and intrinsically fulfilling as possible.

REALIZING AIMS

Like any art, ethics is concerned with the techniques whereby its aims may be realized. In this sense, it is experimental and gains insight from the success of the scientific method. Dewey denied that ethical problems should be handed over to the social sciences or some managerial elite, but he hoped that the cooperative, experimental attitude of science

could be widely inculcated for framing tentative solutions to social problems that leave many human lives devoid of hope or meaning. By seeing the moral life as capable of being guided by a variety of intelligently undertaken experiments instead of as the subject matter for formal principles of ethical judgment, Dewey thought, it might be possible to improve the human condition.

Out of native impulses, desires arise, leading to actions that form habits. Habits “constitute the self,” becoming one’s character. They lead to certain kinds of further action that may cause reevaluation of past desires, a transformation or enlargement of them with respect to their objects, or a deepening of their meaning with broadened experience. Although Dewey agrees with Aristotle that action and habit are the basis of character, he finds no one fixed and defining virtue. The self is a process, Dewey states: It “is impossible for the self to stand still, it is becoming and becoming for better or worse. It is in the *quality* of becoming that virtue resides. We set up this and that end to be reached, but *the* end is growth itself.” Although he rejects absolute values, Dewey is no subjective relativist; instead, he is a contextual pluralist. The good self is one that is informed about its world, grasps the tendencies of situations, and deliberates well about possible ends and the means required to realize them.

Deliberation includes the imaginative search for ideals of conduct and the discovery of new values. Only in a derivative sense is it understood as the mere search for means to preselected ends. Two children fighting over a ball may discover the game of catch, discovering the new value of cooperative play and friendship, transforming the old values of possessiveness and dominance. Deliberation is not primarily a private affair; one deliberates alone because one has deliberated aloud with others. Ethical reasoning, then, is no calculative or rule-bound procedure but is fraught with imagination, dialogue, and dramatic interpretation. It aims to understand the meaning of a present situation by determining its tendencies and the possible values that they realize. An event gains meaning within an overall process. By seeing the actual in the light of the possible, one can make intelligent choices and critically evaluate one’s conduct. One can grow intelligently. This is Dewey’s understanding of freedom.

A society incorporating such behavior would pro-

vide the most secure basis for democracy as a way of life. Civilization would be no abstract ideal but would concretely aim at every means possible to realize conditions whereby human beings could lead inherently significant lives.

Premarital sex

DEFINITION: Sexual contacts between unmarried partners

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Premarital sex is a subject of significant moral controversy; sexual ethics are used to assess the morality of sexual practices in terms of how they affect human welfare.

At the beginning of the twenty-first century, premarital sex remained one of the most controversial subjects in most cultures. Most guidelines for acceptable sexual behavior in the Western world are derived from religious teachings and cultural traditions. In

most cases, the official viewpoint is that sex outside committed married relationships is discouraged if not prohibited. Despite this doctrine, the vast majority of people have sexual experiences prior to marriage.

Sexual ethics revolve around concerns about human welfare. Sexual behavior is deemed moral when it is determined that it does not harm the partners who are involved. To that end, it is essential that sexual relationships be based on mutual consent, equality, and reciprocity. Herein lies one of the challenges of sexual ethics. In cultures such as that of the United States, in which a double standard for sexual conduct prevails, mutual consent is sometimes difficult to assess. Because of taboos and religious proscriptions, some people may choose to enter sexual relationships with reservations. If one partner in a sexual encounter between two people participates with some reluctance, does that qualify as mutual consent?

Two broad ethical perspectives on premarital sex are evident in most Western cultures. The conservative ethical viewpoint is influenced by traditional religious teachings. The liberal ethical viewpoint is a secular perspective prevalent in the media.

CONSERVATIVE AND LIBERAL VIEWPOINTS

The conservative stance advocates a conventional morality that is congruent with most Judeo-Christian teachings. From this perspective, individuals are expected to conform to explicit rules. The conservative stance is viewed as absolutist and legalistic. Moral precepts should guide all sexual practices, and no person is exempt. This perspective is also viewed as restrictive in that its intent is to limit the range of acceptable sexual practices. For example, one viewpoint, consistent with traditional Christian doctrine, considers heterosexual intercourse in marriage to be the only morally acceptable form of sexual behavior.

The liberal viewpoint is less cohesive than the conservative viewpoint. In general, though, this approach is sometimes referred to as the new morality and situational ethics. From this perspective, the morality of sexual choices can only be gauged according to the situations or contexts. For example, one possible context for acceptable premarital sex is a caring committed relationship. In most Western cultures, mutually consenting sexual behavior between two adults in a committed relationship is viewed as acceptable by the majority of people.

The liberal perspective is often described as tolerant and permissive because its proponents often argue that people should be free to choose their own sexual practices rather than rely on traditional or rigid guidelines. As long as nobody is being hurt or deceived, people should feel free to engage in sexual relationships.

SEXUAL ETHICS

Kenneth A. Strike and Pamela A. Moss have summarized five principles that are useful for evaluating moral dilemmas. The greatest good principle evaluates personal choices based on their outcomes. This principle favors choices that yield the most positive outcomes for the greatest number of people, a philosophy also known as utilitarianism. The equal respect principle is akin to the golden rule in arguing that each person merits being treated with dignity and respect. The relationship principle evaluates the morality of an action by its impact on people's relationships. Choices that promote positive relationships are viewed as morally desirable. The community principle evaluates the value of personal choices based on how these affect the community at large, which would include social groups, organizations, and other social structures. Finally, the character growth principle evaluates behavior based on how it contributes to making individuals the kinds of persons they aspire to become.

These principles can be readily adapted to some sexual situations, such as sexual infidelity. Being unfaithful to one's partner clearly violates the greatest good and the equal respect principles. Deceiving someone is likely to have an unfavorable outcome for all parties, and it suggests a lack of respect for one's partner. Deceit does not promote positive relationships, thereby violating that principle. It may also harm other relationships within a larger context. Finally, the majority of people do not aspire to become dishonest or deceitful.

Other situations are more ambiguous, and the applicability of these principles is less obvious in such cases. Premarital sex generally occurs within mutually consenting relationships between individuals of equal status, and deceit is therefore not an issue. Such relationships would conform to the equal respect principle. The extent to which such relationships promote the greatest good, character growth, and the re-

lationship itself is debatable and is at the heart of the controversy surrounding premarital sex.

From the conservative ethical perspective, any sex outside marriage is immoral and is harmful to the parties involved and their community. According to the liberal ethical viewpoint, sexual relationships between unmarried persons are not invariably harmful. They can be morally acceptable if the partners are deeply attached and committed to each other, which would be consistent with most of the principles discussed. Premarital sex could even be morally justified, from this viewpoint, in uncommitted or casual relationships whose encounters are completely open, reciprocal, and consensual. It might be argued that it conforms to the greatest good principle because it is enjoyable for both persons. It might promote character growth by facilitating self-discovery. It could feasibly create a positive bond between the parties. Finally, in an environment free of taboos and repressive views toward sexuality, premarital sex would not have a negative impact on the community or on personal growth. Whether such an environment can ever be achieved is also the subject of controversy.

Prescriptivism

DEFINITION: Theory developed by R. M. Hare holding that the main purpose of moral language is to prescribe or command

DATE: Term coined in 1952

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Prescriptivism implies that ethical knowledge as such does not exist, because moral language affects action rather than containing meaning or truth.

British philosopher R. M. Hare's view has received at least five important criticisms. First, his view that morality consists only of commands implies that ethical knowledge is impossible, since a command, unlike an indicative statement, cannot be true. Second, his view that anyone who accepts a moral statement and can act on it will obey the command has counterexamples in apathetic and evil people who knowingly refuse to do what they admit is ethically required. Third, the great variety of uses of moral claims makes it unlikely that they can all be reduced to imperatives. Fourth, F. E. Sparshott believes that Hare neglects the fact that any morality must incorporate "those rules of conduct that seem necessary for communal living." Fifth, P. H. Nowell-Smith reduces Hare's theory to the absurd by exposing its implication that "Nothing that we discover about the nature of moral judgments entails that it is wrong to put all Jews in gas-chambers."

In ethics and religion, prescriptivism sometimes refers not to Hare's theory but to the theory that the only justifications for moral claims are the commands of some authority (such as God). Socrates criticized this view in Plato's *Euthyphro* (399-390 B.C.E.), where he suggested that an act was not good only because God commanded it but that God commanded the act because it was independently good.

Price fixing

DEFINITION: Agreement by competing sellers of products or services to charge the same prices

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Price fixing is thought of as creating an "artificially" high price for a commodity by circumventing the "natural" deflationary effects of competition. Consumer advocates assert that it is an unfair practice because it takes advantage of consumers' lack of bargaining power.

Concepts associated with price fixing go back at least to ancient Greece. Philosophers argued about how a "just price," one that was fair to both consumers and producers, could be identified. Debates concerning the ethical issues involved in setting prices concerned the relative power of consumers and producers in the marketplace and behavior that constituted fair play. Opponents of price fixing argued that producers are likely, if allowed, to set prices that give them high levels of profit that are not justified by costs or risks taken in business.

The Sherman Antitrust Act, signed into law on July 2, 1890, forbade contracts, combinations of business, or conspiracies in restraint of trade. Exactly what constituted a restraint of trade remained to be decided by the courts, but price fixing was soon declared illegal under the act. The price fixing laws of the United States are more stringent than are those of other countries. Many countries do not forbid the practice, and some well-known trade organizations, such as the Organization of Petroleum Exporting Countries, exist primarily to fix prices. Even the United States allows some forms of price fixing, such as guaranteed minimum prices for farm products and minimum wages. These exceptions are seen as benefiting sellers of products or services that society has an interest in protecting.

Pride

DEFINITION: Reasonable or unreasonable self-esteem; dignity or conceit

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Justifiable pride is often accounted to be a virtue, but in ethical systems which value self-effacement, there is no such thing as justifiable pride. In traditional Christianity, pride is the worst of all the “seven deadly sins.”

John Stuart Mill noted that pride is “a name which is given indiscriminately to some of the most and to some of the least estimable feelings of which mankind is capable.” Pride has been identified as a proper reward for moral achievement and as a key element in a healthy psyche, and it has been blasted as a destructive emotion and as one of the “seven deadly sins.”

The core of pride is a high sense of one’s own moral value. One dimension of this is moral ambitiousness—a desire to achieve excellence of character. People speak, for example, of taking pride in their work; that is, of being committed to the achievement of quality. This forward-looking dimension of pride complements its backward-looking dimension as a sense of self-satisfaction for what one has achieved. People speak, for example, of feeling proud of having done a good job, of having succeeded at a challenging task.

HISTORY

Aristotle held pride, or “greatness of soul,” to be the “crown” of the virtues. Pride, he argued, follows from the achievement of virtue. Anyone who has worked hard to achieve excellence of character will feel a justified sense of self-worth. Excellence of character and the pride that goes with it also translate into a certain style of action: The proud person not only does excellent things but also does them with grace and dignity. Magnificence characterizes the great-souled person in both character and action.

Aristotle’s was a highly optimistic account of what was possible for human beings. Later thinkers often accepted a more pessimistic view of human nature, and therefore deemphasized pride or even condemned it as a sin. The Christian tradition has many prominent representatives of this view. Emphasizing human helplessness in the face of Original Sin, Christians argued that pride is unjustified. Since

humankind is sinful and weak, humility is proper. Pride was condemned as rebellion against God, because it involves a sense of self-worth and competence, and those who feel self-worth and competence will not feel dependent upon God to save them from sin.

The modern era has been an heir to the Greek and Christian traditions, and many modern thinkers seek a middle way between them. Between the extremes of pride and humility lies modesty—thinking oneself neither great nor worthless. Such middle ways can be found in David Hume’s advocacy of a “well-regulated pride” and Adam Smith’s advocacy of magnanimity tempered with self-denial and a ready sympathy for the woes of others.

CRITICISMS

Pride requires that one (a) achieve excellence of character, (b) evaluate one’s character accurately, and (c) act in accordance with one’s evaluation. Opponents of pride argue that one or more of these conditions cannot or should not be satisfied. As noted above, Christians argue that since humans cannot achieve moral goodness by their own efforts, (a) is impossible. Others argue that humans chronically overestimate their achievements, so (b) is wishful thinking, and a dose of modesty or humility is a useful corrective. Still others argue that one ought to be self-deprecating about oneself so as not to hurt the feelings of others, or so as not to appear to be vain or a braggart.

Defenders of pride reject these arguments. Humans have free will, so they can regulate their thoughts and actions. Accordingly, they can act consistently in a way that allows them to achieve excellence of character and a fulfilled life, and this is what one should do: Happiness depends on excellence of character, and excellence of character is acquired by one’s own efforts. This process of forming one’s character means objectively evaluating one’s thoughts and actions throughout one’s life, reaffirming those that are good and changing those that are not. Once one has achieved excellence of character, simple justice requires that one reap the reward for one’s achievement: pride.

FALSE PRIDE, VANITY, AND HUBRIS

True pride should be distinguished from false pride, vanity, and hubris. Everyone knows people who

never miss an opportunity to brag about some achievement, whether real or imagined. A braggart may appear to be proud, but chronic bragging indicates a lack of pride: The braggart feels a desperate need for the approval of others, feeling self-worth only when that approval is received. Therefore, the braggart publicizes his or her accomplishments or, failing that, exaggerates or invents some. Clearly, there is a huge difference between self-evaluation based on actual accomplishment and self-evaluation based on deluded praise or praise extorted from others.

Vain people depend for their feeling of self-worth upon superficial or secondary characteristics, such as having a glorious family history, a slim figure, or a wonderful head of hair. While such things can be pleasant or desirable, vain people place them at the core of their self-evaluation and therefore expect inappropriate amounts of admiration from others.

Hubris is presented in classical Greek mythology and drama as the flaw of wanton activity flowing from an overestimation of one's worth. The man of hubris acts as though he has power and worth beyond his station, and because of his flaw he inevitably meets a tragic end. Hubris is distinguished from pride by reference to the accuracy of one's self-evaluation. The man of hubris misjudges his power and worth, and since he cannot live up to or control the outcomes of his deeds, he ends in disaster. The proud woman, by contrast, judges her considerable powers accurately and has the excellence of character necessary to use her powers confidently, gracefully, and successfully.

Principles of Medical Ethics

IDENTIFICATION: American Medical Association's official guidelines on professional conduct

DATE: Adopted in 1957; revised in 1980 and 2001

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: *Principles of Medical Ethics* formally codifies professional standards of conduct that are applicable to all physicians practicing in the United States.

In 1957, the AMA replaced its *Code of Ethics*—which had, since the organization's founding in 1847, stated the duties that American physicians owed to their patients, to their society, and to one another—with a statement of moral principles, supplemented by commentary. The reform was consonant with the appeal to basic moral principles by the 1948 Nuremberg Tribunal and the World Medical Association. It also lessened physicians' malpractice liability under the explicit obligations stipulated by the code and, at the same time, provided a more flexible format for advising physicians on conduct.

The *Principles* require physicians to provide competent, compassionate medical service, respectful of human dignity; to deal honestly with patients and colleagues; to expose fraud and deception; to respect the law; to respect the rights of patients and to safeguard their confidences; to respect the rights of colleagues and other health care professionals; to advance scientific knowledge; to share information with patients, colleagues, and the public; and to recognize a responsibility to contribute to the community. Revised in 1980 and again in 2001, the *Principles* are largely unchanged but have shifted in subtle ways. They have tended toward a slightly more ex-

Ethical Principles of the American Medical Association

1. A physician shall be dedicated to providing competent medical care, with compassion and respect for human dignity and rights.
2. A physician shall uphold the standards of professionalism, be honest in all professional interactions, and strive to report physicians deficient in character or competence, or engaging in fraud or deception, to appropriate entities.
3. A physician shall respect the law and also recognize a responsibility to seek changes in those requirements which are contrary to the best interests of the patient.
4. A physician shall respect the rights of patients, colleagues, and other health professionals, and shall safeguard patient confidences and privacy within the constraints of the law.
5. A physician shall continue to study, apply, and advance scientific knowledge, maintain a commitment to medical education, make relevant information available to patients, colleagues, and the public, obtain consultation, and use the talents of other health professionals when indicated.
6. A physician shall, in the provision of appropriate patient care, except in emergencies, be free to choose whom to serve, with whom to associate, and the environment in which to provide medical care.
7. A physician shall recognize a responsibility to participate in activities contributing to the improvement of the community and the betterment of public health.
8. A physician shall, while caring for a patient, regard responsibility to the patient as paramount.
9. A physician shall support access to medical care for all people.

Note: Adopted June 17, 2001.

Source: American Medical Association (<http://www.ama-assn.org/ama/pub/category/2512.html>).

PLICIT enumeration of physicians' rights as well as their responsibilities, and they have expunged certain financial rules (for example, a prohibition against referral fees).

Principles of Medical Ethics with Annotations Especially Applicable to Psychiatry

IDENTIFICATION: Addendum to *Principles of Medical Ethics* published by the American Psychiatric Association to address unique ethical issues confronting psychiatrists

DATE: First published in September, 1973; revised in 1981, 1986, 2001, 2003, and 2004

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: The *Principles* sets out the issues particular to practitioners in the mental health field and codifies standards of ethical conduct in matters not covered by the American Medical Association's code.

The 1973 statement of *Principles* recognized that, although psychiatrists have the same goals as all physicians in adhering to the American Medical Association's code of ethics, psychiatrists also face particular ethical questions that differ in kind and degree from those of other medical specialties. The annotations given in the *Principles* were viewed as being open to revision from time to time to reflect current issues and problems. An extensive revision was published in 1986. The most relevant sections of the 1973 document dealt with contractual relationships with other mental health professionals and physicians, the waiving of confidentiality, and speaking out on social issues not related to psychiatry.

The thrust of the document was that psychiatrists must maintain the trust of their patients and other medical and nonmedical professionals. The 1986 revision maintains this basic thrust, but its seven sections contain much more lengthy, detailed, and spe-

cific annotations and focus in particular on the various aspects of the psychiatrist-patient relationship, such as confidentiality, consultation with other psychiatrists, and honesty. In 2001, the AMA adopted a revised version of its *Principles*. The APA followed suit and added a series of amendments in November, 2003.

Prisoner's dilemma

DEFINITION: Thought experiment designed to illustrate issues raised when individuals are expected to cooperate to achieve collective goals

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: The prisoner's dilemma demonstrates that lack of communication breeds distrust, and that without trust mutual cooperation is difficult. It may also demonstrate the pitfalls of treating humans as rational, rather than irrational, decision makers.

The prisoner's dilemma was originally developed as a thought experiment in 1950. It has since become synonymous with a whole class of ethical and social problems involving the conflict between individual rationality and collective action aimed toward serving common goals.

STRUCTURE: TWO-PERSON PROBLEM

The problem begins with two prisoners, A and B, who are arrested for a crime. A clever district attorney, not having enough evidence to convict either defendant, offers each of them a deal separately. If both individuals confess to the crime, then both will receive a lesser sentence of three years. If neither confesses to the crime, they will be convicted of a lesser charge, which carries a five-year sentence. If one confesses and the other does not, however, then the prisoner who confesses will receive a sentence of ten years and the other prisoner will go free. It would appear that both prisoners would be well-advised to confess to the crime and receive a three-year sen-

tence; certainly, both would prefer this result to the one in which neither confesses and both receive a five-year sentence. Yet each prisoner's protection of his or her own self-interest will lead to the less preferred result.

Consider prisoner A's position. If prisoner B does not confess, prisoner A receives a sentence of ten years if he confesses and five years if he does not confess; hence, prisoner A should not confess under these circumstances. If prisoner B does confess, then prisoner A receives a sentence of five years if he confesses but goes free if he does not confess; hence, prisoner A should not confess under these circumstances either. Since prisoner B has only these two choices, prisoner A's individual rationality compels him to avoid confessing, regardless of what prisoner B does.

Similarly, prisoner B should avoid confessing, regardless of what prisoner A does. Both prisoners therefore receive five-year sentences for not confessing, even though both would prefer the three-year sentence they would receive if both confessed. Note that communication between the two prisoners will not help this problem. Even if the two could speak to each other, each would find it in his interest to try to convince the other to confess and to avoid confessing himself.

The ethical dimensions of this problem arise because both prisoners know they would be better off if they would coordinate their efforts and cooperate in their strategy, but their individual self-interest leads them to a less optimal result. One of the first applications of this problem to a real-life situation concerned the control of nuclear weapons. Consider two nations, A and B, in a nuclear arms race. Each nation knows that these weapons are horribly expensive to build and maintain; each nation also has sufficient firepower to destroy the other nation.

However, if one nation gains a significant edge in building nuclear weapons, it will be able to destroy the other nation's weapons in a first strike and dictate terms for peace by threatening the now-defenseless nation with a second destructive strike. Both nations may agree that to build new nuclear weapons is senseless, since the opposing nation will simply build more weapons to match the increase; as a result, they will have the same strategic balance but will be much poorer and will not be able to use their resources for other important domestic priorities such

as social welfare and job creation.

It would seem that the two nations should agree to stop building arms. Yet consider nation A's interests. If nation B does not stop building arms, nation A can stop and risk conquest or can keep building and maintain the status quo. Under these circumstances, nation A will continue building arms. If nation B does stop building arms, nation A can stop and maintain the status quo or can keep building arms and conquer nation B. Under these circumstances, nation A will continue building arms. Since nation B must be expected to think in the same way, the arms race will escalate and both nations will waste resources to maintain the status quo, even though both sides realize they would be better off with fewer weapons (and, therefore, lower costs for the creation and maintenance of arms).

STRUCTURE: MULTIPERSON PROBLEM

A second ethical application of the general prisoner's dilemma, discussed by Mancur Olson and Russell Hardin, among others, extends the problem to more than two parties and discusses individual efforts toward collective action approved by all members of a group. In this scenario, an individual is asked to contribute to a group effort. A common example used is the placement of catalytic converters on cars to reduce pollution. Assuming that it costs \$400 to add a converter to a car and that each individual believes that it is worth paying the money to clean up the air, it seems reasonable to believe that all individuals would order converters for their cars.

However, the individual contemplating this action considers two circumstances. If everyone else does not add a converter, then the individual can pay \$400 to add a converter without making the air significantly cleaner (since one car produces very little pollution) or can choose not to add the converter and avoid paying the price. Under these circumstances, the individual should not order the converter. If everyone else does add a converter, then the individual can pay \$400 to add a converter without adding appreciably to cleaner air (since one car produces insignificant amounts of pollution) or he can not add the converter and enjoy cleaner air without paying the price. Once again, the individual should not order the converter under these circumstances.

The one difference between the two-party situation and the multiparty situation with the prisoner's

dilemma is that it would be in the interest of the individual in the second situation to order the converter only if his contribution made the difference between the success or failure of efforts to clean up the air. Unfortunately, the chances of such a situation occurring are so small in most cases of large groups that it would not provide sufficient incentive to contribute to solving the problem. As a result, all individuals agree that it would be worth the money to contribute \$400 for cleaner air, but none of the individuals does so, and the effort fails.

PROPOSED SOLUTIONS

Two solutions have been posited to both situations. The first involves coercing, or forcing, all individuals to cooperate toward the common goal. In the case of pollution controls, for example, the federal government sets emission standards that must be met for individuals to drive their cars; they are forced to add catalytic converters to their cars. A problem with this solution is that it requires some authority to compel the parties to cooperate; in the example involving nuclear weapons, however, there is no authority that exists that has the power to compel nations to halt an arms race.

A second solution is to give selective incentives to only those persons who cooperate. All individuals who contribute to public television, for example, receive handbags with the PBS logo, which only contributors can obtain. Such selective incentives may include cheaper vacations, group medical or life insurance benefits, or other incentives. The problem with this solution is that in most cases a group must already exist to provide selective incentives; one cannot obtain group health insurance rates, for example, if one does not have a group to insure. This solution does not explain how groups are started in the first place.

Neither solution addresses the central ethical problem of the prisoner's dilemma: that self-interested individuals may be prevented from participating in collective action that all understand is in the general interest. Therefore, self-interest alone may not compel people to contribute to the general welfare in many cases, even when individuals realize that their self-interest would be better served if everyone contributed to the collective goal than if no one did.

Privacy

DEFINITION: Freedom from unwarranted observation of, or intrusion into, one's domestic space, personal relationships, or intimate activities

TYPE OF ETHICS: Civil liberties

SIGNIFICANCE: As a general moral right, the right to privacy came to be discussed and debated in the Information Age far more than it had ever been before, because electronic recording, surveillance, and storage technologies rendered it far more fragile. As a legal matter, the Ninth Amendment to the U.S. Constitution makes it possible to argue that privacy is a constitutionally guaranteed right, but because it is not explicitly enumerated as such, that argument too is a source of controversy.

John Stuart Mill wrote that "there is a sphere of action in which society, as distinguished from the individual, has, if any, an indirect interest; comprehending all that portion of a person's life and conduct

which affects only himself, or if it also affects others, only with their free, voluntary and undeceived consent and participation" (*On Liberty*, 1859). The "sphere of action" in which society has only an indirect interest is a matter of intense controversy. As Otis H. Stephens and John M. Schab II said in *American Constitutional Law* (1993),

The debate over the constitutional right of privacy is ultimately a debate between two sharply divergent views of the law. In the libertarian view, the law exists to protect individuals from one another. In this view, morality is not in and of itself a legitimate basis for law. The classical conservative view, on the other hand, sees law and morality as inseparable and holds that the maintenance of societal morality is one of the essential functions of the legal system.

CONSTITUTIONAL BASIS OF PRIVACY RIGHTS

There are several provisions in the U.S. Bill of Rights that explicitly protect privacy. The Third Amendment prevents forced quartering of soldiers in people's homes. The Fourth Amendment protects against unreasonable searches and seizures. The Fifth Amendment protects the privacy of people's minds by prohibiting compulsory self-incrimination, and the First Amendment ensures freedom of conscience in political, religious, and associational matters. The due process clause of the Fifth Amendment protects substantive as well as physical liberty. Proponents of greater privacy rights have argued that the Ninth Amendment, which states that there are unspecified rights "retained by the people," provides additional justification for expanding constitutional rights of privacy.

Although Justice Louis D. Brandeis dubbed "the right to be let alone" "the most comprehensive of rights and the right most valued by civilized men," the first explicit recognition of a constitutional right of privacy by a majority of the Supreme Court took place in *Griswold v. Connecticut* (1965). An 1879 Connecticut law forbade the sale or possession of birth control devices and also made "assisting, abetting, or counselling" another in the use of such devices unlawful. Estelle Griswold, the director of Planned Parenthood in Connecticut, was arrested for violating this statute three days after Planned Parent-

hood opened a clinic in New Haven. Griswold was convicted and fined \$100. After several intermediate appeals, the Supreme Court agreed to hear Griswold's case. After argument, the Connecticut law was declared unconstitutional.

Justice William O. Douglas, writing for the majority, found that "specific guarantees in the Bill of Rights have penumbras, formed by emanation from those guarantees that help give them life and substance. Various guarantees create zones of privacy . . ." In sum, Douglas's argument was that the First, Third, Fourth, Fifth, and Ninth Amendments, when taken together in the light of the Court's earlier decisions, created a new independent right of privacy that was violated by Connecticut when it attempted to deny people access to birth control devices. Although Douglas's opinion was carefully limited to "marital privacy," it was widely read to go beyond the rights of married couples, and when a similar issue arose a few years later in Massachusetts, the Court extended the *Griswold* holding to unmarried persons.

Eight years after *Griswold*, the Supreme Court enormously extended the right to privacy when it decided in *Roe v. Wade* (1973) that the right of privacy covers a pregnant woman's decision whether to have an abortion. In this case, the Court struck down a Texas statute that prohibited all abortions except for the purpose of saving the life of the mother. Justice Harry A. Blackmun's opinion recognized, however, that there is a state interest in the preservation of fetal life, and therefore the right to abortion is qualified—it is absolute only in the first trimester of pregnancy, the period in which the fetus is not yet viable. *Roe v. Wade* has occasioned immense political and juridical controversy since 1973. The American public has been sharply divided over the abortion issue, and judicial and legislative struggles still continue thirty years after the Court's decision. The right announced in *Roe v. Wade* has been slightly modified in several subsequent Supreme Court decisions, but despite several serious challenges, its fundamental principle still stands.

Roe v. Wade was the high-water mark of the constitutional right of privacy. The Supreme Court has not pressed it further and, indeed, held in *Bowers v. Hardwick* (1986) that there is no constitutional right to engage in homosexual sodomy. The Court explicitly reserved decision on whether there is a right, marital or otherwise, to engage in heterosexual sodomy.

Some public safety issues also raise privacy issues. Recreational drug use, motorcycle helmet and automobile seat belt laws, prostitution, suicide, and euthanasia are all issues that implicate privacy rights and with which courts and legislatures will increasingly have to deal.

Private vs. public morality

DEFINITION: Distinction drawn between the moral codes governing private individuals in their personal and interpersonal relationships and the moral codes governing political and business leaders while acting in their official capacities

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Because the decisions of public figures may significantly impact the lives of vast numbers of people, some theorists posit a fundamental dichotomy between public and private morality.

In his book *Moral Man and Immoral Society* (1932), Reinhold Niebuhr argued that there are sharp, major distinctions between the moral, ethical "rules" of behavior for individuals, on one hand, and for social groups, political and business leaders, and the state and nation, on the other hand. Actually, Niebuhr's thought on the issue was not original, for consideration of this ethical problem dates from antiquity.

The most famous philosopher to address the subject was Niccolò Machiavelli, who taught political rulers how to be “bad” ethically so that they could be “good” in their calling. Such leaders, then, may lie, break promises, use violence, engage in deceit, give and take bribes, and even commit murder if such actions are necessary to hold and augment power. Another who drew distinctions between personal morality and public morality was Martin Luther, who talked of an “earthly realm” and a “spiritual realm” as if they were absolutely different entities. Max Weber also argued that there was a sharp split between personal and public ethics, while pointing out that the public “person”—all leaders in politics, business, the military, and so on—may have to use dubious means to achieve “good.”

Twentieth century political analysts such as George Kennan, Charles Frankel, and Arthur M. Schlesinger, Jr., have argued that *realpolitik* is the only thing that counts in government and in diplomacy. Frankel perhaps spelled it out best. He held that the moral rules of individuals in their personal lives are definitely not the rules that should guide people in performing complex social, political, or economic roles.

Interestingly, J. Fred Buzhardt, legal counsel to the morally condemned former president Richard Nixon, who resigned his office in disgrace, once asked whom the members of society would prefer as a leader—did they want a competent “scoundrel” or an “honest boob”? In this view, the picture of private versus public morality is darkly painted. Is it necessary to choose between ethically upright “boobs” and dishonest, lying, cheating criminals and near-criminals? The implication of Buzhardt’s question is, of course, that the ethical, honest, sincere person is too naïve to assume a leadership role in politics, business, education, and so on. Instead, there is room in the elite leadership class only for liars and thieves.

Machiavelli and Buzhardt, then, endorse unethical public behavior as the norm and ethical behavior as bizarre. Such thinkers are themselves taking an immoral position by clinging to views that, over time, have caused much harm. Therein lies the problem. Public morality has been defined by those who speak for immorality, some of whom would tolerate all corruption and abuse if such practices were to lead to success. Actually, the later scandals in American “public” life have demonstrated that the country does

not need competent scoundrels but should return to honesty, lest American civilization experience a permanent decline.

Consider a few facts. During the Vietnam War, four different presidents at some point lied to the public, as did some of their generals. Had the truth been told, might America have avoided that long, costly, and lethal imbroglio? In the Watergate scandal of the 1970’s, lawyers, onetime Central Intelligence Agency operatives, and their minions committed such crimes as breaking and entering, burglary, and illegally “bugging” phones—all this for political and economic gain. When the scandal became public, lies abounded in such great number that many people think that the public may never know the exact extent of the wrongdoing.

During the late 1980’s and 1990’s, more scandals abounded. Corporate executives of the Chrysler Automobile Company ordered mechanics to “roll back” speedometers so that used cars could be sold as new cars. Executives of many savings and loan associations and commercial banks looted their own depositors, their own “businesses,” and forced the future’s taxpayers to pick up the tab. Many congresspersons also showed their true character when they corruptly mismanaged their post office, restaurant, and bank. Former presidents Ronald Reagan and George Bush were implicated in the “Irangate” arms-for-hostages controversy and a possible cover-up. A person need only read a big-city newspaper regularly to find example after example of corruption and immorality in politics, business, and other public fields.

There are those who believe that public leaders should be held morally accountable for their actions, just as individuals are held accountable in private life. Perhaps public leaders should examine their lives and ask such questions as: Have I lied, cheated, stolen, broken promises, deceived, or taken bribes today?

Pro-choice movement

DEFINITION: Coalition of activists working to keep abortion legal, unrestricted, and available to all women

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: The pro-choice movement represents one side in perhaps the most heated moral debate of the late twentieth and early twenty-first centuries. Although associated with feminists and the political left, neither of those two groups is undivided on the issue of abortion.

Throughout history, a major means by which men have controlled women and restricted their rights is the control of human reproduction. Abortion rights have become a central concern of the women's rights movement. The movement argues that women must have total control over their bodies, including their reproductive processes, if they are to be able to function as free, equal members of society.

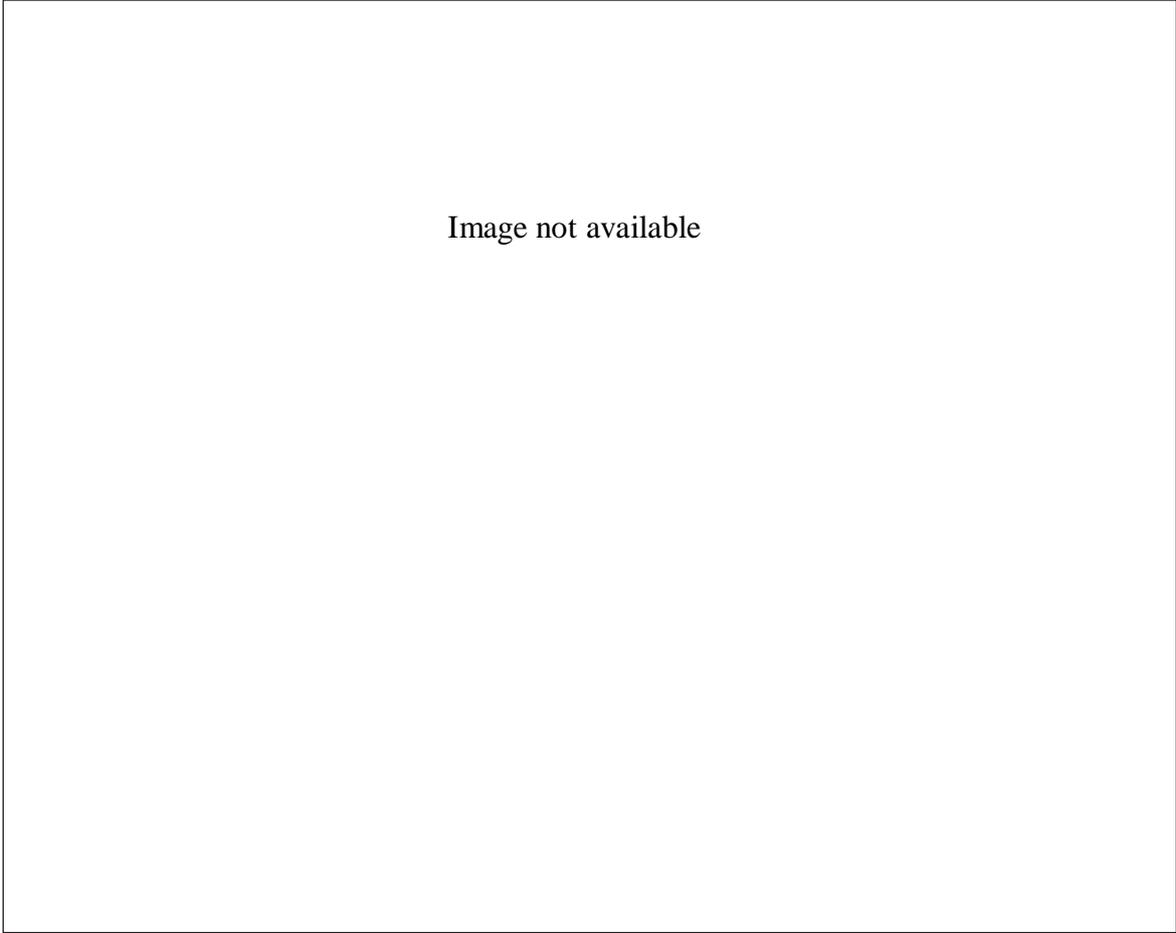

HISTORY

Abortion has been practiced throughout history and across cultures. Formulas for abortion appear in Chinese medical texts dating from 3000 B.C.E. and in Islamic texts in the Middle Ages. Regular references to abortion appear in Greek and Roman texts and early Christian literature. Regardless of societal tolerance or prohibition, women have resorted to abortion to terminate unwanted pregnancies even though many of the techniques used have threatened their lives and health.

The modern pro-choice movement has its roots in the women's rights movements of the early twentieth century in the United States and Europe. Responding to legal prohibitions against disseminating information about birth control, women such as Margaret Sanger incorporated demands for reproductive rights into the movement. Building on this base, the feminist movement in the United States during the 1960's established a pro-choice coalition to support abortion rights. Included were demands that the legality of abortion be restored (abortion had been legal in the United States until the latter half of the nineteenth century).

In 1973, with the Supreme Court decision *Roe v. Wade*, prohibitions against abortion during the first trimester of pregnancy were ruled unconstitutional and only limited restrictions were permitted during the second trimester of the pregnancy. In the ruling, a woman's "right to privacy" in such matters was upheld as having greater legal standing than fetal rights or the right of states to intervene in the reproductive life of women. The Court's decision generated an immediate protest and the establishment of a coalition of religious groups that designated themselves as the "pro-life movement." This movement has worked to limit and even abolish the legal right to abortion. Such limitations have included the removal of federal funding for abortions, the establishment of required waiting periods before abortions can be performed, and parental and paternal notification and/or consent. A number of such restrictions were upheld by the Court during the 1980's and early 1990's.

These new restrictions have revitalized the pro-choice movement and expanded the coalition to include a number of secular and religious groups. The term "pro-choice" was consciously employed during this period to affirm the belief in the primacy of women's right to choose. While persons in this coali-

A large rectangular box with a thin black border, centered in the upper half of the page. Inside the box, the text "Image not available" is centered in a black serif font.

Thousands of pro-choice advocates stage a rally in Hollywood, Florida, as part of a campaign to ease the state's abortion restrictions in 1989. (AP/Wide World Photos)

tion have a wide range of viewpoints pertaining to the morality of abortion, they are united by their belief that abortion should and must remain legal. By the 1980's, the movement had become more proactive, stating that a pro-choice environment requires guaranteed medical care for expectant mothers and young children, guaranteed minimum adequate income that assures proper nutrition and housing for children, job-security guarantees for pregnant women, and federally mandated maternity leaves. Only such rights, it is argued, allow women to exercise free choice in response to pregnancy.

ETHICAL ARGUMENTS

Because of the disparity of beliefs of those who constitute the pro-choice movement, there are no

moral arguments that are universally accepted. The most prominent and widely used arguments follow.

Drawing on the concept of "developmentalism," fetal life is recognized as human life and as having value. Value accrues, however, as humans develop. A woman, as a fully developed person living in a network of relationships in which she is valued, has rights that take precedence over fetal rights in situations of conflict. Since many pregnancies occur without the consent of the woman involved (rape, incest, contraceptive failure, ignorance), the fetus has no more right to use the woman's body than the state or a stranger has a right to use her organs, without consent, for transplant purposes.

Since women are the ones primarily affected by pregnancy and childbirth, they legitimately retain the

right to decide whether to terminate a pregnancy. Only legal access to safe abortions assures women control of their own lives.

Confronted with unwanted pregnancies, many women will resort to abortion whether legal or not. (Between 250,000 and 1,000,000 illegal abortions were performed annually in the United States in the years prior to its legalization.) Illegal abortions are often unsafe, leading to the death or sterility of the mother. Since abortion cannot be stopped, it should be legal, medically safe, and easily accessible.

Failure to provide federal funding for low-income women is discriminatory and leads to unwanted births, further impoverishment, and in some cases life-threatening attempts at self-induced abortion. Since some pregnancies result in the development of severely defective fetuses, the mother, as the party most affected by the birth of such a child, should have the right to decide whether such a pregnancy should be continued.

In an overpopulated world suffering from resource depletion and environmental pollution, women should have the right to use abortion as a means of population control when they view it as a morally preferable choice.

Product safety and liability

DEFINITION: Issues relating to questions of who is liable for products that cause harm

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Two related ethics questions are integrally connected to product safety and liability issues: determination of who is responsible, *prior* to a product's purchase, for ensuring that the product is appropriately safe, and determination of who is responsible, *after* the product is purchased, if someone is injured by it.

Safety is one value among many in transactions between buyers and sellers. Products vary in their degree of riskiness—from cotton balls to butter knives to parachutes—and customers vary in the importance they attach to safety. Automobiles provide an apt example. How attractive a car is to a customer depends upon its price, style, dependability, fuel efficiency, comfort, capacity, speed, power, maker's service record, and safety features. A young man buying his first car is likely to make speed and style higher priorities, while the parents of a young child who are struggling to make ends meet are more likely to make safety and fuel efficiency their highest priorities.

Two competing ethical models of how to achieve appropriate amounts of safety have been debated. One model emphasizes that both the seller of a product and the product's buyer are self-responsible agents who negotiate appropriate levels of safety in a free market. The other model calls for government regulation of safety on the grounds that sellers do not have enough sufficient incentives to provide appropriate levels of safety, and that buyers often do not have the knowledge or power to negotiate for safety.

THE FREE MARKET MODEL

The free market model sees safety as a value no different in principle than any other value that is pro-

duced and consumed. Just as prices, styles, and quality of customer service vary among products and are negotiable between buyers and sellers, optimal amounts of safety are variable and negotiable. Both sellers and buyers are self-responsible agents with their own goals, and both have responsibilities with respect to safety.

The seller's responsibility (*caveat vendor*; let the seller beware) is to manufacture a product within the range of professional standards of competence, to research reasonably foreseeable risks associated with using the product, and, in the case of risks that might not be obvious to consumers, to inform potential buyers of the risks.

The buyer's responsibility (*caveat emptor*) is to become aware of the risks associated with using the product—either by doing firsthand research or by seeking expert advice, such as one might get from physicians or from sources such as *Consumer Reports* magazine. Buyers must then determine their own risk tolerance and learn how to use the products they purchase properly.

Ultimately, sellers and buyers seek each other out and negotiate transactions that are mutually satisfactory, including the question of how safe the products are. On this free market model, appropriate amounts of safety are fixed but vary from product to product and emerge as a result of supply and demand. Different producers emphasize the safety of their products to different degrees and attract to varying degrees customers who are interested in the amount of safety they are providing. The producers' profit motive should lead them to give to consumers the amounts of safety that satisfy them. Some cars, for example, are produced out of heavier materials and have additional safety features, while others are lighter and have extra speed or style features. How many of each kind of car are sold depends on how many customers are interested in their different features. Safety is thus a market value like any other, and the optimal levels of safety are set by supply and demand.

THE GOVERNMENT-REGULATION MODEL

The free market model assumes that customers are knowledgeable about both the relative safety of given products and their own risk tolerances, or that they can become knowledgeable by research. It also assumes that producers are responsive to consumer demands for safety. By contrast, the government-

regulation model is skeptical of both assumptions, so it concludes that safety should be provided primarily via government regulation rather than through free market forces.

Producers have a profit motive, which leads some to cut corners on safety. Since safety can be costly, an obvious way to cut costs is to avoid spending money on either research or additional safety features. Correspondingly, consumers are often unaware of risks involved in using many products, particularly new or complex products, and are consequently often unwilling to pay the extra costs associated with safer products. Therefore, the government-regulation model assumes that many consumers will end up injured or worse because of an unregulated market. Therefore, to protect consumers from both themselves and producers, an informed third party with the power to regulate safety is needed. The government, therefore, should act paternalistically to shield consumers from their own lack of knowledge and poor judgment, and it should act protectively to shield consumers from careless, profit-seeking producers.

According to the government-regulation model, government experts should research products and decide uniform safety standards. The government should craft regulations and communicate them to producers. The producers should be given incentives to produce the specified amounts of safety—the incentives being the avoidance of fines, losing their licenses, or going to prison. Consumers can then purchase products confident in the knowledge that the government has made sure that their production meets adequate safety standards.

The two models of safety differ over two key ethical issues. Both agree that safety is a value but disagree over whether safety is a value that varies from consumer to consumer or is a uniform value that all products in a given category should possess equally. Both sides also agree that assigning responsibility for safety is crucial—but disagree over whether producers and consumers can be self-responsible for safety or whether government regulators can best handle that responsibility.

LIABILITY

During the 1960's, American liability law began shifting from its long-standing emphasis upon a standard of individual negligence to an emphasis upon strict liability. Common law traditionally analyzed li-

Two Relevant Legal Cases

Two key cases demonstrate the trend toward strict liability in modern courts. In 1992, a New Mexico jury awarded Stella Liebeck \$2.7 million in punitive damages and \$200,000 in actual damages because she was scalded by a cup of McDonald's coffee that she spilled while riding in a car. The determining factor for McDonald's guilt was the harm done to Liebeck. The large amounts were awarded to perform the two functions of strict liability. First, the \$200,000 was awarded to cover Liebeck's medical costs (social insurance). Second, the judgment of \$2.7 million was used to force McDonald's to lower the temperature of the coffee it served (safety incentive).

The 1980 case of *Sindell v. Abbott Laboratories* also indicates the newer concepts in strict liability. Judith Sindell brought a class action lawsuit on behalf of the daughters of women who alleged that diethylstilbestrol (DES), a drug approved by the Food and Drug Administration for pregnant women, caused their vaginal cancer. The class action lawsuit was brought against eleven DES manufacturers because the injured women could not isolate which company provided the actual drug to their mothers. Under the strict liability model, the women were not required to prove that DES was the definitive cause of their vaginal cancer—only that they were harmed. The collective liability standard held the DES manufacturers to be responsible even though some women may have never ingested their product.

ability in terms of individual responsibility. Plaintiffs were responsible to show that acts of negligence by identifiable defendants caused their injuries. Negligence is ignoring or hiding a reasonably foreseeable harm to a person. The argument for negligence-based liability relies on the concept of rational self-responsibility. Manufacturers sell goods for profit, and customers purchase them for consumption. Since no product can be completely risk-free, traditional liability requires that both sellers and buyers be responsible.

Manufacturers have two basic responsibilities to consumers. They must identify and address foresee-

able risks in their products and must inform consumers of the risks. Under traditional liability, consumers have three responsibilities to protect themselves from injury. First, they must educate themselves about the products they buy and the companies that make them. Second, they must accept the foreseeable risks associated with the products. When a company issues directions indicating proper use, the consumers' third responsibility is to use the products properly.

If someone is harmed in using a product, determining liability requires identifying who, if anyone, was negligent in upholding his or her responsibilities. However, even when producers and consumers act responsibly, accidents may still happen. If a manufacturing company provides proper warnings of a product's risks, and the consumer accepts those risks, or if the accident that occurs is not foreseeable, then the costs fall to the consumer. Part of being an ethically responsible consumer is to recognize that accidents may happen and to protect oneself through insurance. Under the negligence standard, however, a producer is liable only if the company has been negligent.

STRICT LIABILITY

Although the negligence standard of liability has a long history of solving disputes between parties, proponents of strict liability argue that that standard does not adequately address social concerns, such as large liability claims and complex products. To address these concerns, strict liability eliminates the requirement of having an identifiable negligent party as the cause of the harm. Negligence by the producer or consumer is not necessary for legal liability. Strict liability is a harm-only concept. Additionally, strict liability collectivizes the concepts of harm and liability, in contrast to the negligence standard's individual focus. Strict liability has created two new concepts in litigation, the class action lawsuit and collective liability. A group of people who have suffered the same harm can bring about a single lawsuit in which the question of plaintiff responsibility is irrelevant. Collective liability occurs when more than one producer contributes to the manufacture of the same harm-causing product. If the product cannot be isolated to one company, then all the producers may be held liable.

Strict liability's use of class action lawsuits and collective liability is intended to solve the perceived gaps left by traditional negligence liability. From the

negligence-standard perspective, strict liability may seem unfair to a producer who has not been negligent; however, proponents of strict liability argue that it provides two main social benefits. First, strict liability gives manufacturers a greater incentive to make the safest possible products. If a manufacturer is liable for any of its products that causes harm, then rational economic thought dictates that the manufacturer should market only extremely safe products. Second, strict liability functions as a social insurance policy. Some people who are harmed have no way to pay their medical costs under traditional liability. If, however, companies are legally required to accept the responsibility for harm done to people, then the medical and other costs will be transferred from the victim to the manufacturers of the product. Manufacturer will then simply add liability as a cost of production. In wealthy nations such as the United States it may be easier to make everyone share the cost of liability rather than leaving it as an individual responsibility.

ETHICAL CONTROVERSIES

Proponents of traditional liability find two problems with strict liability. The first problem is with the safety incentive. Under strict liability, companies should produce safer products; however, their incentive to innovate will decline. Since innovative products involve unknown risks, manufacturers will rationally decide in some cases that the costs of innovation combined with unknowable liability exposure is not compatible with the profit motive.

The second criticism of strict liability is a result of ethical differences. Traditional liability holds self-responsibility as its ethical ideal, while strict liability demands sacrifices of some for the sake of others. Therefore, the negligence view believes strict liability is unjust to manufacturers and will lessen consumers' self-responsibility; advocates of strict liability, by contrast, believe that the negligence model is unfair to individuals who cannot pay for their medical costs.

Professional athlete incomes

DEFINITION: Money that professional athletes make from salaries, product endorsements, appearance fees, and other sources

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The dramatic rise in the earning power of professional athletes that began during the closing decades of the twentieth century raised numerous ethical questions about income distribution and the role of athletes in society.

Until the late twentieth century, financial compensation for professional athletes typically varied according to each individual athlete's level of competition, experience, and achievement. Athletes at lower levels of professional competition often earned wages that were below subsistence levels. Those at higher competitive levels typically earned comfortable salaries, while a select few were paid handsomely but not out of proportion to the top earners of other professions. In 1930, for example, baseball star Babe Ruth earned an annual salary of \$80,000—approximately equivalent

Top-Earning American Athletes in 2004

Rank	Athlete	Sport	Salary	Other	Total
1	Tiger Woods	golf	\$6,673,413	\$70,000,000	\$76,673,413
2	Shaquille O'Neal	basketball	\$26,517,858	\$14,000,000	\$40,517,858
3	LeBron James	basketball	\$4,018,920	\$35,000,000	\$39,018,920
4	Peyton Manning	football	\$26,900,000	\$9,500,000	\$36,400,000
5	Kevin Garnett	basketball	\$29,000,000	\$7,000,000	\$36,000,000
6	Oscar De La Hoya	boxing	\$30,000,000	\$2,000,000	\$32,000,000
7	Andre Agassi	tennis	\$2,530,929	\$24,500,000	\$27,030,929
8	Kobe Bryant	basketball	\$13,498,000	\$12,000,000	\$25,498,000
9	Derek Jeter	baseball	\$19,000,000	\$6,000,000	\$25,000,000
10	Grant Hill	basketball	\$13,279,250	\$11,000,000	\$24,279,250

Source: Sports Illustrated/SL.com, May 14, 2004. Totals reflect expected total income for calendar 2004. "Salary" column includes salaries, bonuses, and winnings; "Other" column includes money from commercial endorsements, appearance fees, and other sports-related sources

to a \$800,000 salary in 2003 dollars. At the same time, the average salary of Major League Baseball players was approximately \$6,000, or \$60,000 in 2003 dollars. Athletes competing in sports emphasizing individual excellence sometimes earned much more. In 1927, for example, heavyweight boxing champion Gene Tunney earned \$990,000—equal to almost \$10 million dollars in 2003—for a single boxing match against former champion Jack Dempsey. However, most rank-and-file competitors of the past earned salaries commensurate with national averages for skilled and professional workers.

After World War II, as the advent of mass media made professional athletics increasingly popular and profitable, many professional athletes began to resent team owners and event promoters who were reaping ever higher profits while restricting increases in athlete compensation. In 1966 Major League Baseball players organized the first successful professional athletes' union and, after a series of contentious court cases, won the right to negotiate with other teams when their contracts expired. Andy Messersmith and Dave McNally exercised this option in 1975 and became the first "free agents" in professional sports.

Other professional sports soon followed suit by enacting their own systems of free agency, resulting in dramatic increases in player salaries. By the end of

the twentieth century, the *minimum* salary for rookie Major League Baseball players was \$200,000, and the highest-paid baseball player, Alex Rodriguez, was earning approximately \$25 million per year. In addition to their salaries as players, many top athletes were receiving additional money from product endorsement contracts that often paid them millions of dollars per year.

IMPACT ON SPORTS

Although most observers agree that higher compensation for athletes has exerted a profound influence upon professional sports, disagreements exist as to whether the aggregate impact has been positive or negative. Supporters maintain that higher earnings have provided athletes with increased motivation to improve their performances, resulting in more intense competition among athletes and higher overall standards of athletic excellence. Moreover, since professional athletes no longer have to work during their off-season months to supplement their incomes as they did in the past, they have more time and energy for training.

Some critics argue, however, that high salaries and lucrative endorsements negatively affect performance by compromising team loyalty, fostering jealousy and friction among team players, and diminish-

ing the desire of individual athletes to achieve their full potentials. In order to enhance their “market value,” team-sport athletes are often encouraged to prioritize individual achievement over team success. Thus, critics argue, high salaries and endorsements serve either to distract and spoil athletes or to saddle them with unrealistic expectations.

Defenders of rising compensation rates for professional athlete pay often cite past and present inequalities between athlete pay and the profits of their employers or sponsors. This argument is rooted in the assertion that team owners, event promoters, and corporate sponsors have profited handsomely from the growth of the professional sports industry, and that athletes—without whom the industry would not exist—are ethically justified in their efforts to share in the financial success of their sports.

SOCIETAL IMPLICATIONS

The ethical implications of higher athlete pay upon society have also been the subject of contentious debate. Many argue that paying athletes large amounts of money damages both sport and society by fostering gross inequalities in income, and that salaries should thus be limited through regulation. Proponents of free market capitalism insist that owners, promoters, and sponsors are ethically justified in compensating athletes according to freely conducted negotiations and the demands of the market, and that athletes reserve the right as contract employees to sell their services to the highest bidders. Proponents

of regulation argue that larger payrolls are unethical because they give sports teams in large markets—such as New York and Los Angeles—unfair advantages over those in small markets, and result in increased costs that are routinely passed along to fans in the form of much higher prices for tickets, concessions, souvenirs, and parking.

Some people view the disproportionately high earnings of top professional athletes as an example of growing disparities between rich and poor people in developed societies. Others argue that it is inequitable, and therefore unethical, to pay top athletes amounts totaling hundreds of times the salaries of persons in such essential occupations as education, health care, public safety, and social work.

EFFECTS ON YOUTH

Many critics also assert that higher athlete pay also damages society by setting a negative and unrealistic example for youth that is inherently unethical. The conspicuous presence of multimillionaire athletes, they argue, encourages youth to value athletic achievement over educational accomplishment, character, and citizenship. Moreover, the lure of immense wealth often encourages young people, especially those from disadvantaged backgrounds, to make sports a higher priority than education or personal growth in the often-unrealistic belief that they will themselves eventually succeed in professional sports. This assertion is supported by numerous examples of athletes who have interrupted their educations to “turn pro.”

Proponents of the free market can cite numerous examples of athletes who emerged from modest backgrounds to become rich and famous athletes. By contrast, only a tiny minority of athletes are ever afforded the opportunity to compete professionally, and fewer still ever achieve the level of success required to command large earnings. Therefore, those who are persuaded single-mindedly to pursue careers in professional sports and do not succeed often lack the skills necessary to become healthy, productive members of society.

Professional ethics

DEFINITION: Codes of conduct governing the performance of professional duties

TYPE OF ETHICS: Professional ethics

SIGNIFICANCE: Members of most professions are governed by ethical rules which may be formal or informal, codified or left unspoken. Such rules are designed to protect the public welfare and to encourage a high level of trust for the profession as a whole.

Professional ethics undertakes to examine the special ethical obligations and problems that people who work in professional occupations have because of their professional status. It seeks to reach normative conclusions about these; that is, it considers how professionals *ought* to behave in their professional work, not merely how they *do* conduct themselves. In order to accomplish this goal, it must consider the various professions in their historical, legal, and social contexts in society. Relative to differently organized societies, or relative to different eras in Western society, it may need to reach different conclusions concerning professional conduct.

Every legitimate occupation involves its own characteristic ethical obligations. Thus, firemen have a special obligation to rescue people from burning buildings even when it is dangerous for them to do so, and farmers have a special obligation to see that the foodstuffs that they produce are safe to consume. All

such special obligations presumably could be discussed in the field of occupational ethics.

In order for professional ethics to be a distinctive field in its own right, it needs to differ from occupational ethics. The special ethical obligations of professionals need to be seen as differing in their source and character from those of nonprofessional workers. This can come about only if professional ethics is based on a conception of the professions that succeeds in demarcating them ethically from other occupations.

The term “profession” is used in a variety of ways in the English language, and most of these do not embody conceptions that are suitable for grounding professional ethics as a field in its own right. To forestall confusion that may generate doubt about the legitimacy of professional ethics, it will be useful to review several of these widespread uses before focusing on a more appropriate one.

USES OF THE TERM “PROFESSION”

When people ask “What is your profession?” this is often merely a polite way of asking one’s occupation. In this usage, the terms “profession” and “occupation” are synonyms. Another frequent use, which is familiar from sports, contrasts professional with amateur standing: To be a professional in an activity is to make that activity one’s principal career, from which one expects to derive income. In another sense, professional work is work that is done skillfully. “They do a professional job,” people say of workers who perform knowledgeably and well.

The term “profession” generally carries a favorable connotation, and sometimes it is used merely to express the speaker’s approval of an occupation and the desire that it be accorded high status. Thus, when someone says “Realtors are professionals!” often no factual information is involved, and the speaker is merely voicing approval of the occupation and seeking to enhance its standing in the minds of hearers.

In sociology, professions often have been discussed, and many descriptive criteria of professionalism have been put forward. These include the following: the work is white-collar, above-average education is required, above-average pay is received, there is an explicit code of ethics to which those in the occupation subscribe, entry is limited by licensing procedures, those in the occupation have an association that is dedicated to maintaining standards, the

service provided is indispensable for the public good, those in the occupation work as independent practitioners, and income does not depend much on the deployment of capital. Typically, a sociologist studying professionalism establishes a particular list of such factors and then stipulates that an occupation is to count as a profession only if it accords with at least several factors on that list.

None of these widespread ways of understanding the term “profession” is satisfactory as a basis for normative professional ethics, because each of these definitions picks out as professions some set of occupations that, from the standpoint of normative ethics, do not differ significantly from the occupations it classifies as nonprofessions. If professional ethics is to be viewed as a field in its own right, it is necessary to employ a conception of what professions are that is more normatively oriented than are any of the conceptions noted above.

A HISTORICALLY BASED CONCEPTION

How did certain occupations first come to be called professions? Considering the history of the term may lead toward a conception that is suitable for the purposes of professional ethics.

The Latin term *professionem* originally meant the making of a public declaration. In medieval Latin, it came to mean the taking of religious vows. The English word “profession” comes directly from the Latin, and until the sixteenth century it too meant only the public taking of religious vows. After that, however, it came to mean an occupation in which learned knowledge is applied to the affairs of others, especially medicine, law, divinity, and university teaching.

The linkage between oath taking and distinctively professional occupations arose because of the procedures of the medieval universities. In them, students prepared for one of four careers; they could become physicians, lawyers, clerics, or university teachers. At various stages in the course of study, and especially at its conclusion, the student was required publicly to take religious oaths. These oaths affirmed general loyalty to the doctrines of the Church and to the discipline of the university, and specific commitment to the special ethical standards of the learned occupation being entered into. Such oaths, devised by persons who already belonged to the occupations in question, carried with them the threat of divine re-

tribution should they be violated; thus, they served as fairly effective means for constraining new entrants to respect the ideals of service that had been established for these occupations.

Because they had taken these oaths, members of these four occupations came to have special ethical obligations that were different in origin and nature from those incurred in other occupations.

APPLYING THE CONCEPTION TO MODERN LIFE

Downplaying its religious aspect, this conception of professions nowadays can be regarded as postulating an understanding between society and those in a profession, a bargain from which both sides benefit. This understanding may be spelled out explicitly, at least in part, but often in modern times it is left largely unstated and is taken for granted. Society accords certain valuable advantages to the members of the occupation, and they in return pledge themselves to promote certain goals that have value to society.

The chief benefit that society grants to members of the occupation is the right to a considerable measure of control over their own activities. This includes the right of those in the occupation to define for themselves the standards of performance that should be obeyed in it and their right to organize their own disciplinary procedures for enforcing those standards. They may also be granted the right to restrict entry into the occupation by imposing licensing requirements (this may well have the effect of reducing competition and keeping fees high). It will be especially appropriate for society to grant these privileges to the members of occupations that are highly technical and require extensive knowledge. Outsiders will be unable to make reliable judgments about how those in such occupations ought to conduct themselves; therefore, the setting of standards and the enforcement of discipline may best be left to the specialists within.

In return for granting these privileges, society receives from the members of the occupation higher-quality service and the curbing of certain types of self-interested exploitation of their expertise by those in the occupation. The ethical requirements that the profession imposes upon itself fall under three headings: responsibilities toward clients (or patients), responsibilities toward the profession itself, and responsibilities toward society. Usually, the interests of the client will be accorded high priority, and the pro-

fessional's technical skills will be viewed as the client's to command, for any reasonable purpose. Responsibilities toward the profession itself will aim at enhancing the excellence of the profession's services and maintaining its standing in the eyes of the public. The responsibilities to society, though not negligible, will usually be accorded a distinctly lower priority.

If all goes well, both society and those in the profession will benefit from such a bargain. The ethical status of professionals will thereby become differentiated from that of nonprofessionals, whose conduct is not governed by bargains of this type.

In U.S. society, medicine and law are traditionally the paradigmatic examples of professions in this sense. Other occupations deserve to be classified as professions if they strongly resemble medicine and law in having this type of ethical structure. Whether an occupation counts as a profession will not be a black-or-white matter, however, but will be a question of degree.

FREE ENTERPRISE VS. COMMUNISM

This contrast between the ethics of professionals and those of nonprofessionals makes sense within a society that has an individualistic ideology such as the free enterprise system, which prevails in the economic life of the United States. Such an ideology makes it ethically permissible for workers to aim at promoting their own individual advantage, when they are in occupations which have not entered into any professional-type bargain with society. Such non-professional workers are supposed to be ethically bound by the law and by the requirements of minimal decency (which prohibit lies, fraud, murder, assault, and the like). In addition, they are ethically bound by any explicit promises they have made to others; for example when an employee contracts to obey an employer's orders in doing work of certain kinds. Aside from these limitations, however, non-professional workers in an individualistic society are ethically free to act as they please, seeking their own advantage. (Society permits them this ethical latitude because doing so encourages them to work harder and more efficiently, which ultimately benefits society.) There arises a contrast between their ethical situation and that of professionals, whose conduct is constrained by self-imposed ethical commitments of the kind already mentioned, which are quite unlike employment contracts.

In a communistic society, this difference between professionals and nonprofessionals would not exist. Under communism, the ideology would be that every worker, whether physician or coal miner, always should be striving above all to promote the well-being of society. Consequently, there would be no special group of professional occupations whose ethics would contrast significantly with the ethics of other occupations.

MEDICINE AS A PROFESSION

In Western society, medicine has had a professional character since ancient Greek times, when physicians took the Hippocratic oath, pledging to protect their art and to use their medical skill only for the promotion of health. Although medicine has changed enormously over the years, modern physicians are rightly expected to retain some of the Hippocratic spirit of dedication to healing, righteousness, and service. For example, in an emergency, even a physician who is off duty is ethically bound to provide medical aid to injured persons who would not otherwise be treated (this is not the case with non-professional workers, such as farmers or fire fighters, who have no general obligation to provide services that have not been contracted).

Some writers who discuss medical ethics include in it wide-ranging public policy questions concerning how best to organize the delivery of health care in society. This is potentially misleading, in that it may suggest that defects in the system of health-care delivery exist only because physicians are not fully discharging their ethical responsibilities. It should not be supposed that increasing the ethical dedication of physicians will be the only, or even the best, way to perfect the structure of a health-care system. To deal with its problems, legislators must make wise public policy decisions.

A particularly controversial topic in medical ethics is whether it is permissible for physicians to end the lives of terminally ill patients who request it or to assist them in committing suicide. On one hand, the Hippocratic tradition commits the physician to using medical skill only to heal and to preserve life; on the other hand, suffering patients sometimes desire to die, and some compassionate physicians think that it would be proper to provide such service. Prevailing opinion within the American Medical Association has opposed the latter view as setting too dangerous a

precedent, and U.S. law has forbidden such action by physicians. In the Netherlands, however, euthanasia has been legally accepted and has been widely practiced.

LAW AS A PROFESSION

In the United States, law as a profession has been dominated by the American Bar Association (ABA). Its Canons of Professional Conduct serve as an explicit statement of the way in which U.S. lawyers conceive of their professional responsibilities. According to this statement, the lawyer is "an officer of the court." This phrase expresses the idea that the lawyer is a part of the justice system and therefore has an obligation to uphold that system and to promote its efficient functioning.

The ABA views the lawyer as having a primary responsibility to the client, whose prerogative it is to decide what legal action is to be undertaken. The lawyer's task is to provide accurate legal information and then to carry out the client's wishes. It is the lawyer's duty to keep strictly confidential what the client has revealed in the course of consultation, and the lawyer cannot legally be forced to divulge such information.

One vexing issue in legal ethics is how far the lawyer may go in promoting the client's cause by means that seem shady yet that are not illegal. For example, in a criminal defense, may the lawyer permit the client to give testimony that the lawyer has good reason to believe is untruthful? As an officer of the court, the lawyer ought not to countenance perjury, yet the lawyer also has an obligation to advance the client's case, and the client's questionable testimony may do this. In such cases, two responsibilities clash, and lawyers differ among themselves about how far to go.

BUSINESS AS A PROFESSION

As education in business management has advanced, the field has become more and more complex and technical. Intricate mathematical analyses and strategies have become available to assist and guide the business executive. This development has encouraged some writers to say that business has now become "professionalized."

Business ethics, however, remains different from professional ethics. Under the free enterprise system as it exists in the United States, it is ethically permissible for businesspersons to make pursuit of their own advantage their primary goal, as long as they do

not break the law or violate minimal standards of decency. Professionals, however, have additional ethical obligations that further limit their pursuit of self-interest; they ought not to be as single-minded in their profit-seeking as businesspersons may be.

OTHER PROFESSIONS

Architecture, engineering, accounting, military science, and many other occupations partake of the character of professions in varying degrees. Those engaged in these occupations possess technical skills and provide them to those who need them. Because these skills are so technical, it is difficult for outsiders to evaluate their use; therefore, associations in these occupations establish codes of conduct and seek to maintain high standards. The degree of professional independence is less, on the whole, than that prevailing in medicine and law, but the professional model does make sense in respect to these occupations.

When architects, engineers, or accountants (especially certified public accountants) are independent practitioners taking on clients, their status is more strongly professional. When the practitioner is an employee of a business enterprise, the employer naturally exercises considerable control over the way in which work is carried out, and independence is diminished. Even so, the practitioner who has a will to do so may be able to maintain independence by rejecting any orders that are contrary to professional canons.

JOURNALISM: A CONTROVERSIAL OCCUPATION

Journalism is an occupation whose status has been especially controversial. Many journalists have come to regard themselves as subject to very special ethical imperatives that make journalism a profession rather than a business activity. They think of themselves as charged by society with the vital task of conveying news, and, more specifically, of exposing wrongdoing by prominent persons. (They have sometimes spoken of journalism as constituting a "fourth branch of government.")

A special test of this conception of journalism as a profession arises when journalists claim a legal right to preserve the confidentiality of their sources. For example, suppose an employee in a government department reveals to a journalist classified information about improper activity within that department. The government then seeks to prosecute the leaker

and demands that the journalist reveal this person's name. The journalist perhaps refuses to do so, claiming a privilege of confidentiality that is, supposedly, analogous to the lawyer's privilege of keeping confidential what clients have said in legal consultation. Many journalists have thought they ought to have such a privilege; the U.S. Congress and the courts, however, have refused to grant it to them, and journalists who refuse to cooperate with legal authorities risk criminal prosecution.

Against the view that journalism is a profession, it can be pointed out that it is not an occupation requiring extensive scholarly education. Furthermore, it would probably be imprudent for society to hand over to journalists the kind of power to set their own standards and regulate their own activities that physicians and lawyers are granted. To do so might give journalists more political control over society than they should have.

CONCLUSION

From time to time, society should ask itself whether the tacit bargains that have been struck with professional groups are working out well. If they are not, and the balance has shifted away from the best interests of society in certain areas, then renegotiation may be appropriate.

Modern trends in medicine and law have been away from the older pattern of individual practitioners. More and more physicians and lawyers are becoming employees of large organizations. As employees, they must accept direction from their employers; therefore, they tend to be less independent than was the case in the past. This decreasing independence diminishes their distinctively professional status but does not eliminate it.

Profit economy

DEFINITION: Social system designed to allocate efficiently the scarce resources of a society by allowing individuals to pursue their own self-interest and to accumulate the wealth gained from that pursuit

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: The profit economy is celebrated by those who focus on the theory behind it, which indicates that the system is fundamentally just since it should lead to increased benefits for all members of the community. It is attacked by those who focus on actual examples of such economies, in which the disparity between rich and poor grows larger and larger over time.

The purpose of economic activity is the satisfaction of wants. The question of which wants and whose wants should be satisfied is a problem of social justice. A profit economy determines how resources are to be allocated, what goods will be provided, and which wants will be satisfied by encouraging individ-

uals to act in ways that they believe will enhance their own self-interest. In a profit economy, firms will act to maximize their profits and households will act to maximize their income, since firms and households are motivated by the desire to accumulate wealth.

It is the ability to accumulate wealth that has raised questions about the justice of a system based on profit. Utopian thinking, which is based on the idea of economic equality, considers the getting of profit as the getting of more than one rightfully deserves, resulting in an unjust and preferential system. Supporters of a profit economy counter that in the real world, if profit is not to be had, little will be done. Furthermore, it is argued that a profit economy functions particularly efficiently, creating wealth that, over time, will benefit all.

Profit taking

DEFINITION: Selling one's securities or property for more money than one expended to acquire them, especially when the sale occurs immediately after a rise in their market value.

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Profit taking by many people at once is often the cause of a temporary drop in the price of the security being sold, following the laws of supply and demand. This situation raises ethical issues to the extent that profit takers harm the interests of long-term shareholders to benefit themselves. As the stock market comes less and less to be populated with long-term shareholders, however, this becomes less and less of an issue.

In its broadest context, profit taking simply refers to the action of an investor in cashing in an investment and realizing whatever profit has been made. There are at least three circumstances, however, in which profit taking raises ethical questions. Especially during the 1980's, when corporate restructuring became commonplace, insider or management buyouts and firms "going private" often meant that investors with

privileged knowledge about a company would offer stockholders more than the market value for their shares but less than the true value of those shares. Then, sometimes after only a brief period of reorganization, the investors would “go public” again, sell some or all of their shares at a considerably higher price, and thus engage in profit taking.

Such practices raised questions of a conflict of interest on the part of the managers involved, who were operating in their own interest rather than upholding their fiduciary responsibility to the company’s shareholders. A second circumstance that raises ethical questions occurs when an investor realizes excessive profit from a transaction based on some standard of social acceptability, and a third such circumstance occurs when an investor gains profit by using unreasonable economic power.

Progressivism

DEFINITION: Political movement and philosophy advocating social change through governmental and institutional action

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Progressivism holds that social and political institutions and activist coalitions bear the burden of improving the quality of life for individuals, because an individual alone lacks the power to achieve social justice. On the political spectrum, progressives are generally to the left of liberals and to the right of radicals.

Although lacking a definitive ideology with common tenets, progressivism evolved during the late nineteenth century as a unique American philosophy that was intended to counter the economic and social ills of the Industrial Revolution and a burgeoning urban society. The philosophy formed the basis for a large-scale reform movement, led by young, educated professionals, that embraced all levels of society and encompassed diverse ideologies.

The unifying forces for this movement were a belief that humankind had evolved sufficiently to con-

trol the course of human development through reform, dispelling the prevailing assumption of a fixed unalterable order beyond human control, and the belief that reform was to be accomplished through a democratically controlled government. Progressives emphasized systems, planning, management, predictability, collective action, the scientific method, and the value of expert opinion. Beginning with the Theodore Roosevelt administration in 1901, the U.S. government initiated and sponsored legislation and amendments to cure the ills of society, make society more democratic, and provide equality for all Americans.

Pro-life movement

DEFINITION: Coalition of activists working to ban abortion

TYPE OF ETHICS: Sex and gender issues; bioethics

SIGNIFICANCE: The pro-life movement represents one side in perhaps the most heated moral debate of the late twentieth and early twenty-first centuries. Although associated with Roman Catholics and the political right, neither of those two groups is undivided on the issue of abortion.

Ethical conflict over abortion has grown hugely since the 1960’s, when the pro-life movement began. The first members of this movement were Catholics, whose views were supported by the Roman Catholic Church. Since then, the movement has spread, and it now numbers among its proponents people from every religion, race, and walk of life. All these people view any abortion as being murder because they see the fetus as becoming a human being at the moment of conception, when sperm and egg fuse. Pro-life responses to abortions vary from peaceful methods that include demonstrations and attempts to dissuade women seeking abortions to active demonstrations at abortion clinics that sometimes lead to physical confrontations involving pro-life demonstrators, clinic staffers, and patients seeking to obtain abortions. In some cases, abortion clinic staffers have been threat-

ened with physical violence, abducted from their homes or workplaces, and subjected to various levels of physical harm by pro-life zealots.

The end goals of the pro-life movement are to seek for the fertilized ovum the same rights that persons who have been born enjoy. It is deemed by many or most pro-lifers that the U.S. Constitution should be amended. A version of the amendment supported by several pro-life members of Congress states that “the paramount right to life is vested in each human being, from the moment of fertilization without regard to age, health or condition of dependency.”

CONCEPTS AND METHODOLOGY

The basic pro-life concepts about abortion, from several sources, indicate the following ethical judgments: (1) the fetus at any stage in its growth from fertilization on is a human being in every sense of the word, (2) an abortion thus kills a person and is murder, and (3) anyone who condones abortion condones murder and is a criminal. According to some members of the movement, such people deserve “anything that happens to them.” The action techniques of the pro-life movement vary greatly, and many are codified by pro-life manifestos such as *Closed: Ninety-nine Ways to Stop Abortion* (Scheidler, 1985).

Such manifestos list numerous operational procedures, including sidewalk counseling of pregnant women, picketing and demonstrations at abortion sites, disseminating leaflets and getting pro-life literature into libraries, advertising in the news media, using sit-ins, picketing the homes of abortionists, going into politics, and using horror stories to frighten women who are seeking abortions. Fortunately, many manifesto writers point out that violence should not be used, because it constitutes using evil to fight evil. Yet there have been regrettable instances in which this belief has not been shared by some pro-lifers, who have destroyed property, abducted abortionists, threatened a shooting war, and, in one case, killed a doctor who performed abortions.

HISTORICAL BACKGROUND

The conflict over abortion is as old as humankind. The ancient Greek and Roman philosophers codified the use of abortion. For example, Plato favored the use of abortion when it was for society’s good, and Aristotle defined human life as beginning only forty or ninety days after the conception of a male or fe-

male fetus, respectively. With the development of Christianity, strong antiabortion sentiment arose and began to flourish. In more modern times, English common law stated that abortion was legal until mothers felt movement in the womb—“quickening”—and this view persisted well into the eighteenth century.

By the twentieth century, the abortion debate became quiescent, and many abortions were made legal by the 1950’s. During the 1960’s, with most Americans favoring therapeutic abortion, the pro-life movement began and evolved to include religious, medical, and lay proponents. At first, the pope and numerous Catholic functionaries preached a pro-life manifesto that was not backed by the Protestant churches. During the 1970’s, however, various Protestant clerics began to support the idea.

A number of physicians, including Jack Wilke, have been long time leaders of the movement. Wilke, in fact, wrote a 1970’s “abortion handbook,” illustrated with pictures of mutilated fetuses, that earned eminence for his pro-life National Right to Life Committee. By the 1980’s, the polarization between pro-life and pro-abortion factions had grown hugely, and the debate has since then become more and more acrimonious. It is not clear what will happen; however, verbal—and sometimes physical—battle lines have been drawn.

Pro-life lobbies in Washington, D.C., have sought to pass the amendment alluded to earlier. In addition, Randall Terry’s well-known Operation Rescue has sought to prevent abortions and close abortion clinics. Documents have also been written by prominent lawyers propounding the legality of the rights of the unborn. Some splinter groups among pro-life proponents have warned their adversaries that a shooting war awaits them. A serious confrontation seems to be inevitable.

CONCLUSIONS

The ethical issue that focuses the actions of the pro-life movement is that it is never appropriate to stop the occurrence of a human life. The advocates of this viewpoint warn that if their point of view is unheeded, the consequences of such unethical decision making will lead to the practice of genocide. In contrast, those who favor abortion for “appropriate reasons” fear that its criminalization will lead to other restrictive legislation that will diminish human rights and produce many other forms of related human

persecution. It seems possible that an ethical compromise could give both sides some of their desires. One model for use could be that of Western Europe, in which respect for every human life is promised and abortion is permitted under conditions that are deemed appropriate and ethical.

Promiscuity

DEFINITION: Sexual activity with multiple partners
TYPE OF ETHICS: Personal and social ethics
SIGNIFICANCE: Promiscuity may involve simple non-monogamy, but the term has strong connotations of a lack of discrimination in sexual partners. It is therefore judged by some to cheapen or even commodify the sexual relationship.

The change in sex habits of Americans since the end of World War II has been described as leading to unlimited sexual freedom. Contraceptive devices had provided nearly complete protection from pregnancy,

and changing and more relaxed attitudes about sex had mitigated the stigma of premarital and extramarital sex, sex with multiple partners, and having children out of wedlock. It seemed the American society had indeed become more promiscuous.

An extensive study of sexual behavior by Albert D. Klassen, Colin J. Williams, and Eugene E. Levitt (1989) concluded, however, that there was no evidence suggesting any far-reaching changes in sexual norms. Patterns of traditional sexual behavior were neither significantly reduced nor reversed. The authors concluded that a “sexual revolution” had not occurred in the United States.

PROMISCUITY

The conclusion that no sexual revolution has occurred does not imply that promiscuity does not exist. Klassen et al. pointed out that norms contradicting the traditional ones have emerged and that commitment to the traditional norms may not be as strong as in the past.

In Africa, premarital and extramarital sex are common. For example, a survey in Zimbabwe revealed that 40 percent of married men had had extramarital sex within the past year (the actual figure is probably higher). Part of the reason for this high frequency is that there is a cultural expectation that married men can have other relationships, and these relationships are accepted by the wives. (This attitude is changing because of the AIDS epidemic in Africa.) Ethically, promiscuity per se is neither good nor bad but depends on the culture in which it occurs. Unfortunately, often accompanying promiscuity are the following outcomes, which can only be viewed as negative.

Where promiscuous behavior is not condoned—for example, in marriage—it is usually conducted without the partner’s awareness. Lying and deceitfulness are commonly used by the one having the relationship in order to keep it secret. This breach of trust and of the bonds of marriage is hardly noble and virtuous behavior.

ROLE MODELS

For better or worse, professional athletes are the true heroes of American culture, and therefore their behavior sets a powerful example. When, for example, famous basketball players brag publicly about having sex with more than ten thousand women or

Patterns in American Sexual Promiscuity

An extensive study of American sexual patterns and behavior by Sam Janus and Cynthia L. Janus provided a measure of how extensive promiscuity is. Their data, which suggest that promiscuous behavior occurs frequently, include these findings:

1. Twenty-six percent of women and 40 percent of men aged eighteen to thirty-eight at the time of the survey became sexually active by age fourteen.
2. Forty to 63 percent of men from ages eighteen through sixty-five and older said that their sexual experience before marriage was important. For women, the figure ranged from 25 to 56 percent.
3. Sixty percent of the men surveyed had had relations with from one to thirty partners, 21 percent with thirty-one to sixty partners, and 18 percent with sixty-one or more. For women, the figures were 81, 9, and 7 percent.
4. Eighteen percent of married men had had one extramarital affair, 38 percent had engaged in extramarital affairs rarely, and 29 percent often had extramarital sex. For women, the figures were 27, 38, and 12 percent.
5. Twenty percent of the men, regardless of income level, had had sex with prostitutes, whereas the figures for women ranged from 3 to 8 percent. Most of these people used the services of a prostitute occasionally (25 to 63 percent), rather than once (6 to 50 percent) or often (7 to 31 percent).

Source: Janus, Sam, and Cynthia L. Janus. *The Janus Report on Sexual Behavior* (1993).

contract AIDS in the course of having sex with hundreds of women, or the mistress of a baseball player is rewarded with extensive coverage in *Playboy*, legitimate questions can be raised about the kinds of examples that these heroes provide.

SEXUALLY TRANSMITTED DISEASES (STDs)

The more persons with whom an individual has sex, the greater that individual's chance of contracting a sexually transmitted disease. According to a report released in 1993 by the Guttmacher Institute, 20 percent (56 million) of all Americans have an STD. Of the 12 million new cases diagnosed each year,

about 90 percent involve people under age 25. By March of 1992, 139,269 adults and adolescents and 1,954 children had died from AIDS in the United States (not all as a result of promiscuous sex). The AIDS epidemic in Africa is even worse.

The 1993 *Kids Count Data Book* claims that the status of adolescents is "deteriorating." Aside from STDs, almost 9 percent of all babies in 1990 were born to single teenagers, and teenagers also accounted for about 25 percent of all abortions. Marilyn Gardner used these data to claim that "Early sexual activity can exact a terrible price from promising young lives . . . too many find themselves shackled by unplanned pregnancies, abortions, single motherhood, infections or infertility."

On balance, then, promiscuity is bad. To avoid the pejorative connotation of the term "promiscuity," social scientists often refer to "sexual networking" or "a pattern of multiple partners." Since promiscuity is not neutral in its effects, however, perhaps the pejorative connotation is desirable.

Promises

DEFINITION: Morally binding declarations that one will or will not do something; oaths

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: One's ability or inability to keep one's promises is often taken as a sign of one's general level of integrity or moral character. The keeping of promises is also of central theoretical importance to moral philosophers as different as Immanuel Kant and Friedrich Nietzsche.

Every society is organized according to various kinds of rules and standards for behavior. Humans' social nature, limitations, and similar needs, along with the scarcity of objects, goods, or conditions such as food, wealth, and jobs, serve to create situations of conflicts that moral and other rules seek to resolve or minimize. There are many implied agreements, or moral rules, that allow people to live safely and to

have meaningful relationships with others. These include agreements not to harm one another, not to lie or cheat, to obey laws, to treat others with dignity, and to keep promises.

In earlier times, one's promise, or "word," was part of one's reputation. Many promises and agreements were made verbally or by shaking hands. Some promises, such as personal ones, are still made that way, but many are written down as formal contracts and agreements. This is because such promises tend to be more complex and because fewer and fewer people actually honor their promises.

To understand the concept of promising and the breaking of promises, two basic and opposed approaches to morality must be examined: nonconsequentialist and consequentialist views.

Nonconsequentialist views oppose the breaking of promises at any time. Whether one keeps or breaks promises has an effect on human relationships, and one of the main arguments against breaking promises

Promises and Kant's Categorical Imperative

In *Foundations of the Metaphysics of Morals* (1785), German philosopher Immanuel Kant argues for the existence of a categorical imperative, a universal and objectively valid moral law. Kant's first formulation of the categorical imperative is "I should never act in such a way that I could not also will that my maxim should be a universal law." In other words, in making moral decisions, one should apply the following test: Is it logically possible to universalize the maxim that guides my action? Kant uses the breaking of promises as his central example. If one were to break a promise, the maxim one followed in such a case would be something like this: "I should always keep my promises . . . unless I decide to break them." Kant argues that if this claim were to be universalized, the word "promise" would lose all meaning. "Everyone should always keep their promises, unless they decide to break them." If it is universally acknowledged that no one is obliged to keep a promise, then the promise ceases to *be* a promise, since a promise entails obligation by definition. A world in which the universal version of the maxim is accepted, then, would be one in which there is simply no such thing as a promise.

The important point about the first formulation of the categorical imperative is that it is a statement, *not* about desirability, but about logical coherence. Kant is not saying that oath-breaking is bad, because one would not want to live in a world where promises cannot be trusted. He is rather pointing out that the statement "everyone should always keep their promises unless they decide to break them" is a logically incoherent utterance, because the proposition renders its key term meaningless. Therefore, it is simply not *possible* to will that this maxim should be a universal law, whether one wants to or not. Kant is committed to this kind of analysis, because he believes that the categorical imperative derives its authority from its form rather than its content. It must have the form of law as such. Only then will it be both objective and universal.

This point raises a potential objection to Kant's formulation, however, since it is unclear that any other type of transgression fails his test in the same way. Vengeful murder, for example, does not cause similar logical inconsistencies when it is universally willed. Kant may well have chosen oath-breaking as an example, because it is the only transgression that clearly fits his point.

is that breaking them can destroy or undermine personal relationships. If a person promises to do something, most people will tend to believe that person's word. If the promise is broken, the relationship with that person is weakened, because trust is a central element of vital relationships. The lack of trust that develops makes rapport more difficult to achieve in the future.

A second argument against the breaking of promises is the idea that if a person breaks a promise and gets away with it, it becomes easier to break other promises. It can become a habit that is hard to break. Third, breaking a promise can have serious effects on other people's lives. In some situations, people make decisions that can greatly affect their lives based on promises that are made to them. For example, someone may quit one job for a promised job and end up with no job at all.

The destruction of general social trust is a fourth reason for not breaking promises. Much of what people do is based on promises and agreements. Once these promises and agreements break down, social trust breaks down. One example of such a situation is the lack of trust that people have regarding promises made during political campaigns. A final argument against breaking promises involves the loss of personal integrity of the one breaking the promise. Breaking a promise not only hurts one's reputation with others but also causes the loss of one's own self-esteem.

What if the consequences for everyone affected would be better if a promise were broken? Consequentialist theories argue that whether a promise should be kept depends on the end results. Consequentialists believe that one should always act to maximize happiness and minimize pain for all involved. Breaking a promise is acceptable if the greatest good consequences would be the result of that act.

One argument favoring the breaking of promises has to do with changed circumstances. One who has made a promise should have the right to break it if the circumstances under which it was made have changed. Another defense of promise breaking involves the arising of moral conflicts. For example, protecting human life should take precedence over keeping a promise. Promise breaking should also be allowed when promises are made in unusual situations. For example, a promise made to satisfy someone on his deathbed can be broken later for good reasons.

Finally, in the spirit of the Latin phrase *caveat emptor* ("let the buyer beware"), recipients of promises should beware. They should not assume that promises will be kept.

Property

DEFINITION: Objects, land, ideas, creative expressions, or other things over which individuals or groups enjoy ownership

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: In traditional liberal political philosophy, ownership of property is a fundamental civil right. In socialist theory, it is an evil to be overcome.

Human beings need material goods to survive. Therefore, whoever controls the production and distribution of material goods controls human survival. The legal arrangements that societies enact for the control of material goods—property—are based on ethical principles regarding the proper relationship between the individuals who must ultimately consume the goods and the societies of which they are a part. Historically, three broad ethical approaches have shaped legal arrangements for the control of property: the individual, the collective, and the monarchic.

INDIVIDUALISM

Individualist ethics argue that each individual is an end in himself or herself. Each individual should have control of his or her own life and be responsible for his or her own well-being. Accordingly, individualists argue that each individual should have legal control over whatever property he or she produces or acquires; in other words, the right to private property should be a fundamental social principle. Economically, a free enterprise system results from the recognition of private property rights. In such a system, the moral standard at work is self-responsibility and individual achievement, and the property arrangements in the individualist society reflect this standard.

COLLECTIVISM

Collectivist ethics argue that individuals are subordinate to the larger social group of which they are a part. The larger social group varies depending on the version of collectivism that is advocated: The group may be defined in national, tribal, racial, or cultural terms. Common to all versions of collectivism is the principle that individuals exist primarily to serve the welfare of society as a whole; therefore, collectivists argue that society as a whole (or its representatives) should have legal control over all property in society. Control of a portion of society's property may be delegated to various individuals, but ultimate control remains with society as a whole. Economically, some form of socialist economy should result. In such a system, the moral standard at work is the value of the individual to the society, and the property arrangements within the collectivist society reflect this standard.

MONARCHISM

Monarchist ethics argue that some single individual (or, in aristocratic variations, a small number of individuals) is inherently superior to the rest of the individuals in the society. Accordingly, most individuals in the society exist primarily to serve the monarch (or the aristocratic class), and therefore the monarch should retain ultimate control over all property. Whether an individual has control of much, little, or no property thus depends upon the will of the monarch. Economically, some form of command economy should result. In such a system, the moral standard at work is the value of the individual to the monarch, and the property arrangements within the monarchist society reflect this standard.

MIXED SYSTEMS

Historically, most societies' property arrangements have been mixtures of two or more of the above principles. In some tribal societies, for example, most property is controlled communally, while some is controlled individually. Since no individual has control over the use of enough property to ensure his or her existence, however, an individual's survival is controlled by the tribe. Individuals whom the tribe holds to be valuable are granted greater control over property, both as a sign of favor and in the hope that they will use it to benefit the tribe, while individuals for whom the tribe no longer has a use—such as the deformed, the aged, and those who are deemed troublemakers—are denied access to the tribe's property. In this way, the primary moral standard at work is the value of the individual to the tribe, and the property arrangements within the tribe reflect this standard.

Most modern Western societies are a mixture of individual and collective property arrangements. Much property is owned and controlled by private individuals, but the use to which individuals can put their property is often controlled collectively by, for example, zoning laws; in some cases, a private individual's property rights can be overridden by eminent domain.

CONNECTION TO CIVIL RIGHTS

Individual property rights are sometimes contrasted with other categories of individual rights—most often, civil rights such as the rights to freedom of religion, freedom of speech, freedom of association, and the freedom to vote. In some accounts of

rights, civil and property rights fall into two fundamentally different categories; advocates of such accounts use such a distinction to argue for a mixed system of rights—for example, that all property should be controlled collectively, while individuals should retain the full range of civil rights. Others argue that there is no fundamental distinction between civil and property rights; they will argue, for example, that the right to freedom of speech means very little if one has no right to own a printing press.

INTELLECTUAL PROPERTY

Most philosophical discussion has focused on material property; for example, tools, real estate, machines, and animals. Increasingly, however, many of the values that contribute to human life require primarily intellectual (rather than physical) work for their production. Accordingly, individualist societies have evolved legal mechanisms to protect individuals' rights to the fruits of their intellectual labors, once they have been translated into physical form. Copyrights exist to allow individuals to control the use of the written works or art works that they have produced, industrial trademarks are registered and protected by law, and patents are issued to protect individuals' control over their inventions, such as new machines or drugs. Scientific advances continue to raise questions about the proper scope of such rights—for example, as biotechnology makes possible the creation of new life-forms.

Prostitution

DEFINITION: Provision of sexual services for payment

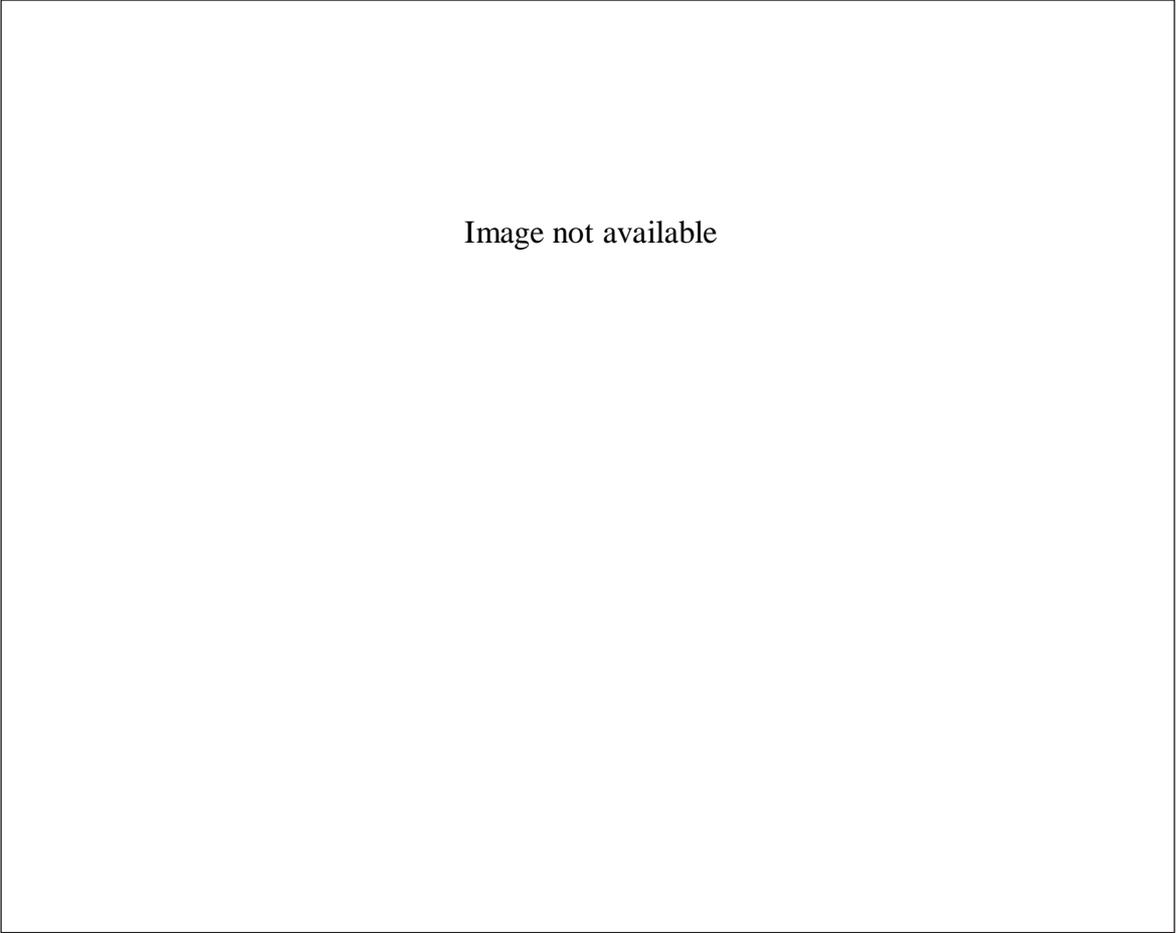

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: The ethics of prostitution constitute one of the most debated and controversial issues concerning human relationships in history, and prostitution itself is the focus of significant criminal justice resources.

Prostitution, or sex for pay, has been pervasive throughout human history. It differs from sex slavery because its sexual contacts are generally voluntary and largely commercial. It also differs from marriages of convenience, or mistress-keeping, in that its sexual contacts are relatively indiscriminate and typically involve large numbers of customers. It differs from sexual promiscuity or sexual addiction because payments are involved. Finally, it differs from other sex work, such as strip shows or pornographic films, because it provides direct physical sex contacts to its clients.

A primary sex issue in prostitution is the contrast between marital or romantic sex and commercial sex, in which the physical acts tend to be more mechanical than emotional. Moreover, the sexual access that the prostitutes provide to their clients is objectified, depersonalized, and merely a means to satisfy their clients' sexual needs. The prostitutes themselves tend to be emotionally detached and even alienated from their own sexuality, and their physical relationships with their clients are brief and utilitarian.

Other issues relating to prostitution include the extent to which oral, anal, and genital sexual access is granted to customers and questions of mutual con-

A large rectangular box with a thin black border, centered in the upper half of the page. Inside the box, the text "Image not available" is centered in a black serif font.

Mexican prostitutes in the border city of Tijuana watch for customers on a rainy afternoon. During the mid-1990's Tijuana's prostitutes—like those in other major Mexican cities—organized a labor union to protect themselves against police harassment and to secure better health care. (AP/Wide World Photos)

sent in the undertaking of such activities as bondage, sadomasochistic acts, and role playing. Gender issues include the relative rights of men and women to work as prostitutes and the sexual access each may grant, and perceptions of male domination symbolized by female prostitution.

BEYOND SEX AND GENDER ISSUES

Many people question the morality of prostitution. Prostitution tends to be judged immoral because it is usually illegal. Critics charge that prostitution does great harm to the prostitutes themselves, their customers, third parties, and society in general. Religious critics charge that prostitution promotes sexual unions that lack the sanctification of marriage, do not

serve the natural purposes of reproduction or conjugal union, and are both impersonal and mercenary. They see prostitution as sinful: Prostitutes are unclean and fallen, at least temporarily, from the grace of God. However, some ancient and primitive religions used prostitutes in religious rites. Social critics would add that prostitution is often forced upon its practitioners by economic forces and is inherently degrading to them.

Human rights advocates see prostitution as a social welfare problem with people taking up prostitution out of economic desperation, lack of skills, or social isolation. They recommend counseling, education, and training to encourage prostitutes to make other employment and human relationship choices.

Women choosing careers in prostitution even though other options are open to them are encouraged to direct themselves toward healthier and safer sexual practices and working environments.

Some civil libertarians view prostitution as a privacy issue and argue that individuals should be permitted to choose any lifestyle and profession they wish, so long as they do not harm others. Sexually transmitted disease or the psychological and economic damage done to third persons including the prostitutes' or customers' spouses and dependent children are possible types of harm.

Politico-economic rights advocates debate prostitution as both a power issue and a free-exchange issue. Those with political power define, through law, what is permissible commercial behavior. Sex is one of several regulated or prohibited commodities. Paternalists would protect the prostitute from abuse, disease, and social ostracism by either banning prostitution or regulating it with geographic zones, medical inspections, and licenses. Free market advocates believe all voluntary commercial exchange, including prostitution, should be permitted and see sex as merely another form of wage labor.

Legal ethics address the subjective and relative criminality of prostitution. Regarded as a victimless crime, prostitution is consequently an offense that is subject to considerable discretion and variance in both law enforcement and adjudication. Some communities treat prostitution permissively, while others subject it to strict, harsh, and punitive enforcement.

Some business and labor ethicists advocate extending to prostitutes and their customers the same business standards and work safety protections offered in other professions. Such a change would help relieve prostitutes from exploitation by third parties, especially pimps, public accommodations operators, and organized crime. According to this view, prostitutes deserve the same health care, insurance, banking privileges, tax paying, public accommodations, and public utility rights as other citizens.

UNINTENDED CONSEQUENCES OF PROHIBITION

Continuing efforts to stop prostitution tend to generate disrespect for both the law and law enforcement, as prostitution continues to flourish. Meanwhile, prostitution enriches pimps and members of

organized crime bodies. Traffickers in prostitutes provide financial incentives for the corruption of law enforcement, the courts, and politics, adding to the burdens of the police, the courts, and the penal system. At the same time, the prostitutes themselves rarely profit financially and are increasingly marginalized socially. They and their customers also stand greatly increased chances of contracting sexually transmitted diseases, including acquired immunodeficiency syndrome (AIDS), especially because they avoid testing.

Prostitution also contributes to tensions in marriages in which one partner is more sexually demanding or adventurous than the other. Laws define as criminals people engaging in what are essentially victimless crimes, while consuming public resources that might be better used elsewhere. Criticisms of prostitution contribute to erosion of respect for religion and other institutions that try to define a relatively popular practice as immoral. Confused public attitudes toward prostitution also help to perpetuate moral, religious, and legal double standards in which the clients are less condemned than the prostitutes, and male clients of female prostitutes are less condemned than female clients of male prostitutes.

Prudence

DEFINITION: Skill in judging how to achieve one's ends while avoiding danger or minimizing risk

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Prudence is sometimes described as a virtue, especially to the extent that it entails avoiding conflicts that will necessarily harm oneself or others. It is also possible, however, to judge people to be overly prudent, or too cautious for their own good.

In twentieth century ethical theory, there are two quite different ways of understanding prudence and its relationship to ethics. According to one, prudence is a virtue that is essential to an ethical life. According to the other, prudence is a principle that is distinct from, and often opposed to, ethics. The best approach to understanding these two conceptions of prudence is to look at their history. Since prudence has been examined during most of its history in languages other than English, it is helpful to identify the non-English ancestors of the term "prudence."

For most of the leading ethical theorists of ancient Greece, ancient Rome, and the Roman Catholic tradition, prudence is understood to be one of the four cardinal (principal) virtues. In the *Republic* (c. 390 B.C.E.), Plato uses the Greek word *sophia*, which is usually translated into English as "wisdom," and Greek words meaning justice, courage, and temperance to name the four chief virtues (states of character) of both good persons and good communities. For Plato, persons with the virtue of *sophia* are those who exercise forethought in determining what is best, both for themselves and for the communities to which they belong, and whose rational faculties are in command of their other faculties.

Plato's student Aristotle distinguishes, in his *Nicomachean Ethics* (c. 330 B.C.E.), *sophia* and *phron̄sis*. For Aristotle, a person with the virtue of *phron̄sis* is able to deliberate rationally about which actions best achieve the end of a good human life. *Phron̄sis* was later translated into Latin as *prudentia*, from which the English word "prudence" is derived. Philosophers in the Stoic and Epicurean traditions, both Greek and Roman, also developed theories of the cardinal virtues.

Drawing from many of his predecessors in the Greco-Roman and Judeo-Christian traditions,

Thomas Aquinas provides a detailed account of the virtue of *prudentia* in his *Summa Theologica* (c. 1270). He defines *prudentia* as "right reason applied to action" and explains that it is concerned not with determining ends, but with determining the means to the end of a good, complete human life. Following Aristotle, he discusses three subvirtues of *prudentia*: *euboulia*, or good deliberation; *synesis*, or good judgment in ordinary cases; and *gnome*, or good judgment in exceptional cases. He distinguishes *prudentia* from false *prudentia*, which enables one to determine well the means to an immoral end, and from incomplete *prudentia*, which falls short of complete *prudentia* in one way or another. He explains that *prudentia* is concerned with both the good of individuals and the good of the families and communities to which they belong, and he offers a detailed analysis of the vices, or negative states of character, that are opposed to *prudentia*.

THE MIDDLE AGES AND BEYOND

The shift in the understanding of prudence that occurred between the thirteenth and twentieth centuries was part of a larger shift in the understanding of the relationship between ethical obligation and the good of persons who perform ethical actions. Whereas the dominant view in ancient and medieval ethics was that being ethical is usually good both for ethical persons themselves and for those who are affected by their actions, the history of modern ethical theories is one of increasing emphasis on the obligation to benefit other persons at the expense of self-interest.

Prussian philosopher Immanuel Kant played a major role in developing the belief that prudence (in German, *Klugheit*) and ethics often oppose one another. His *Foundations of the Metaphysics of Morals* (1785) distinguishes "rules of skill," which describe the means to ends that people could desire; "counsels of prudence," which describe the means to an end that all people do in fact desire (their own happiness); and "commands of morality," which tell people which actions they should perform because they are good actions, regardless of what ends are desired.

For Kant, what makes an action moral is that it is motivated by a desire to perform a moral action, not that it has certain intended or actual consequences. In his *Critique of Practical Reason* (1788) and *Perpetual Peace* (1795), Kant writes that there are clear boundaries between prudence and ethics, and that ac-

tions motivated by the desire to achieve happiness directly oppose morality. Kant's theory is, therefore, a departure from those traditions that understand prudence to be one of the virtues, without which one cannot be ethical.

The history of eighteenth to twentieth century ethical theory in the English-speaking world also includes a shift toward the belief that prudence and morality are in competition with, or opposed to, each other. Jeremy Bentham, in his *Introduction to the Principles of Morals and Legislation* (1789), understands ethics in terms of a distinction between duty to self and duty to others. He associates prudence with the former but is somewhat tentative in calling it a duty at all: "The quality which a man manifests by the discharge of this branch of duty (if duty it is to be called) is that of *prudence*."

In *The Methods of Ethics* (1874), Henry Sidgwick goes beyond Bentham by calling *phronisis* "practical wisdom" and classifying it as an "intellectual virtue," and then classifying prudence as a "self-regarding virtue." Although Sidgwick allows that "prudence may be said to be merely wisdom made more definite by the acceptance of self-interest as its sole ultimate end" and that "it is a strongly supported opinion that all valid moral rules have ultimately a prudential basis," he is a contributor to the separation of prudence from ethics.

In twentieth century English-language discussions of ethics, it is common to find "prudence" used both as the name of a principle that is in competition with ethics and as the name of a virtue that is essential to an ethical life. For example, William K. Frankena writes, within a single paragraph in *Ethics* (1973), both that "morality must be contrasted with prudence" and that "it may also be that prudence is a moral virtue." Some twentieth century writers attempt to minimize confusion by following Sidgwick in using "practical wisdom" as the English name of the virtue *phronisis/prudentia*.

Psychology

DEFINITION: Scientific study of the human mind and human behavior

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: Psychology raises two distinct sorts of ethical issues: how to engage responsibly in psychological research, and how best to treat patients of clinical practitioners. Because patients are often simultaneously research subjects, however, the line between research and treatment may blur, raising other ethical concerns.

When most people think of psychologists, they think of psychotherapists. These are licensed psychologists who have a private practice with individual clients or who work in settings such as hospitals, substance abuse clinics, or victim services centers. Psychotherapists (or clinical psychologists) have as their main goal helping their clients to achieve a better sense of balance, self-esteem, or mental health. To achieve this goal, they use a variety of therapeutic techniques and follow ethical guidelines intended to ensure that the clients' best interests are being met as well as possible.

Not all psychologists, however, are therapists. Psychologists are found in a variety of nonclinical settings where they must follow ethical guidelines as they apply their psychological knowledge and skills. Research psychologists must ensure the well-being of their animal or human experimental subjects, while psychologists who work in industrial, educa-

tional, and government settings try to ensure the well-being of those with whom and for whom they work: employees, students, and citizens in general.

The American Psychological Association (APA), the largest U.S. professional organization for psychologists, has formulated and published ethical guidelines for psychologists in each of these settings. It also maintains several committees that answer questions, make suggestions, and sometimes investigate psychologists who have been reported for malpractice or other unethical behavior.

ETHICS IN THERAPY

The relationship between therapist and client is complex and potentially fraught with ethical dilemmas. In many instances, the reason the client is seeking help is, in and of itself, sensitive information; clients may be embarrassed or ashamed about a problem or behavior, such as phobia, bulimia, or sexual dysfunction. In other circumstances, a client may feel that his or her job, marriage, or even personal liberty may be in jeopardy if the issues that are brought up in therapy somehow become public knowledge. Clearly, one of the primary concerns of any clinician is to establish an open and trusting relationship with the client, and in most cases, that can be done only when confidentiality is ensured.

Therapists try to ensure confidentiality whenever possible, but a promise of complete confidentiality may put the therapist at risk for other kinds of ethical infractions. What if, for example, a client reports repeated fantasies of murdering his former girlfriend and the therapist feels that the reported fantasies may be based upon a real motive and plan? What if the client brings up a history of child abuse and then admits to being a perpetrator as well as a victim? These and other such ethical quandaries are more than hypothetical, and, after a real case in which a client did murder his former girlfriend, the California Supreme Court ruled that the privilege of therapist-client confidentiality, like the privilege of doctor-patient confidentiality, has its limits. In cases in which it appears that the public welfare is endangered (whether it be a particular individual or the public at large), a therapist is ethically and legally required to report his or her assessment of the situation to appropriate authorities who may be able to protect the endangered individual or individuals. Rarely, however, are such decisions either straightforward or without cost.

Another attribute of the client-therapist relationship that makes it difficult to make clear-cut ethical judgments is the fact that the relationship of the therapist to the client may be, at one time or another, that of an objective expert, a friend, an authority figure, a role model, or a variety of other things; and behavior that is appropriate in some kinds of relationships may not be appropriate in others. In addition, since therapeutic sessions often involve intense emotion, there is always the potential for one or both parties to interpret the emotion as personal rather than situational and to respond to that emotion in an inappropriate way. It is not always possible to know when each type of role could be helpful and when it could be harmful; thus, it is impossible to come up with clear guidelines. Most psychologists, however, acknowledge the dangers inherent in playing multiple roles and realize that it is the psychologist, rather than the client, who should always be on the alert for such dangers.

A common but undesirable type of relationship between therapist and client is one of client emotional dependence upon, or indebtedness to, the therapist. While in such a relationship, the client may make it easy for the therapist to take undue advantages that are not in the client's best interest—for example, overcharging, extending the period of therapy beyond what is necessary, accepting favors, or even entering into a sexual relationship with the client. Such outcomes are antithetical to the goal of developing a better sense of self-esteem and well-being in the client, and they should be avoided at all costs; once developed, however, such relationships are often difficult to undo without additional psychological pain or damage.

Licensed therapists are also expected to maintain professional standards in other areas, such as maintaining and upgrading their education and competence, avoiding conflicts of interest, being able to make appropriate referrals when necessary, and being truthful in their advertising and other public statements.

ETHICS IN THE COURTROOM

Psychologists are more and more frequently being called as expert witnesses in the courts. One increasingly common practice is the use of psychologists to present evidence about the validity of certain types of testimony. Psychologists may address, for example, the accuracy (or lack thereof) of eyewitness

testimony of witnesses of different ages (as in child abuse cases), or of memory elicited while the witness was under hypnosis, or the likelihood of different types of errors made by “lie detectors.” They may also be asked to address special issues such as child development (as in custody cases), victimology, post-traumatic stress disorder, or “brainwashing.” Testimony should be unbiased and, to be accepted by the court, should be based upon accepted knowledge and standards.

Psychologists are also sometimes called upon to make judgments that could affect a person’s legal status. As expert witnesses in court, they may be asked to give their opinion on a person’s mental status and ability to stand trial (“competence”), on a person’s likely mental status at the time of a crime (“sanity”), or on the likelihood that a particular convicted criminal will respond positively to treatment or rehabilitation. This type of testimony cannot, like the types discussed above, be based solely upon accepted scientific standards and “facts”; because each case is unique, the psychologist must rely on clinical and personal judgment as well as scientific and statistical data.

Clearly, the impact of such judgments can be of great consequence, both to the public and to the person being judged. Therefore, both ethical and legal guidelines exist in order to help psychologists (and others involved in the criminal justice system) make decisions about a person’s psychological competence and legal status. Despite U.S. society’s long, traditional belief in personal liberty and the pursuit of happiness, that liberty can be taken away if a person is perceived to be a threat to himself or herself or to the public; whenever such drastic measures are considered, the ethical as well as the practical consequences must be addressed.

In some cases, a person is perceived to have lost the capacity to make free, rational choices—not as a result of incarceration, but as a result of severe physical or mental illness. Psychologists must often testify regarding a person’s mental status and abilities when questions arise regarding the legitimacy and enforceability of a contested will, contract, or other legal document, or the involuntary commitment of an individual to a mental treatment facility. Both ethical and legal guidelines exist that allow a guardian or other legally designated individual to make decisions in the best interests of an “incompetent” individual,

but it is difficult to determine when, if ever, a person should lose the legal right to make decisions, even when those decisions may seem irrational to an observer.

Although it is a minority opinion, some psychologists share the view of Thomas Szasz, who argues that all psychiatric and psychological diagnoses of mental disorders are simply negative labels that the majority give to those in the minority who have a different view, or kind of life. Szasz argues that simply because someone may be statistically abnormal and doesn’t function the way that society expects, that does not make him or her any less of a person, even in terms of legal rights and status. Clearly, what one considers “ethical” depends substantially upon one’s philosophy.

ETHICS IN EDUCATION AND THE WORKPLACE

Unlike clinical psychologists, psychologists in educational and industrial settings are unlikely to be working with clients with mental illness, yet there exist in these settings many sensitive issues that require ethical consideration. Perhaps foremost among these are the issues surrounding testing. Students, workers, or potential job applicants may be tested for a variety of things, including honesty, aptitudes and abilities, attitudes, and personality. Such tests are thought to predict academic or job performance and are thus often used to “track” people into particular classes or careers.

One of the most controversial ethical issues surrounding testing is the phenomenon of labeling. Although many of the tests used in academic and industrial settings do have predictive validity (that is, they can predict people’s performance at better than chance levels), no test is perfect, so sometimes a person’s performance is estimated at a much lower level than it actually is. Since the tests are thought to measure stable attributes of individuals, they are usually not given more than once; thus, a person whose test score underestimated his or her abilities would likely be tracked into an area that would underutilize that person’s skills and understimulate his or her intellect. Once the person is labeled as unlikely to succeed in other, perhaps more demanding areas, it is unlikely that such opportunities will be made available. At the same time, the person may self-label and enter into what is called a “self-fulfilling prophecy”; the person will assume that the test is accurate and that he or she

is not cut out for other kinds of challenges, and thus will not try more challenging things. Since many skills really reflect the phrase “use it or lose it,” if the person ceases to try new things and practice skills, his or her competence level may truly drop. Thus, as a result of being labeled by a test, the person may in fact become more like what the test originally (incorrectly) suggested.

The ethical quandary surrounding test use is whether the benefits that the tests confer to the educational or business institution outweigh the potential losses to the individuals being tested. Since some tests are statistically valid, they can save institutions time and money by tracking people quickly and efficiently into areas in which they will perform well; they also can be beneficial for those students or workers who are unhappy and want professional advice about what kind of study or job may suit them better. The costs of labeling someone, however, are unmeasurable.

As an example, consider honesty testing. Some honesty tests, such as the polygraph test, are statistically better than chance at ferreting out dishonest individuals as long as the tester/interpreter is honest and well trained. By giving a polygraph test to all potential employees, a business may save thousands of dollars by screening out some people who might embezzle, steal equipment, or sell company secrets. For each dishonest person who is caught by polygraph testing, however, there are several honest people who will also be weeded out and labeled by the test. Although the institution may save money by giving the test, many innocent (honest) people will suffer—they will not get the job, they may have something negative put in their files, or they may even be told that they failed the test, and may become depressed, hopeless, angry, or otherwise emotionally scarred. Because of these human costs, the U.S. Congress has outlawed the use of polygraphs in some settings, but where they are still allowed, the psychologists involved must consider the ethical issues each time the test is administered.

Unlike the polygraph test, not all tests used in educational and work settings are even statistically valid. Sometimes tests go out of date as society and culture change. Even those that are valid for one population (for example, adult males) may not be valid for another population (for example, adolescent males). Good psychologists must constantly keep up

to date about the strengths, weaknesses, and limitations of the tests they use. Like their clinical counterparts, industrial and educational psychologists must realize that their tests are not always accurate, that there are dangers in mislabeling just as there are in misdiagnosing, and that a person is more than the sum of his or her test scores.

ETHICS IN RESEARCH

Psychologists who do research are subject to federal regulations that ensure that subjects' rights are not abused. According to federal guidelines, each research institute must set up an ethics committee to monitor animal research and another to monitor human research. Each committee must include not only research scientists but also at least one individual who has studied ethics and at least one person who can represent the views of the local community. Research using both animal and human subjects must be approved by the relevant committees before it is begun.

Researchers using animal subjects must ensure that animals are housed, fed, and transported in a humane manner; government-employed veterinarians make unannounced visits to make sure that each facility is operating in compliance with federal animal welfare guidelines. Researchers must also ensure that animals' pain and suffering is minimized, and that all alternative research techniques have been considered before any painful procedures are planned. The number and species of animals that are used must also be justified. On an annual basis, each committee presents a summary report of the institution's research activities to the federal government.

Researchers using human subjects must do much more in order to get a project approved by the local committee. Each researcher must demonstrate that all subjects are informed, in writing, of all possible risks of participation; that each subject signs a written consent form (or has a legal guardian sign instead); that subjects are never pressured to participate in a study and know that they are free to withdraw from the study at any time; that counseling is available for anyone who does somehow feel injured by participation in the study; that all data are kept confidential at all phases of the study; and that all subjects receive a written “debriefing” at the end of the study, which not only thanks them for their participation but also gives them any information about the study that may have been withheld or disguised in the consent form.

Withholding or disguising information in the consent form is called “deception.” Deception is kept at a minimum but sometimes is necessary in order to prevent subject bias. For example, subjects may sign up to participate in a study that is supposedly on reading, but is really on helping behavior. While the subjects are sitting in what they think is a waiting room, the experimenter may stage an “accident” and observe how many subjects try to help the accident “victim” and under what conditions. It is likely that subjects would behave in a different way under these fairly realistic circumstances if they knew that the “accident” was staged and that they were really in a study of helping behavior. All research deception must be approved by the ethics committee in advance, and the debriefing must explain to the subjects why the deception was necessary. Studies that involve major or prolonged deception are generally not approved, even though they might provide useful information.

Psychopharmacology

DEFINITION: Study of the effects that drugs have on emotion, thought, and behavior

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: Psychopharmacology is the basis for the medical treatment of mental illness. As such, it raises ethical questions involving the rights of the mentally ill to determine their own course of treatment or to refuse medication, as well as the long-term risks of medications that produce short-term benefits.

While many physicians and biologically oriented psychiatrists have had a long-standing commitment to the use of psychotropic medications for the treatment of some emotional disorders, others have questioned their use in particular cases. From an ethical perspective, some people have questioned whether such interventions are demonstrably superior to other treatment forms—such as psychotherapy, for

example—in view of the known side effects of medications. In addition, it is not always clear that patients are able to give fully informed consent, and it is not always clear that patients are fully informed of all the risks inherent in psychopharmacological interventions.

HISTORY

While the use of psychoactive drugs designed to treat mental disorders is relatively recent, the use of drugs as pain relievers and sleep producers goes back for many hundreds of years. Alcohol and opiates are good examples of drugs that have been used for such purposes. The use by the medical community of drugs to treat mental symptoms goes back to the 1840's, when bromides were first used to treat anxiety. Later in the nineteenth century, Sigmund Freud, the father of psychoanalysis, suggested that cocaine was a psychoactive drug that could be helpful, and in the first part of the twentieth century, barbiturates were introduced to treat anxiety.

Alan Gelenberg, Ellen Bassuk, and Stephen Schoonover point out in their book *The Practitioner's Guide to Psychoactive Drugs* (3d ed., 1991) that in 1949, with the synthesis of chlorpromazine, the medical community began to focus on the use of drugs to treat mental illness. At about the same time that chlorpromazine was developed, reserpine (another tranquilizer synthesized from the root of the plant *Rauwolfia serpentina*) came into use. Lithium chloride was used as early as 1940, but its ability to counter manic behavior was not established until 1949 and lithium itself was not approved for use in the United States until 1970.

PRESCRIPTION PRIVILEGES

While physicians and some other health professionals (for example, nurse practitioners and optometrists) do have the authority to prescribe medications, nonphysicians, including psychologists, do not have prescription privileges, although on the federal level psychologists have legally prescribed within the Indian Health Service. Since the 1990's, there has been a spirited debate among psychologists regarding whether prescription privileges should be sought by psychologists on a state-by-state basis. The focus of the argument has been on psychotropic medications and their judicious use. Some people have argued that nursing home residents are often treated

with drugs that are designed to treat mental disorders when, in fact, most of these patients are not mentally ill. Conversely, while there is agreement that some children with symptoms of hyperactivity and/or attention deficit disorder should be treated with psychotropic medications, it is important to diagnose such problems carefully, since such problems may involve parents' ineffectiveness in coping with the child.

OBJECTIONS TO PSYCHOTROPIC DRUGS

In his book *Toxic Psychiatry* (1991), Peter Breggin argues that many patients may not have been fully apprised of the negative (addictive and dangerous) side effects of many psychotropic medications. In addition, he argues that the use of drugs even for the severely mentally ill is not unequivocally supported by research and that the results of positive drug studies are countermanded by evidence that some psychotropic drugs cause brain impairment. Mary Lee Smith, Gene Glass, and Thomas Miller, in their book *The Benefits of Psychotherapy* (1980), analyzed 112 experiments that studied the separate and combined effects of drug therapy and psychotherapy. They found that even for serious psychological disorders, psychotherapy was nearly even with drug therapy in terms of overall effectiveness. While drug therapy and psychotherapy taken together produced greater effects than did either drug therapy or psychotherapy alone, the effects of these therapies in combination were only slightly greater than their separate effects.

THE COMBINED USE OF PHARMACOTHERAPY AND PSYCHOTHERAPY

In his book *The Psychotherapist's Guide to Psychopharmacology* (1990), Michael J. Gitlin raises the question of whether there are negative interactions between drug therapy and psychotherapy. To the extent that successful drug therapy reduces symptoms, some patients may not wish to continue in psychotherapy for their emotional problems. There is also concern that dependence on drugs may make patients unusually passive and relatively unwilling to explore their problems in psychotherapy. Finally, some patients may become distressed at the notion that they could benefit from medications in addition to psychotherapy, since they may perceive medications as a kind of crutch. Some patients, however, are convinced that they have some kind of chemical

imbalance that needs to be “fixed” by means of psychotropic drugs. These patients do not believe that it is important to explore their problems in psychotherapy.

Gitlin also describes who should have a medication consultation. He points out that patients with such psychiatric symptoms as delusions, hallucinations, or psychosis should be considered, as well as patients with appetite or sleep disturbances and those with significant suicidal tendencies. Patients with significant medical disorders and patients with a family history of more than minor psychiatric disorders are candidates for drug therapy. Finally, patients presenting confusion, concentration problems, and other cognitive symptoms are also good candidates for medication consultations.

THE RIGHT TO REFUSE TREATMENT

In his book *Law, Psychiatry, and Morality* (1984), Alan Stone raises an important moral and ethical issue. Should hospitalized mentally ill patients be required to take antipsychotic medications? Critics of forcing hospitalized patients to take antipsychotic medications argue that this is an invasion of privacy or that these drugs are mind altering and thus violate First Amendment rights. It is known, for example, that some antipsychotic drugs can affect speech and thought. Stone cites a case in which the court was asked to decide whether the state can impose the use of antipsychotic drugs in the absence of an emergency. In that case (*Rogers v. Commissioner of Mental Health*), a federal judge decided that the patient did have the right to refuse medication, since the patient was not likely to harm himself or others. Stone argues that the real issue that should be addressed is whether a patient’s mental illness will respond to antipsychotic medications, rather than assuming that antipsychotic drugs are chemical restraints. Some organizations, such as the National Association for the Mentally Ill, strongly agree with Stone. Others, including many psychologists, agree with the judge’s decision. Time will tell how this topic will be resolved.

Public interest

DEFINITION: Common good of all members of a society

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Theoretically, the interests of every single member of a society may conflict with the interests of the public considered as a whole. The notion of public interest therefore requires weighing the theoretical rights of the individual against the rights of the collective, as well as considering practical claims of specific individuals or groups in specific situations.

For Plato and Aristotle, the concept of public interest arises together with the following fundamental questions: What is justice? What is the best structure of society? What is the proper role of government? The same concept, under the term “commonwealth,” underlies the social contract theories of Thomas Hobbes (*Leviathan*, 1651), John Locke (*Second Treatise of Government*, 1689), and nineteenth century progressivism.

In 1907, U.S. president Theodore Roosevelt signed the Pure Food and Drug Act, quieting decades of outcry against dangerous consumer products that were perceived as resulting from unregulated pursuit of the profit motive. The 1930’s saw renewed interest in the government’s mission to benefit society, and a plethora of public-interest legislation resulted. Dur-

ing the 1960's and 1970's, legislation addressed to public health and safety introduced a new level of regulation of private enterprise, fueled by the growing consumer and environmental movements. In response to business objections, there was a partial rollback of regulation during the 1980's. The longer-term trend, however, has been the evolution of a closer identification between private enterprise and public needs, partly reversing the traditional view that free enterprise and the public interest are inherently at odds.

Public's right to know

DEFINITION: Notion that government agencies, and some private companies, have an obligation to disclose their plans and actions to the public

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: A guiding principle behind the public's right to know is the idea that citizens in a representative democracy have the inherent right to be informed about decisions, especially those of government, that may affect them and their communities.

On July 4, 1967, President Lyndon B. Johnson signed the Freedom of Information Act (FOIA). That law effectively required the federal government and, by implication, the various state and local governments, to provide fuller disclosure of their actions and decisions to citizens, especially through the news media. The law was the logical result of a long series of campaigns to enact "sunshine laws" ensuring that government would be conducted more in the public view. Those campaigns also grew to include information about significant activities of private corporations that could have impacts on potential health hazards in the air, water, and land, as well as in food and other consumer products. The concept of the public's right to know is not confined to the United States; however, it and the FOIA have special relevance in the United States because of direct connections to the

free press clause of Article I of the U.S. Constitution's Bill of Rights.

As the concept is generally accepted, the public's right to know covers several broad categories. The first is that maximum disclosure is favored over partial revelations. Protected areas may include trade secrets and other exceptions, but supporters of the right to know say exceptions should be kept to an absolute minimum. A second broad category is the promotion of open government, the "sunshine" portion of FOIA. Wherever possible, government decisions should be discussed and made in public meetings freely reported by the media.

A fourth area covered by most FOIA and right-to-know legislation is the imperative for government agencies to facilitate use of their information by the news media and citizens. This goal should be achieved through open meetings, limited costs to copy requested documents, and processes that help spread information freely. These are required obligations on the part of government—and, to some extent, the private sector as well. Finally, protection is often afforded to "whistleblowers," those individuals who come forward with previously withheld information covered by the right to know provisions of the law.

There are opponents to the principle of the public's right to know, especially in sensitive areas involving national security or competitiveness. However, courts have generally been favorable to the concept, perhaps shown nowhere more clearly than in the U.S. Supreme Court's ruling that the government could not use prior restraint to prevent *The New York Times* (1971) from publishing excerpts from the Pentagon Papers that revealed how the United States became secretly and heavily involved in the Vietnam War. The ethical obligations of a democracy to inform its citizens as fully as possible, especially about decisions that affect public policy, has clearly been established as a keystone of media operations, although there are those in and out of government who remain unhappy with the concept and its application.

Punishment

DEFINITION: Penalty suffered as a result of transgression

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: The legitimate purposes of punishment are a source of ongoing debate. Is it permissible, for example, to punish out of a need for revenge, or only as a deterrent to future wrongdoing? To what extent are punishment and rehabilitation compatible or incompatible goals? What limits if any should society place upon parents' rights to punish their children, or employers' rights to punish their employees, in the manner in which they see fit?

Punishment, along with crime, appears to be as old as human society. Punishment involves doing harm to supposed offenders in order to prevent the harm caused by crime. It is a crucial means used to promote social control, order, and, presumably, justice. While punishment has been endemic to human society, it is morally problematic in theory as well as practice. Therefore, it retains the status of a necessary evil. A society in which punishment is clearly obsolete has yet to evolve.

HISTORY OF THE CONCEPT

The idea and practice of punishment are as old as civilized societies. Various histories make it clear that punishment has been a basic component of human society, past and present. Indeed, one measure of advancing civilization has been the codification of law, including criminal offenses and sanctions. Punishment is treated conceptually in Western philosophy, at least from the time of Plato, and is prominent in Asian philosophy as well (for example, the Chinese Legalists). The Bible and the Qur'an contain

many passages and parables involving punishment. With the coming of the Enlightenment (in the eighteenth century), social reformers sought to rationalize and humanize punishments, making penalties proportional to offenses and arguing against particularly brutal sanctions. The Ninth Amendment to the U.S. Constitution, for example, prohibits (though it does not define) "cruel and unusual" punishment.

Punishment may be classified into several types. Corporal punishment involves physical sanctions such as beating, flogging, or the amputation of limbs. Capital punishment involves the execution of offenders and is limited to the most heinous of crimes. Incarceration, the most common modern sanction for serious offenders, involves forced restraint in a prison setting. (Incarceration also may involve forced labor, though this has become less common.) Less-serious offenders may be subjected to fines, house arrest, probation, or community service.

MORAL BASES FOR PUNISHMENT

Punishment involves doing harm to people, restraining their freedom, inflicting pain, or even taking their lives. Because of this, it requires moral justification. The primary justification is "retributive justice" (or just deserts). This means that the harm of punishment may legitimately be inflicted because the victims of punishment deserve punishment. In addition, punishment may be defended as a "deterrent." The swift and certain punishment of offenders discourages other people from breaking laws.

Two defenses of punishment try to minimize the harm inherent in the concept. "Incapacitation" suggests the morally neutral restraint of prolific criminals until they have passed the age of peak criminal activity. "Rehabilitation" suggests that punishment can be beneficial. Here, restraint is used to reform the offender in a way that serves his or her best interests as well as society's. The problem with these last two rationales is that both involve the radical restraint of freedom. (In addition, incapacitation involves massive allocation of social resources and rehabilitation has yet to be proved effective in practice.)

MORAL DILEMMAS

Punishment is morally problematic in both practical and theoretical terms. In practice, the criminal sanction is often utilized to punish real or imagined "political" crimes against autocratic or tyrannical re-

gimes. It is also sometimes meted out by unruly mobs, as in vigilante justice. In addition, real-life punishment is often brutal, even for minor offenses. The remedies for these ills are guarantees of due process and, as mentioned above, the prohibition of cruel punishments. Even when it is formally correct, however, the criminal process is disconcertingly imperfect.

Theoretically, punishment is marred by the problematic nature of culpability and criminal responsibility. Punishment can be legitimate only if offenders deserve to be punished. To be so deserving requires the presumption of free will. Free will, however, is philosophically and sociologically problematic. Where free will is not assumed (as, for example, in cases of criminal insanity), criminal responsibility is mitigated to the extent that temporarily insane defendants may even escape punishment or medical restraint altogether. While insanity is the extreme case, people are compelled in their behavior by all sorts of factors. Thus, free will is not an absolute. Indeed, its very existence is impossible to prove. There are also important social limits to the concept of criminal culpability, particularly where crime is heavily associated with a segment of the population that is in a disadvantaged social position. In such a case, social responsibility becomes confounded with criminal responsibility. As a result, the entire criminal process, including punishment, becomes morally suspect.

LIMITED EFFECTIVENESS OF PUNISHMENT

In addition to the moral dilemmas of punishment, there are practical limits to punishment's effectiveness as a means of maintaining order. Punishment is, at best, only half of the equation when it comes to social order. The other half is the availability to all strata of society of sufficient rewards for legal pursuits. Societies that permit crime-producing socioeconomic disparities are not able to ensure social order by means of the criminal sanction. This means that a society can simultaneously have harsh punishments and high crime rates, as exhibited by the United States during the last third of the twentieth century. Thus, punishment is most accurately seen only as a corollary means of maintaining social order, one that complements the teaching of solid social values and an abundance of opportunity for legitimate gain.

THE FUTURE OF PUNISHMENT

Despite its moral and practical limits, punishment appears to be an indispensable mechanism for dealing with certain kinds of behavior. For centuries, utopian thinkers have held out the hope for a society so well ordered that punishment would become obsolete. Such a condition has yet to emerge. Until it does, people can still attempt to minimize the role of punishment in preserving order and producing justice.

Q

Quinlan, Karen Ann

IDENTIFICATION: Comatose patient who was the focus of a well-publicized ethical controversy

BORN: March 29, 1954, Scranton, Pennsylvania

DIED: June 11, 1985, Morris Plains, New Jersey

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Despite the fact that Karen Ann Quinlan remained alive for almost ten years after she was taken off life support, the removal of her

respirator set an important precedent for legal battles over euthanasia.

On April 15, 1975, Karen Ann Quinlan, then twenty-one years old, was taken to a hospital in a critical comatose state. She had had a few drinks, passed out, and temporarily quit breathing. There was a small amount of alcohol in her body as well as a nontoxic level of aspirin and Valium. Part of her brain had died because of oxygen depletion. She was moved to St. Clare's Hospital in Denville, New Jersey, where it was determined that she had extensive brain damage. Karen began to deteriorate physically and coiled into a fetal position. She was attached to an MA-1 respirator.

In July, Quinlan's parents asked that the respirator be removed and signed papers absolving the hospital from legal liability. The doctors refused. Karen was twenty-one, so her parents were not her legal guardians. Joseph Quinlan went to court to be appointed guardian so that he could have the respirator removed. The lower court ruled against the Quinlans, but the New Jersey Supreme Court ruled in their favor. Six weeks later, Karen was still on the respirator; however, the doctors agreed to wean her from it. She continued to breathe without the respirator. In June, 1976, she was moved to a nursing home where she was given high-nutrient feedings and antibiotics. She lived for ten years in a persistent vegetative state. Her case is important in discussions of the right to die, the ordinary/extraordinary care distinction, the active/passive euthanasia distinction, and the need for a living will.

Qur'ān

IDENTIFICATION: Holy book of Islam

DATE: Revealed to Muḥammad between 609 and 632

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The Qur'ān is the central text of Islam. It is believed to have been revealed to the Prophet Muḥammad by God through the angel Gabriel over a period of twenty-two years.

Muslims believe that the Qur'ān was revealed by God to the Prophet Muḥammad through the angel Gabriel. At the age of forty, Muḥammad began to receive messages from God. Muḥammad had the habit of retiring to secluded places outside Mecca in order to pray and think.

During one of these periods of seclusion, the angel Gabriel first appeared to Muḥammad. Gabriel shook Muḥammad several times and ordered him to repeat after him, to “recite in the name of the Creator” (the literal meaning of the word *Qur'ān* is “to recite”). Muḥammad’s relationship with the angel Gabriel was to last the rest of his life, and the Qur'ān was revealed piece by piece. The actual compilation of the holy book was undertaken by the third caliph, ‘Uthmān.

FORM AND CONTENTS

The Qur'ān contains 114 chapters, or *sūras*, which are further divided into thirty parts, or *ajza*. The order of the chapters, which is not chronological, was decided by Zayd ibn Tabi, who was one of Muḥammad’s close associates. Zayd is believed to have collected all the verses from various sources—some in written form and others orally, from those who knew them by heart.

Some scholars believe that the current form of the Qur'ān took shape many centuries after the death of the Prophet Muḥammad. The accepted belief among Muslims, however, is that the book was compiled in its original form by the order of caliph ‘Uthmān. When the compilation had been completed, ‘Uthmān sent copies to the principal centers of the Muslim empire—Damascus, Basra, and Kufa—ordering that all previous versions be destroyed. According to one account, the people of Kufa preferred another version that had been compiled by Ibn Mas‘ud.

Orthodox Muslims believe that Islam is a com-

plete code of life and that the Qur'ān contains answers for all conceivable questions. The Qur'ān is the fundamental authority on all matters. (If no clear answer is found in the holy book, the next source is the *Hadīth*, or sayings, that grew up around the life of the Prophet Muḥammad.)

The Qur'ān is written in verse, and it is considered to be the ultimate example of Arabic poetry—a standard against which all other literature must be judged. It deals with all kinds of subjects, ranging from property and family law to the way in which prisoners should be treated during a war. The book is written with remarkable fluency and great style, and with a wide range of vocabulary. Because of the Qur'ān’s literary quality, many skeptics challenged Muḥammad’s claim that he did not know how to read and write. Several Christian and Jewish scholars claimed that Muḥammad borrowed concepts from their religions and had help from scholars in presenting his message to his followers. Muslims, however, claim that only a divine message could be so beautiful and poetic.

It is a fact that Muḥammad traveled extensively for business purposes. He is said to have visited several centers of knowledge of the time, including Palestine, Egypt, and Lebanon. These are the places where he is said to have met scholars and to have learned about other religions. Western scholars believe that this is how Muḥammad formulated his ideas.

One important concept contained in the Qur'ān is that the other so-called “religions of the book”—Christianity and Judaism—are valid because they are based on true prophets such as Moses and Jesus, who were sent by God. According to Islamic belief, God sent various prophets to show people the true path. After some time had passed, the people would be led astray by Satan, and God would send another prophet. Muslims believe, however, that God chose Muḥammad to bring the final message of God for all people. One of the Five Pillars of Islam is the belief that there is no God but Allah, and Muḥammad is the prophet of Allah; there will be no prophets after Muḥammad.

Some of the most important ideas of Islam are similar to those of Judaism and Christianity. Both Judaism and Christianity are monotheistic, and in both, the ideas of heaven and hell are similar to those found in Islam. Many of the episodes described in the

Qur'ān are the same as those found in the Old Testament; for example, the versions of the story of Abraham's willingness to sacrifice his son at God's command and the story of Noah's Ark are quite similar in the two books. One of the central themes of the Qur'ān is the day of judgment, which is described in various verses throughout the book. On that day, all human beings will be resurrected and made to answer for all their actions on Earth. Muslims will be expected to have followed the dictates of Islam to the letter.

There are various ways of interpreting parts of the Qur'ān, and these have led to the development of various schools of thought within Islam. Although there are two main sects in Islam—Sunnīs and Shī'ites—there are also several subsects that differ in fundamental ways regarding certain crucial concepts. In the modern Islamic world, for example, there is fierce debate regarding women's rights, laws of inheritance, interest-free banking, and many other subjects. There is a major struggle between a desire for modernity and the requirement to follow Islamic precepts to the letter. In the early twenty-first century, Iran and Saudi Arabia represented Orthodox Islam,

whereas Turkey and Egypt represented more pragmatic, modern varieties of Islam.

R

Rābiʿah al-ʿAdawīyah

IDENTIFICATION: Arab mystical poet

BORN: 712, Basra (now in Iraq)

DIED: 801, Basra (now in Iraq)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Composer of numerous religious poems, Rābiʿah was a formative influence in the development of devotional Sufism. Because her life stands as an exemplum of religious devotion, she is one of the most important women in the history of Islamic ethics.

Rābiʿah’s life is a metaphor for her thought: She was a slave who was set free by her master. She was a joyful ascetic who was freed from attachment to or desire for things of this world, even from the selfish desires of attaining Paradise and avoiding Hell. Her life was completely filled with immediate love of God for God’s own sake. Hers was a jealous God who would countenance no other loves: There was no remaining room for marriage, worldly gain, self, or even any special reverence for the Prophet Muḥammad. She produced no treatises or other lengthy works, but her brief sayings, her short poems in awe and celebration of God’s beauty, and stories of her life made a dramatic impact and played an important part in transforming the severe asceticism of early Sufism into a mysticism focused on divine love. She inspired devotional poets such as al-Rūmī and was celebrated by ʿAṭṭār as “a second spotless Mary.” She remains a popular ideal of devotion to God.

Racial prejudice

DEFINITION: Irrational hostility toward, or baseless preconceptions about, persons of other races

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: Racial prejudice is commonly thought to be wrong in modern society, but it is also believed that one should not be punished for one’s thoughts. There is thus a conflict between the desire to eradicate prejudice and the desire to respect freedom of conscience. Moreover, because it is no longer socially acceptable to express racial prejudice in public, it is difficult to gauge the extent to which prejudice is disappearing in modern society and the extent to which it has simply moved underground.

Racial prejudice stems from the mistaken notion that superficial physical differences among people reflect inherited differences in character, personality, motivation, intelligence, and potential. Racial prejudice leads to interpersonal conflict and to discrimination in housing, jobs, and services. Laws designed to end the effects of prejudice have been enacted in many countries, though large numbers of people continue to harbor prejudiced views.

Racial prejudice is often confused with ethnocentrism, the presumed superiority of one’s own culture over the cultures of other people. Traditional animosity between the Chinese and Japanese, for example, is sometimes interpreted as racist, but this hostility is more likely the result of cultural bias.

HISTORY

On the basis of historical records, it is difficult to distinguish racial prejudice from nationalism and ethnocentrism. An undoubted case of racial prejudice, however, developed among the Tutsi, Hutu, and Twa peoples of Rwanda and Burundi in Central Africa during the fourteenth century. This region was

originally settled by the Twa, who were very short hunters and potters. At some time before the fourteenth century, the Hutu, who were agriculturalists of medium stature, moved into the region and asserted dominance over the Twa. Then the Tutsi, who were unusually tall people, immigrated to the area and assumed sovereignty over *both* the Hutu and the Twa. Physical stature played an important role in the development and maintenance of this prejudicial hierarchical system.

Racial prejudice also played a role in the histories of South Africa and the United States, countries in which white European settlers achieved cultural dominance over indigenous, darker-skinned peoples. The South African system of apartheid, which was dismantled during the early 1990's in response to years of political turmoil and international boycott, was designed by the ruling Dutch colonialists to maintain separate white and black cultures. Blacks and other nonwhites, who accounted for more than four-fifths of the population, experienced restrictions in travel, education, land ownership, and voting privileges.

In the United States, centuries of tension and misunderstanding between whites and Native Americans developed into bitter racist resentments during the nineteenth century. As a result, Native Americans were forcibly removed by the federal government to reservations where they still live. Racial prejudice was also directed against Hispanics, Asians, African Americans, Jews, and other ethnic minorities in America. White supremacist organizations such as the Ku Klux Klan used beatings, lynchings, and other terrorist tactics to maintain the low social status of racial minorities. In response to the social activism of the 1950's and 1960's, however, the Civil Rights Act of 1964 outlawed racial segregation and other forms of discrimination in public establishments. Despite this and other government reforms, white supremacists continue to foster racial prejudice in America.

One of the most chilling examples of racial prejudice resulted in Nazi Germany's attempt to exterminate the Jews during the 1930's and 1940's. Adolf Hitler believed that Jews were innately inferior to Germans and other members of the so-called Aryan race. Because Jews competed for food and other resources that his own "superior" people deserved, Hitler believed that it was his duty to eliminate Jews and other unworthy competitors. Hitler's intense race hatred led to the systematic killing of millions of Jews

during the Holocaust. Similar genocidal campaigns have been mounted by the Turks against the Armenians, the Iraqis against the Kurds, and the Serbians against the Bosnian Muslims.

JUSTIFICATIONS FOR RACIAL PREJUDICE

While social scientists believe that racial prejudice is a learned response, the roots of racial prejudice often remain obscure. The justifications used by people to defend racist attitudes, however, are well documented. Ironically, the most influential justifications for racial prejudice have come from two unlikely sources: science and religion.

Racial prejudice was almost universal among Western Europeans and Americans during the nineteenth century. White scientists felt compelled to provide empirical evidence for the assumed superiority of their race. Craniometricians, for example, believed that brain size and intelligence were causally linked—the larger the brain, the more intelligent the person. Despite a lack of objective support for this hypothesis, craniometry became very popular. Brains of famous people were measured, compared, and preserved after their owners' deaths, and the average cranial capacities of skulls from people of different racial groups were computed. The results suggested that whites were more intelligent than members of other races. When IQ tests were developed during the early twentieth century, these were also employed by psychologists to reinforce the notion of white superiority. Recent studies have shown that attempts by craniometricians and psychologists to provide scientific support for racist views were flawed by unconscious bias or outright fraud.

Religious notions have also provided powerful justifications for prejudiced attitudes, especially against African Americans. For example, biblical fundamentalists have taught that the descendants of Noah's son Ham developed "inferior" traits such as dark skin and kinky hair as the result of a divine curse. Others have ascribed the origin of these traits to the activities of the devil. Still others believed that blacks originated as a result of sinful cross-breeding between humans and animals. Because of distorted ideas such as these, many white Christian congregations in America refused to admit African Americans to their services, denominationally operated hospitals denied care to dark-skinned patients, and church schools closed their doors to black children.

ERADICATING RACIAL PREJUDICE

Deeply ingrained racial prejudice is difficult but not impossible to eradicate in individuals and societies. The mass media can play an important role in reshaping societal attitudes. Political activism can promote legislative changes favoring nondiscriminatory practices. Children can learn to appreciate racial diversity if they are taught the value of human variation early in life. Individuals can overcome prejudice by associating with members of other racial groups on a regular basis.

Racism

DEFINITION: Racial prejudice that is overtly or covertly supported by institutional power structures

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: Racism became a justification for slavery in the Western Hemisphere and for the subsequent denial of human and civil rights to people of color.

The concept of race is an invention of the early modern world. The ancient and medieval worlds did not identify persons by race. Individuals were recognized during these earlier periods in geographic terms. Hence, an African would be called Ethiopian or Egyptian as opposed to being called black or "Negro."

ORIGINS

Racial emphasis came into use as a support for imperialism and its accompanying institution of slavery. Although the origin of the word "race" is obscure, experts believe that it began as a loose description of similar groups. This description originally was not restricted to biologically similar people. For example, in 1678, John Bunyan in *Pilgrim's Progress* wrote of a "race of saints."

The first English record of the use of the word "race" was in 1508. In that year, William Dunbar in a poem spoke of "bakbyttaris if sindry racis" (backbiters of sundry races). However, it was not until 1684 that the term "race" was used to designate skin color and other distinguishable physical features. It was then used by the Frenchman François Bernier, who used his experiences as a traveler and physician to employ such an application.

It appears, however, that such classifications did not become commonplace immediately. It was only after science adopted the concept of race as an explanation for human variation that it became a broadly accepted means of classification.

Some scholars, such as Winthrop Jordan and Joseph Harris, have documented evidence of racial prejudice all the way back to the earliest contact between whites and nonwhites. These actions appear to be based more on geographic differences than on color differences. For example, fantastic fables about Africans circulated among Europeans. Equally preposterous stories about some Europeans, however, circulated in the ancient and medieval world among other Europeans. Thus, such views seem to be the products of encounters between different peoples in an age that was characterized by superstition and fear of the unknown.

SCIENTIFIC APPLICATIONS

The year 1798 has been cited as marking the beginning of scientific racism. This later form of racism was not restricted to skin color alone. It was used to slight Jews and Catholics as well as nonwhite people.

In its earliest use, scientific racism was employed mainly as a justification of economic inertia. Thus, it was said that human deprivation could not be relieved through charitable donations. According to the proponents of scientific racism, government volunteer agencies or individuals would simply be throwing money away if they were to spend it on the segment of humanity that was hopelessly and irretrievably at the bottom of the social and economic status of society.

This employment of a pseudoscientific justification for racism was expanded with the introduction of Social Darwinism during the late nineteenth century. Purveyors of this doctrine imported Charles Darwin's theory of evolution from biology and placed it into a social context. Whereas Darwin himself had only theorized about species, the Social Darwinists declared that one race was superior to another because it had evolved further and faster than had the inferior group. A chain of evolutionary progress was created that placed the black race at the bottom and whites of the Nordic pedigree at the summit of humanity. Thus, black people were portrayed as animalistic, subhuman, and therefore incapable of higher thought, while Nordic Europeans were said to be natural leaders.

The use of science to prop up racism has probably been the most pernicious development in the history of racism. When zoology, anatomy, and other fields of scientific study advanced explanations of human differences, they were given serious hearings. Consequently, the layperson has accepted the scientist's word as authoritative in spite of its theoretical and unproved claims.

RELIGIOUS APPLICATIONS

From the beginning of the European enslavement of Africans, religion was an element in the process. As early as 1442, Pope Eugenia IV granted absolution to Portuguese seamen who, under the direction of Prince Henry the Navigator, took African "souls" and sold them. Within ten years, however, it became unnecessary to ask for absolution, because Pope Nicholas V gave the king of Spain his blessing to enslave "pagans." Christopher Columbus's writings show that he used this same justification for the enslavement of Native Americans.

Chapels were included in most of the slave factories, also known as "castles," which were erected

along the west coast of Africa. Their presence was indicative of organized Christianity's approval of slavery.

At first, the Spanish provided for enslaved Africans to be manumitted upon their conversion to Christianity, since it was considered wrong for one Christian to hold another Christian in bondage regardless of the bondsman's race. As conversions to Christianity became commonplace among African slaves, however, manumissions became uncommon. At least by the middle of the seventeenth century, Europeans began to identify black skin with a lifetime of slavery.

The Bible was used to "prove" that blacks were a cursed people. A favorite scriptural citation for this purpose was Noah's curse upon his grandson Canaan because his father Ham had mocked his own father Noah (Genesis 9:20-27). This scripture was given a racial interpretation by the slavocracy's hermeneutists. They declared that Ham was the father of the black race and that Noah's specific condemnation of Canaan should be expanded to include all black people. Thus, religious justification for the enslavement of blacks evolved from the belief that it was immoral for a Christian to enslave another Christian, regardless of race, to the nineteenth century idea that the African was eternally condemned to be a servant of others. By the nineteenth century, proponents of slavery declared that it simply was the natural order for the African to be "a hewer of wood and drawer of water" for the more advanced races.

This progression is illustrative of slavery and the resulting racism's evolving ethics. As the "peculiar institution" became more prevalent, the argument to legitimate it—especially from a religious perspective—became more vindictive toward nonwhite lands.

Sermons were preached to both slaves and their masters regarding the merits of African chattel property. Especially in the southern United States, both whites and blacks were taught that anyone who espoused any form of equality between the races was actually guilty of violating the divine order of nature. Such indoctrination was extremely effective, and people's attitudes did not change when laws were passed stating otherwise. Religious justifications for racism have continued to be employed by individuals and by such hate groups as the Ku Klux Klan in the United States long after the passage of the Emancipation Proclamation, the Thirteenth Amendment to the Constitution, and even the Civil Rights Act of 1964.

CULTURAL APPLICATION

Both slavery and imperialism used cultural arguments to control other races. The doctrine of the “white man’s burden” said that Europeans had a moral responsibility to expose deprived nonwhites to the superior culture of the whites. Thus, Africans who were kept on a plantation were thought to benefit from their close association with their masters. It was said that Africans, if left alone, would languish in retrogressive ignorance and backwardness.

This paternal view was not unique to American slavery. Both Europe and the United States used the concept of the white man’s burden to justify the usurpation of the lands of nonwhite people. In each territory, the indigenous people were characterized as savage and uncivilized. Only exposure to the white man’s superior culture would save such people.

This attitude of superiority legitimated the takeover of others’ lands. It was believed that the white man knew best what to do with those lands. His takeover therefore not only helped the real estate to be put to better use but also better served the native people. This view reflected the belief that many whites held during the age of imperialism. They saw themselves as God’s gift to humanity. Officially, this concept came to be known as “manifest destiny.” This meant that the imperialists believed that they had a mission to expand beyond others’ borders to uplift those people to the imperialists’ level.

This view of a neglected or minimal culture among nonwhite people was predicated upon a Eurocentric view of history. This meant that unless Europeans were leading and shaping a culture, it was not worthy of study. This attitude was arrogant and discriminatory in its highlighting of historical contributions. Anything of note that had been done by nonwhite people was ignored, while every important aspect of human civilization was always in some way considered a product of white genius. Such a polemical view of culture helped to solidify white supremacy and the existence of racism.

ECONOMIC APPLICATION

Similar to the use of culture was the introduction of economics as a prop for racism. During slavery, the argument was advanced that the institution was necessary for the benefit of black people. It was declared that they were childlike and incapable of self-support. As long as they remained on the plantation,

they had a haven that protected them from want. Slavery’s defenders in the face of abolitionists’ demands used this argument to portray slavery as being quite advantageous to the slaves. Even after the U.S. Civil War, many southern historians continued to use the economic argument to show that slavery was an economic boon to blacks. They pointed to postbellum vagabondage and government dependency among freed slaves as proofs that black people were better off on the plantation, where they were given food, clothing, and shelter.

Such writers never considered that it was the years of exploitation and neglect on the plantation that had contributed to the freed slaves’ deplorable condition. Also, they never addressed the freed slaves and antebellum free blacks who, in the face of tremendous difficulties, still managed not only to support themselves and their families but also to become entrepreneurs, landowners, and employers, sometimes even of whites.

In the twentieth century, economics was used as a defense for South Africa’s apartheid policy and the continued business transactions carried on there by American and European corporations. In the wake of an international call for divestiture, these companies argued that their continued operation in South Africa was for the good of the blacks and colored people at the bottom of the economic ladder. Divestiture would deprive these two groups of a livable wage. Therefore, it was prudent for nonwhite people to continue to work for these corporations while the corporations used their influence to effect change.

The South African argument was as paternalistic as the American slaver’s position. In both instances, the true benefactors of exploited labor declared that they had a higher mission than that of simple selfishness. Instead, they declared that their activities were for the good of nonwhite workers, who could not fend for themselves without white paternalism.

SOCIAL APPLICATION

After the American Civil War and Reconstruction, Jim Crow laws were instituted throughout the southern United States. These laws segregated society on the basis of race in practically every area of life. Except in menial jobs, African Americans could not enter white restaurants, hotels, schools, or any other “white only” public facility. When they were allowed in the same buildings as whites, they had

separate, well-defined places such as balconies or basements to occupy.

Most southern states reinforced their segregation policies with laws that prohibited interracial marriages. Propagandists repeatedly warned that having one drop of African blood meant that one was a “n-gro.” To the racist, amalgamation was a deadly sin.

Resulting from such hysteria was a negrophobia that frequently manifested itself in the worst imaginable forms of brutalization. During the late nineteenth century and the first half of the twentieth century, it was common for African Americans to be lynched. The most common offense leading to lynching was the violation of white women, real or imagined. Frequently, it was the latter. A celebrated case of this sort occurred when fourteen-year-old Emmett Till was murdered in Money, Mississippi, in 1955. Apparently, his only offense was that he called a white woman “baby.”

A Lynching Case That Cannot Be Forgotten

In May, 2004, the U.S. Justice Department announced that it was reopening its investigation into the notorious murder of teenager Emmett Till, who was lynched in Mississippi in 1955 for allegedly whistling at a white woman. The two men originally tried for Till’s murder had been acquitted of all charges and had since died. However, evidence remained implicating other, still living, men in Till’s lynching. The five-year federal statute of limitations had long since lapsed, but anyone charged with the murder could still be tried in a state court. R. Alexander Acosta, the Justice Department assistant attorney general for civil rights leading the Till investigation, said, “We owe it to Emmett Till, we owe it to his mother and to his family, and we owe it to ourselves to see if, after all these years, any additional measure of justice is still possible.”

INSTITUTIONAL APPLICATIONS

With the massive urbanization of African Americans in the United States in the twentieth century and the resulting residential segregation in cities, the stage was set for the emergence of institutional racism. This form of racism was more covert than was individual racism, which was emotional and blunt. Institutional racism resulted in a denial of equal ac-

cess to goods and services by predominantly black sections of the cities. For example, higher prices and less-desirable products were more often found in the predominantly black and Hispanic inner cities than in the white suburbs.

Since this type of discrimination manifested itself through institutions and was not individually accountable, many people were simply oblivious to its existence. In addition, because of diminished interracial contact in urban areas, many suburbanites, as a result of ignorance of the ways in which societal institutions discriminate, are prone to blame deplorable living conditions within inner cities on the residents’ lack of initiative and concern rather than on institutional biases.

Nevertheless, institutional racism can at least help to explain a disproportionate number of nonwhites being unemployed, underemployed, and incarcerated in prisons. Despite affirmative action policies

and legal gains that have taken place during the twentieth century, African Americans and other minorities are excluded and ignored by many institutions, such as employers, lenders, and investment agencies. A prime example is the absence of stockbrokers’ and other investment advertisements in African American-oriented media.

EXPANSION

Although racism had been sporadically applied to various groups from its inception, its primary application had been toward blacks of African ancestry. In their role as America’s permanent bondpeople, African Americans were ridiculed and ostracized in a way that condemned everything associated with them. In the post-World War I world, however, racist attitudes began to be manifested toward others on a systematic basis. By the 1920’s, the Ku Klux Klan had begun campaigns against not only African Americans but also Asians, Jews, Catholics, and all persons born outside the United States. The hatred that had originally been primarily aimed at African Americans overflowed to such an extent that it found other victims as well. Anyone who was not Anglo-Saxon and Protestant was susceptible to racism’s venom.

The following decade of the 1930's saw this expansion reach global proportions. The rise of Adolf Hitler's Nazi regime in Germany was based upon the concept of Aryan supremacy. All other groups were considered inferior and unfit. Unfortunately, this form of expanded ethnic bigotry reached such an extent that 6 million Jews perished at the hands of the Nazis during World War II.

NEW CONFLICTS

Many African American leaders have argued that it is impossible for black people to be racist. They believe that they can be prejudiced, but not racist, because they lack the power to enforce their prejudice.

While this position has been advanced by the African American left, the white right has charged that group with reverse racism. Some white conservatives contended that government affirmative action programs and the preferential treatment accorded minorities since the passage of civil rights legislation victimize whites in the same way that nonwhites previously were discriminated against by white supremacists.

Persons of goodwill have seen the wisdom in freeing humanity of racial bigotry. Although racism has been opposed since its inception, the most celebrated and concentrated efforts began with the modern Civil Rights movement, which began with the bus boycott in Montgomery, Alabama, in 1955. Under the nonviolent leadership of Martin Luther King, Jr., racism was exposed as morally wrong. King's philosophy accentuated the brotherhood of humanity and love for one's neighbor, regardless of race, nationality, or ethnicity.

By developing an integrated coalition and marching peacefully under King's leadership, King's followers erected a workable model of human cooperation that could be emulated throughout the world. In contrast, those who brutalized these nonviolent protesters with police dogs and fire hoses convinced many people throughout the world that racism was an insidious evil that should be stamped out.

As a result, people have become more reluctant to be known as racists. Instead, racially sensitive issues have been adopted as code words to describe positions. Racism continues to flourish, but it has become more institutional than individual.

Rain forests

DEFINITION: Large wooded areas characterized by more than one hundred inches of rainfall annually and tall evergreen trees that provide a high canopy

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: The potential destruction of the rain forests by humans became both a symbolic issue and a grave practical concern for the environmental movement of the late twentieth and early twenty-first centuries.

The rain forests provide indigenous peoples and the world with a rich source of actual and potential benefits. In their natural state, the rain forests act as filters for the global atmosphere, provide habitats for animal and plant species, and provide food for humans. The rain forests are also harvested as a source of fuel, with the resulting cleared land providing a rich soil for farming. Finding a balance between altering the rain forests for temporary benefit and using them in their natural and sustainable state is the heart of the rain forest debate.

In their naturally occurring state, the rain forests of the world act as watersheds for the surrounding land. The rich soil and dense foliage of the forests act as a natural sponge, capturing rainfall and runoff. These trapped waters are slowly released, recharging aquifers, streams, and natural reservoirs. It is this trapping and slow releasing of water that controls both flooding and erosion in the forests and surrounding areas. When the rain forest is clear-cut and removed, streams, lakes, rivers, and other natural waterways are quickly filled with runoff sediment and lost.

Along with playing an important role in the water cycle, the rain forest is critical in the conversion of carbon dioxide into oxygen. The loss of one of the earth's natural air filters cannot be replaced in any manner. This loss threatens not only to affect local areas but also to have global air-quality effects. With the removal of rain forests, the local area immedi-

ately is affected by an alteration in the moisture content of the air and a disturbance in the water cycle. The long-term effects of this disturbance could be the development of arid savanna or desert.

Although the rain forests cover only slightly more than 7 percent of the land masses of the world, they provide habitats for more than 50 percent of the animal and plant species found on the planet. The destruction of plant life in the rain forest not only threatens the water cycle and the planet's carbon dioxide/oxygen cycle but also removes plant species that may provide important medical benefits. This loss of potential medicines is another example of local action's having worldwide effects. Rain forest plants have already contributed aspirin and many other pharmaceuticals, some of which are used in the treatment of leukemia and Hodgkin's disease. The loss of this rich pharmaceutical research possibility is not recoverable in any way.

DEPLETION

The reasons for rain forest destruction are myriad; primarily, however, it is a matter of economics and survival. Nearly half of all the trees cut in the forests are used for fuel to cook and heat homes. The vast majority of rain forests are found in less-developed countries where alternative fuels such as fossil fuels, solar power, or hydroelectric power are not available in remote and isolated areas. Yet while the forests provide a rich supply of fuel, local people nevertheless are not able to cut and secure adequate fuel supplies to meet their basic survival needs. Although globally there exist several other fuel sources, local people lack the economic strength to secure these sources of fuel. As a result, the forests are cut and sold for timber products, providing poor communities with a bit of economic freedom.

The newly cleared land, with its rich and fertile soil, is used for farming until it is depleted of all nutrition—usually, within five years. Although the agricultural use of the land is limited to such a short duration, it again provides the community with much-needed economic benefits. After the soil has been used to exhaustion, the farmer cuts more of the forest, sells the timber, and farms the new land until it also is depleted. When the trees have been cut and the soil has been depleted, the forest on that land is gone and the soil can no longer support the life that existed upon it six or seven years earlier.

Clearly, the economic benefits derived from using the forests in such a destructive short-term manner are enough to drive the process on. It is important to present to local people a means of using the forest in its natural and sustainable state that will provide them comparable economic benefit for the long term. There are several possibilities, such as harvesting and selling fruits and nuts from the forests, tourism, and a tax for the use of the rain forests for medical research.

It is the resolution of this dichotomy—the forest in its natural state providing water, oxygen, medicine, and habitat versus the economic and existence needs of local peoples—that must be effected. It is estimated that one tree, over a period of fifty years, provides \$196,250 worth of benefits by producing oxygen, reducing erosion, recycling water, and creating habitats. The same tree, when sold for lumber, is worth approximately \$600. The \$600 is actual and usable currency, however, while the nearly \$200,000 value exists in the form of benefits. It is the need for hard currency that must be addressed if preservation of the rain forest is to occur and continue. This economic need must be addressed not only by world leaders but also by indigenous peoples. Ultimately, the entire world will suffer the consequences of rain forest destruction; however, it is the local people who will be the first to suffer, and the local people have little economic capability to adjust.

Rand, Ayn

IDENTIFICATION: Russian American novelist and philosopher

BORN: Alisa Rosenbaum; February 2, 1905, St. Petersburg, Russia

DIED: March 6, 1982, New York, New York

TYPE OF ETHICS: Modern history

SIGNIFICANCE: An important philosopher and advocate of rational egoism and libertarianism, Rand expressed her philosophy in both fictional and nonfictional works, including *The Fountainhead* (1943), *Atlas Shrugged* (1957), *The Virtue of Selfishness: A New Concept of Egoism* (1964), and *Capitalism: The Unknown Ideal* (1966).

Rand advocated an ethics of rational self-interest. The hero of her best-selling *Atlas Shrugged* states, "I swear—by my life and my love of it—that I will never live for the sake of another man, nor ask another man to live for mine." The moral purpose of anyone's life is his or her own happiness; he or she exists to serve no other individual or group. The moral standard by which one guides one's actions is set by the objective requirements of human life. Thus, Rand rejected two common theses in ethical theory: that selfless sacrifice is moral and that acting in one's self-interest means doing whatever one feels like. She rejected as "moral cannibalism" any form of altruism—that is, any claim that the selfless sacrifice of some humans for the benefit of others is moral. She also argued that, since feelings are not tools of cognition, they are not reliable guides to action; hence, one must rationally define the principles of action that will allow one to achieve the values necessary to sustain one's life.

Rand extended her ethics to politics. In a social context, an individual's achievement of values requires freedom from coercion. Hence, every individual has a right to his or her own life, liberty, and property, and these rights provide a moral foundation for free enterprise and constitutionally limited government.

Rape

DEFINITION: Nonconsensual sexual intercourse imposed on one person by another

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Sometimes euphemistically referred to as a "fate worse than death," in some cultures forcible rape is considered the ultimate transgression. Despite this judgment, rape remains a pervasive crime in modern society, one which is rendered all the more difficult to combat by the shame often experienced by its victims and by the public distrust they often encounter if they decide to report the crime.

Rape is legally defined as any form of sexual intercourse forcibly imposed by one or more persons upon another person without the consent of the victim or victims. Mary Koss and Mary Harvey consider rape to represent the end point of a continuum of sexual victimization that includes attempted rape (the attempt to use force or the threat of force to have sexual intercourse without the victim's consent), sexual harassment (nonconsensual sexual intercourse obtained through the abuse of power or authority by the offender in a job or school setting), sexual imposition (the use of force or threats to obtain sexual acts other than intercourse, such as kissing), and sexual contact (nonconsensual touching of the victim's intimate body parts).

Koss and Harvey distinguish five types of rape: stranger rape (the rapist is unknown to the victim), acquaintance rape (the rapist is recognized by the victim), date rape (rape occurs during a consensually

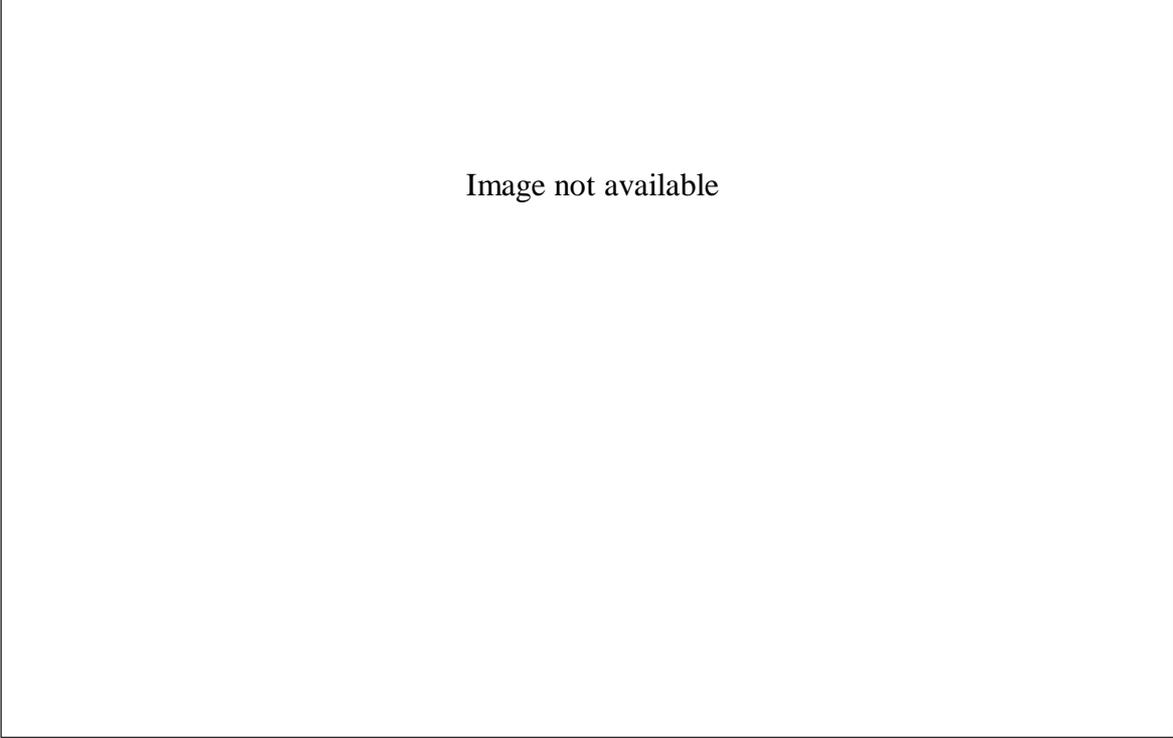

agreed upon social encounter), marital rape (one spouse is sexually assaulted by the other), and child sexual abuse (sexual contact that occurs to a child as a result of force, threat, deceit, or the exploitation of an authority relationship).

INCIDENCE OF RAPE

In the vast majority of cases, rapists are men and the victims are female. The Federal Bureau of Investigation's definition of rape specifies that the victim is female, and according to Koss and Harvey, 100 percent of reported rapes involve a male offender and female victim. Consequently, almost all the rape literature focuses on female victims, although the dynamics of rape are similar when the victim is male.

Rape is a persistent, serious, and frequently occurring social problem. The number of reported rapes in the United States increased more than five-fold from 1960 to 1989 (from 16,680 to 94,504); and in 2002 the number approached 248,000 rape victims. However, the number of reported rapes is undoubtedly significantly lower than the true number, because most occurrences are never reported. Koss and Harvey did a number of studies that revealed much higher rates than those officially reported. For example, in one study, 44 percent of the interviewed sample reported rape or attempted rape, and the report rates for other forms of sexual victimization were less than 1 percent. A study of female adolescents between the ages of eleven and seventeen in 1976 and 1977 revealed that 1 to 2 percent reported sexual assault by peers. Two percent translates into 540,000 sexual assaults nationwide. If children are considered, Koss and Harvey cite data that one-fifth to one-third of all women have had a sexual encounter with an adult male during childhood.

The incidence of rape is geographically influenced. Larry Baron and Murray A. Straus found significant differences in the frequency of rape among individual U.S. states. The states with the highest incidences of rape had five to ten times as many cases of rape compared to the states with the lowest incidences. Although the incidences of reported rapes have increased dramatically in all states over the years, this incidence ratio of five to ten has remained quite constant. Rapes occur much more frequently (rapes per 100,000 population) in the West, followed by the South, the North-Central region, and the Northeast. Within each state, rape occurs more frequently

A large rectangular box with a thin black border, centered in the upper half of the page. Inside the box, the text "Image not available" is centered in a black serif font.

In a manifestation of growing public awareness of the problem of rape, an Alabama state politician joins members of a state antirape organization addressing rape issues in March, 2004. (AP/Wide World Photos)

in urban than in rural areas, and states with a high ratio of males to females show higher rates of rapes. Rape rates were not related to the degree of income inequality in a state or to the percentage of a state's population that is black, the percentage of individuals aged 18 to 24, the percentage of single males aged 15 or older, or the level of unemployment.

CHARACTERISTICS OF RAPISTS

Susan Brownmiller made the interesting observation that when other crimes of violence are compared to rape, the rapist falls midway between aggravated assault and robbery—the rapist is “the man in the middle.” The typical rapist has the following characteristics: He is slightly younger than the assaultive offender and slightly older than the robber; uses less physical force than the assaulter but more than the robber; drinks less prior to the rape than the assaulter but more than the robber; and is less likely to commit rape in his neighborhood than assault, but does not commit robbery. Rape is also more frequently committed against a total stranger than is assault but less

frequently than is robbery. Brownmiller believes that rape “borrows” from these two other crimes; rape is an act of sexual assault and robbery (the rapist “acquires” the woman’s body).

Brownmiller also pointed out that the rapist has the least sharp image, and generalizations about rapists are difficult to come by. Rape is committed primarily by young poor men, and its victims tend to be young poor women. Otherwise, research comparing rapists to other groups (such as convicts, other sex offenders, and college males) has not supported significant psychological differences between these groups. In fact, along almost every dimension examined with sophisticated psychological tests, rapists are not significantly different from other males. This fact, combined with their wide variety of backgrounds, prevents making any sweeping generalizations.

Ann Wolbert Burgess’s review of her and others’ research suggests that a more meaningful way of typing rapists may be in terms of their motivation to commit rape. Burgess distinguishes four motivations for rape.

(1) *Aggression*. Rape is an aggressive activity that enhances the rapist's sense of power, masculinity, or self-esteem, or permits him to express feelings of mastery and conquest. He tends to be manipulative and impulsive, maintains unstable interpersonal relationships, and lacks a sense of empathy. (2) *Anger*. Rape is committed out of anger and contempt toward women and allows the rapist to hurt, humiliate, and degrade his victim. He may also, however, feel some concern for his victim and may even attempt restitution. (3) *Sadism*. The sadistic rapist is sexually aroused in response to violence, and the act of his assault, which is very brutal, may be bizarre. (4) *Impulsivity*. Rape is but one part of a pervasive exploitative, predatory, and antisocial lifestyle in an individual with an extensive criminal history.

THEORIES OF RAPE

On the face of it, it might seem that the frequency with which rape occurs is perplexing. There are easier, often perfectly legal and less risky, ways to satisfy motives of aggression, anger, sadism, and impulsivity. Why then do women so frequently become the objects of these motives? A number of theories have been developed, and these are now briefly reviewed.

The psychiatric theory of rape has dominated explanations of rape since the 1930's. (This is not to say that the theory is correct; vehement objections have been raised against it, which will be discussed.) Diana Scully and Joseph Marolla state that psychiatry explains rape as being caused by, singly or in combination: (1) irresistible impulse, (2) mental disorder, (3) momentary loss of control caused by use of alcohol and drugs, and (4) victim precipitation. In the irresistible impulse, rape is seen as an expression of an urge beyond the rapist's self-control, without logic or reason, and is experienced as a strong and overpowering drive to rape.

To view rape as a mental disorder is to explain it as a significant impairment in normal personal and social functioning. The impairment is most probably caused by faulty upbringing that produced an abnormal childhood; in particular, a sadistic personality and a hatred of the rapist's mother. The basis of the sadistic personality is a combination of the motives of sex and aggression, the two key motives in Sigmund Freud's psychoanalytic theory. Sexual intercourse becomes bound to aggression. The rapist's mother, to whom the rapist was sexually attracted as a

child as part of his oedipal wish, is simultaneously seductive and rejecting. The rapist never resolves his oedipal wish and grows up sexually attracted to his mother but also has strong feelings of aggression toward her. The offender displaces his aggression upon a woman via the act of sex. Symbolically, the rape forces his seductive but rejecting mother into submission. Additionally, some psychoanalysts believe the rapist to be a latent homosexual, which contributes to his hostility toward women.

The use of alcohol or drugs by rapists prior to the rape has been mentioned frequently in the literature. Consumption of alcohol presumably removes or reduces social restraints, allowing the sexual-aggressive drive to overwhelm rapists and lead them to commit rape. Alternatively, the rapist may claim that, although he was not under the influence of drugs, his victim was, thus inviting the rapist to take sexual advantage of her.

Victim precipitation refers to the rape victim's being functionally responsible for the rape by behaving in a way that provokes the rapist to rape her. Commissive behavior would actively encourage the rape by, for example, encouraging but then denying a sexual advance at the last possible moment or by voluntarily agreeing to drink with or ride in a car with the rapist. Omissive behavior involves failing to use preventive measures, such as failing to react sufficiently strongly to sexual overtures or dressing in a sexually suggestive way so as to attract attention and encourage sexual advances. All these acts to invite the rapist are, according to psychoanalysis, expressions of a universal, unconscious, masochistic wish on the part of women to be raped and humiliated.

The evidence to support these psychiatric-psychoanalytic theories is flimsy at best and in most cases nonexistent. The great majority of rapes are premeditated rather than the result of an irresistible impulse. The relationship between rape and alcohol or drugs as a releaser of sexual inhibitions has not been empirically demonstrated. There is also no evidence whatsoever firmly linking rape to latent homosexuality or the family dynamics described by psychoanalysis.

BIOLOGICAL THEORIES

According to Randy Wilsen, Nancy Wilsen Thornhill, and Gerard Dizinno, rape is a behavior that is performed by men who are relatively unsuccessful in competing for the status and resources necessary to at-

tract and successfully reproduce with desirable mates. Rape is a category of sexual conflict in which males seek to control female sexual behavior and therefore is placed squarely in the purview of comparative biology and evolutionary theory. Rape is an evolved mating strategy used by those males (“big losers”) who otherwise would not be able to compete with more successful males. What once may have been an adaptive behavior is now maladaptive, however, since the adaptive costs of reproduction exceed its benefits.

The authors base their theory on a comparative study of forced sexual intercourse in animals and certain statistical data about rape—that it is directed primarily at young (hence fertile), poor women primarily by young, poor (“big losers”) men. This evolutionary theory is interesting. The authors have made predictions from their theory that have been supported. The theory is very new, however, and needs to be tested further. Also, making analogies between human and animal behaviors and selecting certain data on rape that support the theory are open to criticism. For example, that rapists are mostly poor young men may not necessarily mean that they rape because they are “big losers”; it may be that they rape because it is a safe way of displacing antagonism and resentment at their social status onto women or as a way of asserting their masculinity as a substitute for their lack of economic success.

SOCIETAL AND CULTURAL THEORIES

It was noted previously that there are large differences in the rates of rape among individual states and between regions of states. Through complex statistical analyses, Baron and Straus accounted for these differences in terms of three sociocultural variables: gender inequality, pornography, and social disorganization. Specifically, the lower the status of women relative to men, the higher the rate of rape. Gender inequality is part of a social milieu that is conducive to rape. Also, the higher the circulation of pornographic literature, the higher the rate of rape. The authors interpret this finding to suggest that pornography is more likely to be part of “a hypermasculine or macho culture pattern” that condones violence and force, believes in male supremacy, and degrades women. The level of social disorganization is directly related to the level of rape. The social forces that control violent behavior are weakened. In a sociocultural milieu

characterized by sexism and violence, loss of social controls permits easier outlets for rape.

Baron and Straus have identified important social contributors to rape that suggest that rape is more than simply a psychiatric problem confined to the individual male and his upbringing or a biologically based behavior.

FEMINIST THEORY

This theory stands in stark contrast to psychiatric theory and is, in part, a reaction against the psychiatric explanation of rape. According to Burgess and Maggie Humm, rape is an act of social control as well as a social institution that perpetuates the patriarchal domination of women and functions to keep women in their place through sexual degradation, violence, and assault. Rape is viewed as the logical conclusion of sexism and is an especially pernicious form of social control and coercion because it constantly reminds women of their vulnerability to men. Rape is a cultural and social behavior that is institutionalized in law and custom and is the symbolic expression of a white male hierarchy. Rape is an extension of normal sexual aggression acted out within the context of male sexual expectations and hostility toward women.

Feminist theory thus views rape as normative rather than deviant, as does psychiatric theory. Traditional male socialization encourages males to associate dominance, strength, virility, and power with being masculine, but submissiveness, passivity, weakness, and inferiority with being feminine. Thus women are viewed from legal, social, and religious contexts as male property to do with what they will.

Accompanying this attitude is the development by males of what Scully and Marolla refer to as a “vocabulary of motive” to diminish their responsibility and justify and excuse rape. For example, the psychiatrist Benjamin Karpman stated that rapists were sick but were not responsible for their behavior. They did not *consciously* and deliberately rape. Rather, they were victims of a disease from which they may suffer more than their victims. Therefore, since the rapist is “sick,” he cannot be held responsible for his behavior. As another example, linking rape to latent homosexuality serves to place rapists in a group of deviant outsiders. By segregating rapists from “normal” men, the label of latent homosexuality serves to protect the interests of males.

Feminist theory has been criticized for a lack of data to support its contentions. Rather, it is supported by no more than “ideological furor.” For example, if rape is normal, socially sanctioned behavior, then it would be predicted that rapists should be equally represented in all walks of life and age categories. The data show, however, that rapists are mostly young, poor males.

However valid feminist theory eventually proves to be, it has been of critical importance in the consciousness raising of males (or at least some males) concerning how they regard and act toward women. For example, in their 1984 textbook *Abnormal Psychology*, David L. Rosenhan (a psychiatrist) and Martin E. P. Seligman (a clinical psychologist) state:

Rape is a major crime, an act for which it is imperative that society hold the individual responsible, punishing him accordingly. If we were to include rape as a *disorder* . . . , there would be some tendency to excuse the act and lighten the burden of the rapist’s individual responsibility—even if there was not a shred of evidence other than the rape itself that indicated psychological abnormality. The acts of murder, assault and theft are not automatically thought of as psychological disorders unless there is additional evidence of abnormality, and we believe rape should be thought of in the same way. The expression “only a sick man could have done that,” when applied to rape . . . seems to us deeply and insidiously confused.

ETHICAL ISSUES

Ross Harrison observed that “Rape is obviously bad, indeed a horrific thing. It belongs to the real world in which people are hurt, humiliated and abused . . . it is unproblematic that rape is a bad thing.” A 1983 study of rape in New Zealand stated, “Rape is an experience which shakes the foundations of the lives of the victims. For many its effect is a long-term one, impairing their capacity for personal relationships, altering their behavior and values and generating fear.”

The symptoms and signs of rape trauma are well documented: physical (injury, disease), emotional (anxiety, fear, depression, shame, anger), cognitive (flashbacks, memories, impaired concentration), psy-

chological (lessened self-esteem, disruption in social relations, withdrawal, isolation, aggression), and sexual (sexual attitudes, impaired sexual functioning). Rape, then, represents a total assault on the very being and essence of what it is to be a person. Rape is horrifying and is not to be tolerated, and the rapist must be held responsible for his act.

Rape and political domination

DEFINITION: Use of rape and other sexual crimes to keep women politically, socially, and economically subordinated in society

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: As a weapon of political domination, rape violates the ethical principles of gender and race equality, sexual autonomy, and bodily integrity.

Rape has traditionally been seen as a crime, not as an act of political domination. The women's movement of the 1970's and 1980's redefined rape as a social act of white male dominance in a sex- and race-unequal society. In this view, rape is an injury of gender and race inequality that has little or nothing to do with

sexual anatomy or biology as such. The view that rape is implicated in women's second-class civil and economic status remains central to feminist ethics, grounding efforts to change norms and laws concerning rape, sexual harassment, dating, marriage, prostitution and other sex work, and pornography.

ETHIC OF EQUALITY

Rape violates the ethical principle of race and gender equality. Most rape victims are women or girls. One in four women in the United States reports subjection to a completed rape (the Federal Bureau of Investigation contends that 90 percent of rapes are not reported). Forty-four percent of women in the United States report having been subjected to rape or attempted rape at least once in their lives. African American women are subjected to an even higher in-

Image not available

A Legacy of Rape

According to a United Nations report released in 1996, between 500,000 and one million Tutsi women had been raped in the Rwanda genocide two years earlier. Many had been repeatedly gang-raped. Not immediately known, however, was the fact that tens of thousands of the surviving rape victims were carrying the human immunodeficiency virus (HIV). In 2004, Amnesty International estimated that of 100,000 Rwandans in need of antiretroviral drugs, only two thousand were receiving them. Moreover, many of the people who were receiving the drugs were Hutu perpetrators of the genocide and mass rapes then serving time in prison; most of the surviving rape victims were receiving no treatments at all. This human rights crisis was magnified by the fact that many rape victims facing imminent death from acquired immunodeficiency syndrome (AIDS) were indigent widows with children who were the progeny of rape.

cidence of rape than white women. Men who are convicted of raping black women typically receive more lenient sentences than men who rape white women. That rape disproportionately and unfairly falls on women and women of color is evidence of women's continued second-class citizenship in that it continues the state's greater regard for the interests of men over those of women.

Women's rights advocates contend that the state is implicated in the reality of rape as political domination in at least two important ways. First, women's injuries from rape are often trivialized and rendered invisible by political and legal institutions. Most reported rapes are not prosecuted, most prosecuted rapes do not result in convictions, and sentences for convicted rapists are often short. The vast majority of rapists are never held to account for their crimes in any way. Second, widespread restrictions on marital rape prosecution constitute a denial of the Fourteenth Amendment's equal protection of its law. They also express women's unequal citizenship and the diminished personhood of wives.

Criminal law has failed to take the social context of sex inequality into account in defining and adjudi-

cating rape. That rape may be a form of political domination, its injury a harm of gender group membership, remains relatively unexplored in law.

BODILY INTEGRITY AND SEXUAL AUTONOMY

A core constituent of human freedom and personhood is sexual autonomy. Rape violates women's ability to control their own bodies and sexuality. Without physical and sexual security, women's public contributions and their private lives are stunted, not only by personal fears but also by public knowledge of women's legal and physical vulnerability.

Women's rights lawyers argue that existing rape law, which focuses on force and nonconsent as the most significant components of rape, should be reconfigured. In this view, nonviolent abuse or sexual cooperation resulting from extortion, economic threats, and deception impair women's sexual autonomy as much as, if not more than, violent rape. According to Catherine MacKinnon, women experience commonalities between what is legally defined as rape and what is considered normal sex. The legal dividing line between rape and sex does not correspond with women's experience of violence. MacKinnon contends that the pervasive effect of male dominance makes it impossible to say definitively that some of women's sexual relations with men (called sex) are "free" and others (called rape) are "coerced." How the law should identify, within this context of political domination, which sexual acts are criminal and which crimes deserve more severe punishment remains undecided.

Rawls, John

IDENTIFICATION: American philosopher
 BORN: February 21, 1921, Baltimore, Maryland
 DIED: November 24, 2002, Lexington,
 Massachusetts

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Rawls was widely regarded as the most important political philosopher of the twentieth century. His *A Theory of Justice* (1971) presented an egalitarian theory of justice, based on social contract theory.

John Rawls taught at Harvard University from 1962 until his retirement following a stroke he suffered in 1995. He is best known for *A Theory of Justice* (1971). In that book, Rawls defended a theory of justice that sought to strike a compromise between the democratic ideals of equality and liberty. The theory was in the social contract tradition associated with John Locke and Jean-Jacques Rousseau, but Rawls introduced the idea that the contract would establish abstract principles of justice rather than specific laws or arrangements. Rawls's contract was a hypothetical one involving agents who have been idealized in certain ways to create what he called an "original position."

Rawls argued that the agents in this original position should be ignorant of their own abilities and prospects in order to ensure that the principles they choose will be fair ones. The result, he argued, would be egalitarian principles that would maximize the position of the worst-off persons rather than maximize overall utility and that would protect certain basic liberties. Rawls is also known for the idea that any theory should be judged on the basis of whether it is the result of a process of "reflective equilibrium" in which one considers competing theories and their implications, testing these against one's intuitions about general principles and cases.

al-Razi

IDENTIFICATION: Arab philosopher and physician
 BORN: c. 864, Rayy, Persia (now Iran)
 DIED: c. 925, Rayy, Persia (now Iran)

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: As a trained philosopher and a practicing physician, al-Razi epitomized the man of knowledge devoted to both the ethical aspects of medicine and metaphysical speculations concerning life itself. He produced a comprehensive medical encyclopedia in twelve volumes; *The Book of Spiritual Physick* (c. 920), his principal ethical treatise; and the apologetic *The Philosopher's Way of Life* (c. 920).

Early in his life, al-Razi was educated in the fields of traditional Arabic literature, mathematics, astronomy, and philosophy. In the formation of his religious ideas, it is probable that a distinctly nonorthodox teacher, Iranshahri, played a major role. As a physician, al-Razi displays in his medical treatises the careful, methodical temperament of the empiricist, though a sense of genuine empathy is always present. According to al-Razi, some humans have been endowed with divine reason to awaken their souls to ultimate spiritual return with the Creator; others have not. Just as the Creator never seeks to harm humans, people too ought to seek only their own and others' betterment. Al-Razi believed in the transmigration of souls, the sacredness of all life, and the universal possibility of salvation through reason and philosophy, the latter position being fiercely opposed by religious scholars of his own day.

Reality television

DEFINITION: Television programs that involve real-life people engaging in contrived nonfiction situations

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: Much of reality television consists of programs that encourage subjects to compete in actions that might be deemed as violating common social norms.

A large rectangular box with a thin black border, centered on the page. Inside the box, the text "Image not available" is centered in a black serif font.

Members of the cast of Survivor: Pearl Island pose with Mark Burnett (center), the creator of the popular reality show, when he accepted the People's Choice Award for the best reality-based television program of the year, in January, 2004. (AP/Wide World Photos)

During the early twenty-first century, reality television programs emerged as a staple of American television network programming because they were comparatively inexpensive to produce and often attracted large audiences. So-called reality programs might be subdivided into four genres: competitive game shows, such as *Survivor*, *Big Brother*, and Donald Trump's *The Apprentice*; romantic or sexually oriented competitions such as *ElimiDATE*, *Who Wants to Marry a Multi-Millionaire?*, and *For Love or Money*; talk shows such as *Jerry Springer* and *Maury*; and crime dramas such as *Cops* and *America's Most Wanted*. Beyond depicting real-life people, what many reality television shows have in common is that their main theme is to portray subjects engaging in behaviors that tend to violate social norms.

Like traditional competitions, reality game shows generally pit contestants against one another, but with a fundamental difference: Their contestants are

encouraged to engage in devious, unsportsmanlike conduct that frequently crosses common moral boundaries, in exchange for success—which is typically measured in large cash prizes. Romantic and sexually oriented competitions are often similar in nature, requiring participants to change or violate loyalties or social contracts, or engage in morally compromising behaviors, in order to win.

Reality talk shows take a different approach, depicting subjects who have allegedly already violated some form of social contract or norm—such as those against marital infidelity, abuse, or abandonment—and confronting them with their victims. Just as critics have assailed reality game and romance shows, critics have contended that ubiquitous portrayals of inappropriate behaviors on reality talk shows tend to normalize or glamorize misconduct.

Reality crime dramas depict real-life criminals or suspects by reenacting or documenting actual crimes. Similarly, some shows, such as *Cheaters*, act

as on-air private investigators. While supporters claim that such shows may serve as deterrents to inappropriate behaviors, other critics argue that such shows depict society's "tawdry underbelly," and like reality talk shows, tend to normalize or overemphasize morally ambiguous or contradictory behaviors, leading the public to believe that crimes occur more frequently than they actually do.

Realpolitik

DEFINITION: Doctrine holding that governments should eschew abstract moral codes and instead follow whatever course of action will most effectively protect and achieve their own practical interests

TYPE OF ETHICS: International relations

SIGNIFICANCE: Realpolitik is a starkly materialistic theory of international and domestic politics. Adherents to this philosophy deny that considerations such as human rights and safeguarding the environment, or even honesty and justice, should enter into political decision making or international affairs.

To a practitioner of realpolitik, the end always justifies the means. Lying, cheating, stealing, murder, and war are perfectly acceptable means to achieve the desired results. Historians and political scientists often associate the term realpolitik and its underlying tenets with Otto von Bismarck, chancellor of Germany from 1870 to 1890.

THEORY OF REALPOLITIK

The realpolitik theory rests on several premises, including strategic interests, geographic realities, mutually exclusive goals, and competition and conflict over these goals. According to this theory, states have strategic interests upon which their relative securities depend. The most basic of these interests is the security to continue to exist as independent states,

which requires that they achieve power. Leaders must pursue policies that will ultimately increase the power of their state or decrease the power of real or potential enemies. Without power, there can be no true security, because the state's continued existence would rest on other states' lack of interest in destroying it, rather than on its ability to defend itself. Therefore, states must constantly attempt to increase their power relative to the power of competitors. Increasing power may take the form of expanding their armed forces, developing revolutionary new weapons, or expanding their industrial production capacity.

Political leaders also have attempted to increase the power of their nations through imperialistic expansion in order to gain access to markets and raw materials, and to acquire areas into which the excess population of their nations may expand. Power also may be increased through alliances and international agreements. Attempts by political leaders to increase the power of their states and to limit the power of other states resulted in the explosion of imperialistic expansion during the late nineteenth and early twentieth centuries. Most major Western European states, the United States, and Japan became involved in a race for colonies. Imperialistic competition became a primary factor in the massive world wars of the twentieth century, as did the complex web of entangling alliances that virtually guaranteed that any minor conflict between nations would escalate into a global war.

According to the precepts of realpolitik, leaders of states must attempt to increase the power of their state based on strategic interests and geographic realities. For example, if the state's industrial growth depends on a commodity not present within the area it controls, its leaders must attempt to secure access to areas where that commodity is present. Any means necessary to achieve that strategic interest, including war, must be pursued. Geographic realities determine most strategic interests. For example, a completely landlocked nation cannot compete in global trade, and thus increase its power, unless it secures access to a deep-water port. Its leaders may secure such access through negotiation, treaty, or international agreement. If attempts at negotiation fail, the leaders of such a nation may resort to war. Human lives mean nothing to the practitioners of realpolitik, as long as the desired end is achieved.

DOMESTIC DIMENSIONS

Realpolitik also has a domestic political dimension. Since security is the primary goal of all state policies, politicians must suppress what they conceive to be internal threats to the state, which they often interpret as any threat to their continued exercise of power. Political leaders in many different countries frequently have disregarded the constitutional rights of their citizens in suppressing political, religious, and social movements they consider subversive. Political leaders have also eliminated or neutralized individuals whom they considered dangerous to the state, often violating the laws of their nation in the process. Political leaders in all countries, including the United States, often have resorted to the use of realpolitik in domestic affairs.

Political leaders have been practicing realpolitik since the beginning of recorded history. The principles of this essentially amoral political philosophy have contributed to, if not caused, every war in human history and all the suffering associated with those wars. Political leaders have used those principles to justify murder, tyranny, slavery, and injustice.

Cynics argue that the basic premises of realpolitik continue to dominate the international and domestic policies of most twenty-first century world leaders. They maintain that politicians care nothing for issues such as human rights or protection of the global environment; instead, politicians use those issues as tools to gain advantage over real or potential enemies. Constitutional guarantees, the cynics say, are ignored by politicians in their pursuit of security and power. Certainly, many events in the 1990's and the early twenty-first century have suggested that the cynics are not entirely wrong.

If the cynics are correct, humanity would seem to be doomed to the recurrent cycle of war and tyranny that has marked history from its beginning. Unless informed citizens insist that their political leaders base foreign and domestic policies on principles such as justice and human rights, those leaders will continue to follow, consciously or unconsciously, the amoral philosophy of realpolitik.

Reason and rationality

DEFINITION: Faculty that comprehends and makes sense of the world through the application of logic

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Reason is often opposed to emotion and intuition, and the relative importance of each to ethics is a matter of debate. Some philosophers have asserted that reason is the only possible basis for objective moral judgment. Other thinkers believe that logic falsifies a fundamentally irrational world and that the imposition of reason upon reality is itself an immoral act.

Common sense holds that being reasonable is a good thing. Being reasonable means taking account of all relevant evidence when deciding what to believe and do, and when establishing principles by which to live. It means settling disagreements by appeal to evidence, which involves being willing to change one's mind based on the evidence. If one is rational, one will discover what is true and false, and if one discovers what is true and false, one will be able to act so as to live the good life. In short, reason is commonly held to be the primary method of learning truths, including truths about morality; accordingly, rationality is held to be a virtue.

Rational theories of morality are marked by several features. They hold that there are moral facts; that those facts are universal, or true for everyone; that reason is capable of identifying those facts; and that disagreements over moral issues are resolvable by rational investigation.

Such accounts of morality, however, face challenges by accounts that hold that morality is not fundamentally rational.

IRRATIONALISM

One problem is the seeming interminability of debates about moral issues. If moral truths are rationally verifiable, why are moral disagreements so rampant? In genuinely cognitive disciplines, such as mathematics and science, methods exist with which to settle disagreements rationally, but it seems that no such methods exist in morals.

A second problem is the emotionalism that moral issues evoke. Since many people cannot be swayed from their moral beliefs by appeals to reason, perhaps morals are based on some nonrational source.

THE IS/UGHT PROBLEM

A third consideration is the famous “is/ought” problem. David Hume argued that normative (“ought”) conclusions cannot be deduced from descriptive (“is”) premises. In a valid argument, terms cannot appear in the conclusion that do not appear in the premises. Therefore, if morality is concerned with facts, then normative conclusions must be deduced from fundamental statements of fact that contain “ought” terms. Sensation is the only fundamental source of factual information, however, and people do not seem to sense goodness and badness, merely colors, sounds, and so on.

Following Hume’s reasoning, G. E. Moore argued that any attempt to derive moral statements from physical, biological, or psychological facts commits the “naturalistic fallacy.”

While irrationalists agree that morality is not fundamentally rational—that, at most, reason helps to figure out how to satisfy moral commitments made on a nonrational basis—they disagree about the fundamental source of moral commitments.

Religious irrationalism holds that God’s commands are the source of morals. Many religions hold that ethics is a matter of obeying divine commands, whether one understands them or not. The story of

Abraham in the Hebrew Scriptures (Genesis 22) is an example. God commands Abraham to sacrifice his son Isaac. From a rational perspective, obeying would be immoral: It would mean murdering an innocent boy, and it would cause Abraham and his wife great emotional suffering. Yet all Abraham believes that he needs to know is that God has commanded, so he is prepared to kill. Hence, morality for Abraham means obeying without question commands that do not necessarily make sense.

Secular irrationalism comes in several varieties. According to emotivists, such as Bertrand Russell and A. J. Ayer, moral statements express attitudes that are based on subjective emotional states. According to existentialists, such as Albert Camus and Jean-Paul Sartre, moral attitudes are based on arbitrarily chosen commitments.

Irrationalism is thus strongly linked with moral relativism—the thesis that moral values are not universal. If morals are not rationally based, then consistency is not necessary. If morals are based on subjective emotions, faith, or arbitrary commitments, then, since these are highly variable, morals will be highly variable.

REASON’S ROLE

For rational theories of ethics, then, the challenge is to find and validate a rational source of ethics. The history of ethics contains four major types of attempts to do so.

Intuitionists hold that good and bad are properties of external things themselves, in the same way that colors, textures, and sounds are properties of things. Just as people have sense organs to detect color and sound properties, they have a moral sense to detect moral properties. Moral properties are therefore independent of subjective states, they can be identified accurately, and thus they provide data for rational moral reflection and action.

Hedonists hold that moral properties are based on facts about human nature itself: Humans are born with pleasure/pain mechanisms. What causes sensations of pleasure and pain is not a matter of subjective choice. Sensations of pleasure and pain provide the data for rational moral reflection and action. Morality is a matter of calculating which actions will maximize pleasures and minimize pains.

Kantians hold that morality is based on the nature of reason itself. Noumenal reason projects a

priori laws to one's phenomenal self. Since one is human, one should act in accordance with one's distinguishing feature: reason. Since reason demands consistency, morality means using one's reason to determine which maxims of action are consistently realizable, and then acting according to those maxims.

Objectivists hold that morality is based on relational facts about human nature and its environment. Human beings are organisms of a specific nature, and their nature and their environment jointly specify requirements that must be satisfied for them to survive. Good thus is identified fundamentally with what is necessary for survival, and bad with that which leads to death. Reason is a capacity whose function is to identify those survival requirements and to direct the actions of the organism in ways appropriate to fulfilling them.

Reconciliation

DEFINITION: Restoration of relationships between wrongdoers and the wronged persons or parties

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Reconciliation is a central concept in the network of moral and ethical transactions having to do with how individual persons or groups respond to wrongs done to them.

Forgiveness is one's setting aside of feelings of indignation or resentment directed toward another person who has done one a moral injury. As such, forgiveness is a matter of how one feels about the wrongdoer, rather than how one treats that person. In this respect, it differs from the moral transaction of mercy. To show mercy is to treat a person with less harshness than he or she deserves. Justice is treating a person with the appropriate measure of punishment for the offense done. A person may be treated both justly and without mercy and yet be forgiven. For example, if someone used another person's credit card without permission, the owner might forgive that person while still insisting that the other person repay the money needed to cover charges made on the card. The wronged person in this instance would put aside personal resentment and thereby forgive the thief, while not showing mercy by relieving the wrongdoer of responsibility for making good the loss. In contrast, the owner of the charge card account may absolve the thief of any obligation to repay the funds, thus showing mercy while continuing to resent the thief, thereby show that no forgiveness has taken place.

Reconciliation, unlike these other interactions, is a restoration of the relationship between the wrongdoer and the wronged. Such an interaction may be based on forgiveness but does not necessarily require it. Reconciliation may or may not include the showing of mercy. Reconciliation occurs when the relationship between the injured person and the wrongdoer becomes one of substantive moral mutuality. It is not merely a restoration to the previous position between the persons, as it imposes responsibilities on both the person wronged and the wrongdoer. Reconciliation requires that moral work by both parties.

It is possible that forgiveness will not lead to reconciliation. Indeed, reconciliation can be brought about without forgiveness, although this is difficult. Neither forgiveness nor mercy necessarily requires

the cooperation of the wrongdoer, although a confession, apology, or restitution by a wrongdoer may make reconciliation easier. However, reconciliation can be reached only through the mutual commitment and cooperation of both the wronged party and the wrongdoer.

Reconciliation is a community-building activity. It depends on the interconnectedness of persons and reinforces the sinew that binds persons together. It is integrally related to the performance of good deeds to the benefit of each party. When positive benefits are enacted mutually between wronged and wrongdoer, these good deeds are reconciliation, they are not merely a means to it.

Redlining

DEFINITION: Systematic exclusion of residents of certain areas, especially low-income, inner-city neighborhoods, from home mortgage lending and property insurance coverage

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Critics charge that redlining is an unjust practice, because it denies opportunities to those who could qualify for financial services simply because they reside in particular areas; it results in *de facto* discrimination. Practitioners of redlining defend the practice on the grounds that

it is based on what they claim to be objective economic science.

In looking for an efficient way to screen out high-risk applications for home mortgages, rehabilitation loans, and home and auto insurance, banks and insurance companies adopted the practice of "redlining," which involves excluding entire low-income neighborhoods from consideration or charging excessively high prices in these areas. Predictably, the burden of these practices fell most heavily on poor African Americans, and civil rights organizations charged that this amounted to systematic discrimination.

The U.S. Congress passed the Community Reinvestment Act in 1977, followed by the Home Mortgage Disclosure Act, to deal with redlining and the more general problem of directing loans and insurance coverage to low-income areas. The former requires banks and thrifts to make a certain proportion of their loans in the areas where their depositors live, and the latter requires them to report their mortgage lending by census tract. The question remains, however, how much responsibility banks should take for providing loans to low-income borrowers as a matter of social policy, especially if such loans conflict with sound business practice.

Refugees and stateless people

IDENTIFICATION: Persons uprooted from their places of origin—usually as a result of wars or other violent civil disturbances

TYPE OF ETHICS: Human rights

SIGNIFICANCE: In a world of international conflicts, civil wars, and repressive regimes, the plight of refugees and others driven from their homeland poses an ethical challenge to the ability of the more fortunate to ease the suffering of growing millions.

Refugees have fled war zones ever since the losers were routinely put to death or enslaved. History is replete with tales of vulnerable stateless peoples. Jews and Gypsies, for example, were frequently expelled

en masse from medieval and post-Renaissance states in Europe. In modern history, however, the numbers, visibility, and suffering of the displaced have significantly increased. In part, these developments reflect the modern world of global news networks, which have carried images of the powerless victims of warfare into the living rooms of developed societies. They also reflect the greater destructiveness of modern warfare, with its widespread use of mortars and antipersonnel land mines. Above all, these trends have reflected the artificial nature of and tensions within so many of the newer states in today's world.

During the colonial era of the early twentieth century, European nations drew boundaries within their empires with little regard to the presence of the diverse communities living within their colonial realms. In many instances, the colonial powers widened the differences separating the diverse groups

present by economically advancing some communities more rapidly than others. On some occasions, they imported diversity, as in the case of the Asians whom Great Britain brought to Uganda to provide what the British regarded as "industrious" labor. At independence the populations of most of the new states in Asia and Africa contained groups with little in common with one another and often with pre-colonial histories of mutual animosity. Civil wars, the repression of ethnic minorities, and even massacres subsequently ensued, all ejecting streams of refugees into neighboring areas.

Until the violent breakup of Yugoslavia during the early 1990's, the problems of refugees and those internally displaced in their countries of residence were primarily perceived as humanitarian issues limited to developing states. That image was rudely shattered by the reports of "ethnic cleansing," mass

graves, and atrocities committed by all of the parties involved in the conflicts in the new states that separated from Yugoslavia: first Croatia, then Bosnia, and finally Kosovo during the 1990's.

The plight of these unsettled peoples has not gone unattended. Nongovernmental organizations, the United Nations, and other international bodies and individual countries have tendered humanitarian aid and, in some instances, have militarily intervened to halt conflicts generating large numbers of refugees and internally displaced persons. However, those needing assistance have multiplied faster than the funds available for their relief, and the political problems of returning them to a safe and normal life have often proven insurmountable. Thus, for example, three years after the Kosovo conflict ended, fewer than three hundred of the more than 230,000 Romany and Serbian refugees generated by that conflict had been returned to their homes.

Relativism

DEFINITION: Belief that there are no absolute or universal moral standards and that what is morally right or wrong is relative to an individual, group, or culture

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Relativism represents a rejection of both absolutism and pluralism. It eschews the notion that moral judgments can be grounded or ver-

ified in any way, so that moral reasoning becomes a completely subjective endeavor.

Ethical relativism is related to but distinct from general philosophical relativism and epistemological skepticism. According to this position, the human mind is incapable of attaining any genuine or objective truth. Hence, knowledge is subjective and "relative" to the knower.

The ethical relativist is skeptical of determining some truth about moral matters. This position can be traced to the Greek sophists, who were the objects of Socrates' criticism in Plato's famous dialogues. Thus, sophists such as Callicles and Gorgias contended that morality was relative and that what was right for one person or group was not necessarily right for another. They rejected ethical universalism, the notion that what is morally right and wrong is basically the same for everyone, viewing ethical or moral judgments as matters of convention or personal taste.

In contrast to the sophists, most philosophers, such as Plato, Aristotle, Thomas Aquinas, Immanuel Kant, and G. W. F. Hegel, have decisively rejected this extreme position and embraced the equally extreme idea that there are universal, moral absolutes transcending time and place. Some modern thinkers, however, have resurrected the position of moral skepticism and relativism.

TYPES OF ETHICAL RELATIVISM

In general, it is possible to distinguish between two types of ethical relativism: cultural relativism and the more extreme individualistic relativism. The latter represents the viewpoint that moral values or norms differ among individuals within a society or culture. In other words, moral judgments are purely subjective; they are simply a matter of one's personal tastes or an individual's conscience. If someone believes that euthanasia is morally permissible, one's judgment in this regard must be considered valid and tenable. Likewise, if someone else considers euthanasia to be wrong, that too is a reasonable judgment. Thus, extreme relativists accept that valid ethical judgments can be inconsistent with one another.

This notion of extreme relativism is expressed in the work of modern ethicists such as John Mackie. In *Ethics: Inventing Right and Wrong* (1977), Mackie argues that there is nothing truly good or bad or right

or wrong. Rather, these categories must be “invented” in order to have any ethics. Mackie believes that the seeds of this position could be found in the works of his predecessors, such as David Hume and Thomas Hobbes. For Mackie, moral language, with its reference to “right” and “wrong,” creates the illusion of objectivity, but in reality objectivity in the realm of ethics is impossible.

Cultural relativism represents the more moderate viewpoint that moral values differ from one society or culture to another. It admits that within a society some valid moral standards are possible, but those standards will sometimes differ from one culture to another. As a result, principles that are considered central and vital in one society might be on the periphery of another culture’s value system. Moreover, the cultural relativist proclaims that there are no fixed or immutable standards that can serve as the ultimate guide to a society’s moral code. All moral norms are conditional, completely dependent on time, place, and circumstances.

Cultural relativists also differentiate between descriptive cultural relativism and normative cultural relativism. The former version of relativism is summed up in the incontrovertible proposition that moral beliefs and practices differ from one culture to another. It affirms the findings of anthropologists and historians who have discovered that different peoples have different values. For example, while some societies practice polygamy, others prohibit the practice. Similarly, a society’s moral values may evolve over the course of time. Slavery was once legal and was commonly accepted in American society, but now it is regarded as offensive and grossly immoral. The descriptive relativist simply uncovers and “describes” this cultural diversity, along with a society’s evolving standards.

NORMATIVE CULTURAL RELATIVISM

Normative cultural relativism represents the philosophical position that there are no transcultural, universal moral norms and that prevailing moral judgments in different cultures are equally valid. Thus, the moral judgment “bribery is wrong” in one culture is just as valid as the judgment “bribery is right” in another culture. According to normative ethical relativism, each moral judgment must include a qualifier such as the following: “Bribery is wrong *in society X*.” To a certain extent, the normative relativist re-

gards moral values as equivalent to customs in that both have only local validity instead of universal validity. The normative relativist adheres to the dictum “when in Rome do as the Romans do” when it comes to matters of custom and morality.

On the surface, normative cultural relativism seems to be plausible, especially since it is quite apparent that different societies do have different moral codes, but there are some salient difficulties with this position as well as with the more extreme view of individualistic relativism. For philosophers who believe in objective truth, if there is no absolute standard of some sort and all moral codes are valid, it becomes impossible to criticize other cultures or contend that the morals of some societies are inferior to those of other societies. Ironically, relativists would have no problem criticizing other cultures, since they would merely be expressing their equally valid judgment of that culture. But they would recognize that there is no way to ground or render objective such judgments. Similarly, if one embraces cultural relativism, the notion of objective moral progress becomes unintelligible. Progress implies improvement, but if there is no general, independent, transcultural standard, the only people qualified to measure a given culture’s progress are the people inside that culture who share its evolving values.

Finally, and perhaps most significantly, the idea of cultural relativism depends upon the belief that there are distinct cultures with identifiable boundaries between them. Globalism and multiculturalism have rendered this view less and less tenable, however. As cultures mix and come mutually to influence one another, the ability of relativists to demarcate the zones in which a given set of values does or does not operate breaks down. In postmodern society, it becomes impossible to tell where one culture begins and another ends. Ironically, this may mean that postmodernism, often attacked as synonymous with moral relativism, may be the moral relativists’ greatest enemy.

Religion

DEFINITION: Faithful devotion to a divine or supernatural entity, pantheon, or principle

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Every modern religion both professes and serves as the foundation for a specific set of ethical values. The observable behavior of a religion's followers, however, is not always consistent with that religion's ethics.

The relationship of religion to ethics is controversial, especially in cultures influenced by Islam, Christianity, or Judaism. The range of opinion is wide. For some, religion destroys ethics. For others, ethics depends upon religion. For still others, religion and ethics are the same.

Religion might destroy ethics in two ways. Perhaps an omniscient God makes morality pointless, since it does away with the freedom of persons to do other than God has foreseen. A loving, forgiving deity may render obedience to moral laws optional from a practical point of view. Ethics might depend upon religion because religion provides the only effective motivation for persons to obey moral law, as opposed to pursuing their own self-interest. Perhaps

God's will determines legislatively right and wrong action, in which case religion and ethics are identical.

Ethics and morality will herein be considered synonymous. Influential persons have argued for a sharp theoretical distinction, claiming that ethics is the broader notion, including much that falls outside morality. The distinction is not so much theoretical as historical, serving unnecessarily to separate ancient and modern ethical work.

DIFFERENCE ARGUMENTS

That religion and ethics are not co-identical can be shown in at least four ways. The first way is to note that connections between religion and ethics in any particular society are matters of convention. Greek polytheism and Christianity may be used to illustrate this point.

In Plato's dialogue *Euthyphro* (399-390 B.C.E.), a priest of Apollo in Athens suggests to Socrates that piety is what is loved by the gods. This is the conventional answer to the question "What is piety?" in fifth century B.C.E. Athens. Socrates then asks whether piety is pious because it is loved by the gods or is loved by the gods because it is pious. The difference is enormous. Something carried is so because someone carries it, not vice versa. The priest, Euthyphro, becomes convinced that piety is loved by the gods because it is pious. Socrates points out that this communicates that the gods love piety, but not why they love piety or what piety is. Euthyphro is thrown into confusion, not knowing how to cope with the consequences of admitting criteria for piety that are not religious. Piety is a Greek virtue. The difference between this virtue and what the gods love shows at least that arguments separating ethics and religion were known to Plato, though Athenian convention considered them identical.

The argument in *Euthyphro* is generalizable. In a Jewish, Christian, or Islamic context, it involves the awareness that answering the question "Why should I obey God's commands?" with "Because He is good" involves a vacuous circularity unless the word "good" is defined in terms other than those of obedience to God. Therefore, criteria of goodness must be independent of an awareness of divinity. Also, if people possess such criteria, they are in a position to judge good and evil on their own, without consulting divine commandments. This does not mean that the divine commands do not embody norms that are in

fact good according to human criteria. They may embody such norms, which raises the second difference argument.

A second way to show that ethics and religion are different is to recognize that all nonprimal world faiths accept the Mosaic decalogue's ethical prohibitions against lying, stealing, murder, and adultery. The "nonprimal world faiths" include Islam, Christianity, Judaism, Buddhism, Confucianism, and Daoism. Clearly, these religions do not share religious doctrines or beliefs. Nevertheless, the different religions embrace the same basic codes of ethics.

Huston Smith, in his influential book *The World's Religions* (1991), refers not only to these ethical prohibitions as common denominators of world faiths but also to their shared endorsement of three basic virtues: humility, charity, and veracity. There are three common aspects of traditional religious vision as well: Things are more integrated than they seem, better than they seem, and more mysterious than they seem. Smith uses the phrase "wisdom tradition vision" rather than "traditional religious vision" in order to include Western philosophy up to René Descartes in his analysis of commonalities. This shows that ethics is much more stable in its content than is religion and is therefore different from religion.

P. H. Nowell-Smith states that cultural relativism is based on the failure to recognize this distinction between religion and ethics. "If these are lumped together, it is easy to pass from the true premise that religious rules are everywhere different to the false conclusion that moral rules are different too."

A third way to separate religion and ethics is to note that connections between them are generally absent from primal, or pretechnological, societies. The ideas that primal peoples derived their beliefs concerning right and wrong from shamans or holy people who spoke for the gods, and that religion and ethics were separated only in later, more complex and secularized stages of development in those societies, are clearly mistaken. One might use the Australian Aborigines as an example to undergird this point, but one might as easily use the ancient Greeks and Romans, the Vikings, the Druids, the Japanese (Shintō), or any of a dozen Native American tribes.

AUSTRALIA'S ABORIGINES

The Australian Aborigines use a word that means, so far as anyone can tell, "everywhen." Everywhen is

the time an individual spends engaged in activity that is central to the survival or flourishing of the clan-grouping. The essential things are food, shelter, procreation, and such. When I, as an Aborigine, build my house according to the ancient plan, or hunt, or fish, or produce children, I become the first person ever to accomplish these acts successfully, and therefore one of a number of first persons. First persons are not gods to be imitated. The time difference between myself and the first persons is gone when I enter everywhen, as my children will, and their children after them. In these sacred, eternal acts, I overcome the accidents and misfortunes that occur as the normal seasons pass. This is my religion.

The native Australians are quite aware of linear time. Their notion of everywhen accomplishes the same religious work for them that the last judgment of God accomplishes for Muslims and Christians: the domination of linear history. Linear, causal history contains much injustice, accident, disease, and disaster. In it, good things happen to bad people and bad things happen to good people. Religion must offer hope in the form of an understanding that dominates these facts, or it is not a successful religion.

The critical thing to note regarding any connection between ethics and religion for the Aborigines is that judgments concerning where I am entitled to build my house, where I can hunt or fish, and with whom I produce children are not related to everywhen. These are ethical decisions made among humans, by humans, and for humans. No one speaks for the archetypes on these matters. Religion proper has nothing to say about them, and only points to the necessity of the acts themselves.

Thus, primal societies do not exhibit the kind of connection between religion and ethics that some developmental views present. They also do not subsume ethical commandments under religious teaching, as the nonprimal world faiths do. This is obscured in nonprimal religions by the fact that all but one (Hinduism) were founded by some individual. Such an individual is, of course, an integrated human being, usually highly so. He exhibits ethical as well as religious integration in his expressions, judgments, and so on, clouding the fact that religion and ethics are different.

A fourth way to show ethics and religion to be different is to consider the problem of saying just what ethical system is required by any specific religion;

for example, Judaism and/or Christianity. The Judeo-Christian religion has operated, and operates today, as a religious basis in vastly different societies or cultures. Any such religion will offer behaviors that are relatively independent of particular, specific forms of social life. It will also exhibit enormous flexibility regarding moral standards in different cultures and at different times. Historically, Judeo-Christianity has served as the religion of Hebraic tribalism, Hellenistic aristocracy, Roman imperial monarchy, Constantinian bureaucracy, the Third Reich, and American republican capitalism. As Alasdair MacIntyre says, "it will perhaps come as a relief to consider that the whole problem of Christian morality is to discover just what it is."

It is perhaps worth noting that the comparative stability of ethical norms as opposed to religious beliefs pointed out in the second difference argument above can be rendered inconsequential by classifying a group as nonhuman, as the Third Reich did in the case of the Jews, in order to kill them without violating the prohibition against murder.

Taken together, the difference arguments make identity claims hard to defend. This does not mean that individuals who recognize the difference do not themselves integrate religious and ethical beliefs and norms. Plato presents Socrates as not accepting the conventional wisdom, or the institutional understanding of a priest, regarding piety. Just as clearly, Socrates accepts piety as a personal virtue. Plato's Socrates also exhibits religious beliefs when speaking for himself and not engaged in dialectic, particularly in *Phaedo* (388-368 B.C.E.).

DEPENDENCE ARGUMENTS

One need not stray from Plato for a model for arguments that render ethics dependent upon religion for motivation. Plato entertains this line of thought in *Republic* (388-368 B.C.E.), his utopian rendering of the ideal state.

The religion of the Greeks was contained in the narratives and poetry of Homer, Hesiod, and others. These stories were considered by Plato as unsuitable subject matter for the education of the young in *Republic*, because they present the divine as capricious, immoral, and even cruel. The divine nature must be, for Plato, good, not a source of evil. This brings to the fore Plato's attitude toward the truth. It should be noted that the Greek word *pseudos* need not have the

deprecatory connotations of "false" or "lying." The stories (*mythoi*) told to children are in general fictitious (*pseudoi*). What Plato insists upon is that these stories be "true" by not misrepresenting the divine character.

In *Republic* there is a discussion to the effect that, although outright lying is despicable, "spoken falsehood" may be useful; for example, militarily or to save a friend from himself or herself. This passage ends with an analogy to medical practice: As medicine should be administered by a physician only for the good of the patient, so also falsehoods should be employed by rulers only for the good of the state. Plato then passes into a myth for his own purposes. His practical, ethical purposes in this myth are to bind persons to both their land and one another. The myth has it that the rulers, guardians, and workers sprang full-grown from Mother Earth, who nurtured, formed, and educated them.

This sequence of passages has long been used to question or condemn Plato's ethics. Such condemnation has prompted heartfelt defenses also, such as that of Francis Cornford, who despises those who would "suggest that he [Plato] would countenance the lies, for the most part ignoble, now called propaganda." These reactions are extreme because Plato is toying with the controversial notion that a religious creation story is necessary to provide a level of solidarity and fellow-feeling that might serve to glue humans together in community, actual or utopian, and motivate them to follow ethical norms.

Plato is *not* here countenancing propaganda of any crude sort, since he clearly intends for both the guardians and rulers to be convinced of the truth of the myth. Neither group is particularly credulous, and Socrates does not express much confidence in his ability to secure their belief.

This argument and others like it concern motivation, not ethical content. Ethical content is fairly constant between religious cultures. Dependence arguments harp on motivating persons through religion to observe ethical content. Some say that only religion will work, while others say that religion is unnecessary or irrelevant. It is in this standoff that destruction arguments become relevant.

DESTRUCTION ARGUMENTS

Some who claim that religion is unnecessary for or irrelevant to ethical motivation are neutral about or

committed to a religious point of view, but others are not. Some are convinced that religion is the cause of most ill will and violence between persons in the world. They catalog the historical abuses of secular power by ecclesiastical authorities. They cite the enmity in Northern Ireland between Protestants and Catholics. They cite fanatical acts by Christian or Islamic fundamentalists. They are morally nauseated by these facts. Their nausea motivates them to mount arguments that religion destroys ethics, such as those mentioned at the beginning of this article. Quite naturally, such persons react strongly against any suggestion that ethics is dependent upon religion, because the two tend in opposite directions in their minds.

The two sides of this conflict will never touch. One side clings to direct experience with the divine. The other clings just as tenaciously to the trouble caused by organized, and therefore politically effective, religious groups, not to mention clinging to objections to the metaphysics of religious beliefs. Intelligent religious folk are not motivated to refute claims that religion has been the cause of all manner of evil in the world, because it does not threaten the status of their direct experience with the divine. For religious folk, the fact that such experience becomes perverse when constituted as a conflict-producing political platform is a manifestation of human corruption, not divine corruption. This response sometimes incenses those who want religious people to take responsibility for the carnage their religious organization causes, presently or historically. But this is heat, not light. Closed religious people hide behind their belief that without God, all is permitted. Closed humanists hide behind their belief that all religious people have been lobotomized. The two groups never speak directly to each other.

THOMISM

Is there any hope for resolution, anything better than this heated darkness? Some religious persons and humanists think there is a positive answer: Thomism. Although Thomas Aquinas was a Roman Catholic theologian, open, secular persons are not put off by Thomism. MacIntyre says, "Aquinas' theological ethics is such as to preserve the nontheological meaning of the word good." This is true, for Thomas Aquinas defines good as "that toward which desire tends." MacIntyre allows Thomas Aquinas's faith because, in it, calling God good is naming him as the object of

desire. This means that God and good are not defined in terms of each other. Therefore, "'God is good' is a synthetic proposition, and to cite God's goodness is to give a reason for obeying his commandments."

This reason, the nature of goodness, is naturally desired and as available to nonbelievers as believers, so both groups have access to accurate beliefs about goodness. Believers must regard unbelievers as possessed of natural reason, because of, not in spite of, their own faith. God created this natural reason, acknowledged or not, in every person. Believers and unbelievers are even in terms of practical rationality and can learn from each other in making ethical decisions. MacIntyre, in turn, does not consider religious folk ethically irrelevant; only their religious beliefs are ethically irrelevant.

Clearly it matters more, regarding ethics, whether a religious person is open or closed than whether he or she is religious or nonreligious. The same is true of a nonreligious person. MacIntyre goes as far as to say, "Thomist Christianity . . . exhibits more of a kinship with certain kinds of secular rationalism than with certain kinds of Christian irrationalism."

Thomism is Thomas Aquinas's version of Aristotle. Neither of these thinkers separates virtue from happiness, acting well from doing well. Modern ethicists, religious and nonreligious, have separated virtue and happiness. Modern ethics texts take the crucial issue to be the reconciliation of altruism with self-interest. This presupposes that to be virtuous is not to be happy, if "happy" means satisfying one's natural desires, and that to be happy is to be not virtuous. The invention and acceptance of modern individualism by Martin Luther, Niccolò Machiavelli, Thomas Hobbes, and Immanuel Kant was necessary to accomplish this separation. Modern individualism presupposes that basic opposition between self-centeredness and virtuous behavior that prompts requiring virtuous behavior to be motivated by the power of religion. According to Hobbes and Luther, humanity is depraved by nature. Thomas Aquinas and MacIntyre refuse to allow this presupposition.

Thomism cannot be expected to solve much in Islamic or Jewish cultures unless it is properly translated. Such translation and synthesis await an appropriate time or champion. It is difficult, however, to ignore a sophisticated, open theology in a time of oppression and violence caused partly by closed religion. The significance of Thomism is underrated in

the academy's postmodern reflection in proportion to the overrating of the necessary demise of religion and/or closed humanism.

Buckman, Robert. *Can We Be Good Without God? Biology, Behavior, and the Need to Believe*. Amherst, N.Y.: Prometheus Books, 2002. Argues that the need to believe in transcendent principles may have a biological basis, but that it is nevertheless useful to assume that there is no God when constructing practical moral systems.

Byrne, Peter. *The Philosophical and Theological Foundations of Ethics: An Introduction to Moral Theory and Its Relation to Religious Belief*. 2d ed. New York: St. Martin's Press, 1999. A general survey of moral theory as seen through the lens of the relationship between ethics and religion.

Gilby, Thomas. "Thomism." In *The Encyclopedia of Philosophy*, edited by Paul Edwards. New York: Macmillan, 1972. A brief but excellent introduction to Thomism, with an explanation of its attractiveness to nonreligious ethicists and statesmen.

Hudson, Yeager. "The Independence of Ethics from Religion." In *The Philosophy of Religion*. Compiled by Yeager Hudson. Mountain View, Calif.: Mayfield, 1991. Contains useful discussion of primitive societies, developmental issues, and Thomist natural law. Hudson fleshes out the relation between rational and religious ethics in a manner acceptable to religious Thomists and secular rationalists alike.

MacIntyre, Alasdair. *After Virtue: A Study in Moral Theory*. 2d ed. Notre Dame, Ind.: University of Notre Dame Press, 1984. MacIntyre critiques Kant for attempting to preserve a religious moral category (Original Sin) within the framework of a secularized moral system. Without the Christian notion of redemption to make sense of it, MacIntyre demonstrates, Kant's notion of inherent sinfulness damages his moral philosophy irreparably.

Religion and violence

DEFINITION: Relationship between religious ethics and acts of violence carried out in the name of religion

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: From its earliest conception, religion has been linked with violence. Because religious violence is a pronounced aspect of contemporary societies and international politics, exploring the ethical connections between religion and violence is critical.

Religion and violence are intimately linked. The earliest archaeological records show evidence of apparently religiously motivated animal sacrifices and, later, human sacrifices, as in Mexico's Aztec culture. The biblical story of Abraham and Isaac is the repudiation of human sacrifice in Judaism, but animal sacrifice remained. In Christianity, the central symbol, the cross, is related to an act of violent sacrifice. Likewise, the historical and mythological stories of the world's religions are steeped in war and violence, from Hinduism's *Bhagavadgītā* to the conquest of the Holy Land in Judaism.

There are many explanations for interconnections between religion and violence. Religion involves human responses to the ongoing struggle between life and death. Primal religions saw all life as interconnected. For life and generation to continue, the forces responsible for the continuance and renewal of life had to be appeased. Sacrifice was seen as necessary for the continuance of the life cycle. A second explanation focuses on the social animosities that develop in any culture. To maintain social stability, animosities are focused on a sacrificial “scapegoat.” The act of violent sacrifice defuses social tensions, guaranteeing continued social cohesion.

As human societies evolved into urban-based cultures, religion became a legitimization for both violent forms of punishment and warfare. The laws of the state were presented as the laws of the gods. To break a law was to insult the sacred. Violent punishment was required to appease the gods and set right the moral order. Jesus’ death on the cross was presented as such a sacrifice.

Warfare was also given divine sanction under the rubric of “holy war.” Nation states were representatives of particular gods. In the name of those gods, urban civilizations made war on each other. To kill or to die in the service of a god was seen as a great honor and brought the promise of great rewards. The use of war, having a common enemy, is also viewed as an extension of the scapegoat theory, a means for creating social cohesion. These dynamics are still current in many modern conflicts.

STRUCTURAL VIOLENCE

Religion has also legitimated various forms of structural violence, violence that is a product of social laws and institutions. Religion has been used to justify caste systems, such as that in India, which left those in the lowest class (the untouchables) destitute and powerless. In Western Protestant societies, aid for the poor was withdrawn, as their poverty was viewed as God’s punishment for their immoral behavior.

Religions also justified racial oppression and discrimination. Most notable was the claim by Europeans that the blackness of Africans was a sign of God’s punishment, thus justifying slavery. Whiteness was also equated with purity and being God’s chosen people. A similar theology was expressed in apartheid concepts in South Africa.

Likewise, women have been oppressed, often quite brutally, in all cultures. Such oppression has been justified by religious myths and teachings. In traditional India, widows were sometimes burned alive, along with their dead husbands, as part of funeral services. Some African groups practice female genital mutilation. In most societies, until recently, women could not vote, own property, or hold public jobs. Such restrictions based on religion continue in many countries and cultures.

As the twentieth century progressed, there was a widespread belief that religion was diminishing in terms of its social influence and so would cease to be a contributing force for violence (secularization theory). In reality, religion has become increasingly prominent in many societies and in the realm of international politics. Most early twenty-first century international conflicts have religious components. Examples include Hindus versus Muslims in the India-Pakistan conflict, Christians versus Muslims in the United States-Iraqi conflict, and Jews versus Muslims in the Israel-Palestine conflict. Religion has also become a source of violence inside many countries as conflict between religious groups has intensified and religious extremism has become more prominent, most notably in Northern Ireland, the Sudan, and the “ethnic cleansing” in Serbia and Bosnia.

RELIGIOUS FUNDAMENTALISM

Increasing religious violence in the world has several sources. In some cases conflicts arise over disputed sacred territories, such as Jerusalem and the site of the former Babri Mosque in India. In others it is a continuance of religious legitimization of certain forms of structural violence such as racism and the oppression of women. More pronounced, however, has been the rise of various forms of religious fundamentalism that have come to be part of many cultures and most religious traditions.

While most religious fundamentalists do not engage in violent activity, fundamentalism presents a worldview that encourages and legitimates violence. Religious fundamentalism develops in reaction to aspects of modern culture and politics, and its adherents define themselves oppositionally. In addition, religious fundamentalists typically claim to have precise understandings of God’s will and see themselves as God’s “chosen” agents. Additionally, fundamentalists view the world dualistically: as a battle be-

tween forces of good and evil. The opposition is by definition evil and so becomes a religiously sanctioned target of violence. This is evident in events such as the 1995 bombing of the Oklahoma City Federal Building and the September 11, 2001, terrorist attacks on the Pentagon and the World Trade Center.

Reparations for past social wrongs

DEFINITION: Compensation, typically in money, for injuries or damage done to members of groups or their ancestors

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: The concept of paying reparations for past social wrongs involves such ethical issues as justice and fairness, and the moral obligation to atone for wrongs committed.

International law firmly dictates that the victims of human rights violations have a right to compensation. In recognizing this right, several nation-states have provided reparations to members of groups

whose human rights were violated. The two most recognized cases are those involving the provision of reparations to the Jewish people by the German government for crimes committed against them during the Holocaust, and the provision of reparations to Japanese Americans by the government of the United States following their internment in World War II.

The most highly debated case for reparations involves African Americans. While it is generally agreed that slavery was morally wrong, several unique ethical issues are involved. The reparations issue is complicated by the fact that slavery happened so far in the past. In the cases of victims of the Holocaust and Japanese American internees, many of the perpetrators of the violations were still alive when the reparations were offered, as were many victims. In the case of slavery, both the original perpetrators and the original victims are long dead. Who, then, should be the recipients of reparations for slavery? Who would be responsible? Can crimes committed so long ago be judged in terms of modern standards of morality?

From a relativistic perspective, human rights violations that were committed in the past cannot be judged by the moral standards of the present day. Thus, while contemporary moral standards hold slavery to be a crime, relativists argue that it is unfair to judge past behavior by current standards. However, others argue that human rights are universal; they transcend time and space. Therefore, successor nations have a moral obligation to compensate the victims of crimes that were committed long ago. Actions by the U.S. government in the late 1990's supported this latter perspective. For example, the Sand Creek Massacre National Study Site Act of 1998 provided reparations for an 1864 attack on a Cheyenne village.

THE VICTIMS OF SLAVERY

The injuries sustained by slaves are unquestioned. Slaves were denied freedom, treated as chattel property, physically punished, killed, denied their own cultures and languages, denied marriage rights, and made to suffer other abuses. The slaves provided their owners free labor. While former slaves were promised compensation at the end of the slavery (for example, the Southern Homestead Act of 1866 promised "forty acres and a mule"), that promise was never realized. Therefore, a case for former slaves can be made quite easily. However, those who served

as slaves are deceased. Who, then, would be the beneficiaries of reparations?

Essentially, there are two possible beneficiaries in this case. First, the direct descendants of slaves could receive reparations. Proponents argue that the legacy of slavery has been sustained by a number of factors, one of which is a lack of wealth. Wealth is generally passed down from one generation to the next. Since slaves were unable to obtain wealth, they had almost nothing pass along to their descendants, thereby handicapping their descendants by making it more difficult for them to compete fairly in the economic market. This option is criticized on the grounds that it is unjust, since the descendants were not slaves themselves. It is also criticized on the basis that it encourages African Americans to view themselves as victims, denying them self-esteem and dignity.

The other possible beneficiary could be African Americans as a group. The system of slavery was jus-

tified by negative stereotypes of blacks as a whole. Since stereotypes are applied to groups and tend to be sustained over long periods of time, all African Americans may be regarded as having to suffer the negative consequences of slavery. Also, the Jim Crow system of discrimination that existed after slavery affected all members of the group, not merely former slaves. Even when legalized discrimination ended, institutional discrimination remained. The counterargument is that all African Americans have not suffered equally. By the early twenty-first century many African Americans were doing quite well. The conditions of African Americans as a group have improved substantially over time. By providing reparations to all African Americans, it is argued, the beneficiaries would be treated on the basis of race as a primary characteristic. This is, by definition, racist. This option, like the first, may also encourage African Americans to view themselves as victims.

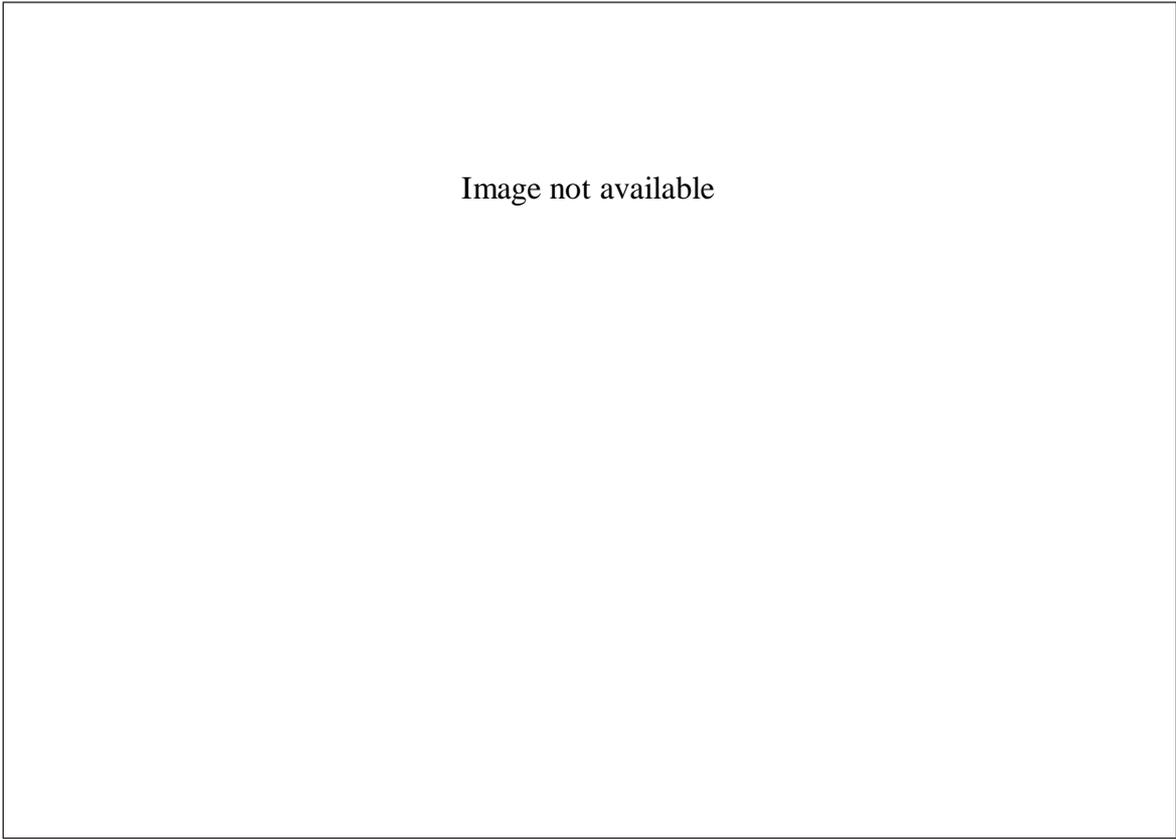

Image not available

Andrew Robinson-Gaither, a Los Angeles pastor, speaking at a Washington, D.C., demonstration in favor of reparations for slavery in August, 2002. (AP/Wide World Photos)

A final criticism of this approach is based on the primacy of individual rights over those of groups. Since the Enlightenment, notions of justice have been based on individual rights. Therefore, it would be unjust to pay reparations to those who are not the direct descendants of slaves. However, justice was extended to groups through civil rights legislation. Contemporary justice includes group rights.

WHO IS RESPONSIBLE?

The perpetrators of slavery are deceased. Who, then, should be responsible for paying reparations? Again, there are two primary options. One group that could be held responsible is those who inherited the wealth produced by slaves. The descendants of slave owners would be included, as would corporations that significantly increased their assets during the slavery era. However, these descendants were not directly involved in slavery, and it is argued that it would be unfair to hold them directly responsible.

The federal and state governments are the other possible option, since they allowed the human rights violations to occur. This option would, in essence, hold the whole nation accountable. It is argued that white Americans, as a group, have benefited from slavery and the ensuing discrimination and therefore have a collective responsibility to compensate the victims. Just as negative stereotypes hurt black Americans, they advantaged white Americans. The main argument against this approach again deals with an individualistic notion of justice. Not all white Americans living in the time of slavery participated directly in slavery, nor did any of the immigrants who arrived after slavery ended. In addition, it is argued that judging all whites simply on the basis of skin color is racist in itself, and therefore unjust.

Republic

IDENTIFICATION: Book by Plato (c. 427-347 B.C.E.)
DATE: *Politeia*, wr. c. 388-368 B.C.E. (*Republic*, 1701)

TYPE OF ETHICS: Classical history

SIGNIFICANCE: *Republic* is arguably the single most influential work of ancient Greek philosophy. It is a dramatic meditation on the nature and value of justice and on the social structure best suited to achieve it.

Republic consists of a lengthy discussion of the advantages of choosing justice rather than injustice. In order to persuade his interlocutors, Socrates, the protagonist of *Republic*, uses every rhetorical device available to him, blending images and arguments into a whole that is worthy of the name "cosmos." Included in the work are fictional regimes, noble lies, an analogy of the good, allegories exposing human ignorance, geometrical explanations of knowledge, an image of the soul in speech, and a myth. The interlocutors, however, remain skeptical. They see no reason to believe that the soul has conflicting powers that are in need of intelligent governance, and they doubt that a philosopher-king would rule the city more successfully than would a greedy tyrant who might agree to satisfy the interlocutors' own greed.

Framed among the most refined set of images available to philosophy, Socrates' failure to persuade is also a success. So rich is Socrates' ability to demonstrate the truth of his claim that it has provoked innumerable commentaries. The power of the dialogue lies in its drama. Captured at the end of a religious festival, Socrates is forced to argue the merits of justice and the disadvantages of injustice. Under the tyrannical rule of Cephalus, who believes that justice is good only for those whose appetites have become dull with time, Socrates gives in to his craving for arguments and must find a way out of his own injustice.

Cephalus leaves the discussion and hands his power to his son Polemarchus, who claims that justice is good for collecting debts. Thrasymachus, a guest, believes that justice proves advantageous for strong persons who can use justice to subdue the weak.

SOCRATES ON JUSTICE

Aware that justice has been shattered and that each speaker has taken from it what suits his preference, Socrates does justice to justice. Since justice requires the ordering of many parts into a unity governed without tyranny and with concern for the well-being of both the parts and the whole, the philosopher must attempt to educate his interlocutors. The hardest to persuade are Thrasymachus and Adeimantus, who are men of appetites; like the appetites that govern them, they are insatiable unless they are restrained but are also fragile and can be destroyed easily by excessive discipline. In respect to the city, the larger picture of the soul, this is tantamount to saying that Socrates must convince the artisans, or the masses, to accept the rule of the philosopher-king. Appetites and artisans respond to whatever appears to be pleasurable. The philosopher, therefore, must carefully select images that are simultaneously appealing and restraining. The story of Gyges and the tale of Er meet this need, awakening desire for the pleasures of justice and rejection of the pain that follows injustice.

Spiritedness, in turn, receives a strong dose of fiction. Intelligence thrives on the divided line. In order to educate whole souls and entire cities, one must use didactic devices that function as a whole. *Republic* itself is that whole. It should be kept in mind, however, that this whole is not available to the *dramatis personae* of the work. Therefore, the fact that the interlocutors are not persuaded by Socrates does not diminish the power of the drama. *Republic* is written in the first person and is presumed to be Socrates' recollection of past events. In fact, only the unnamed audience must be truly persuaded.

Socrates' instruction relies on two parallel triads, each of whose parallel terms are presumed to share a common virtue. The intelligence of the soul corresponds to the ruler of the city, and their common virtue is wisdom. The spiritedness of the soul corresponds to the guardians of the city, and their common virtue is courage. Finally, the appetites of the soul correspond to the artisans of the city, and their com-

mon virtue is moderation. Justice is the virtue of the city and the soul taken as a whole. Training into moderation proceeds through imitation, courage comes about through fictions, and wisdom (rational thought) arises from the study of music and geometry. Geometry satisfies intelligence's desire to look into the nature and structure of things, and music prepares intelligence to govern the many, forming a beautiful unity that never neglects the well-being of its parts. Justice, then, is learned through music. Presumably, music keeps intelligence in touch with the whole soul, for "someone properly reared in rhythm and harmony would have the sharpest sense of what has been left out or what is not a beautiful product of craft or what is not a fine product of nature." When intelligence matures in reason, or *logos*, music takes the form of dialectic. This claim makes good sense if one recalls that Greek is a language with pitch and rhythm.

Dialectic harmonizes. If one analyzes the divided line musically, one notices that its center is a continuous note that is interrupted by pauses marked by the lines that divide images from sensations and thoughts from truths. At the end of sensation, one sees a longer pause that is analogous to the rest that is inspired in the soul by the trust that seeing an object causes. When the object that is being observed causes a contrapuntal sensation, the soul, which is provoked to think, continues the melody. The sensation in question provokes thought by "tending to go over to the opposite." Seeing the index finger, the middle finger, and the little finger, one is satisfied to call them fingers. One pauses. Their relationship, however, gives mixed messages, calling the index finger both large and small.

What is required is a measure, a gathering of the parts into a harmonious whole that is analogous to the organization that is required by the parts of the city and the powers of the soul. The dialectician is the one who grasps the explanation of the being, or *ousia*, of each thing and unifies the many according to their nature. He provides a melody, conducts the orchestra, and hears and cherishes every note that is played, but never imposes an interpretation on the players. He governs by minding his own business. That minding of one's own business precisely defines what justice is. It should not surprise one then, that the best ruler of both the city and the soul is the philosopher-king.

Responsibility

DEFINITION: Legal or moral liability for one's acts or omissions

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: Responsibility is a precondition for moral regard. People are usually judged morally praiseworthy or blameworthy only if they are responsible for their actions.

The concept of responsibility is a focus of long-standing dispute in metaphysics and moral philosophy. There is widespread disagreement about whether and in what sense persons are morally responsible for their actions. Some philosophers believe that to be morally responsible an agent must be free. Others think that responsibility obtains independently of the question of free will. Among those who regard freedom as essential to responsibility there are various theories about whether and in what sense persons are free. To understand the philosophical background of dispute about the concept of responsibility, it is nec-

essary to sketch out the main lines of controversy and evaluate the strengths and weaknesses of some of the most influential positions.

FREEDOM AND RESPONSIBILITY

It is commonly said that people can reasonably be held responsible for what they do only if their actions are done freely. In moral evaluation and legal decision making, persons are usually excused from responsibility for their actions if the evidence suggests that they acted without the ability or opportunity to choose to act differently.

People with severe mental disabilities or mental illness and those under extreme duress are routinely exempted from moral responsibility. The law similarly draws commonsense distinctions between murder in the first degree and manslaughter, in which an agent is said to have acted in the heat of passion. The idea is that under circumstances of extraordinary confusion or stress, the average person is not capable of acting freely; therefore, moral responsibility is at least temporarily diminished or suspended. A victim coerced by threat of violence to commit a moral offense in conditions in which most persons would find they have no choice but to comply is often seen as a mitigating circumstance absolving the agent of moral responsibility.

The same reasoning applies to the exclusion of severely mentally retarded or insane persons from the category of moral responsibility. Persons with such disorders are usually judged unable to reason about their actions and the consequences of those actions. They are thought not to act freely or to act with such limited freedom that they cannot be considered moral agents, and their actions are not judged morally right or wrong. More morally and legally controversial cases concern substance abuse addicts and others under the influence of biochemical compulsions who may be involved in wrongful actions but who seem to lack the necessary self-control to be considered responsible.

DETERMINISM

If these examples prove that responsibility entails freedom, then moral responsibility for action is problematic. There are scientific and philosophical reasons for doubting that humans are free enough in a deeper metaphysical sense to support the traditional concept of moral responsibility. The freedom to

choose to act or to refrain from acting is challenged by causal, logical-semantic, and theological kinds of determinism. These theories maintain, on different grounds, that persons cannot act otherwise than they in fact do. Logical-semantic determinism holds that agents are determined in what they do by the eternal abstract truth conditions of propositions describing their future actions.

Theological determinism makes similar claims from the assumption of God's perfect omniscience of what agents will do and how they will choose to act. Since causal determinism is thought to pose the most serious threat to free action, however, it is convenient in what follows to limit discussion to it. Causal determinism arises from the conception of human beings as physical systems, subject, like other macro-physical entities, to deterministic natural laws. If persons are determined by the laws of physics, then they are no more free to choose and act than nonliving things are. If moral responsibility entails causal freedom, then persons are not morally responsible.

There is a spectrum of degrees of freedom and responsibility in the ordinary, nonphilosophical, sense. It begins, on the low end, with nonhuman animals and severely retarded or insane persons, who are believed to have no moral responsibility at all. Then come addicts and persons under the direction of psychopathological compulsions; they are intermediate cases, who are typically thought to have some, but less than normal, moral responsibility. Finally, there are normal human adults, who, other things being equal, are usually regarded as morally responsible agents. If nonhuman animals, the severely retarded, and insane persons lack responsibility, and if addicts and compulsives have diminished responsibility because they cannot exercise sufficient self-control, the same reasoning coupled with philosophical arguments for determinism suggests that no one anywhere in the spectrum is morally responsible.

If human beings are merely complicated physical systems, then even normal human adults are not freely in control of what they do. They cannot do other than what they do, but are merely manipulated through body chemistry and the environment by the same cause-and-effect relations that govern all other natural phenomena in the universe. If this is true, and if moral responsibility entails causal freedom, then no person is morally responsible, and there is no justification for regarding normal human adults as more

morally responsible than nonliving things, nonhuman animals, the severely retarded or insane, addicts, or compulsives.

Accordingly, to preserve moral responsibility in the light of the challenge of determinism, some philosophers have argued that freedom is not necessary for moral responsibility. They interpret responsibility as mere accountability. By this they mean that to be morally responsible is to be the person causally responsible for a certain event, capable of explaining one's reasons for acting, and perhaps able and willing to accept approval for a good result and accept blame for or rectify an unwanted outcome. It is in this pragmatic sense that airlines are held responsible for damage to a passenger's luggage, and it is at this level that legal responsibility generally functions, without raising deep metaphysical issues about whether airline employees act freely in the sense of being causally undetermined.

METAPHYSICS OF RESPONSIBLE ACTION

There are two main types of theories of moral responsibility, which can be referred to as compatibilist and incompatibilist. Compatibilist theories of responsibility hold that responsibility is independent of the problem of freedom, or that responsibility is logically compatible with causal determinism, so that agents can be responsible in the pragmatic sense even if they are not free. Incompatibilist theories insist that whether agents are morally responsible logically depends on whether and in what sense they are free, and that responsibility is logically incompatible with causal determinism. Incompatibilism further divides into responsibilist and nonresponsibilist theories. Responsibilist incompatibilism is the position that responsibility is incompatible with determinism but that agents are responsible precisely because they are not causally determined. Nonresponsibilist incompatibilism is the view that responsibility is incompatible with determinism, but since agents are causally determined, they are not responsible. Nonresponsibilist incompatibilism implies that an agent's feeling of responsibility, sometimes manifested as pride, guilt, or stirrings of conscience, is illusory.

The distinction is reflected above in cases involving compatibilist responsibility, such as an airline's collective accountability for a passenger's luggage, and the incompatibilist judgment that if agents are not causally free in a deeper metaphysical sense, then

they are no more responsible for what they do than are nonhuman animals or even nonliving physical things. The advantage of compatibilism is that it assumes no burden of challenging the modern scientific world outlook according to which all natural phenomena are supposed to be reductively causally explainable by the laws of physics. Yet it preserves a pragmatic sense in which it is intelligible to hold normal human adults responsible, while morally excusing and excluding from responsibility nonhuman animals, the severely retarded or insane, and related commonsense and legally recognized exceptions.

The advantage of responsibilist incompatibilism, if it can be convincingly defended, is that it accords with traditional moral thinking about the dignity of mind and the difference between human beings and other natural systems, and especially with the conception that an agent in acting responsibly could have chosen to act differently. From the standpoint of responsibilist incompatibilism, compatibilism offers an intellectually unsatisfying diluted sense of responsibility that is insufficient to sustain moral judgment and justify the social mechanisms of praise and blame, reward and punishment. From a nonresponsibilist incompatibilist standpoint, such judgments and practices cannot be justified, because they are based on false assumptions about the freedom of action.

To resolve the metaphysics of freedom and responsibility requires an investigation of concepts in philosophical psychology or the philosophy of mind. The freedom of the will is accepted by substance dualist theories of mind, in which the mind or soul is said to be a spiritual substance distinct from the body's material substance. If the mind is immaterial, then it is causally free and undetermined by causal necessity. Unfortunately, substance dualism cannot satisfactorily explain causal interaction between body and mind. If mind and body are causally independent of each other, and if only the body is subject to causation, then the mind cannot be causally responsible, and hence cannot be morally responsible, for actions involving body movements. If, however, mind and body are identical, and if the body, like other purely physical systems, is subject to causal determinism, then so is the mind; therefore, the problem of the causal determinism of action remains on incompatibilist assumptions to threaten moral responsibility. The dilemma is that if the mind is part of the body's causal nexus, then it is causally deter-

mined and therefore not morally responsible for its actions; if the mind is not part of the body's causal nexus, then the mind is not causally responsible, and again therefore not morally responsible for its actions.

There is another theory of mind that allows both mind-body causal interaction and incompatibilist freedom of will and moral responsibility. Instead of regarding mind as a spiritual substance distinct from but somehow interacting with the body's physical substance, persons can be understood as physical substances with both physical and nonphysical aspects, or properties. This alternative to classical substance dualism is known as aspect, or property, dualism. If the mind is not an immaterial substance, then the problem of its causal interaction with the material body does not arise. If mental properties are irreducible to purely physical properties, then there is a sense in which persons are not merely physical entities. The nonphysical or physically irreducible properties of persons constitute an aspect of persons by virtue of which they do not fully fall under deterministic causal laws. The difference between the mind and ordinary purely physical systems postulated by this kind of theory permits minds to be causally undetermined in the contracausally free ethical decision making for which they are morally responsible.

ACCEPTING RESPONSIBILITY

There are social as well as metaphysical dimensions of the concept of responsibility. To be judged morally responsible for the consequences of an action, an agent must intend to act, intend that the action result in the consequences for which the agent is responsible, and be aware of or remember having done the action when held accountable for it. A shared sense of values in taking responsibility and holding others responsible is also presupposed. These factors impose additional intentional conditions on the concept of moral responsibility.

The importance of these additional conditions can be illustrated by a commonsense example. Suppose that an agent freely decides to turn on a light switch. The agent is responsible for the immediate action of turning on the light but not necessarily responsible for its further unforeseen consequences. If turning on the light enables a killer to see a victim in the room, then the agent's turning on the light may in some sense be causally responsible for the victim's murder.

If the agent has no knowledge that the killer is present or that the person in the room might be a target for murder, however, and has no acquired responsibility to act as the victim's guardian, then the correct judgment seems to be that the agent is at most partly causally responsible, but not morally responsible, for the victim's death. This condition can be formulated by saying that an agent must intend the consequences of an action in order to be morally responsible for it. The agent in the example intends to turn on the light and is, as far as moral considerations are relevant, morally responsible for doing so. The agent does not intend that the victim be killed, however, and therefore is not morally responsible for the fact that this occurs in part as a consequence of turning on the light. The killer intends to murder the victim and is morally responsible for that action, for which the light's being turned on merely affords an opportunity.

AWARENESS OF CONSEQUENCES

A related though more controversial condition is that the agent recognize or be aware of doing an action or of its effects at the time when held responsible for it. Persons who have committed what would otherwise be regarded as a moral offense are sometimes acquitted of responsibility by the consideration that they have no memory of having so acted. If an agent acts and then suffers amnesia permanently affecting memory of the action, it may be inappropriate to hold the person morally responsible thereafter, even if at the time the agent would have been rightly judged morally responsible. It seems pointless to praise, blame, reward, or punish persons for actions they have no memory of doing.

It may be equally pointless to hold persons morally responsible, in the sense of morally praising, blaming, rewarding, or punishing them, if they do not share at least some of the relevant values of those judging them. This is a normative condition that can be explained as the agent's intending to do an action in a certain way, as a morally good, bad, or indifferent act. The light switcher may intend to turn on the light as a morally indifferent act. The killer presumably intends to murder the victim as a morally wrong act.

If, however, the killer has values so different from those of the persons who judge the murder that the act is not intended to be something morally wrong, but instead something morally good or indifferent, and if there is no prospect of altering the killer's behavior or

values by moral censure or punishment, then, regardless of legal proceedings taken against the person for the safety of others, it may be inappropriate to regard the killer as morally responsible. A more realistic example concerns the incompatible attitudes of those persons who value the private possession of property and those who share all things in common. If members of two such opposite cultures meet and the sharers take and use a possessor's property, it is arguably unjustified to hold the sharers morally responsible for committing an act of theft. The fact that moral responsibility is seldom overridden by normative considerations testifies to prevailing agreement among human cultures at least about the most basic moral values. The normative element is nevertheless an important part of the complete philosophical analysis of the concept of moral responsibility.

LIMITS OF RESPONSIBILITY

If there are some things for which agents are morally responsible, there are still others for which they clearly are not responsible. Some existentialist philosophers maintain that each person is morally responsible for the state of the entire universe, including its past history and future.

The exact meaning of this extravagant thesis is obscure, but the claim seems to be that in accepting the fact that the universe exists, the individual participates in the fact of its existence in such a way as to comply with and constitute the universe as existent. The individual's acceptance is an intentional mental act, involving the person as agent in adopting a certain attitude toward the world. The consequence of the act is that the universe exists and would otherwise not exist for the individual who accepts the fact. If persons are morally responsible for the intended consequences of their acts, then an individual who accepts the existence of the universe becomes morally responsible for it.

The existentialist argument seems confused. Agents are morally responsible only for intended events for which they are causally responsible, provided that memory and normative conditions are also satisfied. Accepting the fact that the world exists does not make the agent causally responsible for its existence, and the agent certainly cannot be causally responsible and hence is not morally responsible for any part of the world's past history. Assuredly, no human agent correctly remembers having caused the

universe to exist. In the present analysis of moral responsibility, there is no sound basis for existential guilt, despair, and anxiety about the state of the world as the burden of one's personal responsibility. By the same token, no person can be morally responsible for what another does, except insofar as an agent acts as an instrument of another's will. This is not an exception to the analysis, but an application of the definition of moral responsibility by which a person is indirectly but still ultimately causally responsible for an event undertaken by another person acting as delegate.

Resumés

DEFINITION: Written summaries, or inventories, of job-seekers' qualifications and experiences

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Accurate and honest resumés are valuable tools for job applicants; not only can they influence applicants' current and future employment, they also reflect the ethics and integrity of the applicants.

Ethical principles define behavior as good, right, and proper. An ethical person uses these principles when making personal and professional decisions. Making ethical decisions leads to self-esteem and respect from others. However, many obstacles can intrude on ethical decision making. One obstacle is self-interest,

by which every decision a person makes is based on a risk-reward calculation: Is one willing to do the right thing even when it is not in one's self-interest to do so?

Life is full of choices and an important aspect of choice is intent—why one engages in a particular action. The answer is that one's actions matter. Individuals are morally—and often legally—responsible for the outcomes of their decisions. Responsible people are in charge of their own choices and can be held accountable. One area in which ethical issues may arise is in the writing of a resumé. A resumé is a concise summary of a person's work history, education, skills, and experience. Because of its value to the employment process, accuracy and honesty are important features of a resumé. Accurate, honest and ethical resúmes can influence their writers at three moments: When they are written, during the job applicants' interviews, and after the applicants take up their new employment.

People tend to compartmentalize ethics into occupational and private categories, and when it comes to resúmes they often underestimate the cost of lying. Many people think that ethically questionable behaviors are justified when they see other people doing them, when no one appears to be hurt, or when the misbehavior seems to be trivial. However, since ethical decisions generate and sustain trust and demonstrate respect for societal rules, any ethical violation can have serious consequences. Thus, regardless of qualifications, many employers want to be sure they are hiring applicants whom they can trust.

There are many examples of people who have lost their jobs after it is discovered that they had lied about their experiences or are found to have presented false credentials. Examples include people who have gotten their degrees from diploma mills or who claim to have earned college degrees when, in fact, they have not. Other examples include people who fail to report criminal convictions or lie about their past employment records to cover gaps in their employment history.

Ethical decision making plays an important role in the development and use of resúmes. Employers spend time and money checking the accuracy of resúmes. Inaccuracies can lead not only to a loss of trust but also to an applicant's loss of employment.

Retirement funds

DEFINITION: Savings that individuals invest in stock markets and other places in the expectation that their investments will steadily grow and provide them with secure income after they retire from working

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: When working people invest funds for their retirement, they understand the risks but also expect to be treated fairly and count on government agencies to regulate the ethical practices of the security firms in which they place their investments.

Until the Great Depression of the 1930's, American security firms regulated themselves, and the result was that influential investors received preferential treatment and had access to information not made available to the general public. However, after the collapse of the New York Stock Exchange in 1929, it became painfully clear to the public that the stock market was effectively rigged to favor certain investors over others. Those who had inside information about the impending collapse of stock values sold their shares before the crash occurred, while average investors lost their investments. Although investors lost much of their faith in the stock market, President Herbert Hoover was philosophically opposed to government regulation of security markets. Things changed, however, after Franklin D. Roosevelt's inauguration in March, 1933.

Roosevelt realized that the federal government needed to regulate the stock market in order to save capitalism by restoring public trust in the market. During his first two terms, he signed three important bills that imposed ethical values on the security industry and created a Securities and Exchange Commission (SEC) with the power to regulate the security industry and to punish violators with fines and jail terms. These laws were the Securities Act of 1933, the Securities Exchange Act of 1934, and the Investment Company Act of 1940. Among other things the new laws made fraudulent financial reports, insider trading, unequal treatment of investors, and deceptive selling techniques federal crimes. The SEC also created the National Association of Security Dealers (NASD) to regulate securities representatives.

RESPONSIBILITIES OF SECURITIES REPRESENTATIVES

Candidates for certification as securities representatives must pass a qualifying examination that tests their understanding of what a representative can and cannot do. About one-quarter of the examination deals with ethical issues. For example, when securities representatives advise investors, they must propose stocks, bonds, or mutual funds that are appropriate to the specific investors' needs. For investors who are opposed to risks or who are elderly, appropriate investments might be government bonds or conservative bond funds.

By contrast, significantly younger investors who are willing to accept higher risks in the hope of reaping high returns in the future might be directed toward such riskier investments as growth or international mutual funds, junk bonds, or stocks in unproven new companies. In all presentations to their clients, securities representatives must make appropriate recommendations and repeatedly remind investors that investments in stock markets are not guaranteed and that they might even lose their principal.

MANAGING RETIREMENT FUNDS

Investment companies and security companies must also behave in an ethical manner in managing retirement funds. Many investors choose to invest in mutual funds and not in individual stocks because they wish to spread out risks over the many different companies in which individual mutual funds invest their members' money. The federal Investment Com-

pany Act of 1940 requires that mutual funds establish the values of their shares right every day, immediately after the closing of stock markets. This regulation was designed to prevent insider trading and to make sure that all investors receive equal treatment.

Mutual fund managers must also adhere to the philosophies announced in their prospectuses. For example, a mutual fund that states that its intention is to invest 70 percent of its funds in blue-chip American companies and 30 percent in government guaranteed bonds cannot suddenly decide to invest its funds in foreign companies or in junk bonds. If managers of such funds do not respect their announced approaches, the SEC can bring criminal charges against them, and investors can sue such managers for losses caused by investments that contradict the announced goals and philosophies of a specific fund.

These ethical and legal protections are important because they give investors legal rights and remedies. A scandal that became public in 2003 illustrates the importance of such protection. Managers of several mutual funds, including the Putnam and Strong funds, made illegal trades after the 4:00 P.M. closing time of the New York Stock Exchange that gave them profits that were not shared by other investors. Not only were these managers and their investment companies forced to pay large fines to state and federal regulators, but individual investors in the funds also had the legal right to sue the mutual fund companies and their managers for real losses and punitive damages.

Some investors oppose investments of their retirement funds in industries that may conflict with their ethical beliefs. Many people, for example, do not want their money used to support the production and sale of alcoholic or tobacco products because of their opposition to tobacco and alcohol for personal or religious reasons. Many investment companies offer such mutual funds, which are often called "social choice" funds, that do not invest any funds in tobacco or alcohol companies. In this way, investors can be sure that their retirement funds are not being used to promote activities that are incompatible with their ethical beliefs.

Revelation

DEFINITION: Communication or disclosure of absolute truth to humans by a divine being

TYPE OF ETHICS: Beliefs and practices

SIGNIFICANCE: If instances of divine revelation have in fact occurred, they establish the existence of God and of an objective moral law. They do not, however, guarantee that God's law is known or knowable on Earth, because it may not be possible for the human mind to encompass or comprehend divine truth.

While the earliest reflections on the nature of ethical conduct were rooted in religion, the philosophical treatment of ethics has led many people to assume the autonomy of ethics. This is the idea that ethics is not in any way dependent on revelation. Thus, a wedge has been driven between moral philosophy and theological or revealed ethics. There are, however, interesting and persistent questions about a possible relationship between the two.

Since revelation means, at the highest level of generality, divine disclosure, questions about the relationship between revelation and ethics are part of a larger network of more general questions about the relationship between God and morality. Those questions that focus expressly on the significance of revelation for the moral life arise for any religious tradition that holds that God has revealed himself in some way that bears upon the human moral situation, but revelation may be understood in different ways.

THE MEANING OF REVELATION

First, revelation may take the form of general information about divine reality gleaned from the pattern of the natural world order created by God. Here, divine truth is disclosed indirectly through the effects of divine activity—especially the activity of creation. This is often called “general revelation.” Some philosophers, such as Thomas Aquinas, have argued that general revelation is an ample source of knowledge about the foundations, principles, and sanctions of ethics. This view is known as the natural law tradition in ethics.

Second, revelation may refer to an intersubjective encounter between God and humanity that is entirely lacking in the overt transmission of any truths. The propositional content of what may be called “personal revelation” is at most implicit in the divine-human encounter. The possibility of basing ethics on revelation depends on what is concretely implied by the character of one's religious experience. It would be difficult to justify the universalizability of moral principles derived in this fashion since religious experience is in principle a very private matter.

Third, revelation may be understood as the direct divine disclosure to humans of truths in propositional form. The great “revealed religions”—Judaism, Christianity, and Islam—hold that their respective scriptures are a deposit of divine revelation. Theologians have called this sense of divine revelation “special revelation” to distinguish it from general revelation. It is special revelation that is usually in view in discussions about the relationship between revelation and ethics.

ETHICS AND REVELATION

There are at least three views about the general relationship between revelation and ethics. First is the view that a system of ethics must be based on (special) revelation. This claim is defended by a developed account of the implications of divine sovereignty and of human sinfulness and by the attempt to refute all secular systems of ethics. The sovereignty of God implies that the content of morality is determined by the will of God. Moreover, human depravity involves rebellion against the will of God, resulting in a failure even to know the will of God. Finally, all secular theories of ethics provide empirical evidence of the corruption of human thought about ethics.

A second approach affirms the complete, or nearly complete, autonomy of ethics. Goodness cannot be determined by the will of God, for it can be meaningfully asked: Is the will of God itself good? Those who define goodness in terms of God's will are no better off than those who define goodness in terms of some natural property such as pleasure. To define goodness, which is an irreducible property, in terms of something else is always a mistake.

The suggestion that ethics is autonomous must be qualified, for, as British philosopher G. E. Moore observed, one's metaphysics will have a bearing upon the practical question "What ought I to do?" "If, for example, Metaphysics could tell us not only that we are immortal, but also, in any degree, what effects our actions in this life will have upon our condition in a future one, such information will have an undoubted bearing upon the question what we ought to do. The Christian doctrines of heaven and hell are in this way highly relevant to practical Ethics." Since revelation might provide the sort of metaphysics that Moore refers to here, one cannot strictly rule out the bearing of revelation upon ethics, even if goodness is a non-natural and unanalyzable property.

In any case, there is an important difference between that which makes an action right or wrong and the way in which one is to know that the action is right or wrong. One is an ontological problem; the other is an epistemological question. Even if the moral quality of an action is not ontologically determined by the will of God, God, if he is omniscient and wills the goodness of humans, may elect to reveal the nature and content of that morality which does not strictly depend upon his will.

According to the third view, ethics enjoys a limited range of autonomy from special revelation, though ethics is supplemented or completed by special revelation. Natural law theories are typical examples of this approach. To be sure, they envision a link between revelation and all correct ethical thinking, but much of the content of a true ethical system can be known without the aid of special revelation, since general revelation is also an important source of moral knowledge.

THREE ADDITIONAL QUESTIONS

Does moral experience establish a need for revelation? Background knowledge about the existence and nature of God, together with an awareness that

humans are faced with a complex set of moral difficulties, may be thought to justify the expectation of some further revelation from God that would address the moral needs and concerns of the human community.

This raises a second question: Is God a member of the moral community? If God exists, then it is quite possible that God himself is a member of the moral community, and that human persons have moral obligations toward God as well as toward other humans. It may even be that God has moral responsibilities toward humans about which it would be useful for humans to know. Suppose, for example, that God should make a promise to act in a certain way on behalf of humans and thus obligate himself to them. How should humans know of his promise apart from revelation, and what would be the force of a promise of which humans were not aware? Suppose, further, that the promise takes effect only if humans act in a particular way. In that case, the conditions must be revealed as well.

Finally, it needs to be asked, What effect might revelation have upon moral theory? If it turns out that there is a good argument for the need for revelation given the quality of human moral experience, then people can expect that any revelation answering this need will deeply inform, perhaps even overturn, much of human moral theory. The supposition of a revelation that addresses human moral experience implies that morality may be deeply affected by revelation.

H. Richard Niebuhr has noted four changes to the moral law caused by divine revelation: the prescriptive force of the moral law is discovered to be absolute in that humans are revealed to be beholden to the sovereign of the universe; the application of the moral law is discovered to be wider ranging than any secular ethics and timelessly in force; the moral law is discovered to be unexceptionable, providing an external corrective to any corruptible human system of morality; and the eventual transformation of human persons into freely loving agents is discovered to be a real possibility.

Revenge

DEFINITION: Response in kind for a wrong done to oneself; punishment inflicted in retaliation for an offense

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Many moral codes, including Jewish and Christian ethics, consider revenge to be wrong. Social philosophers have questioned whether systems of criminal justice are genuinely interested in rehabilitation and deterrence, or whether they are actually state-sanctioned systems of revenge in disguise.

Pietro Marongiu and Graeme Newman proclaim in *Vengeance* (1987) that “Vengeance has the power of an instinct. The ‘lust for vengeance,’ the ‘thirst for revenge’ are so powerful that they rival all other hu-

man needs.” Revenge is a form of the universal motive of aggression in which reciprocity is sought to avenge injuries to oneself or to restore a sense of equality.

Revenge is often considered to be neurotic, aberrant behavior. In the words of the psychoanalyst Karen Horney, “Every vindictiveness damages the core of the whole being,” implying resentment, spite, malice, or righteousness. Revenge is the basest of human motives. At the other end of the continuum stands forgiveness, the act of pardoning another person for any unpleasant or hostile behavior committed against oneself. In contrast to revenge, forgiveness is good and represents the noblest manifestation of human nature.

THE FUNCTION OF REVENGE

The dichotomy between revenge and forgiveness obscures certain facts about the place of revenge in the human psyche, according to Susan Jacoby (*Wild Justice*, 1983). If revenge is a universal human need, then to forgive requires conscious suppression of the need to make others suffer as one has suffered. Humanity’s long history is characterized by injury being inflicted on and sustained by others. That humanity seems to prefer revenge to forgiveness gives revenge a certain importance.

In fact, both Jacoby and Marongiu and Newman argue that revenge is not abnormal or aberrant behavior but a legitimate human need. Underlying this legitimacy is, as Jacoby says, “the profound sense of moral equilibrium impelling us to demand that people pay for the harm they have done to others.” Revenge serves both moral and utilitarian roles. It is an example to society and a means of dealing with an offender. By making an example of an offender through revenge, society demonstrates to its members that certain behaviors are serious violations of the social order, are morally repugnant, and will produce unpleasant consequences for the perpetrator. Thus, revenge has deterrent, exemplary (it shows the public that society’s well-being is being addressed), and moral aspects. In 1976, the U.S. Supreme Court legitimized the death penalty by proclaiming that revenge was an acceptable legal objective. That capital punishment was appropriate under certain circumstances reflected society’s belief that some crimes are so terrible that the only adequate penalty for them is death.

THE DOCTRINES OF POLLUTION AND PROPORTIONALITY

The use of the term “revenge” may produce a disquieting sense of unease and discomfort. “Revenge” seems to be pejorative. If the words “justice,” “restitution,” “punishment,” or “retribution” are substituted for revenge, however, the pejorative connotation disappears. Looked at in this way, the issue is not whether revenge is aberrant or evil behavior, but the establishment of a just and proper relationship between the nature of the act and the severity of the revenge. Finding such a relationship has been an ongoing matter of concern in literature, religion, and law since antiquity.

The two key concepts in striking this appropriate balance are the doctrines of pollution and proportionality. In ancient times, revenge was carried out as an individual vendetta or at the tribal level. The religious and political doctrine of pollution that developed among the ancient Greeks and Hebrews viewed certain acts, such as murder, as offenses against the whole society. This doctrine was an important point of transition between tribalism and written law. By means of this doctrine, the primacy of the state and of its gods and laws over the individual and tribe in enforcing punishment for acts of pollution was established.

The doctrine of proportionality states that the revenge extracted for an act of pollution shall be neither excessive nor trivial but shall match or be proportional to the seriousness of the act. This statement establishes a distinction between constructive revenge and destructive revenge. Limits are placed on the imposition of extreme forms of legalized revenge for lesser transgressions by forbidding penalties greater than the original crime and making the punishment fit the crime. “If men strive, and hurt a woman with child, so that her fruit depart from her . . . and he shall pay as the judges determine . . . thou shalt give life for life, eye for eye, tooth for tooth, hand for hand, foot for foot, burning for burning, wound for wound, stripe for stripe” (Exodus 21:22-25).

REVENGE AS A QUANDARY AND A DILEMMA

The doctrines of pollution and proportionality establish that certain acts shall be met by revenge meted out by the state and that this revenge shall be proportional to the offending act. Pollution is relatively straightforward in that there will be a relatively high

level of agreement among people regarding what acts pollute. Proportionality is often very difficult to determine, however, as is indicated by the wide variation in prison sentences handed out for the same crime in different states and the controversy surrounding the issue of capital punishment. Thus, the pollution aspect can be viewed as a quandary (a question for which no single undisputed answer or consensus can be attained), but the proportionality aspect is often a dilemma (in which more than one ethical position is possible). Since revenge seems to be inherent in the human condition, these issues will have to be faced continually.

Reverse racism

DEFINITION: Racial prejudice directed by a minority group that lacks institutional power toward the racial or ethnic majority; or, pejorative term for institutionally sanctioned racial preference systems, such as affirmative action, designed to counteract the effects of racism

TYPE OF ETHICS: Race and ethnicity

SIGNIFICANCE: Reverse racism is often used as a term of disapprobation for a politically controversial set of practices, including affirmative action and consideration of race in college admissions. Debate continues over whether such practices are just or unjust.

Reverse racism is a term for government-supported programs designed to remedy past injustices caused by racial discrimination. It is a term employed only by people who disagree with such programs. Remedies such as hiring quotas and affirmative action favor one race at the expense of another to make up for privileges that the second race has traditionally enjoyed at the expense of the first. In the simplest terms, such policies have been questioned on the basis of whether two wrongs can make a right. The term “reverse racism” has also been used to attack racial consciousness-raising methods among minority groups that use the denigration of the majority racial group as a means of attaining intraracial solidarity. These methods are practiced by minority political and religious figures such as the Nation of Islam’s Louis Farrakhan and academics such as Leonard Jeffries, head of the African American Studies Department of City College of New York, who has told his classes that the lack of melanin in the skin of whites has rendered them inferior to blacks.

Revolution

DEFINITION: Overthrow of an existing ruler or political system and replacement with a new ruler or political system, accomplished by or in accordance with the will of the governed

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: The term “revolution” carries a strong connotation of a popular or majority movement. The sudden and violent overthrow of a government by a minority, or of one ruler by another, is usually referred to as a *coup d’état*. Unlike a coup, revolutions usually involve the transformation of

the entire social order and of the society’s central values.

During the late twentieth and early twenty-first centuries, the term “revolution” was invoked so frequently as to lose its currency. The word has come to be used to describe dramatic changes in virtually any area of human activity. Thus, one may read about a “revolution” in fashion, a “sexual revolution,” a “women’s revolution,” or a “revolution” in the arts. While revolution in its traditional sense may involve change in any or all of these activities, it is a term whose classical application is properly limited to a few events of enormous political and social magnitude. It is not to be confused with a rebellion, a revolt, or a *coup d’état*, in which only political power is transferred from one group to another. While it includes a shift in political power, its transforming effects are not limited to politics. They involve rapid and enduring social, cultural, and economic change as well as political change.

In its original sense, the word “revolution” had nothing to do with politics or with violent or rapid social and political change. Rather, the word was part of the scientific vocabulary and meant to return to a proper, prescribed course. Therefore, for example, in 1543, a posthumously published book by the Polish astronomer Nicholas Copernicus was titled *The Revolutions of the Celestial Spheres*. Copernicus was using the word “revolution” in its accepted sense—something proceeding according to a proper, prescribed course. The planets, he contended, proceeded according to such a course around the sun. Revolution, then, meant literally revolving. In retrospect, Copernicus’s book was revolutionary in a more modern sense—it transformed the human view of the world by postulating a theory of a heliocentric universe in place of the geocentric universe that was dominant until that time.

The association of the term “revolution” with the political events of the seventeenth century began to transform the term’s meaning. Even then, the word continued to retain its earlier meaning of persisting in a prescribed course or returning to a designated course from which there had been a departure. The events of 1688-1689 in England provide an example of this usage. They were called the Glorious, or Bloodless, Revolution, by which was meant that, after the improper actions of King Charles II and

James II, England returned to its proper, designated course with the replacement of King James II by William and Mary.

In this sense, revolution was political but conservative; that is, the revolutionaries were restoring things, returning them to a proper course. The American Revolution was also sometimes justified in this way. Americans thought that they were deprived first of the “rights of Englishmen”—then of the “rights of man.” They were restoring something that they claimed they already had but that King George III had allegedly taken from them. Insofar as war for American independence was not accompanied by a radical social transformation, some historians argue that it was not a revolution in the classic sense.

THE FRENCH REVOLUTION

The French Revolution, which began in 1789, became the model for revolution, not only for historians but also for later revolutionaries of the nineteenth and twentieth centuries. They would try to emulate the French Revolution. Even the Chinese, who began

their revolution in the second decade of the twentieth century, thought first in terms of the French example, and the French Revolution was only later displaced by the model of the Russian, or Bolshevik, Revolution of 1917.

The French Revolution, even in its early stages, was characterized by Edmund Burke, its harsh critic, as a social revolution, “a revolution in sentiments, manners and moral opinions.” It challenged and overturned the values of society. What was most appalling to Burke was that the French Revolution rejected the past. The French Revolutionary generation rather quickly adopted the phrase “old régime” to designate the society that it was rejecting. The revolutionaries were sweeping away the old order of privilege and inequality and were replacing it with something new and, presumably, better. The best example of this repudiation of the past was the attempted institution, however unsuccessful, of a new calendar. The French Revolutionaries established the year 1 to be dated from the beginning of the Republic in 1792. History was starting over. Religion and the Church

Bolshevik soldiers during the Russian Revolution. (Library of Congress)

were repudiated. The social order of the old society was abolished. Even established fashion changed, as with the *sans culottes* (those who wore no britches), who repudiated the dress that was associated with the corrupt aristocracy.

REPUDIATING THE PAST

The extent to which the past is repudiated may differ with different revolutions, but it is not only the political order that is transformed. Along with their repudiation of the past, revolutionaries need a vision of a future, however vague. They must be convinced that they are building a better world. The vision of the future may be drawn from the writings of a generation of social critics, as the French Revolutionaries drew upon the *philosophes* of the eighteenth century, or from a more systematic theory of society, such as that of Karl Marx and Vladimir Lenin, whose work influenced the Bolshevik revolutionaries in Russia in 1917. Although they are influenced by theories developed in the past, revolutions are future oriented, insofar as they are ordinarily conceived as inaugurating a period of enduring progress, equality, and justice.

In this connection, revolution is related to the humanism of the Western tradition, since revolutionaries assume that humankind can improve the human condition. This optimism and fervor are evident in the sense of passion and zeal that is displayed by revolutionaries and even those nonparticipant contemporaries who are transported by the intensity of their times. So, for example, William Wordsworth could write of 1789, "Bliss was it in that dawn to be alive/ But to be young was very heaven."

Revolutionaries have often been aware of the importance of their own times and instilled with a sense of the righteousness of their actions. Accordingly, their deeds are often accompanied by eloquent justifications, such as the American Declaration of Independence or the French Declaration of the Rights of Man and the Citizen.

Revolution has been a modern phenomenon, insofar as it requires an organized state against which to rebel. While it was also a Western phenomenon, it has in the twentieth century been transported to other areas of the world, such as China. Given their dimensions and their transforming effects, revolutions are relatively rare. Many historians would include the English Revolution of the 1640's along with the American and French Revolutions in the following

Time Line of Major World Revolutions

1688	England
1776	United States
1789	France
1804	Haiti
1848	Europe
1910	Mexico
1917	Russia
1949	China
1959	Cuba
1979	Iran

century among the few pre-twentieth century revolutions. In the twentieth century, after the Russian Revolution, the upheavals in China and Cuba qualify as revolutions given the magnitude of the social changes that they generated. The Iranian Revolution appears to be unique in that it was not future oriented. It rejected the immediate past, which had been influenced and supposedly corrupted by the West, in order to return to a more purified condition that ostensibly obtained before Western influence was exerted.

Right and wrong

DEFINITION: Right: in accordance with the ethical values of justice and goodness—moral; wrong: violating or transgressing those values—immoral

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Perhaps the oldest and most central of all ethical questions is how best to determine the difference between right and wrong.

Since the days of the ancient Greek philosophers Socrates, Plato, and Aristotle, thinkers have searched for a way to distinguish between right and wrong. One twentieth century thinker who adopted and further developed the Aristotelian position was William D. Ross. He made the case for intuitionism, arguing that the moral convictions of well-educated, reasonable, and thoughtful people were the data of ethics, just as sense perceptions are the data of the sciences. He rejected both ethical subjectivism and utilitarianism, arguing instead that duty was the key to ethics. For Ross, right and good had distinct objective qualities. The former had to do with acts, while the latter had to do with motives.

Another modern philosopher who accepted Ross's argument was James Rachels, who added that morality—the attempt to discern right from wrong, good from bad—must be guided by reason. One should do whatever one has the best reasons for doing while keeping in mind the worth and interests of all those people who will be affected by one's actions. When considering a course of action, the conscientious moral individual will analyze the possible choices, measuring the implications of certain choices. After

such deliberation, the moral individual will take the best possible course of action. Not all thinkers, however, agree with the above appeal to reason.

THE PROBLEM OF ETHICAL SUBJECTIVISM

Scholars such as Ross and Rachels refused to accept subjectivism, which holds that everything is relative. To a subjectivist, nothing is right or wrong. Rather, moral judgments about good and bad and right and wrong are simply personal opinions based on an individual's "feelings" and nothing more. Even "truth" to an individual is truth according to "feelings." Thus, subjectivists reject the role of reason in making moral judgments. Furthermore, cultural subjectivism or relativism addresses a similar point, arguing that morals and values vary from culture to culture. Thus, there is no one standard of right and wrong. Regarding both ethical and cultural subjectivism, Ross and Rachels responded that reason and reasons are central, for truths in morals are truths of reason; that is, moral judgments that are correct must be backed by better reasons than an alternative judgment. Subjectivists are right that feelings and opinions are important to an individual, but to consider only those factors in making judgments is, in effect, to opt out of moral thinking, for moral thinking must weigh the reasons for and consequences of potential actions.

RIGHT, WRONG, AND RELIGION

In the United States, most laypersons would list ministers, priests, and rabbis if they were asked to name moral "experts." Unfortunately, such laypersons regard morality and religion as inseparable when, in fact, religious leaders appear to be no better and no worse judges than are people in other "walks" of life. Nevertheless, many people embrace what some theologians call the divine command theory, which holds that what is morally right is commanded by God and what is wrong is condemned and forbidden by God. A positive result of such a view is that it immediately solves the problem of subjectivism.

Atheists and agnostics reject the divine command argument. Even the noted Christian Thomas Aquinas rejected it. One reason why philosophers object to the theory is that it poses an unsolvable dilemma, for the following question must be asked: Is conduct right because God commands it or does God command it because it is right? To answer the question, one might take the example of truthfulness. The He-

brew God commands it in the book of Exodus; therefore, people should be truthful because God orders them to be so. It is God's command that makes telling the truth necessary, and without such a command, truth would be neither right nor wrong, neither good nor bad. This view makes God's commands seem arbitrary, meaning that God could have given another command (to lie, for example) that would then have been right. Such logic reduces the goodness of God to unintelligible nonsense, for believers think that in addition to being all-knowing and all-powerful, God is also all-good.

A second analysis of the divine command theory takes another path. God commands truthfulness, other virtues, and right action simply because they are right. Thus, he commands people not to lie, not to kill, not to steal, and so on because such actions are simply wrong, while their opposites are simply right. This view avoids the dilemma mentioned in the above paragraph. The goodness of God is maintained. Upon reflection, however, one sees that this second view abandons the theological definitions of right and wrong, for it is saying that there are standards of right conduct and right thinking that are independent of God and that rightness existed prior to God's affirmation of it.

Because of the above contradictions, most theologians do not stress the divine command theory. Instead, they embrace the theory of natural law, which holds that reason determines moral judgments of right and wrong. Were the natural law theory to end there, modern philosophers such as Ross and Rachels could likely accept the position. Theologians explain, however, that God is still involved, for he is a perfectly rational entity. He created a rational order in the universe and gave humans the power to be rational and to use powers of reason. Thus, in this view, moral questions of right and wrong still depend on God.

The natural law theory seems to hold up well in minor matters but appears to falter whenever moral dilemmas emerge. Since the 1970's, for example, an ongoing struggle has been waged on the issue of abortion. Good, sincere, reasoning people have disagreed on the subject. Many religious people are on opposite sides of the issue. Whither the natural law theory? It does not provide the answer. A further criticism includes the fact that if God gave humans the power to reason, he obviously did not give all people

equal reasoning skills. Simple observation demonstrates that not all people are equal when it comes to intelligence, skills, and so on.

PSYCHOLOGICAL AND ETHICAL EGOISM

Any "system" of morality discerns rights and wrongs and also asks people to behave unselfishly. Before one acts, one must consider the consequences. Will anyone be hurt by the course of action? Unless one can answer no, a proposed action should be forestalled. Psychological egoism attacks the just-stated point. Once widely held by philosophers, psychologists, and others, the theory of human nature holds that, indeed, people will act selfishly as they pursue their own self-interest. Furthermore, the theory holds that it is unreasonable to expect people to act otherwise, for pure altruism has never existed except in myth.

Psychological egoism leads to a reinterpretation of motives for being right and good. For example, if a wealthy man or woman donates much time and money to charitable work that benefits hundreds or thousands of people, that person is really only showing his or her superiority, for he or she is publicly demonstrating how successful he or she is. The unspoken statement is this: "Look at me. Not only can I

Egoism of Abraham Lincoln

According to legend, even Abraham Lincoln was a psychological egoist. Once, while riding a stagecoach, he remarked to a fellow passenger that he thought most men were motivated by selfishness. Just as the other passenger was collecting his thoughts to rebut Lincoln's statement, the coach passed over a bridge and the two men heard a sow below the bridge making horrible noises. Her piglets were mired in water and mud and were threatened with drowning. Lincoln called out to the driver to stop, then got out of the coach, ran down below the bridge, and pulled the young pigs to safety on a dry bank. As Lincoln climbed back into the coach, the other passenger asked him what had happened to the selfishness. Abe supposedly replied that had he not saved the pigs, he would have worried about it for days, so he had actually acted out of self-interest.

take adequate care of myself, but I have much left over and will share with those who are failures and who are therefore inferior to me.”

Perhaps another person, John Doe, also gives money to charity. His motive is likely selfish, for his religion teaches him that he will be rewarded in Heaven, and John is trying to buy his way in. Or, again, a hero saves several families from a burning apartment complex. Had it not been for her valor, all would have perished in a most horrible way. While the mayor gives the hero the key to the city, a psychological egoist points out that the hero acted not out of concern for the innocent families but to gain public acclaim.

It is actually the unselfish person who derives great satisfaction from helping others, whereas the truly selfish person does not. If one wishes for others to be happy (or fed, or given health care, or given a job, or saved from a burning building) and acts on that thought, then one is indeed unselfish and altruistic. Psychological egoism is only the act of reinterpreting “right” motives to make them seem “wrong,” while straining the English language and the meaning of its words.

A close cousin of psychological egoism, ethical egoism says that there is only one principle of conduct: self-interest. All questions of morality, of right and wrong, of good and bad must be subordinate to that principle. Occasionally, however, it might be that one cooperates with others, keeps promises, completes duties, and so on because one’s self-interest might be compatible with the self-interest of others. Furthermore, ethical egoism also sees a boundary between self-interest and self-indulgence. Indulgence might lead to a life of drug use, drinking, gambling, and so on; ethical egoists would frown on all such lifestyles, arguing that such vices are definitely not in a person’s true self-interest.

Ayn Rand was one thinker who embraced a form of ethical egoism. She argued that striving for one’s own self-interest is the only way one can make one’s life valuable. True altruism, she argued, would lead one to see that one’s own life was nothing but a “thing” to be sacrificed for the sake of doing good deeds for others. Altruism, she concluded, does not “teach” one how to live one’s life, only how to sacrifice it. Although Rand was not a trained philosopher, her ideas, which were most popular during the 1960’s and 1970’s, still have some force.

Among the problems of Rand’s view is the problem of extremism. In her writings, she pushed ideas to their absolute extremes. To her, altruism implied that one’s life had no value at all because one had to sacrifice everything upon any demand made by others; for example, when considering the starving poor, one would give all one’s food and all one’s money to those unfortunates and would then, of course, become one of them. Altruism does not necessarily push one to that extreme. One can help others within reason. Additionally, ethical egoism cannot be correct, for it cannot provide true solutions to the many different people whose self-interests are in conflict. In real conflicts, all cannot “win” unless moral rules are adopted, which Rand condemned.

UTILITARIANISM AND THE SOCIAL CONTRACT

Utilitarians in the mold of David Hume, Jeremy Bentham, and John Stuart Mill hold that one should follow the course that brings the greatest good to the greatest number; in other words, one should follow a course that will create happiness for the greatest number. The problem? Utilitarianism can soon lead to hedonism, a philosophy that accepts no moral rules whatsoever. Whatever feels good and makes one happy is all that counts.

With extreme utilitarianism, all moral rights and rules are tossed aside. Consider, for example, the case of Mr. X, who lives in a small town where everyone knows everyone else. All other adults in town hate Mr. X because he is always dirty, never takes a bath, and shows up for all occasions in tattered clothes; worse, there is always alcohol on his breath. What an awful example he is to the youngsters in the community, especially since the children love him, for he always has time to stop and tell them stories about elves, fairies, and leprechauns. One morning the police find Mr. X shot to death. A strict, no-exceptions utilitarian would conclude that the murder of X was right, for it brought happiness to the adults of the community and it saved the children from the influence of a degenerate. In this way, extreme utilitarianism can be used to condone murder.

Those who believe that they can find rules for right-wrong, good-bad in the social contract may be close to the mark in developing a moral ethical society. They hold that people are naturally social and want to live among their kind for mutual benefits such as group protection from danger, companion-

ship, a more interesting social and cultural life, and so on. When people enter the social contract, however, they agree that certain moral rules are necessary if the group is to survive and flourish. Personal violence and murder are not permitted, nor are untruthfulness, theft, child abuse, adultery, and so on. Those vices are not permitted because they would tear the group-society asunder.

IMMANUEL KANT

Aspects of Kant's philosophy can, in a manner of speaking, be used to buttress the argument for the social contract theory of right and wrong. His categorical imperatives remain potent in this modern age. His imperatives are not relative and are unchanging over time. He held that people should say and do things that could be accepted as "universal" laws that could be followed by all people, everywhere. Thus, is it right or good to steal the goods of others? No, for society would revert to violent chaos if all stole from all. Can one be a habitually violent person, perhaps even a murderer? No, for if everyone behaved in that way, the war of one against all and all against all would commence as society collapsed. One should not lie because that would be an announcement that universal lying was permissible. Yet such behavior would be self-defeating, for if all people lied, no one would ever believe anyone again, including the first liar who started it all. Modern philosophers will not press Kant's views to the extreme, however, for they hold that exceptional circumstances may, if only rarely, mitigate any of his imperatives.

CONCLUSIONS

There are many approaches to finding an answer to the question of moral right-wrong, good-bad, and several are complementary. Modern philosophers such as Ross and Rachels stress that ethics is a product of reason, not merely of feelings or opinions. Certainly, they are correct. Many voices call for less selfishness, holding that one must also think of others and their welfare if they will be affected by an action. Concern for others, then, is desired. Certainly, this, too, is correct. The utilitarian's belief in the greatest good for the greatest number can also be a guide, but one with limits—limits that must include concern for duty and justice. Equally, the social contract's view of moral rules for civilized living, rules that can hold a society together, are also valid. Finally, all of Kant's

categorical imperatives (with room for exceptions) could be interwoven with the ideas of reason, good, and the social contract to add more strength to the doctrine of right and wrong. Rejected then would be relativism of any kind, egoism in any form, and reliance on God, for God's true commands are unknowable.

Right to die

DEFINITION: Just or legitimate claim to be allowed to die rather than submit to necessary medical treatment

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Claims that terminally ill persons have a right to die are founded upon the notion of human dignity. Proponents claim that forcing someone to stay alive and to continue suffering against their will violates their dignity, whereas allowing them to die restores or preserves it. Opponents may assert that suicide, even passive suicide, is an absolute moral wrong, or they may point out that extremely ill people are often not in their right minds and may not be competent to make such a difficult and irrevocable decision.

“Right to Die” was the title of a debate in the journal *Forum* on legalizing euthanasia. Later, the term was used to refer solely to voluntary euthanasia. Viewed narrowly, the right to die is merely the application of autonomy-based legal principles of self-determina-

tion and informed consent developed in the nineteenth century: If treatment cannot be given without consent, even for the individual’s own good, then the individual must have a right to refuse treatment. During the 1970’s and 1980’s, the right to die was used in this sense, as a synonym for voluntary passive euthanasia.

HISTORY

After World War II, several factors led to the recognition of the right to die. Medical advances and social prosperity reduced sudden deaths, resulting in a growing population of older people, greater incidence of senility, and greater incidence of death from degenerative diseases. Meanwhile, health care costs soared and smaller, more dispersed families led to increased institutionalization of older people. By means of respirators and other forms of technology, life could be continued indefinitely despite failing organs. Although the number of patients in “a limbo between life and death” had increased, these issues remained private as physicians discontinued treatment or withheld resuscitation for some hopelessly ill patients. With the advent of transplants, however, particularly heart transplants, the established definition of death became inadequate. Public debate began with a Harvard committee’s 1968 recommendation that brain death be included in the “definition” of death. Meanwhile, civil and human rights movements emphasizing self-determination, bodily integrity, and individual empowerment were reflected in a movement away from “mercy killing” to a focus on voluntary euthanasia.

Then, in 1975, the case of Karen Ann Quinlan galvanized the public consciousness in the battle for end-of-life decision-making control. The family sued to have Karen, who was in a persistent vegetative state (a coma with minimal brain function and no anticipated recovery of consciousness), removed from a respirator. The New Jersey Supreme Court held in 1976 that under the Constitution, acceptance or refusal of any treatment was to be made by the patient, or in the case of incompetency, by her guardians in accordance with her expressed desire. The Quinlan case also suggested that “ethics committees” could assist families and physicians in medical decision making. Such committees, staffed by physicians, ethicists, and lawyers, later became common.

Afterward, courts consistently found a “right” to

die in the common law or federal or state constitutions. In 1990, the U.S. Supreme Court confirmed a federal constitutional “liberty” basis for the right to refuse life-sustaining treatment, including possibly artificial nutrition and hydration.

ETHICAL ISSUES

Society has long held legal and moral prohibitions against the taking of human life. Early discussions centered on whether allowing a human being to die when that death could be prevented or forestalled was tantamount to killing. In 1957, Pope Pius XII distinguished between permissible forgoing of treatment in “hopeless cases” and active euthanasia, which was killing or suicide, but who was to determine which was which? The pope intimated that the individual’s duty to accept, and society’s duty to provide, medical treatment extended to ordinary treatment but not to extraordinary (or “heroic”) measures. Although popular during the 1970’s, these categories were later dismissed as unworkable. Other attempts to distinguish killing from permitting “natural death,” distinguishing between withholding and withdrawing treatment and between acts and omissions, were also rejected as morally indefensible and tending to discourage the initiation of treatment. Committing suicide cannot be distinguished from refusing treatment on the basis of an action versus nonaction distinction. Thus, the fundamental question is whether an individual should ever be allowed to forgo life-sustaining treatment.

The right to die is often justified along utilitarian grounds and opposed on the basis of deontological, beneficence-based principles. Some utilitarians oppose any euthanasia, however, believing that the harms from potential abuse and from accepting incursions into the sanctity of life outweigh the benefits. Conversely, some deontologists support the right to die by defining “benefit” to encompass not only prolonged life but also freedom from suffering, or the protection of individuals’ liberty interests. Some suggest that autonomy cannot be overridden, others that decisions in extremis are not autonomous.

OPPONENTS OF EUTHANASIA

Opponents of euthanasia often argue the “slippery slope”—that allowing some to die will lead to further “justified” endings of lives. Some cite various eugenics movements as evidence for this view. Pro-

ponents counter that all moral choices involve drawing lines with a potential for abuse. Another objection raised is that the slippery slope entails accepting a recognized evil, disregarding the autonomy, dignity, and suffering of the dying patient in favor of possible future evils.

Some argue that human life is inviolable and that acceptance of a decision to forgo any amount of life necessarily requires a societal recognition that some lives are not worth living. Others counter that this inviolability is negated by causes throughout history that have been deemed worthy of self-sacrifice. Some fear that passive euthanasia will insidiously change the treatment of older people and dying; individuals may be subtly coerced into dying because they perceive themselves as burdens to their families, or because they see others who are younger, healthier, or even in comparable positions refusing treatment.

Passive euthanasia for the terminally ill enjoys overwhelming societal and judicial support, though popularity in the polls does not foreclose the need to address the ethical concerns surrounding the issue. The public and the media characterize the issue as one of not unduly “prolonging life” or of allowing individuals to die “naturally” and “with dignity”; such characterizations beg the question of what is a dignified and natural death in the context of advancing medical technology.

Even if passive euthanasia is acceptable, a number of issues remain unresolved: Can the right be invoked on behalf of incompetent patients? For formerly competent individuals, treatment decisions can be made on the basis of previously expressed wishes. For the never competent (including children), recognizing an equal right to refuse treatment produces thornier questions of how to carry out that right without committing involuntary euthanasia.

Is a slow, painful, and lingering death or an indefinite existence under sedation dignified? Can artificially administered nutrition and hydration be withheld to hasten the end? Are feeding tubes or intravenous drips another form of medical treatment? Is it dignified to allow individuals to starve to death? Does the right to die include the right to assistance in suicide? Finally, should the right to die be extended to individuals suffering from painful chronic or degenerative illnesses?

Right to life

DEFINITION: Just or legitimate claim of an unborn child to be carried to term and allowed to live, rather than being aborted

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Another name for the pro-life movement, the right-to-life movement argues that abortion impermissibly violates the inalienable right of a fetus to be born. The term sometimes, but not always, implies an embrace of a consistent ethic opposed to killing under all circumstances, including abortion, capital punishment, warfare, and even the killing of animals for food.

Ethical conflict over abortion has faced humanity throughout history. On one hand, sociological prob-

lems, maternal health, woman's rights, and the fear of overpopulation have led many people to espouse abortion. On the other hand, religious and biological issues have led others to favor antiabortion (right-to-life) concepts. Finding sensible, ethical solutions to the problem of abortion is essential to society. Appropriate solutions must satisfy mothers, prevent the murder of humans still in the uterus, and avoid exploitation of individual population sectors while permitting abortions that are deemed acceptable.

METHODOLOGY AND CONCEPTS

Many nonabortive birth control methods are widely used. These include abstinence, coitus interruptus (male withdrawal), rhythm (intercourse during safe portions of the menses), pessaries (for example, condoms), birth control pills, and surgical intervention by tubal ligation or vasectomy. Despite these methods, many unplanned pregnancies present the moral dilemma of whether to abort.

Those favoring abortion argue that it is fitting during the time period when a fetus is not a person, though precisely when humanity occurs is uncertain. Many people argue that any abortion is correct when carrying a fetus to term will cause a mother death, severe psychological damage, or impinged human rights. Another point of view is that when a fetus is found to be severely physically or mentally damaged, abortion is merited. Still other abortion advocates note that abortion stops overpopulation.

The antiabortion viewpoint—right to life—also varies greatly. Some advocates preach that sexual abstinence is the only suitable birth control method and that conception always engenders the right to life. Others believe that once egg and sperm join, a human has been produced, and that the abortion of unborn people—they claim that tens of millions of such operations have been carried out—exceeds the worst planned race or religious genocide ever carried out. At the other end of the right-to-life group spectrum are those who espouse factoring into the decision the age—yet to be determined—at which a fetus becomes a person, potential problems for the mother, and societal aspects.

HISTORY

Many people believe that abortion is a product of modern medicine and that the debate—nowadays very antagonistic—regarding whether to abort and

why or when to do so is a modern phenomenon. This belief is the result of clashes between pro-choice and pro-life factions who espouse appropriate abortion and no abortion, respectively. In fact, the Greek, Roman, and Jewish philosophers of antiquity codified abortion and its use. For example, Plato and Aristotle favored abortion when it was for the good of society, and Aristotle defined human life as present forty or ninety days after conception for males and females, respectively. Neither philosopher, however, would have set those times as upper limits for abortion.

With the development of Christianity, strong anti-abortion sentiment arose (for example, Roman emperor Constantine outlawed abortion). As the power of Christianity grew, so did sanctions against abortion. Even among theologians, however, there were—and continue to be—various degrees of condemnation. Some declared that any abortion was murder, others saw it as murder beginning forty days after conception (a holdover from Aristotle?), and some believed that abortion was acceptable to save a mother's life.

In more modern times, English common law stated that abortion was legal until mothers felt movement in the womb—"quickening"—and this view persisted well into the eighteenth century throughout the British Empire and the nations that arose from it. Hence, in the colonial United States, quickening was viewed as the time when abortion became illegal. On this basis, despite the unchanged view of Christian ministers and priests, abortion became a common mode of birth control. The practice, which was so widespread that abortionists often advertised their services in newspapers, led to antiabortion sentiment. First, the American Medical Association (c. 1850) condemned it. Soon, feminist movements joined in, denouncing abortion as a tool of male domination.

This segment of the abortion debate was relatively mild and died out by the twentieth century. In fact, it was so quiescent that beginning during the 1950's, many abortions were made legal, a legality supported by the American Medical Association, the National Organization for Women, many states, and the federal government. Adding to the popularity of abortion legality was fear—fanned by the media—that population growth would soon cause the world to starve to death.

It was at this time, with most Americans in favor of therapeutic abortion, that the right-to-life move-

ment came into being. The polarization between pro- and antiabortionists has grown hugely, and the debate has become more and more radical. In 1973, the Supreme Court case *Roe v. Wade* assured women the right to decide whether to terminate pregnancy. Then, in 1989, in *Webster v. Reproductive Health Services*, the Supreme Court reversed its position. The attempts by Operation Rescue to stop legal abortions by picketing and by harassing those choosing abortion and physicians performing abortion have further confused the issue, polarizing public opinion even more.

CONCLUSIONS

Two thorny ethical issues concerning abortion are whether it is ever appropriate to stop the occurrence of a human life and whether a woman should determine what happens to her body. Advocates of both issues propose that if their point of view is unheeded, the consequences, aside from unethical decision making, will cause horrible outcomes for society. Anti-abortionists state that the murder of fetuses will lead to other equivalent crimes (such as genocide). Those who favor abortion fear that following absolute criminalization will come restrictive legislation that will diminish human rights and produce a model of minority persecution. It seems possible that both these views are extreme and that ethical compromise could give both sides some of their desires, with much flexibility. One model for use could be that of Western Europe, which promises respect for every human life and permits abortion under conditions deemed appropriate in a well-thought-out, ethical fashion. Abortion programs also must be designed so that inequities (such as limitation to less-advantaged classes) are avoided and informed consent is guaranteed.

Rights and obligations

DEFINITION: Concepts of what people are allowed to do or are expected to refrain from doing are rights, and concepts of what people should ought or should not do are obligations

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Ethics deals with moral judgments of the behavior of individuals and groups. Questions surrounding what the rights and obligations of these moral actors are lie at the heart of ethics.

Rights may be seen from several different perspectives. They can be seen as claims to perform or refrain from certain acts without interference by others, or they may be claims to have certain acts performed or refrained from by others, or they may be claims to have certain entitlements honored. The basis of such entitlements may be by law, such as legal rights or claims to state welfare benefits, such as health care. Likewise, rights may be claims made on moral grounds alone, such as the right to have an item of trifling monetary value returned that someone has been given with the understanding that it was not a gift but would be returned. In this case, the right has been created by an express or tacit promise.

Obligations are acts that one ought or ought not to perform. However, “ought” has more than one meaning. Consequently, there are various kinds of obligation. Moral obligations are those generally believed to deserve some degree of social condemnation when they are not kept. Such condemnation may be mild or strong, depending on public judgment of the act—or omission of the act—in question. In instances of

strong condemnation for violation of certain moral obligations, people believe serious consequences should follow. Those who violate certain primary or fundamental obligations, such as violating the right of others to life, are generally thought to be wicked or evil. Another way of saying this is that people generally believe that there should be serious social pressure brought to bear on those found violating moral obligations.

Other kinds of obligations include prudential obligations, which individuals are morally free to perform or not, as they please. If someone says that you ought to leave for the theater if you wish to avoid missing the last show, there is no suggestion that it is morally wrong for you to fail to leave. All “prudential” obligations can be put in an “if, then” format: If you wish to get top grades in school, then you “ought” to study hard. However, people who possess superior talent in fields such as music or sports that restrict their study time or people who choose to take some time away from their studies each week to perform charitable work are not usually considered to be morally worse than those who spent all their free time studying. General laziness, however, is usually condemned.

A final form of obligation to be considered is rational obligation. This form of obligation states that one must accept such propositions as the mathematical equation that “two plus two equals four.” Certain propositions of symbolic or ordinary logic, geometry, and similar disciplines also fall into this category. In the context of ethics, however, only moral obligation is relevant

RECIPROCITY OF RIGHTS AND OBLIGATIONS

Most rights and obligations are interrelated in particular ways. Most rights, for example, involve what is called reciprocity. That is, one’s claim to certain rights necessarily involves recognition of an obligation to respect the same or similar rights of others. Failure to recognize reciprocal obligations places one in a situation of untenable self-contradiction or irrationality. Thus if one claims a right to one’s own wallet but refuses to respect the rights of other persons to their own wallets, such a person would be in a state of self-contradiction. For the claim of a right that everyone ought to respect necessarily involves recognition of a reciprocal right held by others. That is, claiming a right necessarily involves an obligation

to respects similar rights of others. Thus rights and obligations usually are intimately related in this way.

One class of rights, however, involves no such relationship. This class involves rights in certain cases of competition among individuals or groups, for example sporting competitions. Each team in a football game has a right to win the game, but there is no obligation on the part of either team to respect the right of the opposing team by allowing the other team to win. *Both* teams have a right to win. This is a situation of a right versus a right. However, such situations often involve obligations consisting of adherence to sets of rules. Each football team has a right to win, but not by any means. The teams are obligated to win in accordance with mutually agreed rules and not otherwise.

SOURCES OF RIGHTS AND OBLIGATIONS

A principal source of both rights and obligations is law. Valid law is created by those individuals or bodies such as legislatures that are authorized to make law by politically organized societies. Such bodies must act in accordance with a rule of recognition that describes the procedures that a legal system has laid down as valid for creating law.

In Western societies, it is generally agreed that there are limits to the obligation to obey law. Such limits are usually said to be moral limits as determined by the concept of justice or other moral limits such as those set by religious doctrine. Moral limits based on strictly secular sources are also often recognized. Those refusing to obey military conscription laws obliging persons to join armies cite either religious doctrines or secular equivalents.

Among the most common sources of both rights and obligations is the institution of promising. Since the meaning of the word “promise” is a requirement that must be met, promises are universally accepted as sources of obligation. Those who make promises incur obligations by the act of promising. By the same token, those to whom promises are made gain rights—the right that the promise be kept.

Promising takes a variety of forms, some more formal and others less so. Everyone is familiar with informal acts of promising found in everyday life, such as agreeing to meet someone at a specified place and time. More formal acts of promising include varieties of contract, often written documents enforceable by courts. Contracts may be oral or written; written contracts (and some oral ones) tend to stipulate

the exact nature of the rights and obligations incurred by the agreeing parties. Creating new rights and obligations is something people do every day.

Another familiar form of promising is the institution of marriage. In some societies, the institution of marriage has even included formal marriage contracts. In modern American society, certain rights and obligations of many marriages are set forth in detail prior to the marriage ceremony through contracts known as prenuptial (premarital) agreements.

All acts of promising that create valid rights and obligations raise legitimate expectations on the part of those being promised that such expectations will be fulfilled. On the other hand, promises that raise no legitimate expectations create neither rights nor obligations. Thus if someone known not to be wealthy promises to give another person a million dollars, it is not reasonable that those promised (knowing the promisor lacks resources) expect to receive the money. Accordingly, recipients of such promises thus have no legitimate expectations, and the promises themselves create no rights or obligations.

Another aspect of understanding the institution of promising as a principal means of creating rights and obligations is the distinction between tacit and express promises, or consent to acquire obligations. Tacit consent is consent—that is, promising—that is understood from the context of situations or the implications of acts or statements. The idea that “silence is consent” expresses this idea.

Another common form of tacit consent occurs when one travels to another country. It is commonly understood that entrance of foreigners into the territory of a state entails the traveler’s tacit consent to obey the country’s laws. There may, indeed, be various exceptions to this idea based on moral rules that foreign laws may violate; however, the tacit consent to obey has been generally accepted for centuries.

INTERNATIONAL LAW AND HUMAN RIGHTS

In addition to the domestic laws of a country and various forms of promises, two other sources of rights claimed in the modern world stand out. One is rights (with corresponding obligations) based upon international law. International law is based on several sources. One is treaties, conventions, and other kinds of formal agreements among states. In making such treaties, nations consent to follow them. In consenting they acquire obligations.

Conflicting Obligations

During World War II, a member of the French Resistance approached philosopher Jean-Paul Sartre to ask his advice: Should he devote his energy to fighting against Nazi tyranny in Occupied France, or should he, an only child, care for his aged, invalid mother? Sartre replied, "Choose!"

Another important source of international law, and therefore of legal obligation, is custom. In that case, standard, certain well-established practices are recognized by many courts dealing with international law as valid law when not contradicted by positive (written) law, especially by international treaty.

A further source is obligation is human rights, which are rights said to be conferred upon human beings solely on account of their humanity, as opposed to rights gained from written laws. Human rights are modern versions of the "unalienable rights" of the Declaration of Independence. Such rights are said to be "natural rights," based on human nature and the nature of society. Their successor category, "human rights," have been recognized as legitimate since the Nuremberg Trials of Nazi war criminals after World War II.

Some Nazi actions, especially the Holocaust, in which an estimated eight million people—mostly Jews—were exterminated, were unprecedented in human history. Existing laws did not describe these acts; however, common decency and moral right cried out for their judicial condemnation. The concept of "crimes against humanity" was therefore created to deal with such colossal crimes. Soon afterward, in 1948, a Universal Declaration of Human Rights was issued by the newly established United Nations Organization.

Controversy, however, surrounds the concept of human rights. Not all philosophers agree that such rights exist or even make sense. Moreover, all rights, including human rights, are either negative—in the sense that people have the right to be protected against certain acts—or are positive—in the sense that holders of the rights have entitlements, such as the right to health care or housing. Some philosophers argue that positive rights give the state exces-

sive and dangerous power. Others insist that positive rights are legitimate.

CONFLICTS AMONG RIGHTS AND AMONG OBLIGATIONS

Conflicts can occur among rights as well as among obligations. In the case of rights, the right to freedom of speech may conflict with a right of privacy, for example, or it may endanger rights to life and property if mob action is incited. Or the right to religious freedom can conflict with children's right to life, if parents withhold medical care on religious grounds. Numerous such conflicts exist.

Similarly, conflicts among obligations are common. On an everyday level, employees' obligations to their employers may conflict with their obligations to their own families. On another plane, obligations to perform military service may conflict with religious obligations; or obligations to enforce law may conflict with moral obligations to family members, and so on. On many occasions, processes of moral reasoning may satisfactorily determine which obligations are stronger, but not always.

Robotics

DEFINITION: Science and technology of creating machines that mimic the ways in which humans perform tasks

DATE: Originated during the 1940's

TYPE OF ETHICS: Scientific ethics

SIGNIFICANCE: The existence of machines that are capable of replacing humans in various activities has a far-reaching impact on society and may eventually redefine humankind's role in the world

The word "robot" was first used in 1921 in *R.U.R., or Rossum's Universal Robots*, a play by the Czech writer Karel Čapek. In that dramatic work, the term was used to describe machines that performed the work of humans. The word itself is derived from the Czech word *robota*, which means slave labor. Čapek's play is a story of mechanical laborers who revolt against their human masters.

The science of robotics draws on two technologies: automatic machine control and artificial intelligence. Devices for automatic machine control, which are called servomechanisms, work by feeding information about a machine's location, speed, and direction back to a computer-based control unit that automatically makes adjustments.

By the 1950's, mathematicians began to explore the possibilities of emulating human logic and behavior in computer programs. In 1956, John McCarthy, then at Dartmouth College, gave this discipline its name—artificial intelligence. The first artificial intelligence researchers began to program computers to play games, prove mathematical theorems, and even play the role of ersatz psychologists. Later efforts focused on the building of robots. The first patent for an industrial robot was awarded to Joseph Engelberger in 1961. His machine, which was called the Unimate, used a feedback control system that was attached to a computer. The Unimate robots were first used to control die-casting machines.

ROBOTICS DEVELOPMENT AND APPLICATIONS

Robotics has continued its development through two approaches to design. The first of these is the top-down approach, which focuses on a specific task to be done by the machine. Industrial robots that pick parts from a bin, paint auto body parts, or do welding, drilling, grinding, routing, or riveting from a fixed position on a factory floor are examples of top-down design. Computer programs called expert systems also employ the top-down approach to perform tasks focused in a narrow field—such as identifying mineral deposits or advising doctors about blood diseases—by consulting a body of knowledge in the form of rules.

A more difficult approach to robot design is the bottom-up approach, in which the goal is to build general-purpose machines. Robots of this type tend to be mobile, use camera systems to see the world around them, and employ electronic sensors for touch. They may be programmed to accomplish a variety of tasks. Computer programs for these machines simulate learning by adding observations and experience to their models of the world.

Reliable, quick industrial robots have become regular components of industrial processes. Some applications combine two conventional robotic arms to work together to perform complex assembly tasks, including maintenance operations for nuclear reactors, removal of toxic waste, and loading and unloading machine tools—tasks that are dangerous for humans to perform.

In the medical field, heart surgery is being performed without opening the patients' chests by using robotic arms that are inserted into the chest region

through three or four holes, each less than a centimeter in diameter. One robot has a camera for transmitting images to a computer console, while the others are fitted with operating instruments. The robotic movements are guided by a surgeon sitting at a computer, on whose monitor a magnified image of the operating area appears. Bypass surgery and repairs of heart murmurs and valve defects have been successfully performed with this alternative approach to conventional surgery. Similar applications are being used with brain and lung surgeries.

Much of the focus of robotics researchers is on the development of autonomous robots. In the first years of the twenty-first century, robotics researchers at Cardiff University in Wales were developing agile, versatile robots fitted with the latest Pentium-based

control systems, vision sensors, video links, and a Global Positioning System for navigation. One application allows farmers to use these robots to check on distant herds of animals, unload feed in selected fields, and inspect gates and fencing. Other applications include robotic wheelchairs and cleaning and security devices.

Another robot, a hexapod, is a two-foot long, six-legged, self-propelled machine that can avoid obstacles and negotiate rough terrain. This robot has sensors to monitor its position and a charge-coupled device camera and laser to generate a three-dimensional map of the surrounding terrain.

Numerous military applications for robotics are also being explored. An intelligent, mobile robot known as Rhino was developed at the University of

One of the practical applications of using robotics to protect human lives is this remote-controlled device designed to handle and neutralize terrorist explosives at the 2004 Olympic Games at Athens. (AP/Wide World Photos)

Bonn and has been used to conduct guided tours at a museum in Bonn, Germany. Mobile robots have also been used to explore the earth's seafloor and the surface of Mars.

ETHICAL ISSUES

The ethical issues of robotics arise from several areas. One fundamental concern is what kind of ethical principles should be built into robots. Science-fiction author Isaac Asimov began to explore this issue in the 1940's with a series of stories about intelligent robots, which were collected in *I, Robot* (1950) and other books. Asimov's robots had "positronic brains," circuits based on what he called the Three Laws of Robotics, whose principles were protecting the well-being of humans, obeying human orders, and self-preservation—in that order.

Asimov's principles are tested when considering the social consequences of replacing human labor with machine labor. Large-scale factory automation has resulted in the permanent loss of millions of unskilled jobs throughout the industrialized world. As robots continue to be refined and used in more applications, they will replace humans in jobs requiring ever greater degrees of skill. The economic benefits of robot automation reach a point of diminishing returns when the social costs of the unemployed workers—government subsidies, poverty, crime, and political unrest—become too high.

Some experts think that general-purpose humanoid robots will remain too expensive ever to reach widespread use. They contend that society is working itself through an inevitable turbulent period in the wake of the robot automation of industry and will evolve into a period in which skilled workers are used instead of robots. Others believe that advances in computer and robotics technology will inevitably lead to a convergence of the specialized, expert approach and the general-purpose, mobile, artificial intelligence approach. Such a convergence would lead to the development of self-aware machines with sophisticated models of their worlds and the ability to increase their knowledge.

Other ethical issues arise from the prospect of robots becoming more and more like humans in appearance and behavior. Such issues raise questions that have no answers, because there is no way to know what will happen until sentient machines actually make their appearance. Until then, the cost effec-

tiveness of such development is likely to remain a major obstacle.

By 1993, chess computers were playing at tournament level, and in 1997, Deep Blue became the first computer to defeat the reigning world chess champion, Garry Kasparov, in a classical chess match. Given the possibility of intelligent, humanlike robots, what should be their place in human society? Should they be allowed to coexist with people, with their own fundamental rights protected by law, or should they be regarded as a disposable race of slaves?

LEGAL ISSUES

Many questions have been raised about the legal status of intelligent robots. If they are accorded rights under the law, should they also have responsibilities? For example, might robots ever manage human workers, serve on juries, or run for elected office? Will they ever vote? Who would be blamed if a robot's "negligence" were to cause the accidental death of a human being? (Many of these issues are raised in Asimov's fictional robot stories.)

On May 17, 1992, an industrial robot called Robbie CX30 killed its operator, Bart Matthews, at the Cybernetics corporation in Silicon Heights, California. Authorities concluded that a software module written by a computer programmer from Silicon Techtronics was responsible for the robot oscillating out of control and killing Matthews. The programmer was charged with negligence. Further investigation revealed that the interface design combined with flawed software was probably the real culprit. That tragic incident emphasized the need to supply robot designers and programmers with guidelines and handbooks that deal with the ethical issues and principles that should be incorporated into future robot development.

Some robotics experts predict that intelligent machines will eventually be capable of building other, even more intelligent machines. Although robotics research and development currently models robots based upon human senses, actions, and abilities, as the future continues to unfold, people may confront some very disturbing prospects if the machines they have created become more intelligent and powerful than they are themselves. Because machine technology develops millions of times faster than biological evolution, the capabilities of robots could someday so far surpass human ones that the human race could

become extinct—not because of war, pestilence, or famine, but because of a lack of purpose. Consequently, future robotics research and development should be carefully governed by the ethical principles advocated by Asimov.

Roe v. Wade

THE EVENT: U.S. Supreme Court decision legalizing a woman's right to choose to terminate her pregnancy through abortion

DATE: Decided on January 22, 1973

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: The Court's decision ruled that under the Constitution, a woman's right to choose to terminate a pregnancy is a fundamental part of the right of privacy, and only a compelling reason will allow the government to interfere with or abridge that right.

In January, 1973, Justice Harry A. Blackmun delivered the 7-2 opinion of the Court, which upheld a woman's right to choose to terminate a pregnancy. That right, however, was not absolute. The Court divided the full term of a normal nine-month pregnancy into three three-month-long trimesters. During the first trimester, the decision to terminate a pregnancy rests with the woman and her physician. The government may not interfere, except to mandate that any abortion is performed by a licensed physician.

In the second trimester the government has the power to regulate abortion only in ways designed to protect and preserve the health of the *woman*. The Court stated that this objective becomes compelling at the end of the first trimester because before that time abortion is less hazardous than childbirth. During that time period, the only permissible abortion regulations are those designed to ensure that the procedure is performed safely.

At approximately the beginning of the third and final trimester, the fetus becomes viable, or capable of surviving outside the womb. At that time, protection of fetal life also becomes a compelling reason sufficient to justify interference by the government to regulate or even prohibit abortion in order to protect fetal life unless the abortion is necessary to preserve the life or health of the woman.

The Court ruled that the "liberty" interest of the Fourteenth Amendment was broad enough to encompass a woman's decision to terminate her pregnancy. According to the Court, a woman's right to abortion outweighs the rights of a nonviable fetus and generally prohibits government interference.

SOCIAL CLIMATE

The central figure in the *Roe v. Wade* case was "Jane Roe," a twenty-one-year-old panhandler who claimed that her unwanted pregnancy was the product of rape. In order safely and legally to end that pregnancy, she filed a lawsuit against Henry Wade, a Dallas county prosecutor and state official charged to enforce a Texas law forbidding abortion. Along with the laws of approximately two-thirds of U.S. states at that time, Texas law outlawed abortion. The social climate of the early 1970's was being transformed by a breakdown of traditional moral and ethical norms governing sexual behavior, and a rise in family disruption. At the same time, the medical pro-

fession had been performing elective abortions in states that permitted the procedure, but physicians were concerned with possible criminal and civil liability. The decision, therefore, shielded physicians.

Roe, who later revealed that her true name was Norma McCorvey, was the mother of two children prior to her lawsuit, and she later worked in abortion facilities. In 1995, however, she denounced abortion, became a Christian, and founded a pro-life ministry called “Roe No More.” Her original story that her unwanted pregnancy was the product of rape proved to be false, as was her claim to have been unmarried. In reality, her mother had adopted her first child, and her second child had been adopted by its natural father.

AFTERMATH

The main consequence of the decision in *Roe v. Wade* was to revive a right-to-life movement that had predated the case but which became well organized largely by virtue of the Supreme Court’s decision. The pro-life group elected public officials who believed, as its members did, that abortion was a form of murder that should be outlawed. The members of the movement also attempted to remake the federal judiciary by seating new judges who would interpret the Constitution as not protecting abortion rights. They hoped ultimately to seat a majority of pro-life justices on the Supreme Court who would overrule *Roe v. Wade*. President Ronald Reagan, a right-to-life advocate, appointed more than half of the members of the federal judiciary and three Supreme Court justices. Numerous cases subsequent to *Roe v. Wade* sought its reversal.

On June 17, 2003, Norma McCorvey filed an appeal to the Fifth Circuit Court of Appeal requesting that it reopen and overturn *Roe v. Wade*. In her accompanying affidavit, she alleged that the original case had been wrongly decided and caused great harm to women and children. She also alleged that she had been exploited and deceived by the legal system and did not understand the meaning and consequences of abortion at the time of her own abortion. The Texas District Court dismissed her motion.

Despite the tenuous nature of the constitutional right to choose to terminate a pregnancy, and the

Image not available

Norma McCorvey, the “Jane Roe” of Roe v. Wade, speaking at an antiabortion rally in Dallas, Texas, in June, 2003. (AP/Wide World Photos)

complex moral sentiments in America, that right still existed at the beginning of the twenty-first century. Meanwhile, several cases concerning abortion had led to notable court decisions. These include *Webster v. Reproductive Health Services* (1989), in which the Supreme Court examined the time line for the viability of fetuses, advancing it to twenty-four weeks, with testing to determine viability to be performed at twenty weeks’ gestation. In *Planned Parenthood of Southeastern Pennsylvania v. Casey* (1992), the Court also upheld a state law requiring a mandatory twenty-four-hour delay following information conveyed by a doctor to a patient and before an abortion can be performed because the waiting period did not constitute an “undue burden” on a woman who chooses abortion by placing substantial obstacles in her path.

THE ABORTION DEBATE

The debate between the so-called pro-life and pro-choice factions entails such ethical issues as autonomy (independent decision making) and non-maleficence (doing no harm). Pro-life feminists have challenged the claims of pro-choice feminist that abortion rights are prerequisites for women’s social equality and full development. Pro-lifers argue that women can never achieve fulfillment of their role of motherhood in a society that permits abortion. Pro-choice advocates assert that the unrestricted right to choose to terminate a pregnancy is a moral imperative and an integral part of women’s reproductive freedom.

Stating the argument otherwise, the pro-lifers argue that abortion does not equate with the moral right to control one’s own body. That concept, they feel, belongs to cases of organ transplantation, contraception, sterilization, and mastectomies. They distinguish pregnancy because it involves not one, but two, individuals, and point to the wrongfulness of harming others, no matter how immature or powerless.

The pro-choice position rests on the concept of individual autonomy, or one’s own decision-making capacity, and advocates that if a woman does not wish to continue a pregnancy for whatever reason, that pregnancy should be terminated. Philosophers have made the argument that a woman’s body is her property, to do with as she chooses. If pregnancy and childbearing impede her living a particular kind of life, she is therefore justified in seeking abortion. The permissiveness of abortion law is often greeted with the reaction that it is unethical, juxtaposed against the argument that one person cannot ethically impose her individual opinion on others. The ethical and moral dilemma, therefore, continues.

DIVISION IN RELIGIOUS CIRCLES

Abortion is not only a feminist issue, but a divisive religious issue as well. In religious circles, especially the Roman Catholic Church, those who disapprove of abortion point to the “sacredness and sanctity of life” and often argue that life begins at conception. Abortion advocates, however, counter with the argument that viability is evidence of life. Prior to the time of viability, a fetus is not a “person” entitled to the full cadre of rights.

Critics assert that the due process clause of the Fourteenth Amendment, which prohibits a state from

depriving any person of life, liberty, or property, does not give a woman the right to abort her fetus. Instead, they contend that the amendment protects all life and does not distinguish between unborn and living persons. It should be noted that when mentioned in *Roe v. Wade*, the Supreme Court referred to “person” in the postnatal sense.

Role models

DEFINITION: Persons whose behavior in particular roles is admired and imitated by others, especially by the young

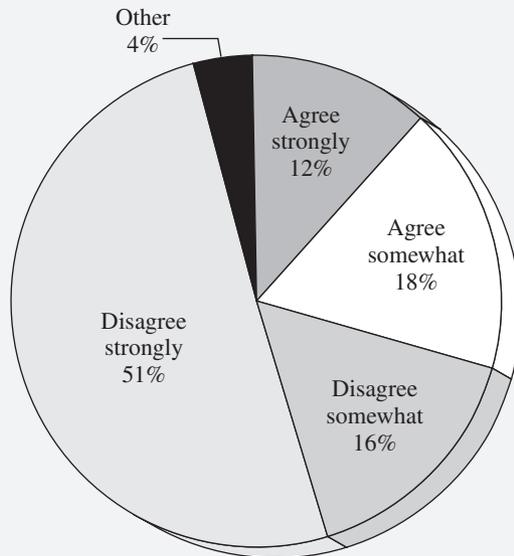

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Individuals whose character or vocations are in the process of formation are inclined to emulate those whom they regard as admirable, giving those who are regarded as role models special ethical responsibilities.

The value of role models has been recognized at least since the time of Aristotle, the ancient Greek philoso-

Public Opinion on Successful Cheaters

An opinion poll conducted by the Massachusetts Mutual Life Insurance Company in 1991 asked a cross-section of Americans how strongly they agreed with the statement that society looks up to people who succeed by cheating and breaking rules, so long as they make a lot of money.

Source: The Roper Center for Public Opinion Research. Figures based on responses of 1,200 adult Americans surveyed in September, 1991.

pher who asserted that human beings learn to be virtuous by imitating the behavior of moral people. Since virtue was for Aristotle an activity, it is important to be able to observe worthy actions. Beginning also in the ancient world, books such as Plutarch's biographies of famous Greeks and Romans were emphatically moral in their purpose. Biographies written for children in particular have historically served the purpose of inspiring children with impressive models of behavior. Other than in reading material, role models throughout history have generally been people close in time and space to their admirers and might thus be expected to recognize their ethical responsibility to set positive examples for their admirers.

Although worthy role models are desirable at any age, they are particularly important for children and adolescents. From the late twentieth century into the early twenty-first century, young Americans have increasingly grown to admire popular entertainers and

athletes. Images in the mass media—motion pictures, television, and the Internet—have greatly intensified the influence of such heroes. Propelled thus into prominence, these influential achievers are often reminded of their responsibilities to conduct themselves in a manner worthy of emulation, as they have been selected as role models by legions of the young. There can be little doubt that for children, misbehavior on the part of their heroes can be a shattering experience.

From the viewpoint of successful athletes, performers, and other prominent individuals who have become role models without consciously seeking such status, the high expectations of their fans are likely to seem unreasonable. Athletic or artistic excellence, though frequently the result of the exercise of self-discipline and other virtues, does not guarantee overall moral excellence. Many in the limelight have proven to be either unable or unwilling to serve adequately as models for would-be emulators they have never met. Whether a prominent athlete or entertainer should feel any obligation in this matter, the fact that the frequently large incomes of such persons derive from the approval of their admirers constitutes an argument for their accepting some measure of responsibility. Because such arguments in many

“I am not a role model”

In 1993 basketball star Charles Barkley caused a minor sensation in the sports world when he appeared in a television commercial for Nike shoes in which he declared, “I am not a role model.” Although Barkley was known for his outspokenness and occasionally ill-mannered public behavior, his statement surprised many people because of the possible damage that it might do to his career, particularly in off-court endeavors, such as commercial endorsements. Barkley's statement had the positive effect of promoting public discussion of issues such as the merits of young people making sports and entertainment heroes their role models and the responsibilities of public figures to their young admirers.

cases go unrecognized, however, parents, teachers, and counselors must exercise their responsibility to advise the young as to which habits of their heroes are worthy of imitation.

Roman Catholic priests scandal

THE EVENT: Revelations of widespread and long-term sexual abuse of children by Roman Catholic priests that first gained national attention in Massachusetts

DATE: First publicized in January, 2002

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: This church scandal has raised questions about the Roman Catholic Church's authoritarian structure, and how it may have interfered with the church's capacity to discharge its responsibility to protect its members, as well as the psychosexual dynamics of sexual abuse.

The Roman Catholic priests sex abuse scandal first captured public attention when a sensational story hit the front pages of the *Boston Globe* in January, 2002. The *Globe* story contained shocking revelations concerning John Geoghan, a defrocked Boston priest and convicted child sex abuser, who had been transferred from parish to parish by his church superiors, despite their knowledge that he had been sexually abusing children. The story immediately raised questions about how such a thing could happen. As the outraged public responded, there was no shortage of culprits whom people alleged to be responsible. Some people blamed a church hierarchy that they re-

garded as more zealous to protect its church's reputation than to protect the lives of the church's youngest members.

Other people responded to the story by suggesting that the church's requirement of priestly celibacy imposed impossibly difficult rules and thus invited priests to violate the rules. Some people even claimed that the problem could only have occurred in the context of an all-male clergy. That view, while unproven, does in fact conform with statistics on sexual abuse, which suggest that it is a male specialization.

Observers on the right argued that the villain was homosexuality, which was known to be widespread among Roman Catholic priests. However, that argument also presupposed a connection between homosexuality and pedophilia, which, though perhaps cherished in the popular heterosexual imagination, has no scientific basis. In any case, the vast majority of offenders were never accused of pedophilia at all. Typical cases involved inappropriate touching of post-pubescent boys. Such behavior constituted a legal offense, a religious transgression, and perhaps signs of underlying psychological disorders, but not necessarily pedophilia.

When the dust finally settled on the initial revelations of priestly misconduct, the essence of the "scandal" appeared to center more on the church's attempts to cover up the story than on the priests' crimes. One result of this collective redefinition was a public call for the resignation of Bernard Cardinal Law, the archbishop of Boston and a key player in the cover-up. Law retired under pressure in December, 2002.

THE QUESTION OF CELIBACY

The most interesting, difficult, and profound questions arising from the scandal relate to sex and gender. Understandably, members of the Roman Catholic Church have tended to focus more on ecclesiastical matters, such as the question of reforming policies for reporting abuse and disciplining abusers. However, the complex question of the relation between ecclesiastical and legal norms has also received widespread attention. Only at the outset did the public raise the question of the nature and meaning of the abuses themselves.

The fact that the perpetrators and most of their victims were male might lead observers to conclude that the underlying cause of the problem was homo-

sexuality. However, if the problem were defined as one of repressed homosexuality that expressed itself, desperately, in furtive encounters with helpless, compliant victims who were predisposed to keep things secret, then what needs to be addressed is not homosexuality but homophobia—both within the church and society in general. It is presumed that persons with what are considered normal sexual outlets would not be driven to have sex with young people entrusted to their professional care. In this regard, the subject may be less about homosexuality than about heterosexuality.

If the central problem is priestly celibacy, one might expect that heterosexual abuse would be as rampant within the Roman Catholic Church as homosexual abuse, which is not the case. On the other hand, opportunities for homosexual abuse in the church are much more common than opportunities for heterosexual abuse, as priests are more likely to lead same-sex outings, such as camping trips, than to lead mixed-sex outings. However, the relative scarcity of heterosexual abuse cases in the church does not prove an absence of motivation. Indeed, since in the various cases of same-sex abuse that came to light, perpetrators have not necessarily been homosexuals but may have acted as they did because of the opportunities that were presented to them. The underlying cause would seem to be sexual repression and not necessarily homosexuality.

The church's main response to the scandal has been to promise to be more vigilant in enforcing its celibacy rules and to punish transgressors, rather than to revisit its own rules themselves. It is important to note that this represents a particular position regarding the rule of celibacy. Drug laws present a relevant analogy. One could argue either that drug abuse is caused by lax enforcement of drug laws or that the very existence of drug laws encourages people to abuse them. If one believes that any kind of use is immoral then the problem is clearly one of enforcement.

GENDER NORMS

Another approach to the problem involves examining gender norms. Interestingly, there has been no reluctance on the part of the church's critics—both inside and outside the church—to assert that the cover-up could only have been perpetrated by an all-male authority structure. By contrast, little has been

said about the possibly inherent relation between masculinity and sexual abuse. Sex abuse is abnormal—as abnormal as abuse of power.

An act that is abnormal is not necessarily the opposite of a normal act. Indeed, it may not differ qualitatively from normal behavior at all, as it merely violates a boundary that may have been established for purely practical purposes. For example, while it is legal to “hard sell” a product, it is illegal to sell something by making fraudulent claims. The question is whether there is a qualitative difference between fraud and exaggeration. There is a legal distinction between the two. However, what if the difference between normal male sexuality and sex abuse were similar? What if a potential for sex abuse—such as sexual harassment—were built into the structure of male sexuality as a deviant expression of it? The sex abuse crisis in the church would then look similar to what happens when men are in charge without anyone to whom to answer. In that sense, the ethical questions raised by the problem of sex abuse and those raised by the cover-up are essentially the same.

Rorty, Richard

IDENTIFICATION: American philosopher and author

BORN: October 4, 1931, New York, New York

TYPE OF ETHICS: Modern history

SIGNIFICANCE: One of America's best-known contemporary philosophers, Rorty has developed a theory of ethics that encompasses such issues as immigration, the obligations of citizens, contemporary liberalism, the politics of gender, and democracy's role in world politics.

Renowned for the breadth of his philosophical interests and publications, Richard Rorty is the son of intellectuals with leftist leanings. He entered the University of Chicago when the university's Great Books Program permitted its students to master the curriculum at their own paces. Rorty completed his bachelor's degree at Chicago before he was eighteen, stayed on for a master's degree, then entered Yale University, where he earned a doctorate in philosophy before his twenty-fifth birthday.

A committed lifelong liberal, Rorty focused on ontology—the philosophy of being—in his doctoral dissertation. In his earliest book, *Philosophy and the Mirror of Nature* (1979), he concerned himself with the ways in which individuals form the perspectives through which they view the world. In that book he comments on the relativity of such eternal verities and ethical concerns as truth, good, and evil. As a liberal thinker, Rorty was prepared to accept the absolutism of many earlier philosophers who dealt with theories of being and defined ethical behavior absolutely.

Rorty is best known, however, through his essays collected in *Contingency, Irony, and Solidarity* (1989), which has been translated into several languages. In that work, Rorty calls himself a “liberal ironist,” one who views society as determined by a combination of history and of nominalism. However, these factors coexist with factors that, in all humans, have individual moral and ethical bases.

Rorty's appeal is accounted for largely by his relatively accessible prose. He is centrally concerned with developing a theory of ethics that encompasses such burning contemporary issues as immigration, the obligations of citizens, contemporary liberalism, the politics of gender, and democracy's role in world politics.

Rousseau, Jean-Jacques

IDENTIFICATION: French philosopher

BORN: June 28, 1712, Geneva (now in Switzerland)

DIED: July 2, 1778, Ermenonville, France

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: The author of *A Treatise on the Social Contract: Or, The Principles of Politic Law* (*Du contrat social: Ou, Principes du droit politique*, 1762), Rousseau was one of the most influential proponents of social contract theory. Based on an optimistic notion of the state of nature, he believed that humanity was naturally innocent, and that a legitimate and genuine social contract could help to recover the innocence humans had lost when they entered society.

Rousseau's philosophical writings and novels, all of them rich in ethical content, inspired a major shift in Western thought during the eighteenth century and part of the nineteenth century. They substantially undercut the Age of Reason and inspired a new Age of Romanticism. In the process, Rousseau's eighteenth century lifestyle and work influenced manners and morals, the reevaluation of education, conceptions of the state and of politics, and the reassertion of religious values. His philosophical genius led the way to new views of human nature, liberty, free creative expression, violence, the character of children, and the vital human and cultural importance of women.

FOUNDATIONS OF ROUSSEAU'S ETHICS

Rousseau's ethics were rooted in his moral and religious perceptions about human nature, human behavior, and human society. In *Discourse on the Sciences and the Arts* (*Discours sur les sciences et les arts*, 1750), *Discourse on the Origin of Inequality* (*Discours sur l'inégalité*, 1755), and *Social Contract* (1762), he systematically traced his thoughts on each of these subjects. Humanity, Rousseau believed, was fundamentally good. Originally living alone, simply, and in a state of nature, humanity was free, healthy, and happy. As a result of living in society, however, humanity acquired property along with the aggres-

siveness required for securing and defending that property. Depraved conditions, ignoble passions, and vices soon were rampant: pride in possessions, false inequalities, affectations, greed, envy, lust, and jealousy, which were attended by insecurity, personal violence, and war. Thus, although humanity was by nature good, society itself was innately corrupt. Humanity, Rousseau concluded, had been corrupted by society. What most educated eighteenth century observers viewed as the rise of civilization, Rousseau viewed as its decline.

Rousseau's own experiences were responsible for this assessment of society, even though the assessment itself was laced with idealism. He had begun life orphaned, poor, and vagrant. Unhappily struggling through menial posts and an apprenticeship, he subsequently rose to notoriety, thanks to the help of generous and sensitive patrons, many of them women. He became familiar with sophisticated intellectuals and with the rich, yet eventually he abandoned this level of society for a life of simplicity and honest, if irrational, emotions. His style and philosophy repudiated society's standards, its affectations, its belief in the indefinite improvement of humanity, and its philosophical addiction to stark reason and utilitarianism.

ROUSSEAU'S SOCIAL CONTRACT

Rousseau believed that humanity had descended from a natural state of innocence to an artificial state of corruption—a state made worse by what he regarded as the stupidity and self-delusion of most of his contemporaries. He fully understood that any hopes of returning to humanity's ancient innocence were chimerical. Nevertheless, the values that he cherished—freedom, simplicity, honestly expressed emotions, and individualism—were still in some measure attainable as the best of a poor bargain. In his *Social Contract*, he indicated how the liberty that humanity had lost in the descent to "civilization" could be recovered in the future.

Recovery could be achieved by means of humanity's acceptance of a new and genuine social contract that would replace the false one to which Rousseau believed humanity was chained. Thus, while humanity was born free and was possessed of individual will, its freedom and will had become victims of a fraudulent society. People could, however, surrender their independent wills to a "general will"; that is, to

Rousseau's abstract conception of society as an artificial person. In doing so, people could exchange their natural independence for a new form of liberty that would be expressed through liberal, republican political institutions. The general will, a composite of individual wills, pledged people to devote themselves to advancing the common good. The integrity of their new social contract and new society would depend upon their individual self-discipline, their self-sacrifice, and an obedience imposed on them by fear of the general will.

RELIGIOUS AND EDUCATIONAL ETHICS

The history of republican Geneva, Rousseau's birthplace, imbued him with a lifelong admiration of republican virtues, but neither the eighteenth century Calvinism of Geneva nor Catholicism, Rousseau believed, fostered the kind of character that would be required for the republican life that he imagined under the "Social Contract." In his view, Catholicism, for example, directed people's attention to otherworldly goals, while Calvinism had succumbed to a soft and passive Christianity that was devoid of the puritanical rigor and innocence that had once characterized it and that Rousseau admired. Rousseau, on the contrary, advocated the cultivation of this-worldly civil values that were appropriate for a vigorous republican society: self-discipline, simplicity, honesty, courage, and virility. His proposed civic religion, stripped of much theological content, was intended to fortify these values as well as to enhance patriotism and a martial spirit.

Rousseau's educational ideas, like his religious proposals, sought to inculcate republican civic virtues by directing people toward freedom, nature, and God. Small children were to be unsaddled and given physical freedom. Children from five to twelve were to be taught more by direct experience and by exposure to nature than by books. Adolescents should learn to work and should study morality and religion. Education, Rousseau argued in his classic *Émile* (1762), should teach people about the good in themselves and nature, and should prepare them to live simple, republican lives.

Royce, Josiah

IDENTIFICATION: American philosopher
 BORN: November 20, 1855, Grass Valley, California
 DIED: September 14, 1916, Cambridge, Massachusetts
 TYPE OF ETHICS: Modern history
 SIGNIFICANCE: In such works as *The World and the Individual* (1899-1901) and *The Philosophy of Loyalty* (1908), Royce developed an ethic based on his "philosophy of loyalty," which emphasized that human beings are not isolated individuals but are members of communities.

After teaching in San Francisco and at the University of California at Berkeley, Josiah Royce moved to Cambridge, Massachusetts, in 1882 and distinguished himself as a professor of philosophy at Har-

vard University. There he became close friends with the American pragmatist William James, although Royce's philosophy differed fundamentally from that of his famous colleague.

Royce's philosophical idealism stressed that a human self is a center of purpose and striving; therefore, human life involves suffering and a struggle with evil. Royce affirmed, however, that in facing these obstacles courageously, in achieving success wherever one can, and in recognizing that one's relationship with the Absolute, or God, entails the overcoming of every evil, one can experience positive meaning and joy.

According to Royce, such human fulfillment depends on loyalty, which he defined as "the willing and practical and thoroughgoing devotion of a person to a cause." Not all causes are good ones, but Royce believed that the act of being loyal is good whenever it does occur. He concluded that the most fundamental principle of the moral life ought to be that of being loyal to loyalty. This principle points toward a community where all individuals are free, where they use their abilities and cultivate their interests, and where all these persons and factors encourage and support one another.

Rūmī, Jalāl al-Dīn

IDENTIFICATION: Afghan mystical poet
 BORN: c. September 30, 1207, Balkh (now in Afghanistan)
 DIED: December 17, 1273, Konya, Asia Minor (now in Turkey)
 TYPE OF ETHICS: Religious ethics
 SIGNIFICANCE: Rūmī was the most influential mystical poet in the Persian language and the eponymous founder of the Mevlevī Sufi order. He wrote numerous mystical and philosophical poetic works, including *Mathnavī* (1259-1273).

Rūmī was an extraordinarily prolific Persian poet, best known for his *Mathnavī*, which is arguably the

most important single work in Persian literature. Although the *Mathnavī* is massive in scope (26,000 verses), it focuses on Rūmī's primary concerns: the longing of the soul for its beloved and the loss of self in a love for God so absolute that only God exists. He emphasized the cycle of the origination of all things from God and their return through extinguishing the self. The highest possible achievement of the soul is longing for God, beyond which there is annihilation of individuality. Rūmī frequently reworked traditional stories or used metaphors of intoxication and/or human love, and, disdainful of discursive thought and logical argument, he saw himself as being in the spiritual tradition of al-Hallāj, Sanā'ī, and 'Aṭṭār.

BIOGRAPHY

Rūmī's family left Balkh when he was quite young, fleeing the invading forces of Genghis Khan. In 1228, he moved to Konya, where his father, the noted theologian Bahā' al-Dīn Walad, taught. Rūmī took over those teaching duties after his father's death. In 1244, he met the famed Sufi Shams al-Dīn Tabrīzī in Konya (they may have met previously in Syria), and the two became inseparable partners in the rapture of absolute, mystical love of God. This relationship seems to have been the cause of Rūmī's turn to mystical poetry. Rūmī's relationship with Shams dominated his life, eclipsing responsibilities to family and students, who exiled Shams to Syria. Rūmī's eldest son, Sultan Walad, recalled Shams because the separation was heartbreaking for Rūmī. Their previous behavior resumed, leading another of Rūmī's sons to conspire successfully with his students to murder Shams. Soon thereafter, Rūmī entered into a similar relationship with Salāh al-Dīn Zarkūb.

LEGACY

After Rūmī's death, Sultan Walad organized the Mevlevī (Turkish for Rūmī's title, *maulānā*, or master) order of Sufis, in which dancing in circles is an important spiritual exercise. The Mevlevī (the "whirling dervishes" of European writers) have been a significant popular, devotional alternative to more legalistic Islamic orthodoxy, and Rūmī's tomb remains a focus of popular religion and pilgrimage. His poetry was influential as far away as Bengal and has remained influential to the present day. Among those moved by his poetry were the Mughal emperor

Akbar, the Chistī Sufi saint Nizām al-Dīn Auliya, and the twentieth century poet Muḥammad Iqbal.

Thomas Gaskill

SEE ALSO: Ḥallāj, al-; Rābi'ah al-ʿAdawīyah; Sufism.

Russell, Bertrand

IDENTIFICATION: English mathematician and philosopher

BORN: May 18, 1872, Trelleck, Monmouthshire, Wales

DIED: February 2, 1970, Plas Penrhyn, near Penrhyndeudraeth, Wales

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Although primarily a logician, Russell developed a subjectivist ethical position in the belief that human beings could choose good over evil. His most important ethical works include *On Education* (1926), *Why I Am Not a Christian* (1927), *Marriage and Morals* (1929), *Education and the Social Order* (1932), *Religion and Science* (1935), and *Human Society and Ethics* (1955).

Bertrand Russell's early work centered on mathematics and logic, culminating in a book he co-authored with Alfred North Whitehead, *Principia Mathematica* (1910-1913). Twice, however, he was dramatically drawn into issues of values and ethics. The first occasion came in 1901, when a "quasi-religious experience" brought home to him the isolation of the individual and led to his advocacy of humane policies in education, the punishment of criminals, and personal relationships. He published an essay, "A Free Man's Worship" (1903), but was too involved in his work on logic to devote much time to these ideas. The second and lasting shift was prompted by World War I, which he opposed, though he would later support the opposition to Nazism in World War II.

The horrors of the world wars prompted Russell to consider how humankind might change. He was convinced that the key was education, because childhood experience molded adult attitudes, including the acceptance of violence. In his writings and at Beacon Hill School, which he founded, he advocated

the disciplined but kindly treatment of students. Ultimately, however, he realized that values were matters of opinion, and he never found an objective way to prove that his values were best. He argued powerfully, however, for his humane approach to education, as well as to sexual relationships, religion, and other important aspects of social life.

Rwanda genocide

THE EVENT: Ethnic conflict in which as many as 800,000 Rwandans—mostly Tutsis—were killed

DATE: April-July, 1994

PLACE: Rwanda, Central Africa

TYPE OF ETHICS: Human rights

SIGNIFICANCE: In addition to the obviously horrific slaughter of hundreds of thousands of innocent people, the Rwandan genocide raised troubling questions about the ethical responsibility of the world's nations to intervene in the affairs of other nations.

Covering more than ten thousand square miles in the heart of Africa, Rwanda has a population made up of three distinct peoples. The Hutu constitute the majority of the population and are traditionally subsistence farmers; the minority Tutsi were traditionally cattle herders and provided the country's rulers; and the Twa, who constituted only about 2 percent of the total population, were traditionally potters. After Germany and Belgium colonized Rwanda and neighbor Burundi around the turn of the twentieth century, colonial rule reinforced and exacerbated the distinctions among Rwanda's three groups.

Under Belgian rule, which lasted from 1916 until 1962, colonial administrators favored the Tutsis, sin-

gling them out for greater access to education and government jobs. By 1959, however, the majority Hutus were powerful enough to force out the last Tutsi king. Thousands of Tutsi supporters went into exile to neighboring Uganda at that time. After Rwanda declared its independence from Belgium, a government headed by Hutus came to power. In 1973, a Hutu general, Juvenal Habyarimana, seized power in a coup and a dictatorship was established that lasted until his death in 1994, when an airplane on which he and the president of Burundi were traveling crashed, killing both leaders. Suspicion that the airplane had been shot down by Tutsi opponents of the Hutu government touched off the genocide that ensued against the Tutsis in Rwanda.

A few years before Habyarimana's death, a civil war had begun, between the Rwanda Patriotic Front (RPF), representing the Tutsis and operating out of Uganda, and the Hutu government. Habyarimana was also under pressure from the international community to democratize Rwandan politics and ameliorate the country's economic condition, which was dismal. In 1992, he agreed to conditions that led to a cease-fire between the two sides. Since the negotiations leading to the cease-fire took place in Arusha, Tanzania, they were referred to as the Arusha Accords. A power-sharing schedule was drawn up that included the eventual holding of elections. Many within Habyarimana's government were angry at the conditions imposed by the Arusha Accords, charging that the Tutsis would maximize their power under the agreement. With so many unhappy within the ranks of his own government and with Habyarimana trying to simultaneously appease his people as well as appear to be moving forward under the accords, political unrest grew.

GENOCIDE IN RWANDA

On April 6, 1994, Habyarimana's plane crashed in Rwanda's capital city, Kigali, and he was instantly killed. Blame for the apparently sabotaged plane was

never finally established; Hutus claimed that Tutsis were responsible, and Tutsis claimed that extremist elements within the Hutu government had killed their own leader. The Hutu-dominated army seized upon the crash as a pretext to move against all Tutsis, organizing ruthless killings of the RPF and all Tutsis in an attempt to eliminate them from Rwanda. Ordinary Hutus were exhorted to kill "Tutsi vermin" in radio broadcasts throughout the country, and many did.

Human rights abuses that dehumanized the other side and portrayed them as animals were common on the part of the Hutus as the genocide spread. Over the next three months, the RPF advanced in the north and was eventually able to take control of large parts of the country and form an interim government. A Tutsi government still ruled the country a decade later.

Meanwhile, however, three months of genocide had taken around 800,000 lives, the majority of whom were Tutsi. Many Hutus, including members of the former government and militias, fled to refugee camps in the neighboring Democratic Republic of the Congo (then called Zaire) and Tanzania.

The genocide in Rwanda was a sober lesson to the world community in how rapidly civil violence could spread and how deadly its effects could be. The debates over what ethical and moral responsibility the world community had in stopping the genocide were still being voiced a decade later. The United Nations had only a small force in the country on the eve of the violence and failed miserably to stop the genocide, although the Canadian commander of the U.N. peacekeeping mission, Roméo Dallaire, tried to alert U.N. officers to the need for additional help.

Ethical questions have also been raised about the reluctance of the United Nations to get involved in the conflict until after the genocide had occurred. In 2004, Rwanda was still limping back to normalcy after trials for crimes against humanity were held against Hutus responsible for the killings. The coun-

try's first election after the genocide, held in August, 2003, resulted in the maintaining of power by President Paul Kagame, although there have been charges of voter intimidation by his opponents.

S

Sales ethics

DEFINITION: Formal and informal codes of conduct defining the morally proper and improper ways to sell things to people.

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Sales is often perceived, by both buyers and sellers, as the art of convincing people to purchase things they do not really need or to pay more for a commodity than it is really worth. This act raises ethical concerns involving who is ultimately responsible for the decisions of consumers and the extent to which purveyors of commodities can or cannot be said to manipulate buyers or the marketplace itself.

The selling of goods and services has long been the subject of moral and, sometimes, theological concern. Economic theorists at least since the time of Adam Smith have assured people that when a buyer and a seller with equal knowledge of a product reach agreement and a transaction occurs in the marketplace, the situations of both buyer and seller are improved; otherwise, one or the other would not have agreed to the transaction. Nevertheless, since both buyer and seller are seeking to maximize their positions and since their interests are diametrically opposed, one seeking the lowest possible price and the other seeking the highest, it is natural to expect each to try to take advantage of the other, sometimes unfairly. The problem is rooted in whether buyer and seller have equal knowledge; as products and services have become increasingly complex and as manufacturers and sellers have grown into multibillion-dollar corporations, equal knowledge, and therefore equal power, in the marketplace has become the exception rather than the rule.

MARKETING ETHICS

The ethics of marketing, a broader and more current interpretation of sales, can be viewed in terms of the natural dimensions of the marketing function.

The first concerns the safety and appropriateness of the product or service being marketed, normally considered under the subject of product liability. Here the question is: Who has responsibility and liability for any harm done to individuals or to society by the product? This has become an enormously complex and rapidly changing area of the law and of moral concern as well. Traditionally, common law and social thought relied on contract theory, which holds that buyer and seller come as equals to the marketplace, and once the deal has been struck, the buyer is responsible for the product, including any harm it might cause. Especially since the 1950's, however, more and more of the responsibility and liability have been placed on the seller and, particularly, the manufacturer. It has been argued that the manufacturer has the most knowledge of the product, is in the best position to prevent harm from occurring, and is better able to bear the financial liability for harm than is the buyer, especially when the latter is an individual consumer. No longer is it necessary to show that manufacturers have been negligent in any way; they are now expected to anticipate any potential hazards or possible misuse by customers.

PRICING AND PROMOTION ISSUES

Ethical questions can arise also in the pricing function of marketing. Here the question is whether a price is considered fair, especially when the product is a necessity such as a basic food item, housing, or medical care. The introduction of revolutionary pharmaceutical products—for example, Burroughs Wellcome's AZT for the treatment of acquired immunodeficiency syndrome (AIDS) patients and Genentech's TPA for heart attack victims—has often triggered complaints that the manufacturer's high price puts an unfair burden on the buyer. Some retailers have been accused of unfairly charging prices in low-income areas that are higher than those that they charge in more affluent neighborhoods for the identical merchandise.

Sophisticated advertising and other promotional

tactics are often the subject of ethical questioning. Critics charge that advertisers, usually the manufacturers, manipulate and exploit consumers, and thus use unfair means to encourage them to buy. Manufacturers and some social scientists respond that unless the advertising is actually dishonest, and therefore illegal, consumers cannot be coerced by legal advertising messages into buying anything that they do not really want to buy. This issue takes on added significance when so-called "vulnerable" groups are the target. Cigarette companies have been criticized for targeting African Americans and women; breweries for targeting young, inner-city African Americans for high-alcohol-content beverages; breakfast cereal and toy manufacturers for targeting children; and door-to-door sellers of safety devices for targeting older people. Other ethical questions raised about advertising include the promotion of inappropriate values; for example, materialism and the exploitation of women by emphasizing sex.

In the distribution function of marketing, ethical questions are raised when retailers close stores in inner-city areas (for example, after the Los Angeles riots of May, 1992), when major food retailers collect "slotting fees" from manufacturers just for agreeing to carry new products, and when direct marketers buy and use confidential demographic and consumer behavior information in compiling lists of potential customers.

CORRECTIVE ACTION

Action to correct these ethical problems comes from three sources. First, various industries and business associations agree to exercise self-restraint through company-wide or industry-wide codes of conduct and through the formation of organizations such as the Better Business Bureaus to monitor corporate behavior. Second, dozens of watchdog consumer organizations, such as the Center for Auto Safety, Co-op America, and the Center for Science in the Public Interest, have been formed to guard consumers' interests and call attention to what they perceive as improper behavior on the part of sellers. Third, since the 1970's, many laws have been passed to help protect consumers, such as the Consumers Products Safety Act, the Child Protection and Safety Act, and the Hazardous Substances Act at the federal level.

SALT treaties

IDENTIFICATION: Cold War treaties designed to curb the nuclear arms race and to place limits on the development of antiballistic missile defenses

DATES: SALT I, May 26, 1972; SALT II, June 18, 1979

TYPE OF ETHICS: International relations

SIGNIFICANCE: The Strategic Arms Limitation Treaties (SALT I and SALT II) began the process of mutual U.S. and Soviet nuclear weapons reduction, in recognition of the dangers posed to the long-term security of all nations by unfettered nuclear stockpiling.

After several years of preliminary efforts, negotiations between the United States and the Soviet Union regarding reducing strategic nuclear weapons began

on November 17, 1969. Several factors spurred both states toward an agreement. The United States was anxious to stop the steady Soviet buildup of intercontinental ballistic missiles (ICBMs), which in 1970 for the first time exceeded those of the United States. By the early 1970's, the Soviet Union was approaching numerical parity with the United States in the total number of strategic nuclear delivery vehicles.

For its part, the Soviet Union was anxious to avoid a competition with the United States in building anti-ballistic missile (ABM) defenses. In 1967, the U.S. Lyndon Johnson administration decided to proceed with a pilot ABM system, as did the succeeding Richard Nixon administration. Another factor was that both countries had committed themselves to nuclear weapons reductions as part of their effort to persuade non-nuclear weapons states to sign the Nonproliferation Treaty. Finally, during the early 1970's, the two superpowers were moving toward improved relations, which both sides recognized would be dramatically symbolized by significant arms control agreements.

SALT I

Between November, 1969, and May, 1972, seven negotiating sessions were held, alternating between the cities of Helsinki and Vienna. Completion of the SALT I package was not achieved until May, 1972, when Richard Nixon and Leonid Brezhnev met in their first summit session in Moscow. The fundamental compromise of SALT I was embodied in two agreements: an ABM Treaty limiting defensive weapons (the primary concern of the Soviet Union) and a moratorium on the deployment of offensive weapons (the principal U.S. objective).

The ABM Treaty was the more important of the two agreements. It provided that each party would refrain from building a nationwide antiballistic missile defense and would limit the construction of ABM

SALT Treaties Time Line

<i>Date</i>	<i>Event</i>
September 18, 1967	U.S. secretary of defense Robert McNamara announces limited U.S. ABM system.
July 1, 1968	U.S. president Lyndon B. Johnson announces preliminary SALT discussions.
November 17, 1969	SALT negotiations begin in Helsinki, Finland.
May 26, 1972	SALT I agreements are signed in Moscow, Russia.
July 1, 1972	Moratorium on offensive missiles begins.
September 30, 1972	ABM Treaty is ratified by United States.
October 3, 1972	SALT I agreements take effect.
November 21, 1972	SALT II negotiations begin.
November, 1974	Ford-Brezhnev accord begins at Vladivostok summit.
March 12, 1977	U.S. president Jimmy Carter endorses comprehensive plan.
October 1, 1977	Missile moratorium expires.
June 18, 1979	SALT II Treaty is signed in Vienna.
December, 1979	Soviet Union invades Afghanistan.
January, 1980	U.S. president Jimmy Carter withdraws SALT II Treaty from Senate consideration.
March, 1983	U.S. president Ronald Reagan proposes Strategic Defense Initiative (Star Wars).

site defenses to only two specific sites. (Subsequently, the treaty was modified to limit site defense to a single site.) The site defenses were intended to permit both sides to protect their national capitals and one ICBM site. The Soviet Union had already begun construction of an ABM defense of Moscow, and the United States was free to do the same for Washington, D.C. (which it never did). An important provision of the ABM Treaty stipulated that "Each Party undertakes not to develop, test, or deploy ABM systems or components which are sea-based, air-based, space-based, or mobile land-based." More than a decade later, this prohibition would be used to criticize as illegal the proposal of the Ronald Reagan adminis-

tration for a “strategic defense initiative.” The ABM Treaty, which was ratified by the United States on September 30, 1972, is of unlimited duration, although it is subject to review every five years.

The other part of SALT I was an Interim Agreement not to construct any new fixed, land-based ICBM missile launchers for a five-year period beginning July 1, 1972. This five-year moratorium was formalized as an Executive Agreement rather than as a treaty. Both parties could modernize and replace their strategic offensive missiles and launchers, but they could not increase their total number. Thus, the United States was limited to 1,054 ICBMs and the Soviet Union to 1,618. A protocol to the Interim Agreement limited the United States to a maximum of 710 submarine-launched ballistic missiles (SLBMs) and the Soviet Union to 950 launchers. The rationale for this agreement was that while both parties possessed a different mix of weapons, they were nevertheless roughly in a state of parity. While in certain categories of missiles the Soviet Union possessed more, the United States had the advantage of technological superiority. It was assumed that before the moratorium expired, both governments would negotiate a follow-on agreement (SALT II) that would begin the process of inventory reduction.

SALT II

SALT II proved to be considerably more difficult to negotiate than SALT I had been. In October, 1977, the five-year moratorium ended and no follow-on agreement was in sight. Both governments unilaterally and simultaneously announced their intention to abide by the constraints of the Interim Agreement, pending a new accord. Not until May, 1979, was SALT II completed, and then it was never ratified. There were three principal reasons for the protracted negotiations of SALT II. First, during the 1970’s, technological improvements in weapons systems made verification of an agreement extremely difficult. The development of cruise missiles by the United States, the deployment of mobile launchers by the Soviet Union, and the deployment of multiple independently targeted reentry vehicles (MIRVs) by both sides required intrusive and cooperative monitoring measures that both sides were reluctant to accept.

Second, the détente relationship of the early 1970’s collapsed as the decade passed. Soviet-American

conflicts in the Third World fueled suspicions that the Soviet Union was determined to expand at Western expense. Soviet-Cuban involvement in Angola and Ethiopia during the mid- to late 1970’s particularly angered the United States. The Soviet invasion of Afghanistan in December, 1979, induced U.S. president Jimmy Carter to abandon the effort to ratify SALT II. Third, negotiations were complicated by domestic politics, particularly in the United States. President Nixon was disabled by the Watergate crisis, which forced his resignation in 1974. President Carter was slow to move the negotiations because of both overambition to produce drastic cuts and diplomatic ineptitude.

In 1974, President Gerald Ford met Leonid Brezhnev in Vladivostok to devise a general framework for a SALT II treaty. They agreed that each side would be permitted a total of 2,400 strategic delivery vehicles, of which 1,320 could be MIRVs. Five years later, under a different American administration, an agreement was reached. It was signed by Carter and Brezhnev at a summit meeting in Vienna.

Unlike SALT I, SALT II is a long and complicated agreement. The documents include a Treaty to remain in force through 1985, a Protocol of three years’ duration, and a Joint Statement of Principles to serve as a guideline for future negotiations. The main terms of the agreement can be summarized as follows: a ceiling of 2,400 strategic launchers, to decline to 2,250 by 1981; a limit of 1,320 on MIRV missiles and bombers; a further subceiling of 1,200 for MIRVs, ICBMs, and SLBMs; a further subceiling of 820 for MIRV ICBMs; a limit on the number of warheads on MIRV missiles; limits on the deployment of mobile missiles and cruise missiles; and a limit on Soviet production of the Backfire bomber.

By the time SALT II was signed, relations between the superpowers had deteriorated, making ratification in the United States politically difficult. Reagan, who was elected U.S. president in 1980, opposed the ratification of SALT II, though throughout his administration he adhered to its provisions (as did the Soviet Union). During the 1980’s, U.S.-Soviet relations radically improved, and subsequently the two states did agree on arms control measures that went breathtakingly beyond both SALT I and SALT II. The threat of nuclear devastation was substantially reduced by these agreements.

Sanctions

DEFINITION: Political, economic, or military measures adopted by one or more nations designed to coerce another nation into obeying international law or otherwise acceding to the coercive nations' will

TYPE OF ETHICS: International relations

SIGNIFICANCE: Sanctions provide a means short of full-scale warfare to encourage compliance with international law, but they may still be seen as violating the sovereignty of the nation being sanctioned.

International relations are marked by the lack of centralized mechanisms for maintaining order and punishing violations of international law. For this reason, states, in both their individual capacities and as collective groups, have relied on sanctions to punish of-

fending governments. Sanctions take a variety of forms, including the imposition of trade boycotts and embargoes, the freezing of assets held in foreign banks, the suspension of foreign aid or investment activity, the breaking of diplomatic relations, the establishment of blockades, and even the limited use of military force. Economic sanctions are not always effective in achieving compliance from the offending government. Their success is most likely when a large number of states that have commercial and economic ties to the offending state act quickly and firmly to impose sanctions, when the offending state is economically weak and unable to withstand the sanctions, and when third parties are unlikely to come to the offender's assistance. Historically, sanctions took the form of unilateral retaliation by the injured state against the offender. In the twentieth century, with the rise of international organizations such as the League of Nations and the United Nations, sanctions have been adopted as a multilateral mechanism for taking action against renegade states that violate international law.

HISTORY

Sanctions have always been present in international relations as a means of punishing violators of international law. In effect, an injured state, having no capacity to appeal to a higher authority, relied on its own resources to take action against governments that injured it by violating treaty obligations or customary international law. Several principles, however, placed ethical, moral, and legal constraints on how states could use retaliatory force and how much force they could use as a sanction against the offender. Three basic principles were involved. First, it was assumed that one could retaliate legally only when the action was in response to a prior illegal action or provocation. Second, it was assumed that the injured party would allow some time to resolve the dispute peacefully. Third, it was required that any retaliation would be proportional in character and degree to the original offense. Excessive retaliatory force was considered illegal, and restraint in the course of retaliation was expected.

With the emergence of global and regional collective security organizations in the twentieth century, governments moved toward the multilateral use of sanctions. Collective security organizations require their members to resolve disputes among themselves

peacefully; that is, to avoid the use of force against one another. When a member of a collective security treaty such as the United Nations illegally uses force against another member, other member states are expected collectively to resist and punish such aggression. Sanctions are typically employed to deal with such situations, although the severity of the sanctions and their effectiveness have varied substantially in actual practice, and in many instances there has not been adequate consensus to employ any sanctions at all. This happens when there is doubt about which state was actually the author of aggression and in cases in which a clear aggressor has powerful allies that will oppose efforts by collective security bodies such as the United Nations to take any action. In such cases, individual states are free to impose sanctions of their own against a state that has violated international law. Multilateral sanctions, in other words, have not replaced self-help by individual states but have supplemented it. When, how, and whether sanctions are imposed ultimately depends more on political realities than on ethical, moral, or legal considerations.

ETHICAL ISSUES

International relations are marked primarily by the principle that states are sovereign. This principle calls for nonintervention in the domestic affairs of a state. It calls for each state to recognize the independence, territorial integrity, and equality of other states. How then can sanctions be justified against a state? When should sanctions be imposed? Under collective security treaties to which governments have voluntarily subscribed, sanctions are justified when one state violates the territorial integrity of another state and, at least under the United Nations Charter, when such violations threaten international peace and security. In other words, if states have a right to territorial integrity and noninterference in their domestic affairs, then they have a duty to respect other states' independence and territorial integrity. Where clear-cut aggression occurs, sanctions are ethically, morally, and legally justified. The U.N. Security Council can act only if a majority of its members (that is, nine states, including the five permanent members who have veto power) agree to impose sanctions. If they fail to do so, then states are left to decide how to proceed to protect their rights and interests.

One of the most ticklish issues concerning sanctions turns on the question of their use against states for actions that are primarily domestic in character and that may not clearly threaten international peace and security. May the international community, for example, interfere in the domestic affairs of a state to punish it for mistreatment of its own citizens? States have, for example, imposed sanctions on their own, and at the request of the United Nations, to oppose South Africa's domestic policy of apartheid. Sanctions were imposed on Rhodesia when a white minority unilaterally declared independence during the 1960's. Such cases are, however, rare. Usually, sanctions are imposed when the domestic actions of states begin to have serious international consequences. When domestic instability produces civil war, refugee flows into neighboring states, boundary incursions, and the like, then states are more likely to impose sanctions.

Another problem with economic sanctions is that they often hurt the innocent population of a country without damaging or removing the culpable government, as happened in Iraq in the late twentieth century. For how long should states impose sanctions that are hurtful to the innocent? Here, ethical and humanitarian considerations must be weighed in the balance with political judgment.

CONCLUSION

Sanctions are imposed by states for many reasons. Sometimes they are meant to punish an aggressor, sometimes to pressure an outlaw state into compliance with international law, sometimes to prevent the further spread of conflict, and sometimes simply to express the moral indignation or outrage that the people and government of one country feel about the actions of another country's government. In the latter case, the imposition of sanctions fulfills its purpose in the very act of implementation even if the offending state fails to desist from its objectionable behavior.

Śaṅkara

IDENTIFICATION: Early Indian philosopher

BORN: c. 700, Kālaṣi, Kerala, India

DIED: 750, Himalayas

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: In his commentaries on the Hindu religious canon (the Prasthānatraya), Śaṅkara advocated monistic or Advaita Vedānta philosophy, which explains how to achieve the ultimate reality, or *Brāhmin*. He founded four Indian *mathas*, or monasteries.

The most influential philosopher of the Advaita, or nondualistic, school of Vedānta philosophy in India. Śaṅkara was considered the incarnation of the god Śiva. His view is representative of the main teachings of the Upaniṣads, which do not portray any consistent view of the universe and of reality. Śaṅkara detected a synthesis underlying the Upaniṣads and insisted on interpreting them in a single coherent manner. He tried to revive the intellectual speculation of the Upaniṣads through his reaction against the ascetic tendency of Buddhism and the devotional tendencies stressed by the Mimāṃsā school. The central position of Śaṅkara's philosophy is that all is one;

only the ultimate principle has any real existence, and everything else is an illusion (*māyā*). The basic teaching of Advaita Vedānta is that the direct method of realization of *Brāhmin* is the path of knowledge, which consists of getting instruction from a teacher, reflecting on its meaning, and meditating on truth with single-minded devotion. For Śaṅkara, philosophical discrimination and renunciation of the unreal are the basic disciplines for the realization of *Brāhmin*. Finite humanity can catch a glimpse of *Brāhmin* through a personal god, who is the highest manifestation of the infinite.

The self, or *ātman*, according to Śaṅkara, is pure subject and is never an object of consciousness. It is not a duality; it is different from the phenomenal, the spatial, the temporal, and the sensible. It is assumed to be foundational but it is in no sense a substance. Self is the ever-existent and self-existent first principle. It is not something that is unknown. One must come to the realization that one is *Brāhmin*. This is self-knowledge, the knowledge of self being the self of all things. One must realize one's identity as *Brāhmin*, for *Brāhmin* is knowledge. Self-knowledge and realization are one and the same. From the level of *Brāhmin*, nothing is seen to be real—not the existential self that people view as ego, not the worlds, and not the universes.

According to Advaita Vedānta philosophy, the highest good consists in breaking down the bonds that shut one out of the reality that one is. It is only the realization of *Brāhmin* that can give one permanent satisfaction. Śaṅkara wrote, "Attaining the Knowledge of Reality, one sees the universe as the nondual *Brāhmin*, Existence-Knowledge-Bliss Absolute." It is not possible for everyone to achieve this highest state, yet everyone can try to achieve it progressively, through his or her inner light. It is up to the individual to choose any course of action (*karma*) that is of value to that person. When one clings to the world, one looks for rewards for action and feels disappointed when the objects of desire are not achieved. This applies even to praiseworthy actions such as worship and giving alms. If these actions are performed with desire or attachment, they cause bondage. Therefore, nonattachment must be cultivated if one wants to progress to the highest good.

It is often believed that Śaṅkara discourages the performance of duties and advocates the discipline of nonaction for the realization of truth. This is not true,

however, because Śaṅkara's position is that because of *māyā*, or ignorance, one does not recognize one's true nature and finds oneself involved with the relative world of good and evil, life and death, and other pairs of opposites. Therefore, one tries to avoid evil and to do good, rising and falling according to the results of one's actions. Gradually, one discovers that it is impossible to attain lasting happiness and peace by clinging to rewards and realizes that work performed in the spirit of surrendering the results to God, in the spirit of calm, unattached by love or hate, by reward or punishment, purifies the heart and makes it inclined toward the cultivation of meditation and self-knowledge. The liberated person engages in service to humanity but not in an egoistic way, because a liberated person is above good and evil, above morality.

Release from the wheel of birth and rebirth comes through *jñāna*, or knowledge or insight, which lifts one out of one's individuality into the oneness of the infinite. At the beginning stage, one learns the art of concentration through the worship of the personal God and acquires purity of heart through performance of unselfish duties. In the next stage, one acquires knowledge of *Brāhmin* and realizes the impersonal absolute. The way of devotion (*bhakti mārga*) must be transcended if one is to realize the supreme good, the realization of self as *Brāhmin*. It is at this level that one becomes liberated from the endless sufferings of the world. This level can be achieved during one's lifetime. This freed soul does not have anything more to achieve but still continues to work for the welfare of the world. The liberated person does not negate his or her relationship to the finite world, since there is a direct relationship between the spiritual and the ethical. The freed soul (*jivan-mukta*) follows the moral code set down by his or her society, because he or she is unattached and freed from desires.

Santayana, George

IDENTIFICATION: Spanish philosopher, poet, and novelist

BORN: December 16, 1863, Madrid, Spain

DIED: September 26, 1952, Rome, Italy

TYPE OF ETHICS: Modern history

SIGNIFICANCE: The author of *The Life of Reason: Or, the Phases of Human Progress* (1905-1906), *Scepticism and Animal Faith* (1923), and *Realms of Being* (1927-1940), Santayana posited an evolution of ethics that led to lifestyles that emphasized detachment, contemplation, kindness, faith, and a sense of irony about human failings.

A materialist and a gentle skeptic, George Santayana expressed himself as sensitively in his extensive formal and philosophical writings as he did in his poetry and novels. Pushing doubt as far as he could, he ended his explorations believing that everything could be doubted except, possibly, faith. Such "animal faith" sprang, he explained, from humankind's survival instincts. Santayana's somewhat Platonic ideal world arose from primitive magic and science and took a higher form in religion. The ethics that he derived from his philosophizing were explained as the results of a three-phase historical evolution. Early, or prerational, morality, although culturally rich, was crude and without consistent application. Its refinement, rational morality, was a vital outgrowth of humankind's general adherence to the dictates of reason and, as the nineteenth century well understood, to a belief in progress.

The horrendous effects of two world wars, however, supplanted the positivism of rational morality

with postrational pessimism. With little that was positive distinguishing this world, humankind's attention shifted to the promise of otherworldliness—for Santayana, the sad end of ethical development. After years of teaching at Harvard University, Santayana, the recipient of an inheritance, took up residence in Rome, thereafter exemplifying a lifestyle that conformed with his ethics. It was a contemplative existence marked by a kindly, tolerant skepticism and detachment. Able to cultivate the interrelated values of science, art, and religion, he came as close as a doubter could to assessing the benefits of his ideal society.

Sartre, Jean-Paul

IDENTIFICATION: French philosopher, playwright, and novelist

BORN: June 21, 1905, Paris, France

DIED: April 15, 1980, Paris, France

TYPE OF ETHICS: Modern history

SIGNIFICANCE: The leading proponent of modern existentialist thought, Sartre departed from traditional ethical theory with his subjectivist perception of human morality. He is the author of *Being and Nothingness* (*L'Être et le néant*, 1943), *Existentialism and Humanism* (*L'Existentialisme est un Humanisme*, 1946), and various plays and novels reflecting existentialist themes.

At the heart of Sartrean ethics is the same basic premise that defines Jean-Paul Sartre's larger existentialist philosophy: that humanity makes itself. There is no created human nature and thus no prescribed grounds for behavior apart from what the individual chooses. This is not to say that ethics was peripheral to Sartre, or simply an afterthought. Even during the formative days of his philosophical career, before World War II, he emphasized the need for "authenticity" in human behavior, which is one of the cardinal tenets of his theory of morality.

His first novel, *Nausea* (*La Nausée*, 1938), is the story of a young scholar seeking to learn more about

an obscure historical figure, and his research leads him to face the universal human tendency to distort real identity. For Sartre, this "unauthenticity" precluded genuine morality by denying the most elemental truth. Sartre's experiences in World War II—witnessing the defeat of France by Germany and his own imprisonment in a Nazi camp—further convinced him that morality must emanate from candidly facing the truth about one's existence.

EXISTENCE PRECEDES ESSENCE

In Sartre's thought, there was no higher being, no God who had created human nature, and thus no transcendent basis for ethics. "There is no human nature," he wrote, "since there is no God to conceive it." Candidly atheistic, Sartre turned away from traditional religion. An individual, he argued, exists before he or she has a nature (essence), and the essence that a person acquires is the result of his or her own choices and their translation into action. The pivotal emphasis is upon action, for intentions alone do not shape essence.

Jean-Paul Sartre. (Library of Congress)

If this seems to place Sartre clearly within a relativist genre of ethics, other factors qualify the apparent radical individualism of his thinking about morality. The first is his unflagging zeal for human responsibility. Although one does shape one's own essence, one is also responsible—for the sake of authenticity—to be consistent with the goals of one's chosen way of life. For example, one who eschews dishonesty can hardly spend his or her life lying or otherwise deceiving others. Responsibility in Sartrean ethics is tantamount to commitment, a view that has an interesting correlation with more conventional ethical thinking in the Judeo-Christian and other great major religious traditions.

A second dimension of Sartrean ethical thought that limits extreme relativism and individualism is Sartre's perception of "bad faith" (*mauvaise foi*). It is bad faith, to Sartre, to pretend—particularly to oneself—to be something that one is not. Social role-playing such as "being" a student, professor, worker, or attorney is one level of such bad faith, but so is assuming that one's being is exhausted by such a definition. People are more than the social roles they play, and morality is much more than being good at performing the expected behavior patterns. Although there is no one in the final analysis to help one make choices, one is responsible to one's past and anticipated future to be sincerely what one is.

Furthermore, Sartre defined individual existence in terms of broader human existence. Just as a person is the product of the past, he or she is also relational. The surrounding world of things, as well as other people, is an integral part of one's existence and therefore morality. In the play *No Exit* (*Huis clos*, pr. 1944, pb. 1945), the characters are in Hell, which is symbolized by a small room where each is subjected to the piercing gaze of the others. One of them, Ines, is a lesbian who is responsible for the death of her friend's husband. Like Garcin, a deserter, and Estelle, a child-killer, Ines can find no escape from the others' eyes and presumed judgment.

No less a philosopher than Immanuel Kant had raised similar moral issues, but he did so in terms of the question of whether a person could legitimately want his behavior to be universal. Kant's "categorical imperative," as it is called, assumed a universal transcendent moral order. Sartre did not, but neither did he advocate behavior that did not in some sense aid the existence of others. If Sartre thus seemed to ap-

proximate such concepts as love and universal moral premises, he remained humanistic in his ethical theory. The significance of others in one's ethics is that they also objectively exist and are part of the individual's responsibility.

BEING-FOR-ITSELF

Basic to this line of ethical reasoning is Sartre's distinction between being-for-itself (*pour-soi*) and being-in-itself (*en-soi*). Being-in-itself is the type of existence that defines things. A rock's essence and being are identical. There is no self-conscious reflection, no selfhood at stake. In short, there are no choices to be made by things. Human existence is radically different, a being-for-itself; that is, the human mode of existence is one of active choices and bearing the responsibilities for the outcome of those choices. In that sense, it is being-for-itself. Humanity also exists "*en-soi*," however, and this dual nature demands responsibility. A tree or rock cannot decide, either for itself or for other things, what to do or be. Humans can and must. The individual is in the present, facing the de facto past and facing a future that requires continued decision making and acting on those decisions responsibly.

IMPLICATIONS FOR ETHICAL CONDUCT

In the Sartrean view of human life, nothing counts more than responsibility. Indeed, responsibility is the essence of being human. With no higher moral order either to shape one's essence or by which to judge one's actions, one must face squarely individual responsibility as well as the possible impact that one's behavior might have on others. Sartre's own estimation of the ethical implications of his ideas focused on the notion that the individual's quest for being is related to that of humanity as a whole. People are, he argued, agents "by whom the world comes into being." Lacking in Sartrean ethics is a transcendent source of value, but there are good reasons in the existentialist perspective to love, to help others, and to discipline one's actions.

Schindler, Oskar

IDENTIFICATION: German industrialist

BORN: April 28, 1908, Zwittau, Moravia, Austria-Hungary

DIED: October 9, 1974, Frankfurt, Germany

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Schindler saved eleven hundred Jews from certain death during the Holocaust. His actions testify that ordinary people facing extreme danger can act in an ethical manner.

Nothing in Oskar Schindler's early life suggested that he would one day become a moral hero. A poor student, he was expelled from school at the age of sixteen for playing pranks. After marrying in 1928, Schindler soon became bored with his wife; he frequented taverns and took up with other women. After his father went bankrupt in 1935, Schindler became a salesman for the Moravian Electrotechnic Company. In 1938 he joined a local branch of Adolf Hitler's Nazi Party. During that same year, the German intelligence service recruited Schindler to gather military information during his business travels in Poland.

One month after the German army occupied Poland in September, 1939, Schindler arrived at

Image not available

Oskar Schindler in 1968. (AP/Wide World Photos)

Krakow looking for moneymaking opportunities. In Krakow he acquired a Polish enamelware company that the Nazis had confiscated from its Jewish owner. Cultivating the friendship of high-ranking Nazi officials, Schindler showered them with gifts and in early 1940 received contracts to produce field kitchenware for the German army. The Jewish slave labor that Schindler used in his plant made his contracts particularly lucrative. Schindler became wealthy and lived lavishly, supporting several mistresses.

At first, Schindler objected to Nazi mistreatment of Jews because arbitrary abuse of his workers interfered with efficient operation of his factory. However, after he realized, in mid-1942, that the Nazis intended to kill all Jews, Schindler's opposition became more principled, more far-reaching, and increasingly dangerous to him. He was arrested on three separate occasions, but each time he managed to be released. Schindler then began deliberately staffing his factory with Jews who appeared to be in greatest danger of being sent to Nazi death camps. He certified children,

intellectuals, and the elderly as machinists whose labor was vital to the German war effort.

SCHINDLER'S LIST

After the Germans eliminated Krakow's Jewish ghetto, Schindler, at his own expense, set up a sub-camp around his factory so that his workers could avoid living in the terrifying Plaszow labor camp. In September, 1944, Schindler learned that the Plaszow camp was about to close; all its inmates were to be sent to death camps. Through cajolery and bribery, he received permission to move his factory to Moravia, in eastern Czechoslovakia, taking his workers with him. The names of the laborers who were to go with him made up the famous "Schindler's list" of eight hundred men and three hundred women who survived the Holocaust because of Schindler's efforts. When the women on Schindler's list were mistakenly sent to the Auschwitz death camp, Schindler personally arranged for their release—the only mass rescue reported by Holocaust survivors.

Why Schindler, ostensibly an unscrupulous fortune hunter, risked losing his life and wealth to aid the Polish Jews is unclear. He afterward said it was the human thing to do; however, few others in positions similar to his acted as he did. When Schindler arrived in the American Zone of Austria in 1945, he was penniless, and he never again succeeded in business.

During the final decades of his life, Schindler lived on donations from the Jews whose lives he once had saved. In 1993, nearly two decades after Schindler died, director Stephen Spielberg told the story of his heroism in *Schindler's List*, a film honored with several Academy Awards, including best picture.

Schopenhauer, Arthur

IDENTIFICATION: German philosopher

BORN: February 22, 1788, Danzig (now Gdańsk), Poland

DIED: September 21, 1860, Frankfurt am Main (now in Germany)

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Schopenhauer's pessimistic philosophy, put forward in *The World as Will and Representation* (*Die Welt als Wille und Vorstellung*, 1819), advocated an ethics of asceticism, yet his emphasis on the primacy of will influenced both will-to-power thinkers and modern existentialists.

Financial independence enabled Arthur Schopenhauer to devote his life to philosophy, and he developed his pessimistic system as a follower of Immanuel Kant. In *The World as Will and Representation*, he identifies the will as the Kantian thing-in-itself that comprehends the external world through the mental constructs of time, space, and causality. As Schopenhauer understood it, will comprises intellect, personality, and the potential for growth and development. Although powerful, it is not free but is controlled by causation like all else that exists.

Confronting a meaningless existence and a godless universe, Schopenhauer concluded that ethical behavior requires withdrawal from the pleasures of life in favor of contemplation. The individual must tame the will so that it becomes less insistent on its egoistic desires, which lead only to further desires. Where others are concerned, the proper attitude is compassion, since they too suffer an identical fate. The truth of Christianity, according to Schopenhauer, lies in its early emphasis on renunciation of the world and an ascetic life. Although he failed to clarify how this asceticism could be achieved in the absence of freedom, Schopenhauer's work includes a strong suggestion. Because human actions are explicable through motives, he equates motive with cause. Thus, causation may be rooted in intellectual concepts. As the individual recognizes the futility of existence, he or she can become compassionate toward others and accept the futility of desire.

Schweitzer, Albert

IDENTIFICATION: German theologian and missionary

BORN: January 14, 1875, Kaysersberg, Upper Alsace, Germany (now in France)

DIED: September 4, 1965, Lambaréné, Gabon

TYPE OF ETHICS: Modern history

SIGNIFICANCE: A important theologian who was always interested in public affairs, Schweitzer used his *Philosophy of Civilization (Kulturphilosophie I: Verfall und Wiederaufbau der Kultur, 1923)* to explore the ways in which civilization had become “self-destroying.” He received the 1952 Nobel Peace Prize.

In his early adulthood, Albert Schweitzer was an organist, a music scholar, and a world figure in theological studies. In 1905, Schweitzer began studying to be a physician so that he could be a mission doctor in equatorial Africa. In 1913, he opened a clinic in Gabon, doing much of the building with his own hands. He lived there for most of the rest of his life.

Schweitzer’s work in Africa caused him to contemplate world civilization as a whole. He developed an ethics that he called “Reverence for Life.” He believed that life itself was of the highest value, but that life is harsh and self-destructive. People should treat every form of life with the same reverence that they afford their own. They should do this by trying to reach their own highest level of perfection and by helping their society reach perfection. These two goals are often contradictory: In raising the individual, one must keep in mind one’s responsibilities to the society. In addition, because humans destroy something or someone by their every act, every action taken to attain perfection also results in destruction. This awareness drove Schweitzer’s philanthropy but also made him an unhappy man.

Science

DEFINITION: Formal theorization and experimentation designed to produce objective knowledge, especially knowledge of the general laws governing the natural world.

TYPE OF ETHICS: Scientific ethics

SIGNIFICANCE: Modern standards of scientific inquiry require science to be conducted as far as possible in an impartial, disinterested fashion, but most forms of science cannot be conducted at all without major sources of funding which may influence inquiry either directly or indirectly. Ethical issues raised by science also include appropriate treatment of living research subjects and the practical effects upon the real world of scientific discovery.

Science, ethics, and philosophy interact in a range of arenas. The development of ethical standards—that is, codes of behavior that govern moral decisions—has been a major issue for the great philosophers and thinkers throughout time. Traditionally, metaphysical hypotheses and religious beliefs have governed the attempts of humankind to fathom the unfathomable, to come to grips with mortality, and to hold themselves to a set of standards of conduct. The science of the twentieth century influenced this search, in some cases incorporating, in some cases rejecting, religion as a part of that effort.

The writings of Albert Einstein epitomize the attempt to reconcile science with religion. Einstein holds a central place in modern history because of his groundbreaking ideas on theoretical physics. He writes, “To know what is impenetrable to us really exists, manifesting itself as the highest wisdom and the most radiant beauty which our dull faculties can comprehend only in their most primitive forms—this knowledge, this feeling, is at the center of true religiousness.”

At the same time, the achievements of science and technology have posed their own moral dilemmas. For example, the theory of relativity, developed by Einstein during the early twentieth century, set the stage for the development of the atom bomb. In the face of a creation with such awesome destructive potential, however, the question is posed: To what extent should scientists involve themselves in the ultimate consequences of their research?

For this generation and for generations to come, the advances in the fields of genetics and biomedicine are likely to give rise to similar dilemmas. The much-seen film *Jurassic Park* (1993) focused the popular consciousness on the risks inherent in bioengineering technology. With all their inherent potential for good, genetic technologies may carry as yet unknown risks and consequences.

The limited amount of funding available for scientific research has forced both scientists and those responsible for science policy to make choices regarding which projects to fund. Should “big” projects such as the Human Genome Project or the Superconducting Supercollider (SSC) be funded or should many smaller but important projects receive government or private monies? Where should these “big” projects be located? Should basic research be targeted in the hope of eventual payoff or should applications research be the major focus? Are political and economic concerns playing a too-important role in the funding process? To what extent should science and mathematics education be considered a priority?

During the late 1980’s and early 1990’s, the spotlight turned on ethical conduct and misconduct in scientific research. A major challenge to both the scientific community and the community at large is this: What is the appropriate response to scientific fraud and misconduct? What should be the response to the “gray areas” of even more problematical situations of conflict of interest or “honest mistakes”?

PHILOSOPHICAL ISSUES

As a guide in an attempt to deal with the range of ethical issues involved in scientific research, the scientific community and the community at large might look to philosophical thinkers who have dealt with issues in this field. In fact, from antiquity through the beginning of the twenty-first century, the great thinkers concerned themselves with issues not only of philosophy, ethics, and morality but also with those of science. Aristotle, René Descartes, and Immanuel Kant made major contributions not only to philosophy but also to the sciences. Wolfgang von Goethe, although best known for his literary works, also wrote extensively on the natural sciences.

At the same time, science has had a major, sometimes even a revolutionary, impact on the values and the worldview of society. The theories of Galileo and Isaac Newton on planetary motion and the views of

Charles Darwin on the evolution of species had that kind of revolutionary impact. Similarly, the development of the atom bomb strongly influenced the political and social climate of the latter half of the twentieth century. It is likely that major advances in computer science and bioengineering now taking place will have their impact well into the twenty-first century. It is equally likely that scientists and society will have to deal with the ethical dilemmas posed by the positive and negative capabilities of these technologies.

The analysis of moral and ethical decisions in science might make use of following principles of ethics and philosophy.

The value neutrality of science is epitomized by the vision of the scientist as the ceaseless seeker motivated only by the search for truth. This theory has its basis in features first introduced in the seventeenth and eighteenth century. The theory of the scientific method, which is known as inductivism, has relied on this concept and postulates that science begins with the collection of data, goes on to generalize about laws and theories, and makes predictions that can be proved. The theory of inductivism had its roots in the writings of Francis Bacon in the sixteenth and seventeenth century and in the empiricist theories developed by David Hume in the eighteenth century. The inductivist view was supported by the Cambridge school of Bertrand Russell during the early twentieth century and the Vienna circle of the 1920’s and 1930’s.

Critics of the Vienna circle and of inductivism have included Karl Popper. Popper maintains that the concepts and postulates (which are ultimately proved or disproved by experimentation) are the products not necessarily of observations but of potentially “unjustified (and unjustifiable) anticipations, by guesses, by tentative solutions to our problems, by conjectures. The conjectures are controlled by criticism; that is, by attempted refutations, which include severely critical tests.” The source of the hypothesis is irrelevant; the originator of the hypothesis or postulate joins in the criticism and testing of the hypothesis that he or she has proposed. Popper is considered to have inaugurated the current era in the philosophy of science.

MISCONDUCT IN SCIENCE

The embarrassment of the “honest mistake” is far surpassed by the violation of the ethos of science of

the outright fraud. Fraud in science impugns the integrity of the research process and destroys the trust on which scientific achievement is built. At the same time, intentionally fraudulent actions undermine the confidence of society and the body politic in science and scientific inquiry. Potentially, the effects of fraud may be horrific; if, for example, a medical treatment should be based on fraudulent results.

Many scientists base their codes of conduct on the example of role models and on what some have termed the "school of hard knocks." A more systematic approach has been contributed by professional organizations who have contributed their expertise. A recent contribution is a 1989 publication of the National Academy of Science, *On Being a Scientist*. Other resources include a 1992 report, likewise from the National Academy of Sciences, called *Responsible Science: Ensuring the Integrity of the Research Process*. These publications and others often cite as examples of fraud and misconduct the actions of William Summerlin at Sloan-Kettering during the 1970's, those of John Darsee at Harvard and those of Stephen E. Breuning in Pittsburgh during the early 1980's, and those of Thereza Imanishi-Kari and Nobel laureate David Baltimore during the late 1980's.

A well-known and rather tragic example of fraud was that of William Summerlin. During the early 1970's, Summerlin came to the Sloan-Kettering Institute as the chief of a laboratory working on transplantation immunology. A laboratory assistant noticed that the supposedly black grafts on white mice could be washed off with ethanol. It turned out that Summerlin had used a black felt-tipped marker to mimic the appearance of black grafts. Additional discrepancies regarding Summerlin's results on corneal transplantations led an internal committee to recommend that Summerlin take a medical leave of absence and to condemn Summerlin's behavior as irresponsible.

During the early 1980's, John Darsee had worked under the supervision of Eugene Braunwald, a well-known cardiologist at Harvard University. At Harvard, three coworkers apparently observed Darsee fake data for an experiment. An internal investigation for the next few months found no discrepancies. A subsequent National Institutes of Health (NIH) investigation, however, demonstrated that virtually every paper that Darsee had produced was fabricated.

Another episode involved a professor at the University of Pittsburgh, Stephen E. Breuning, who had

become prominent for his expertise in the medical treatment of mental retardation. In 1983, Breuning's former mentor, Robert Sprague, questioned the veracity of his student's research. Eventually, it turned out that much of Breuning's data came from experiments that had not been performed on subjects that had not even been tested.

An exceptionally disturbing case was that of Thereza Imanishi-Kari and Nobel laureate David Baltimore of the Massachusetts Institute of Technology (MIT). A postdoctoral fellow at Imanishi-Kari's laboratory, Margot O'Toole, uncovered evidence that Imanishi-Kari may have fabricated certain results appearing in a paper in *Cell* on gene transplantation, a paper that was also coauthored by Baltimore. University inquiries at MIT dismissed O'Toole's concerns, but a few years later, the concerns resurfaced, resulting in ultimate retraction of the *Cell* paper and investigations by the NIH, Congressman John Dingell, and the Secret Service. While the U.S. attorney in the case declined to prosecute Imanishi-Kari, as of this writing, clouds continued to obscure her career and that of Baltimore.

During the late 1980's and the early 1990's, more than two hundred allegations of misconduct in science were received by the U.S. government. One study has indicated that approximately 40 percent of the deans of graduate schools knew of cases of misconduct at their institutions. A survey sponsored by the American Association for the Advancement of Science likewise indicated that during the first ten years, 27 percent of scientists indicated that they had personally encountered incidences of falsified, fabricated, or plagiarized research.

In fact, by the late 1980's and into the early 1990's, articles on misconduct in science continued to constitute the vast majority of references on science ethics produced by computerized literature searches. During the late 1980's, incidents of apparent fraud, plagiarism, and misconduct drew the attention of the Subcommittee on Oversight and Investigations of the U.S. House of Representatives, chaired by Congressman John D. Dingell. The threat not only to the research process but also to the autonomy of the scientific community posed by examples of abuse has challenged scientists to develop ways of dealing with misconduct within their ranks. Congressman Dingell himself acknowledged the drawbacks of resolving issues of misconduct in the congressional hearing.

“Encouraging science to police itself is far preferable to the alternatives . . . But with every case [which is] is covered up or mishandled, pressure builds for such extreme measures.”

GRAY AREAS

Certain instances of apparent fraud violate any accepted standards of moral or ethical conduct. Many other situations, however, fall into what might be termed a “gray area.”

For example, a vexing question concerns the allocation of credit for scientific achievements. The bitter dispute between Newton and Gottfried Wilhelm Leibniz over who first discovered the calculus is paralleled by the twentieth century quarrel between Robert Gallo, the renowned acquired immunodeficiency syndrome (AIDS) researcher at the NIH, and his counterpart at the Pasteur Institute, Luc Montagnier, over the discovery of the AIDS virus.

Also in what might be termed a “gray area” are issues of “conflict of interest.” (Outright bribery to promote fabrication of results would violate most standards of conduct.) By the late 1980’s and early 1990’s, doubts over the degree to which scientists’ findings might be influenced by funding sources led journals such as *Science*, *JAMA*, and the *New England Journal of Medicine (NEJM)* to adopt standards of disclosure for potential conflicts of interest. The *JAMA* and *NEJM* standards stressed financial conflicts; the *Science* standards also include a range of other relationships that might possibly have influenced the scientist’s work. The possibility of abuse inherent in these kinds of standards has led to a “backlash” as scientists and physicians engaged in medical research talked of a “New McCarthyism in Science” and evoked the possibility that not only financial conflicts but also such factors as religion and sexual orientation might be included in the disclosure standards. Kenneth J. Rothman, writing in the *Journal of the American Medical Association*, cites Popper (*The Open Society and Its Enemies*, 1966) in noting the impossibility of achieving full objectivity in any scientific endeavor.

Equally problematical for the scientist—and also in a “gray area”—are the new ethical problems created by scientific discoveries. Are scientists responsible for the ethical and moral uses of their discoveries? For example, should decisions about the use of the atom bomb have been in the hands of the scien-

tists or, as actually occurred, in the hands of the politicians? Should scientists attempt to exert any kind of control over the uses of their discoveries?

A tradition of political neutrality governed science from the seventeenth century through World War I. Bacon, for example, conceived of science as a “new instrument.” The chemist Robert Hooke warned the founders of the Royal Society of London that their business was to “improve the natural knowledge of things, not meddling with Divinity, Metaphysics, Moralls, Politicks, Grammar, Rhetorick or Logic.” World War I, however, disrupted the tradition of neutrality as technological solutions not only made up for the losses of raw materials caused by the war but also played a major role in enhancing the lethal effect of explosive and chemical weapons.

Political authorities continued to come into the scientific arena with the advocacy by Joseph Stalin’s regime of the 1930’s and 1940’s of the genetic theories of T. D. Lysenko. Nazi Germany purged its Jewish and left-wing scientists. Some disapproving scientists left the country, but others remained, adhering to a tradition that held no place for social responsibility and hoping to exert influence on the Nazi regime. World War II gave impetus to research in a range of areas, as synthetics replaced raw materials and new drugs such as penicillin became available. Refugee scientists from Nazi Germany encouraged preliminary research on an atom bomb. The ensuing success of the Manhattan Project resulted in the explosion of the atom bombs over Hiroshima and Nagasaki, which was followed by the development of atomic capability by the Soviet Union in 1949.

The dilemma for scientists is this: To what extent should they concern themselves with the ultimate consequences of their discoveries? Is scientific knowledge and discovery an inherent good? Are the risks of scientific and technological advances as important as the potential benefits?

The challenges posed by the development of the atom bomb are paralleled by issues raised by the scientific advances of the 1980’s and 1990’s. The development of computer and electronic technology raises some important issues of privacy and the possibility of social control. Equally problematical are issues raised by advances in the biological and medical sciences.

An additional ethical issue concerns the eradication of racism and sexism in science. For example, a

particularly shocking example of racism involved the Tuskegee syphilis experiment. During a forty-year study that received federal funds, African American victims of syphilis were denied treatment even after penicillin became available. The apparent justification was that the denial of treatment was essential to the study of the progress of the disease.

A challenge for researchers is to design studies of common illnesses (for example, myocardial infarction, diabetes) that not only provide sufficient data on the white middle-class male population but also include information on which to base the treatment of minority and female patients.

ALLOCATION OF RESOURCES

Scientific research in the United States is funded to a large extent by the U.S. government. Major corporations, such as large pharmaceutical companies, support much of the rest. What are the implications of these facts?

The marriage of science and government dates back to World War II and Vannevar Bush, who then headed the Office of Scientific Research and Development. In the system that evolved, research proposals are initiated by the researcher, who usually works in a university or institute setting. At the same time, funding was a federal responsibility, and although some research was taking place in government laboratories, most basic research was undertaken in universities. There arose not a single funding agency, as envisioned by Bush, but a multiplicity of agencies—responsible for funding basic research.

By the late 1980's, the numbers of individuals involved in basic research had increased, while the pool of dollars available stayed the same. The result was that a far smaller proportion of grant proposals were being funded. For example, in 1980, the NIH approved up to one in three "meritorious" grants for funding, while by the 1990's, fewer than one in five grants received approval. The system in place through the latter half of the twentieth century achieved scientific productivity, as measured by the numbers of citations; prestige, measured by the numbers of Nobel Prizes; and some degree of economic productivity.

During the late 1980's and early 1990's, the lessened availability of funding and the potential for political abuse and "pork-barrel" science led some experts to question the current criteria for funding

scientific research. At the same time, the costs of new technologies and issues relating to the use of those technologies have led some people to question the direction of public policy on science issues. This position has yet to be adopted by public policy makers. The direction of governmental policy at the beginning of the 1990's is reiterated by Donna Shalala, Secretary of the federal department of Health and Human Services. Shalala states:

The last thing we should try to do is try to curb technology in our attempt to deal with costs or to slow down our investment in research. . . . The issue is how you use technology, far more than whether we should keep producing technology. Rather than beating up on technology, we need to get scientists and administrators to think about the more appropriate use of it.

Adele Lubell

Scientology

DEFINITION: Controversial modern religious organization

DATES: Founded as a church in 1954

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Many former members of the Church of Scientology have accused the organization of such cultlike practices as brainwashing, intimidation, and financially controlling its members. Many people also question Scientology's claims to be a religion, accusing its leaders of using the church as a ruse to exploit the tax-exempt status and other privileges afforded to religious organizations.

The foundation of any new "religion" is an audacious undertaking, as most people's notions of spirituality are inextricably linked to the traditions of their cultural legacies, making the exact characteristics of the concept difficult to define. Nonetheless, religions are generally regarded as systems of belief in which spiritual values are held in higher regard than material values.

During the early 1950's science-fiction novelist L. Ron Hubbard attempted to found an entirely new church based on a belief system that he called "dianetics." Difficult to describe succinctly, dianetics is a practice that combines elements of Buddhism, psychology, and new age mysticism into an eclectic philosophy that is characterized by its penchant for forms of discipline and systematization. In this regard, dianetics is more akin to the pragmatic, materialistic focus of modern scientific thought than to what Hubbard viewed as the metaphysical vagaries and superstitions of traditional religion. The Church of Scientology that Hubbard formed in 1954 takes its name from its ostensibly unique synthesis of traditional spiritual principles and scientific rationality. It focuses especially on efforts to control negative emotions that, according to Hubbard, impede the individual's progress toward inner peace, satisfying interactions with others, intellectual growth, and material prosperity.

As dianetics and Scientology became well known during the 1960's and 1970's, so did the controversies surrounding these new belief systems. Detractors of Scientology dismissed it as a legal entity rather than a spiritual one, many claiming that Scien-

tologists merely organized a “church” in order to receive tax-exempt status. Critics cited the ambiguities and secrecy that make it difficult for outsiders to understand Scientology’s organization and belief system, as well as the organization’s apparent emphasis on material success as a measure of its members’ spiritual growth.

By the late 1960’s, the church’s net worth was estimated at one billion dollars. The fact that that sum rivaled the assets of many major traditional religious institutions called Scientology’s financial practices into question. Scientology became the target of media criticism and eventually litigation by those claiming that the group brainwashed its members, required them to pay large sums of money to advance to the higher levels of membership, expected them aggressively to recruit new members, and systematically alienated them from relatives and friends who were not involved with the church.

Critics of Scientology also cited the group’s penchant for science-fiction symbolism and imagery as casting serious doubts on its authenticity as a genuine religious institution. Although the symbolism of Scientology evokes elements a variety of traditional belief systems, images of spacecraft and extraterrestrial life abound in its rituals and mythos. Scientology’s popularity demonstrates that many followers throughout the world believe that they have benefited from its rationalistic and original approach to spiritual enlightenment. However, those who accuse Scientology of being a cult that manipulates its members to its own self-serving ends cite such things as its references to space travel and extraterrestrial life and its eclectic and allegedly haphazard reinterpretation of traditional religious ideas. Nevertheless, Scientology remains widely discussed and debated as a development in the evolution of contemporary religious thought and practice.

Scorched-earth policies

DEFINITION: Military strategies calling for the destruction of the natural environment, particularly food resources, as a deliberate means of waging warfare

TYPE OF ETHICS: Military ethics

SIGNIFICANCE: Whether offensive or defensive, scorched-earth tactics do harm to noncombatants and cause environmental and economic damage that can outlast by years the war of which they are a part. They raise the fundamental issue of the ethical limits of warfare and whether warring parties have any moral obligations to limit the ill effects of their actions or whether belief in such obligations is unrealistic in the context of war.

In its narrow sense of setting the grass of the plains on fire, the practice of scorched-earth warfare is particularly associated with the steppelands of Russia and the Ukraine. The first attested example of the practice occurred during a war between the Scythians and the Persians in 512 B.C.E. (recorded by Herodotus in 440 B.C.E.). The Scythians, a nation of nomadic horsemen, lured the Persian army of Darius ever deeper into the steppe by retreating before the Persians. Some Scythians then doubled back, destroying the grass and poisoning the wells along the Persians’ original route, believing that this would prevent the Persian cavalry’s escape (since their horses would be deprived of food). As the Scythians candidly recalled, however, their plan backfired. The Persians escaped by retracing their footsteps, despite the devastation they encountered.

MODERN WARFARE

Analogous tactics were used more than two millennia later. During the Russian retreat before the invading army of Napoleon Bonaparte in 1812, the Russians themselves burned Moscow and the croplands along the route of Napoleon’s advance. When the tide of battle turned, the French army had to retreat through a devastated countryside that offered no food or shelter. This successful use of the

scorched-earth policy as a patriotic and defensive tactic—enhanced by Leo Tolstoy’s epic depiction of Russian sacrifices during 1812 in his historical novel *War and Peace* (1865-1869)—lent it an enduring positive aura, at least in the Russian context.

More typically, however, scorched-earth tactics used defensively have backfired. If one goes along with environmentalist Arthur Westing’s interpretation that deliberate destruction of the land by other means, such as flooding, is also scorched-earth policy, then the most cataclysmic example in the twentieth century occurred during the second Sino-Japanese War (1937-1945). In 1938, as a defensive measure, the Chinese dynamited a major dam on the Yellow River. This temporarily halted the Japanese advance and resulted in several thousand Japanese casualties; in the long run, however, several hundred thousand Chinese, mainly civilians, drowned, and damage from flooding continued for a decade.

Scorched-earth tactics used offensively have tended to be successful in the short run. Major incidents of deliberate crop destruction as a means of offensive warfare have abounded throughout history. During the Peloponnesian Wars (431-404 B.C.E.), the Spartans repeatedly destroyed the Athenian grain crops (and, not incidentally, won the war); the Athenians did not choose to employ a tactic that until then had been used only by barbarians. Widespread crop destruction, in large part deliberate, accompanied the ravages of the Huns, the Vandals, and the Mongolian conquests (1213-1224). The Mongolian conquerors of Mesopotamia destroyed the ancient irrigation works on which agriculture had depended for millennia, and the Fertile Crescent became a desert. In the Thirty Years’ War (1618-1638), the majority of Czech casualties (up to 75 percent of the population of Bohemia) resulted from starvation and disease caused by crop destruction.

The use of scorched-earth tactics increased in the modern era, and it came to be morally justified as a humane means of bringing war to a swifter conclusion. The theory was formulated in the American context during the U.S. Civil War (1861-1865) by two Union generals, Philip Sheridan and William Tecumseh Sherman. One of the many ways in which this war transformed civilization was an increased consideration of all factors that contributed to the war effort, including food itself. As part of a conscious policy of bringing the war home to the civilians who

supported the soldiers, in order to make the war end quickly, Sheridan oversaw the destruction of about 2,700 square miles of agricultural land in the Shenandoah Valley, and Sherman’s troops laid waste to about 15,000 square miles of rural Georgia (1864). As a result, the war did indeed end quickly. In view of the success of these tactics, they were incorporated into U.S. policy during late federal government wars with Native Americans and again during the U.S. intervention in the Philippine Insurrection around the turn of the twentieth century.

NUCLEAR WAR AS AN ALTERNATIVE

The apotheosis of the scorched-earth policy as a fast way to end a war, justified by the idea that there would be fewer total casualties, was the atom bombing of Hiroshima and Nagasaki in Japan in 1945. This action immediately ended Japanese participation in World War II, but it raised ethical questions that cannot be easily answered.

The ultimate scorched-earth policy would be a nuclear war, after which the affected parts of the earth would be so scorched as to be uninhabitable for thousands of years. The ultimate scorched-earth policy thus brings one back to the discovery made by the cunning Scythians who may be credited with inventing it in the first place: It tends to backfire. Defenders who employ the tactic find that they have a tiger by the tail: Both immediately and in the long run, they may do far more damage to themselves than to the invading enemy. Those who employ scorched-earth tactics offensively stand to lose on many counts: They put themselves in an extremely weak position in world opinion, since the policy will justifiably be termed barbaric; they are destroying the earth’s resources, thereby impoverishing themselves as well as others; and they are moving in the direction of total war, which tends to blur distinctions not only between combatants and noncombatants but also between the opposing sides.

Scott v. Sandford

- THE EVENT: U.S. Supreme Court decision placing limits on Congress's ability to control slavery and determining that African Americans were not eligible to become U.S. citizens
- DATE: Ruling made on March 6-7, 1857
- TYPE OF ETHICS: Modern history
- SIGNIFICANCE: The Supreme Court's decision in *Scott* strengthened slaveholders' claims that they had unlimited property rights to slaves and affirmed that slaves were legally incapable in principle of ever gaining the protections of the Bill of Rights.

Scott v. Sandford was the result of a suit for freedom by the slave Dred Scott. Scott's master had taken Scott to serve him during an army posting in the northern part of the Louisiana Purchase, where slavery had been prohibited by Congress. Eventually, Scott's master returned Scott to the slave state of Missouri. Scott sued for his freedom on the basis of his residence in a territory where slavery did not exist. Chief Justice Roger B. Taney ruled that Scott was still a slave and that Congress had no authority to prohibit slavery in American territories.

Congress had denied southerners due process of law under the Fifth Amendment by singling out their property, and not that of northerners, for restriction.

Furthermore, Taney ruled, the case was not properly before the Supreme Court. No person of African descent—whether slave or free—was a citizen of the United States with rights to bring suit in federal court. This case strengthened the power of slaveholders and undercut antislavery activists who were seeking a general abolition of slavery in U.S. territories.

Scottsboro case

- THE EVENT: U.S. Supreme Court decision holding that states must provide counsel for indigent or ignorant defendants in capital cases
- DATE: Ruling made on November 7, 1932
- TYPE OF ETHICS: Race and ethnicity
- SIGNIFICANCE: The Supreme Court's finding in the Scottsboro case, that deprivation of counsel in a capital case had denied the defendant a fair hearing, represented the first time the Court had held that a state criminal trial was defective under the due process clause of the Fourteenth Amendment. It thereby set a crucial precedent and paved the way for the general extension of the rights of the accused contained in the Bill of Rights, from federal to state courts.

The Scottsboro case (known technically as *Powell v. Alabama*) was one of several sensational cases that arose from the arrest and trial of seven young black men for the rape of two white women in Alabama. The men were quickly tried and sentenced to death in an atmosphere of great public excitement; units of the Alabama National Guard had to be called up to prevent the defendants from being lynched. At trial, no effective assignment or employment of counsel had been made, as the Supreme Court later found.

By a 7-2 vote, the Supreme Court ruled that the trial court's failure to assure effective representation of the defendants had deprived them of a fair hearing. Since notice and hearing are the central elements of due process, the convictions were reversed. This case provided a particularly significant precedent because the Court showed itself willing for the first time to in-

Clarence Norris, one of the men convicted in the Scottsboro case, leaving his Alabama prison cell in 1946—fifteen years after his wrongful arrest. (Library of Congress)

voke the due process clause of the Fourteenth Amendment to hold that a state criminal proceeding had deprived a defendant of a fundamental right.

The Second Sex

IDENTIFICATION: Book by Simone de Beauvoir (1908-1986)

DATE: *Le Deuxième Sexe*, 1949 (English translation, 1953)

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: *The Second Sex* attempts to explain why women as a class remain oppressed. It advo-

cates a constructivist view of gender, rejecting the essentialist view that gender traits are determined by biology.

Simone de Beauvoir rejects the Aristotelian position that women, because of their biological characteristics, must play a limited role in society. She further rejects Freudian psychology's position that woman's natural state is passive while man's is active because of the physical characteristics of the genitalia. She posits that women are limited primarily by the conditioning imposed on them by a male-dominated society, not by any biologic weakness or inferiority.

Because the behavior of human beings is based in large part on rationality and choice instead of on instinct, Beauvoir suggests that human behavior is not fixed and immutable but should be based on the individual's rational decision to behave in a particular way in a given situation. Beauvoir then expands on that stance, using Jean-Paul Sartre's belief that to be fully human, each person must be free to choose what he or she will become and that the process of choosing never ends. She further asserts that the sexual identity assigned to girls by modern Western society, which prepares them primarily to become wives, mothers, and housewives, destroys women's creative potential and leads to self-alienation and destruction of the psyche.

Secular ethics

DEFINITION: Any set of moral principles or school of moral philosophy whose values do not derive from religion or belief in the supernatural

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: A secular ethics may directly attack religious ethics as ill-advised or untrue, or it may simply ignore religious systems altogether.

"If God is dead, then everything is permitted." Toward the end of the nineteenth century, Fyodor Dostoevski expressed his despair at the disrepute into

which religious ethics had fallen. The enormous prestige of science had led many thinkers to believe that science had supplanted religion as the proper source of answers to questions about the universe and humanity's place in it. Ethics, many believed, should follow the path of other disciplines—such as astronomy, physics, and biology—and become secular; that is, shorn of its traditional religious context.

Traditional religious ethics claim that without a god, ethics is meaningless. Three considerations motivate this claim. First, the fact that humans have argued about ethics for several millennia without reaching agreement is evidence that humans are not able to discover, by their own efforts, what is good and bad. Second, the fact that many people do things that they believe are unethical is evidence that humans are weak by nature and therefore are not competent to be good by their own efforts. Third, the fact that many evil-doers are never brought to justice is evidence that humans are not competent to administer justice effectively. Without a god, therefore, humans would wallow in ignorance and sin, and evil would often triumph over good. Accordingly, the religious account argues, a being greater than humanity—a powerful, knowledgeable, and good being—is needed to tell humans what to do, to make sure they do it, and to administer ultimate justice.

CRITICISMS OF RELIGION

One major difficulty of the religious view is proving the existence of a god. Even supposing that the existence of a god could be proved, however, religion still would face serious difficulties. For, even if there is reason to believe there is a god, why should humans do what that god says?

The fact that the god was powerful would not guarantee that what it said was in fact good, for it could be both powerful and evil or both powerful and uninformed. To do what it says simply because it ordered one to do so would be to commit a logical fallacy—the appeal to force.

The fact that the god was knowledgeable also would not be a sufficient guarantee—for it could be both knowledgeable and evil—and to do what it says simply because it is knowledgeable would be to appeal to authority.

Finally, that the god is good cannot be determined without circularity, for the religious approach claims that humans do not know what is good before the god

tells them so; they would have to know what was good, however, before they could judge whether the god was good and therefore whether they could trust its commands. If humans can distinguish good and evil, then they do not need a god to tell them which is which, but if humans cannot distinguish good and evil, then they have no way of knowing whether a god is telling them to do good things or bad things.

According to these objections, religion fails to ground ethics rationally. Advocates of religion may reject rationality and fall back on faith, but irrational faith is a precarious thing. Without evidence, one has no way of knowing whether one's faith is true, and therefore one has no way of knowing whether the principles upon which one acts are moral. Since different individuals believe different things on the basis of faith, faith leads to social difficulties. Without appealing to rationality and evidence, members of different faiths cannot resolve disagreements peacefully. History provides ample evidence that disagreements over articles of faith regularly lead to violence.

The above epistemological criticisms are sometimes supplemented by criticisms of the central content of religious ethics. By placing the sources of value in a supernatural realm, religion devalues life on Earth. Evidence for this view can be found in the fact that virtually all religions emphasize sacrifice rather than achievement, suffering rather than pleasure, and self-denial rather than self-affirmation.

SECULAR SOURCES

These criticisms of religious ethics have given impetus to secular accounts of ethics. By appealing to natural phenomena, secular approaches try to solve the problems that have traditionally motivated religious ethics.

One such problem is finding a source for universal ethical principles; that is, principles that are true for everyone. Religion attempts to solve this problem by claiming that a god establishes rules and stipulates that they hold for everyone. Some secular theorists (relativists) attempt to solve this problem by rejecting the assumption that there are universal ethical principles. Relativists argue that ethics is based on individual or group feelings or traditions. If ethics is primarily a matter of feeling, however, then the obvious fact that feelings vary radically rules out universality. If ethics is primarily a matter of social traditions, history and anthropology provide evidence of

a wide range of radically different social traditions.

Other secular theorists, however, accept the challenge of finding a universal source for values by identifying natural facts that are universal. For example, some theorists (Hedonists) note that all humans have a pleasure/pain mechanism, and therefore they argue that people should define “good” and “bad” in terms of pleasure and pain. Other theorists (the Kantians) note that all humans have a rational faculty, and therefore they argue that morality should be defined in terms of the rational consistency of action. Other theorists (objectivists) note that all humans have the same fundamental survival needs, and therefore they argue that people should define “bad” in terms of what leads to death and “good” in terms of that which makes human life possible.

Sedition

DEFINITION: Criminally inciting others to resist or overthrow their government

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Because it incites people to violent action rather than merely expressing dissent, sedition is one of the few types of speech not protected by the First Amendment. In order to ensure that the right of political dissent is preserved, current definitions of sedition include only direct incitements of violence.

The first sedition laws in the United States were the Alien and Sedition Acts of 1798, which were passed during the administration of President John Adams. These laws defined sedition very broadly; many believed them to be unconstitutional. They were certainly impolitic and unpopular, and they were repealed under the Thomas Jefferson administration in 1801. In the United States today, sedition consists of advocacy of the illegal or violent overthrow of the government; it is more than mere defamation of the government or government officials. Because the essence of sedition is speech or publication, the crime as it is defined in most American jurisdictions always involves free speech issues. By the latter part of the twentieth century, rules set by the U.S. Supreme Court made it nearly impossible to convict anyone of sedition unless the government could show that the defendant's speech or publication explicitly advocated illegal acts and that it created a “clear and present danger” that the acts would take place. These rules place so heavy a burden on the prosecution that there were no successful federal sedition prosecutions in the United States between 1953 and 1993.

Sedition Act of 1798

IDENTIFICATION: One of four “Alien and Sedition Acts” designed to suppress domestic opposition to Federalist policies during a period of European anti-American aggression

DATE: Passed in 1798

TYPE OF ETHICS: Media ethics

SIGNIFICANCE: The Sedition Act challenged the First Amendment's guarantees of free speech and a free press, an attempt that ultimately served to broaden the scope of both rights and to limit governmental restraint of political dissent.

The Sedition Act was prompted by Federalist fears that growing Republican opposition to Federalist policy would weaken popular support and lead to the end of Federalist control at a time when the United States was caught between rival international pow-

ers. The act sought to apply the English common-law tradition of “seditious libel” by making it unlawful to “write, print, utter, or publish . . . any false, scandalous, or malicious writing . . . against the government of the United States . . . or to bring [it] . . . into contempt or disrepute.” On that basis, ten newspaper editors were convicted, one of them a congressman, by courts made up exclusively of Federalist judges.

Advocates justified the act by interpreting the First Amendment as pertaining only to “prior restraint,” meaning that the government could not prevent the publication of dissent but could prosecute the result. Opponents protested that the First Amendment prevented the government from suppressing political speech at any stage, and they pronounced the act unconstitutional. Republican opposition was carried out through the Kentucky and Virginia Resolutions (written by Thomas Jefferson and James Madison, respectively), which asserted the right of states to “nullify” unwanted federal intrusions on individual rights. The act expired with the inauguration of Thomas Jefferson, and no subsequent attempt to suppress political dissent has ultimately been successful.

Segregation

DEFINITION: Physical separation of one group, especially a racial or ethnic group, from another

TYPE OF ETHICS: Race and ethnicity; Civil rights

SIGNIFICANCE: Now deemed to be unconstitutional, racial segregation in the United States was originally the product of overt and unapologetic racist ideologies. When racism and white supremacy initially became less defensible as legal principles, however, segregation remained in place, but it was justified on grounds of social harmony. It was argued that maintaining separate but equal facilities and institutions would prevent the disorder that racial mixing would supposedly produce.

Segregation, historically, was born in the colonial era when the “majority” practiced de facto segregation. When most black Americans were slaves, free blacks

suffered de facto segregation in housing and social segregation based on “custom” and “folkways.” As the northern colonies abolished slavery, de facto segregation sometimes became de jure separation supported by local ordinances and state law.

As long as the South maintained slavery, that institution “regulated” race relations, and de jure segregation was not needed. In 1865, however, the southern slaves were set free, and legal segregation made its appearance. After the Civil War, most southern states passed legislation known as black codes, which resembled the old slave codes. Under the new codes, social segregation was often spelled out. For example, most states moved immediately to segregate public transportation lines. By the end of the Reconstruction (1865-1877), race lines had hardened, and social segregation was the rule rather than the exception.

UNSUCCESSFUL CHALLENGES

Some African Americans challenged segregationist laws. In 1896, blacks from Louisiana sued a public transportation company (railroad) that operated segregated passenger cars, as stipulated by Louisiana’s state laws. Black leaders argued that the state laws and the railroad’s actions violated the Thirteenth and Fourteenth Amendments to the Constitution. The case, *Plessy v. Ferguson* (1896), reached the U.S. Supreme Court, which ruled that segregation was “legal” as long as “separate but equal” facilities were made available for minorities. A lone dissenter, Justice John M. Harlan, who happened to be a white southerner, rejected the majority opinion, saying that the Constitution should be “color-blind” and that it should not tolerate “classes” among the citizens, who were all equal.

Despite Harlan’s dissent, the *Plessy* decision gave absolute legal sanction to a practice that many states, including some in the North, were already practicing by custom and tradition: *Plessy* “froze” segregation into the highest law of the land. Thereafter, segregationists, especially those in the South, used their legislatures to pass a host of new laws that extended the supposed “separate but equal” doctrine to all areas of life. For example, restaurants, hotels, and theaters became segregated by law, not only by custom. Railroad cars and railroad stations divided the races; hospitals, doctors’ offices, and even cemeteries became segregated.

The laws of some southern states called for segre-

gated prisons, while prisons in other states took criminals from both races but separated them within their facilities. At least one state passed a law that forbade a white and a black prisoner to look out the same prison window at the same time. If the prisoners were physically close enough to look out at the same time, they were too close to please segregationists.

As the United States matured during the twentieth century, segregation was extended whenever “technology” made it seem necessary. For example, in 1915, Oklahoma became the first state in the Union to require segregated public “pay” telephone booths. When motor cars were first used as a “taxi” service, taxi companies were segregated—a “white” taxi serving whites only and a “black” taxi serving African Americans only. Public water fountains became segregated, as did public restroom facilities.

Another problem became associated with segregation. Often, there was *no* separate facility for blacks, who were denied service altogether. For example, as late as the 1960’s, President Lyndon B. Johnson’s personal maid and butler-handyman experienced dif-

ficulty traveling by car from Washington, D.C., back to Johnson’s Texas home. There were few if any “motel” along the way that would rent rooms to African Americans.

SUCCESSFUL CHALLENGES

Eventually, the National Association for the Advancement of Colored People (NAACP) launched new attacks against segregationist laws—especially in circumstances in which no separate facilities existed for African Americans.

For example, in *Gaines v. Missouri* (1938) and *Sweatt v. Painter* (1949; a Texas case), the Supreme Court ruled that blacks could attend white law schools because no separate school was available in state for African Americans. In 1950, in *McLaurin v. Oklahoma*, the NAACP tested the same concept and won another court battle. As *McLaurin* showed, the University of Oklahoma had admitted a black student to its graduate program but then had segregated him on campus. After the high court ruled that such segregation was unfair and illegal because it denied

Typical “white only” sign of the Jim Crow era. (Library of Congress)

“equal” education, Thurgood Marshall of the NAACP became even more determined to challenge segregation. He did so successfully when, in *Brown v. Board of Education* (1954), the Court declared segregated public education illegal.

If segregation was unjust and unconstitutional in education, it seemed clear that it was also unjust in other areas of life. Thus, in 1955, under the leadership of Martin Luther King, Jr., and others, a nonviolent protest movement took to the streets and eventually won victories that included new laws such as the Civil Rights Act of 1964 and the Voter Registration Act of 1965.

Ultimately, a limited social and economic “revolution” occurred that condemned segregation and, in part, created a new American society.

Self-control

DEFINITION: Discipline or restraint exercised upon one's own actions or emotions in frustration of one's impulses or desires

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Self-control may be seen as a necessary characteristic for maintaining virtue and resisting temptation, or it may be seen as a virtue in itself, especially in value systems in which desire and bodily impulses are represented as inherently sinful.

The concept of self-control as a modern moral and psychological trait is directly rooted in the Greek concept of *sōphrosynē*, which is usually translated as “temperance,” although there is no exact English equivalent. Although a number of concepts capture facets of what the Greeks meant by *sōphrosynē*—balance, limit, proportion, order, equilibrium, harmony, restraint, moderation, sobriety—none defines it completely. Yet the concept of self-control, complemented by self-knowledge, lies at its core, being a virtue crucial to the achievement of order and moderation in life. In contrast to it is *hybris* (hubris), the vice of arrogance, excessive behavior, unrestrained passion, and other extremes.

Sōphrosynē was not only a personal virtue for the Greeks but a civic one as well; in addition to being a standard of individual behavior and character, it was, especially for Athenians, a measure of the political and social health of the *polis*, lying between the extremes of tyranny and anarchy. Just as the individual was responsible for maintaining the proper order among the elements of the soul by means of the intelligent control of its baser parts, the rulers were responsible for maintaining the proper order among the various segments of society by the wise governance of its lower echelons. Plato utilizes this concept of self-control in his *Republic*. An individual must control the influence of spirit (feelings) and passion (desire) by subjecting them to the constraints of reason (intelligence), the highest element of the soul. The philosopher-king, using the judgment that comes from philosophical wisdom, must maintain order among the lower elements of society so that the self-control proper to a virtuous individual is amplified in the *polis* as a whole.

Aristotle understands self-control, the virtue of

“temperance,” more narrowly. In the *Nicomachean Ethics*, self-control is marked by the disciplined enjoyment of eating, drinking, and sexual intercourse, as opposed to the correlative vices of excessive indulgence and insufficient sensitivity to physical pleasure. Although Aristotle cites temperance as a separate virtue, however, it possesses a generic component that is fundamental to the other virtues as well. Every Aristotelian virtue requires self-control. For example, courage is the exercise of bravery in the right way at the right time for the right reason and to the right degree. To misjudge the proper measure of courage—to be brave to the point of foolhardiness, or to be cowardly when courage is required—is to be wrongly controlled by either ambition on the one hand or fear on the other, which happens when one loses control over oneself and allows intelligent judgment to be subdued by one’s nonrational faculties.

Sōphrosynē was central to Stoic moral teaching during the Hellenistic period. The Stoics viewed it as essentially the exercise of wise and practical judgment in matters of indulgence and abstinence, preserving the traditional Greek association between *sōphrosynē* and self-control. The Romans eventually absorbed *sōphrosynē* into their ethical canon, where it figures prominently in the writings of Cicero, who identifies *temperantia*, or “self-control,” as its most important component and contrasts it to *luxuria* (United States (“excess”)) and *avaritia* (greed), which he believed were the worst vices of Roman citizens. Early Christianity, although at first eschewing anything associated with paganism, eventually assimilated *sōphrosynē*, along with other classical virtues, into its own ethical structure, since these virtues were consistent with Christian ethics. Christians made chastity the defining feature of *sōphrosynē*, however, almost eclipsing its other aspects.

MODERN VIEWS

Sōphrosynē was absorbed by the modern mind in essentially its original Greek form, with a continued emphasis on self-control. It is recognizable in Michel de Montaigne’s essay “Of Husbanding Your Will,” in which Montaigne extols the virtues of a moderate lifestyle: “One must moderate oneself between hatred of pain and love of pleasure; and Plato prescribes a middle way of life between the two.” Undue absorption with personal and public affairs is to be avoided if one wishes to live serenely. In addition, the

more possessions one acquires, the more likely one is to suffer the bad luck that is an inherent aspect of material acquisition and ownership. One’s energy should be expended chiefly on what one can control; namely, oneself and one’s personal affairs: “The range of our desires should be circumscribed and restrained to a narrow limit . . . and moreover their course should be directed not in a straight line that ends up elsewhere, but in a circle whose two extremities . . . terminate in ourselves.” Balance and moderation are the keys to tranquillity.

Because of its inward, quasi-psychological nature, self-control, like some of the other traditional virtues of character, has been largely neglected by most modern philosophers. Some thinkers, however, have attempted to reinstate consideration of the traditional virtues as an essential feature of moral discourse. Anthony Quinton (1993), for example, defines moral character as self-control or self-discipline, which is required to maintain one’s determination toward a goal and to avoid being distracted by “passing impulses” and unproductive pursuits. It is the essential element in moral development, even though the self-control necessary to good moral character may be used for bad purposes as well. According to Quinton, modern people would do well to emulate the vigorous moral rectitude of the Victorians, whose incorporation of self-control into their character made them worthy models of moral uprightness.

Self-deception

DEFINITION: Conscious or unconscious clinging to a belief that one knows on some level to be false

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Self-deception often facilitates immoral action, but some philosophers have posited that some forms of self-deception may be necessary to survival.

A person is tempted to self-deceive whenever the reasons for accepting a certain thought as true are better than the reasons for not accepting it and the person does not want the thought to be true. If the individual in such a situation avoids acknowledging a fact that is supported by evidence because of the intimated advantage of doing so, then the person self-deceives. Since this act violates a basic principle of rational cognition (to assent to what is supported by the evidence), the self-deceiver will further self-deceive about the very activity of self-deceiving. Hence, people who in fact are deceiving themselves will vehemently deny to themselves and to others that they are doing so.

In this general process, the person need not fully embrace utter falsehoods. Self-deception essentially occurs by avoiding the recognition of some important and well-supported conception. The person can be held accountable for this evasion because there is tacit awareness of the good reasons for not evading

acknowledgment; "deep down," the self-deceiver "knows better." This paradoxical nature of being self-deceived is manifested in inconsistencies in conduct and in speech; on some occasions, action will be based on what is "really known," and on other occasions, it will be based on self-deception.

Self-deception is morally problematical for three reasons. First, it is a practice of untruthfulness, and to the extent that being truthful is inherently good, self-deception is always wrong. This is true even if the deceiving involves a morally neutral issue.

Second, deceiving oneself can have deleterious effects on one's conscience and the ability to understand oneself. Conscience is corrupted because self-deception (especially if it is habitual) can involve overlooking moral failures in one's past and avoiding consideration of moral obligations to which one is bound in the present. The ability to understand oneself is damaged because self-deception (again, especially if it is habitual) can direct attention away from realities of oneself that are important but are very difficult to accept.

Third, self-deceiving can have harmful effects on others. Being able to deceive oneself about a topic greatly facilitates deceiving others about that same topic (by masking from them one's own disbelief). In addition, deceiving oneself about the harm that one is causing for others makes it easier to harm them (by precluding scruples arising from one's own conscience). If this type of self-deceiving becomes habitual, then one can become completely oblivious to the harmful effects of one's conduct on others.

FAILURE TO TAKE RESPONSIBILITY

A prevalent type of self-deception with deleterious effects on self and others involves not taking responsibility for one's own actions. People tend to deceive themselves concerning how able they are to act in a manner other than the manner in which they act when they do something wrong. Shunning avowal of the immediately evident reality of their own free will, they focus instead on how "pressing" their needs and wants appear to be to them. This type of self-deceiving subverts the sense of being in control of one's own impulses, which in turn results in those impulses being less controlled. It thereby becomes likely that the individual does whatever he or she wants to do, in spite of obvious immorality and harm to others.

The diminishment in self-control brought on by

chronic self-deception about one's own responsibility can also affect the degree of control that one has over the very impulse to deceive oneself. This in turn can make it difficult to distinguish voluntary self-deception from pathological self-delusion. In the latter case, the person is incapable of admitting the truth and is not subject to moral censure. Only if a person is able to abstain from self-deception and admit to the truth is the act of self-deception subject to moral evaluation. If it is controllable and wrong, it should be avoided.

In order to avoid deceiving oneself, one must be aware of the subjects about which there is temptation to deceive oneself. Since all people want to think highly of themselves and want to avoid making costly sacrifices, the strongest enticements to self-deceive arise when people assess their moral imperfections or are subject to demanding moral obligations. To prevent self-deception when one confronts such topics, it is necessary to keep clearly in mind the good of authentic self-understanding and the evils that can result from deceiving oneself. There are, however, issues about which a measure of self-deception could be harmless or even beneficial. For example, if one deceives oneself into thinking that one is less afraid than one actually is about delivering an impending public address, then one may be better able to deliver the speech. Nevertheless, in such situations, self-deception is rarely the only means available to achieve the beneficial results. Since self-deceiving can become a habit and habitual self-deception carries with it the dangers noted earlier, it is probably best to always avoid deceiving oneself.

Self-interest

DEFINITION: Concern for one's own success, well-being, goals, and projects

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Self-interest is the opposite of altruism; it is valued by those who disparage altruism and attacked by those who see altruism as a moral good. Philosophers also disagree as to whether one's own interests and the interests of one's community are necessarily compatible, are necessarily incompatible, or have no necessary relationship.

Although Plato in his *Republic* was the first to raise the issue of the role that self-interest plays in ethics, it was Thomas Hobbes's treatment of the concept in *Leviathan* (1651) that cast the discussion of the relationship between ethics and self-interest in modern terms.

VARIETIES OF SELF-INTEREST

Philosophers generally speak of two kinds of self-interest: enlightened and unenlightened. This distinction is made by those who think that self-interest has a significant contribution to make to ethics. Interests can be classified as being either short-term or long-term, and sometimes what may be in one's short-term interest may not be in one's long-term interest. Short-term interests are those that are immediate consequences of the action performed and are of immediate benefit to the individual who is acting. Long-term interests, however, are future consequences of the action, and the benefit to the individual may not matter for quite some time.

Almost no one would advocate that one should pursue short-term interests exclusively. Rather, those who believe that self-interest and ethics are related encourage the pursuit of long-term interests. Emphasizing the pursuit of long-term as opposed to short-term interests is called enlightened (or rational) self-interest, while emphasizing the pursuit of short-term interests is called unenlightened self-interest.

One can appreciate the different positions regarding the relationship between self-interest and ethics by reflecting on the answers to the following question. Do the demands of enlightened self-interest ever correspond to the dictates of ethics? There is a theory of ethics that answers this question in the affirmative: egoism. This theory claims that self-interest plays a crucial role in determining ethically appropriate action. There are two kinds of egoism, depending in part on the role that is assigned to self-interest.

PSYCHOLOGICAL EGOISM

This theory claims that human beings by their very nature must act in their own self-interest. According to this view, human beings cannot help but act in their own interest. That is how they are constituted.

Technically, this is not an ethical theory but rather a scientific or psychological theory about human nature. In fact, a psychological egoist would contend that ethics as traditionally conceived is impossible, since traditional ethics requires a person to act altruistically, to act in the interests of others, and human beings are simply psychologically incapable of doing that. Psychological egoism advocates that ethics should be revamped to take into account this important fact about human nature. Once this is done, the goal of this redefined ethics is to persuade people to pursue enlightened rather than unenlightened self-interest. Thomas Hobbes is the person most often associated with psychological egoism.

ETHICAL EGOISM

The other brand of egoism is called ethical egoism. In contrast with psychological egoism, ethical egoism is a traditional ethical or normative theory that acknowledges that people have the ability to act altruistically. It contends that, although people can act in the interests of others, they should not. Ethical egoism claims that one should pursue one's enlightened self-interest exclusively. It contends that the

only time one should take into consideration the interests of others is when it is in one's interest to do so.

A number of reasons have been offered by ethical egoists to explain why one should act in one's own self-interest. For one thing, it just makes good sense. People should know what is in their own interest better than they know what is in the interest of others, and it is always good to act on as much information as possible. For another, if everyone pursued his or her own interests exclusively and did not meddle in other people's business, everyone would be better off.

Two major branches of ethics—namely, utilitarianism and deontological ethics—answer the above question in the negative. They both claim that acting solely in the light of one's own self-interest is never ethically acceptable. They contend that one of the goals of an ethical theory is to persuade an agent to put aside self-interested pursuit, whether enlightened or not, and act altruistically. These groups, however, deal with self-interested behavior in different ways.

UTILITARIANISM

Utilitarianism claims that, in determining what the morally appropriate action is, one should take into consideration the interests of everyone who is affected by the action, and no one person's interest should count more than anyone else's. The right action is the one that will produce the greatest good for the greatest number of people. Notice that this theory still uses the concept of self-interest, though in a much-diminished capacity. One's interests do matter, but they matter only as much as everyone else's. This theory requires that one may have to sacrifice one's interest for the interests of others (the common good).

DEONTOLOGICAL THEORIES

Both egoism and utilitarianism determine right and wrong by looking at the consequences of an action. Deontological theories look to something other than consequences to determine right and wrong. For that reason, these theories go a step further than utilitarianism does, banishing self-interest in any form. According to these theories, acting in self-interest automatically removes the agent from the ethical realm. Self-interest is something that must be controlled or defeated in order for true ethical behavior to take place.

Selfishness

DEFINITION: Concern with and pursuit of one's own interests and desires without regard to or in conflict with the interests and desires of others

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Always a pejorative term, unreflective or excessive selfishness may be opposed to altruism or selflessness on the one hand and to mere self-interest or ethical egoism on the other.

Selfishness is construed as a vice or character flaw. All one has to do to see this is to reflect on the common usage of the term. To be labeled "selfish" is to be censured and held in low regard. Such labeling is a condemnation. Ethical theorists also share this disdain, though Ayn Rand with her philosophical theory of objectivism may appear to be an exception. Selfishness plays an important role in her ethical theory.

If someone is acting selfishly, that person is not acting ethically. Traditionally, the goals of ethics and those of selfishness are antithetical. Even those theories of ethics that advocate acting in one's own interest—namely, the various versions of egoism—would never endorse constant selfish behavior. For this rea-

son, it will be helpful to explore the relationship between selfishness and self-interest.

SELFISHNESS AND SELF-INTEREST

Are acting selfishly and acting self-interestedly identical? Critics of egoism, which is the ethical theory that claims that one should always act in one's own interest, answer this question in the affirmative. They find egoism morally repugnant because they find selfishness morally repugnant. Certainly, selfish behavior does involve some form of self-interested behavior. A selfish act is performed because the person expects to satisfy some current need or desire. Does self-interested behavior, however, necessarily involve selfish behavior? In other words, can there be behavior that is self-interested yet unselfish? Defenders of egoism say yes. For example, they insist that it is not in one's interest to act purely selfishly all the time, though there are some egoists who maintain that it is acceptable to act selfishly on occasion. Egoists distinguish between short-term and long-term self-interests.

SHORT- VS. LONG-TERM INTERESTS

Short-term interests are those that are met immediately, while long-term interests are those that will be satisfied in the future. When one acts selfishly, one is acting on the basis of short-term self-interests exclusively. When one acts selfishly, one does not take into account the impact of the pursuit of one's short-term interests on others; hence, one does not take into account the impact on one's own long-term interests. Since interfering with others in their pursuit of their interests may lead them to hinder one's own pursuit of future interests, such interference may have a negative impact on one's long-term interests. What this means, then, is that acting selfishly, though it is in one's short-term interest to do so, may have consequences that will hinder the pursuit of one's long-term interests.

Conversely, it may be in one's long-term interest to act unselfishly, since acting unselfishly would not anger others and would give them no reason to interfere with one's future goals. Thus, an egoist could simultaneously advocate the exclusive pursuit of self-interest and avoid the charge of selfishness by insisting that it is the pursuit of one's long-term as opposed to short-term self-interest that is at the heart of egoism. Aiming for the long-term is described as acting in

one's rational self-interest. This means that it is not generally rational to act selfishly, although an egoist could still advocate selfish behavior as long as that behavior did not interfere with one's long-term interests.

AYN RAND AND OBJECTIVISM

In *The Virtue of Selfishness* (1961), Ayn Rand seems to be contradicting the claim made at the start that ethics views selfish behavior with disdain and contempt. It seems that she encourages selfish behavior, believing that it is at the core of true ethical behavior. By calling selfishness a virtue, she seems to be sanctioning that kind of behavior.

It turns out, however, that her position is not far from that of the ethical mainstream. Her title is intended to capture and hold the reader's attention. As a title for a treatise on ethics it is misleading. What she is really advocating is that the definition of selfishness should be stripped of all its negative connotations. She suspects that there has been some kind of moral conspiracy on the part of the ethics of altruism, which advocates that one needs sometimes to put one's own interests aside and act for the interests of others, and which demeans and belittles anyone who dares to act in his or her own interest exclusively.

The goal of her theory, known as objectivism, is to expose this conspiracy and to show that there is nothing wrong with acting in one's own interest exclusively. What does selfishness, denuded of its negative connotations, look like? It is nothing other than what traditional egoists call rational self-interest. Hence, her position on selfishness is consistent with the ordinary one, and her own ethical theory is just another version of egoism. Although she claims the contrary, the point is essentially a semantic one. For Rand, then, selfish behavior and self-interest are identical, but selfishness should be stripped of its negative connotations. For traditional egoists, however, selfishness, and self-interest are not identical. They discourage selfishness and encourage the pursuit of rational self-interest.

Self-love

DEFINITION: Pursuit of actual or apparent goods for oneself, or, narcissism

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Self-love is considered by different writers to be essential to an ethical life, to be the greatest opponent of ethics, or to lie somewhere between these extremes.

The best approach to understanding the relationship between self-love and ethics is to study its history. Aristotle, in his *Nicomachean Ethics* (c. 330 B.C.E.), addresses the question of whether ethical or unethical persons love themselves more. His answer is that, although most people believe that unethical persons love themselves more than do ethical persons, precisely the opposite is actually true. He defends this position by making an analogy between self-love and the friendship of two persons. The type of friendship he has in mind is not a superficial one, but rather a strong relationship between two ethically mature persons. He identifies five characteristics of such a friendship: (1) wishing and doing what one believes to be good for the friend, (2) wishing the friend to continue living, (3) finding it pleasant to spend time with the friend, (4) desiring the same things as does

the friend, and (5) sharing the friend's sorrows and joys.

Aristotle then writes that if one is ethical, one will have an analogous relationship with oneself: (1) wishing and doing what one believes to be good for oneself, (2) wishing oneself to continue living, (3) finding it pleasant to spend time with oneself, (4) having consistent desires, and (5) sharing one's own sorrows and joys consistently. Aristotle then contrasts this type of self-love with the self-love of one who is unethical: (1) wishing and doing for oneself what is pleasant to the senses, rather than what is good for oneself; (2) hating one's own life, because of painful memories of evil actions; (3) seeking the company of other persons in order to be distracted from the memory of past evil actions and the expectation of future evil actions; (4) having inconsistent desires; and (5) being torn by the internal conflict of both regretting one's evil actions and remembering them as pleasurable.

Aristotle goes on to explain that most people have false beliefs about self-love. There is a sense in which "selfish" people, those who seek the greatest share of such contested goods as money, honors, and bodily pleasures for themselves, love themselves. This is what most people mean by "self-love." It is, however, an inferior type of self-love that deserves condemnation. In contrast, persons who sacrifice the inferior goods of money, honors, and bodily pleasures in order to benefit others are the ones who genuinely love themselves. Aristotle believes that this is true even in the case of what most people consider the ultimate sacrifice: that of one's life. He maintains that the true self-lover prefers dying in defense of friends and country to living a long life with the memory of having been a coward.

These two types of self-love, sometimes distinguished from each other and sometimes not, appear frequently within post-Aristotelian discussions of ethics. For example, both of the following passages are found in Saint Augustine's *The City of God* (413-427):

The two cities were created by two kinds of love: the earthly city was created by self-love reaching the point of contempt for God, the Heavenly City by the love of God carried as far as contempt of self.

God, our master, teaches two chief precepts, love of God and love of neighbor; and in them man finds three objects for his love: God, himself, and his neighbor; and a man who loves God is not wrong in loving himself.

Although one could conclude that Augustine is inconsistent, a more reasonable conclusion (perhaps supported by the fact that he uses different Latin words for "love" in the two passages) is that there is a qualitative difference between the two self-loves.

In more recent ethical theory, however, the trend is toward viewing self-love as being opposed to ethics. Joseph Butler, in his *Fifteen Sermons Preached at the Rolls Chapel*, maintains that both the "principle of benevolence" and the "principle of self-love" are natural to human persons. Furthermore, he does not see them as being in competition with each other: "Though benevolence and self-love are different; though the former tends most directly to public good,

The eighteenth century English cleric Joseph Butler wrote that the principles of both benevolence and self-love are natural to human beings. (Library of Congress)

and the latter to private: yet they are so perfectly coincident, that the greatest satisfactions to ourselves depend upon our having benevolence in a due degree; and that self-love is one chief security of our right behavior toward society." He also states, however, that in his discussion of these two principles, "they must be considered as entirely distinct." He explains that "there can no comparison be made, without considering the things compared as distinct and different."

Although Butler argues at length that benevolence and self-love promote each other, many of his successors maintain that the two principles are indeed distinct and that they frequently oppose each other. This understanding of the relationship between self-love and ethics is quite different from Aristotle's. For Aristotle, people are confronted with the choice between loving themselves improperly and loving themselves properly. Because to love oneself properly is to love others, however, one does not have to choose between proper self-love and love of others. According to what has become the dominant position of eighteenth to twentieth century ethical theory, however, one is confronted with a choice between loving oneself and loving others. Although few writers hold that one should have no self-love, many argue that ethics requires that one decrease one's self-love and increase one's love for others.

One example of a twentieth century writer who is committed to what is now the dominant view is William K. Frankena. Despite the fact that both Saint Augustine and Joseph Butler were Christian bishops, and even though the mainstream of the Christian moral tradition has considered proper self-love to be the basis of obedience to the biblical command "love your neighbor as yourself," Frankena writes in *Ethics* (1973): "In the Judeo-Christian tradition, self-love, even of an enlightened kind, has generally been regarded as the essence of immorality, at least when it is made the primary basis of action and judgment." Although there is room to debate the meanings of "enlightened self-love" and "primary basis," Frankena's statement is at best misleading and at worst false.

Self-preservation

DEFINITION: Activity in which a being works to perpetuate its existence or to avoid harm

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The instinct for self-preservation can motivate and perhaps be used to justify drastic and immoral actions under extreme circumstances. Acts of heroism often require one to mitigate if not ignore such instincts.

On July 20, 1993, a Pennsylvania logger named Don Wyman found himself trapped in the wilderness, his left leg broken and pinned underneath a fallen tree. For an hour, Wyman called for help and attempted to dig his leg out, both to no avail. Aware that he was continuing to lose blood from his injuries, the trapped logger began pursuing what he perceived to be his only chance to escape. Using a bootlace as a tourniquet, Wyman proceeded to amputate his leg just below the knee with a pocket knife. Thus freeing himself from the tree, he crawled two hundred yards up a steep slope to a bulldozer, drove the bulldozer some three hundred yards to his pickup truck, and drove the truck to a farm two miles away, where an ambulance was called.

The case of Wyman is a dramatic illustration of the drive for self-preservation that is a fundamental

inclination of human nature. Interestingly, philosophers reflecting on this natural inclination have reached very different conclusions concerning its moral significance. Especially noteworthy in this regard is the contrast between the advocacy of suicide by Stoicism and the absolute prohibition of suicide by some schools of natural law morality.

Fourth century B.C.E. Stoic philosophers such as Zeno of Citium and Cleanthes of Assos were committed to following the demands of nature and were equally aware of the inclination for self-preservation that permeates the natural order. In the case of human beings, they understood the inclination for self-preservation as a demand to perfect one's nature. Taking rationality to be definitive of human nature, the Stoics advocated the soul's complete governance by reason as the epitome of virtue. Strong passions and appetites, however, were symptomatic of a diseased soul and thus were regarded as states of mind that needed to be expunged in the quest to achieve true virtue. Because a soul's attachment to the affairs and goods of the external world is what causes it to be governed by emotions and desires, the Stoics prescribed a rational indifference to the vicissitudes of life. So strong was their commitment to this indifference that the Stoics saw the rational choice of one's own death as a morally legitimate expression of indifference to the affairs of the world, a conviction upon which both Zeno and Cleanthes are believed to have acted. Although it is not obviously inconsistent, it is at least ironic that a philosophy that recognizes the natural inclination toward self-preservation as a basic moral principle should come to the conclusion that suicide is a morally permissible option.

NATURAL LAW MORALISTS

Also recognizing the natural inclination toward self-preservation, Thomas Aquinas and other natural law moralists reach the conclusion—in direct opposition to that of the Stoics—that it is always impermissible to commit suicide. According to the natural law ethics of Thomas Aquinas, God has created the natural order according to a plan and has placed within natural beings a tendency to work toward the fulfillment of that plan. Human beings, like all other natural beings, have divinely implanted inclinations that point the way to their fulfillment. Unlike other natural beings, however, human beings have been given the gift of freedom and thus can choose to act

either in accordance with God's plan or in opposition to it. In order to live a virtuous life, then, human beings must reflect upon their God-given nature and freely act so as to fulfill that nature. Insofar as he viewed the drive for self-preservation as one of the fundamental inclinations of human nature, Thomas Aquinas arrived at the conclusion that it is always impermissible intentionally to terminate or shorten one's own life.

In order to understand fully Thomas Aquinas's position, it is important to note that he did think that there are circumstances in which it would be morally permissible to perform an action that one foresees will result in one's own death. For example, it would be morally praiseworthy for a soldier to throw himself or herself on a hand-grenade to save the lives of fellow combatants. That such cases do not contradict the absolute prohibition of suicide is found in the fact that a true case of suicide requires that one intend to kill oneself, whereas the heroic soldier intends only to save the lives of others and does not intend his or her own death.

One of the strongest objections to the natural law defense of an absolute moral prohibition of suicide is that formulated by the Scottish philosopher David Hume. Hume maintained that the inclination for self-preservation is not a fundamental inclination, because it is grounded in the more comprehensive inclination to achieve happiness. Therefore, suicide does not violate a human beings' natural inclinations if the continuance of the individual's life promises more hardship than happiness.

Self-regulation

DEFINITION: Imposition of a code of conduct or set of ethical standards by an organization or profession upon its own members

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: The term self-regulation generally implies that measures have been taken to preempt or otherwise render superfluous government intervention or statutory regulation of an industry. Essentially, a group promises to act ethically in order to avoid being forced to act legally. To the extent that members of the group may disagree with the action taken on their behalf, self-regulation raises issues about individual autonomy.

During the late nineteenth century, social critics began to promote increased government regulation of business, industry, and various professions. In an attempt to stave off additional government intrusion into commercial affairs, many Self-Regulatory Organizations (SROs) were formed. SROs function as private rule-making and enforcement bodies that govern the activities of their members. Exemplary among such SROs is the American Institute of Certified Public Accountants (AICPA), which was founded in 1887 to self-regulate the accounting profession. The AICPA states that its mission is to “provide standards of professional conduct and performance,” “monitor professional performance,” and “promote public confidence in the integrity, objectivity, competence, and professionalism” of public accountants. SROs such as the AICPA possess the

power to censure or disbar their members from practice if they violate professional standards of conduct. Proponents of SROs contend that voluntary professional organizations are inherently more capable of encouraging ethical behavior than is a centralized government agency. Critics of SROs charge that the organizations merely act in the self-interest of their members rather than in the interest of society at large.

Self-respect

DEFINITION: Recognition of and behavior in accord with one’s own intrinsic worth

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Self-respect is usually opposed to self-degradation. That is, lack of self-respect results in treating oneself, or allowing someone else to treat one, as an object or a means, rather than as a subject or an end in oneself.

According to Immanuel Kant, self-respect is the most important of one’s moral duties to oneself and is the prerequisite for the fulfillment of one’s duties to others. To transgress this duty is to forfeit the intrinsic worth that one possesses as a human being. Being human confers upon one a uniquely significant status: One possesses the gift of reason, and only rational beings can engage in moral deliberation. Consequently, only rational beings can recognize the concept of duty and act in recognition of universal moral law. Since the moral law commands the respect of rational beings by virtue of its absolute power over them, each rational being must acknowledge and respect this power of recognition in every rational being. One owes one’s fellow humans respect as rational, moral beings; likewise, one owes oneself respect insofar as one is human and, therefore, rational and moral.

FORFEITURE OF SELF-RESPECT

There are actions that result in the forfeiture of one’s self-respect and the respect of others. Drunkenness robs a person of dignity insofar as it makes that person an object of ridicule, unable to act responsibly

or to exercise the powers of rational deliberation. “Cringing servility” is likewise degrading, and it detracts from one’s special status as human, as does lying. A liar, though possibly harming no one, becomes tainted by the intrinsic vileness of the lie. One who becomes the instrument or plaything of another, and who may do so for gain or profit, forfeits the respect that humans owe to themselves and to which they are entitled from others. Since all persons are equal by virtue of their common humanity, any act that places a person in a subservient position relative to someone else diminishes that person’s self-respect. Accepting favors or charity places one in a permanently subordinate position relative to one’s benefactor, a position in which the recipient remains even after repaying the debt.

Suicide, however, is the most serious violation of one’s duty to oneself because it constitutes the use of oneself as an instrument, a means to an end, violating the supreme moral duty to treat every human being, including oneself, as an end rather than a means. To end one’s life, even to escape intolerable suffering, is an abuse of the ennobling freedom that gives humans the capacity for virtue. Finally, just as this freedom is the source of human virtue, so is it also the source of human depravity, which springs from actions that not only dehumanize the perpetrators but also degrade them below the level of animals. Such an action is the *crimen carnis contra naturam*, an unnatural crime of the flesh, exemplified by an offense so abominable that it arouses nausea and contempt in one who merely contemplates it. In the light of the potential for depravity through the abuse of humanity’s freedom, each person has a special responsibility to use that freedom to bring credit to himself or herself as an individual representative of humanity, for when one degrades oneself individually, one degrades humanity as a whole. According to Kant, respect for humanity as exemplified in oneself reveals one’s respect for the moral law.

From the standpoint of modern moral psychology, self-respect may be viewed as being somewhat different from “self-esteem.” Whereas self-respect is rooted in the moral quality of one’s character, self-esteem refers to a positive assessment of oneself that may come from traits such as appearance, personality, talents, and so forth. The difference is evident in the fact that a negative appraisal of oneself with respect to characteristics such as physical appearance or tal-

ent does not necessarily result in an unwillingness to recognize one’s value and rights as a human being.

MODERN MORAL PSYCHOLOGY

Self-respect, in addition to being an important theme in modern moral psychology, occupies a prominent place in the ethical thought of modern moral philosophers after Kant. Thomas Hill, Jr., allows self-respect to retain its Kantian significance when he contrasts it with servility. Servility, which is marked by a refusal to insist on respect from others and by a willingness to submit to public humiliation, is morally blameworthy when it springs from laziness, timidity, or the desire to retain some relatively unimportant advantage. The moral wrongness of this kind of servility results from the fact that in refusing to stand up for one’s rights, one devalues oneself as a human being. In doing so, one devalues the moral law, which humans have a unique duty to uphold.

Self-respect serves as an important component in a well-ordered society, according to John Rawls in *A Theory of Justice* (1971). Rawls distinguishes self-respect as the most important primary good, a primary good being something that a rational individual would want regardless of the kind of life the person lives or whatever else that person wants. The just society, in recognizing the importance of each individual, provides a strong foundation for self-respect. A person who has a secure sense of self-worth is more likely to carry out life plans successfully, since the value of those plans is derived to a significant degree from the self-respect that comes from having one’s personal value acknowledged by society.

Self-righteousness

DEFINITION: Belief that one's own moral values are superior to those of others or that one's own actions comport better with a common value system than do those of others; narrow-mindedly or self-importantly preachy

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Self-righteousness is commonly associated with lack of sympathy or compassion for others. It connotes an inability to put oneself in another person's shoes and an utter lack of nuance in applying abstract moral rules to concrete, complex, flawed human reality.

Self-righteousness can be condemned as involving either or both of two moral faults: hypocrisy (one does not measure up to one's avowed standards) or pride (one treats others with disdain or makes ostentatious displays of one's accomplishments). In the first case, one's claim to being righteous is vitiated by unacknowledged moral faults; in the second case, by behavior toward other persons designed to make them feel inferior and to enhance one's own self-image by comparison.

Christian thinking has typically opposed finding one's righteousness in oneself in favor of finding it through faith in Jesus. Self-righteousness can, however, be understood more positively as the reasonable conviction that one indeed does adhere of one's own will to a defensible moral code and thus deserves self-approval. Such self-approval, however, does not warrant requiring others to accept that judgment. Also, Jesus' condemnation of the Pharisees as hypocrites for attending to external rather than internal matters of law and morality (Matt. 23) points to the possibility of self-deception that is inherent in thinking of oneself as righteous.

Paul L. Redditt

Sentience

DEFINITION: Capacity to feel pain and pleasure; consciousness

TYPE OF ETHICS: Animal rights

SIGNIFICANCE: Some animal rights advocates assert that sentience is a necessary and sufficient condition for moral standing, because morality requires that all creatures capable of suffering be prevented from suffering, as much as possible. Many philosophers, however, believe that consciousness alone is insufficient, and the actual condition of moral standing is *self-consciousness*. They assert, in other words, that only moral agents, those capable of making moral decisions, have full moral worth.

Derived from the Latin verb *sentire*, meaning to feel or perceive, the term "sentient" was used as early as 1632 to describe a being as conscious. The concept of sentience (the quality of being sentient) became crucial to the animal rights movement after Peter Singer took it to be a necessary and sufficient condition for having interests in his book *Animal Liberation* (1975). Singer's view was that all (and only) beings that are capable of feeling pain or conscious suffering have interests that matter from the moral point of view. The question "Which beings are sentient?" is answered by using an analogy. The more relevant be-

havioral and neurophysiological similarities there are between a given organism and a human being, the stronger is the case for saying that the organism is sentient. In *Animal Liberation*, Singer speculated that (with the exception of cephalopods like octopi, squid, and cuttlefish) probably only animals above the phylogenetic “level” of mollusks are conscious. While excluding insects, this does include crustaceans (such as shrimp and lobsters).

Many who have examined the available evidence have concluded that although all vertebrates probably are capable of feeling pain, invertebrates probably are not (again, with the exception of cephalopods).

Service to others

DEFINITION: Helping others without expectation of reciprocity

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Service to others is denying one’s own self-interests in order to serve the interests of others. Such service may be motivated by a personal sense of civic obligation, moral or religious obligation, or some calculated social utility. A service-to-others ethic in Western civilization is built upon the foundations of classical Greek and Roman civic philosophy as well as Judeo-Christian moral philosophy.

In classical Greek and Roman thought the ideal citizen serves society and other citizens selflessly—a requirement that weighed especially heavily upon the privileged classes. The Greeks and Romans understood that citizenship required individual sacrifices in order to provide for the common good. Without such sacrifices, society would degenerate into a chaos of self-interest in which the strong would dominate the weak, thereby destroying social cohesion. Both the values of honor and duty underscored the classical notion of service to others. The most hon-

ored Greek citizens were not necessarily the wealthiest or most beautiful or most wise but those who heroically sacrificed and performed their civic duty to society.

The Judeo-Christian tradition built upon the classical tradition by adding a layer of moral obligation to the service ethic. In the Judeo-Christian tradition, service to one’s neighbor is not merely a civic obligation for the sake of social cohesion but also a religious obligation imposed by God. In other words, to serve others is to serve God. The Bible, both Old and New Testaments, is replete with examples of how the faithful are called to serve others. The powerful have a special obligation to protect and help the weak. In a way, service to others becomes a test of religious devotion.

A more economic or utilitarian approach would argue that by serving others one improves one’s own lot however distant or vague the benefit may be. Under the rubric of conditional altruism, one’s interest in serving others is conditional upon others (not necessarily the beneficiary of one’s own actions) doing the same. For example, a person may be more likely to donate money to public television knowing that others are willing to do the same. Or even more broadly, one may be more likely to help the homeless if one knows that others are also serving the homeless or at least using their resources to alleviate social problems.

A person’s service is conditional upon the service of others because one recognizes that the likelihood of success in any social endeavor is greater if more people are involved, as combining their resources increases the likelihood of success. Moreover, when there is greater level of social involvement by others—even on different problems—individual persons calculate that they will ultimately reap some benefit, however distant or indirect, such as safer streets or better schools.

Sex therapy

DEFINITION: Mental and emotional treatment of sexual disorders

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: For many people, sex therapy can conflict with personal or intimate codes of ethics, because it involves talking about activity that they feel should remain private or because they believe it entails seeking artificial help with something that should be utterly natural. In addition, sex therapy raises all of the ethical issues of therapy and intimate relations generally, including confidentiality, mutual respect between partners, and the nature of the therapist-patient relationship.

Sexual therapy was pioneered by William H. Masters and Virginia E. Johnson, although other therapists have also created many important techniques. Sex therapy generally focuses on reducing performance anxiety, changing self-defeating expectations, and fostering sexual skills or competencies. Both sex partners are often involved in therapy, although individual treatment is possible. Because sexual dysfunction may be linked to drug effects, sex therapists must be knowledgeable to some degree about pharmacology. Sex therapists educate the couple and guide them through a series of homework assignments. They also treat interpersonal problems.

TYPES OF SEXUAL DISORDERS

Three main sexual disorders treated by sex therapy are arousal and erectile disorders, premature ejaculation, and inhibited orgasm. Two causes are predominant: people's tendency to adopt a spectator role during intercourse, which causes them to examine their own performance; and the fear of performing inadequately. Either of these problems can create inhibitions against enjoying the normal sensations that lead to sexual satisfaction.

Arousal and erectile disorders are of two types: primary and secondary erectile dysfunction. Primary erectile dysfunction means that a man has never had an erection of sufficient strength for sexual intercourse. Fear and unusual sensitivity or anxiety regarding sexual incidents that have happened early in life may contribute to primary erectile dysfunction. Secondary erectile dysfunction means that the man has had successful sexual intercourse in the past but now fails to achieve penile erection in 25 percent or more of his sexual attempts. Secondary erectile dysfunction can be a vicious cycle: One or a few incidents of impotence can lead a man to become over-anxious and abnormally sensitive, so that the next

Image not available

Masters and Johnson

Using scientific measuring equipment, William H. Masters and his wife, Virginia E. Johnson, recorded physiological responses to sexual stimulations in men and women engaging in sexual activity. In 1966 they published the results of an eleven-year-long research project in the best-selling book *Human Sexual Response*. Their other books include *Homosexuality in Perspective* (1979), *Crisis: Heterosexual Behavior in the Age of AIDS* (1988), *The Pleasure Bond: A New Look at Sexuality and Commitment* (1975), and *Textbook of Sexual Medicine* (1979).

attempts at intercourse are also failures. Next, an interpersonal component enters the picture. Almost any response by the man's partner exacerbates the problem. If she continues to be physically affectionate, he may interpret her actions as a demand for sexual intercourse, a demand that he fears he is unable to satisfy. If she is less affectionate physically, he may defensively interpret her behavior as a rejection of his sexually inadequate self.

Sensate focus, which is a basic element of treatment of arousal and erectile disorders (as well as inhibited orgasm), involves directing attention away from intercourse and toward other behaviors that feel pleasurable to the partner, such as caressing the neck or massaging the back. Intercourse is initially forbidden by the therapist, so these exercises take on importance, allowing the couple to experience sexuality in a relaxed, non-performance-oriented manner. Gradually, more and more involved sexual activities are allowed, and the couple is eventually told that intercourse is permissible. Typically, such treatment is successful. Improvement rates for primary erectile dysfunction are about 60 percent, and for secondary erectile dysfunction, they are 74 percent.

Premature ejaculation occurs when a man cannot delay ejaculation long enough to satisfy his sexual partner during at least half of his sexual encounters. Premature ejaculation is usually caused by emotional and psychological factors. The most common treatment is the squeeze technique, in which the man's sexual partner stimulates him manually until he signals that ejaculation is about to occur. Then, the partner firmly squeezes the tip of his penis to inhibit orgasm. When he feels that he has control, stimulation is repeated. Gradually, he acquires the ability to delay orgasm sufficiently for satisfactory intercourse.

Inhibited orgasm is of two types: primary and secondary. Primary orgasmic dysfunction means that a woman never achieves an orgasm through any method of sexual stimulation. Although many causes are physical, more often they are psychological and are grounded in extreme religious orthodoxy, unfavorable communication about sexual activities, or some childhood trauma. Secondary orgasmic dysfunction is the inability of a woman who has achieved orgasm by one technique or another in the past to achieve it in a given situation. Secondary orgasmic dysfunction may occur when a woman is unable to accept her partner because she finds him sexually un-

attractive, undesirable, or in some other way unacceptable. In addition, many women find that orgasm brings about feelings of guilt, shame, and fear.

TREATMENT

Treatment of primary and secondary orgasmic disorders involves understanding the woman's sexual value system and the reasons for her inability or unwillingness to achieve orgasm. Using her value system, the therapist teaches her to respond to sexual stimulation. Often, she is encouraged to focus on sexual responsiveness through masturbation or vigorous stimulation by a partner. Initially, the couple is directed to avoid intercourse but is taken through a series of treatment sessions involving an increasing amount of erotic pleasure. Orgasm is not the focus of these sessions, but ultimately it is achieved in an unhurried situation in which pressure to perform is removed from both partners.

Treatment of both male and female disorders involves teaching people not to fear failure and helping them to be free from anxiety. Both the man and woman are taught the art of giving pleasure in order to receive pleasure. They are encouraged to relax and to enjoy touching, feeling, and being sexual. The therapist may arrange desensitization experiences in real sexual encounters between the couple. Eventually, natural processes will take control and intercourse will follow in due time.

A central aspect of treatment of both male and female sexual disorders is communication. Couples must learn to communicate their sexual needs without embarrassment and misinterpretation. Such communication may be difficult. Also, for sex therapy to be successful, the sexual partners must be flexible individuals who are willing to accommodate the directive- and sometimes value-laden features of sex therapy. In addition, both partners need to develop a better understanding of male and female sexual response cues. Sex therapy may involve a specific technique, such as the squeeze technique, or an overall treatment of the couple's relationship.

Sexism

DEFINITION: Bias toward people on the basis of their sex

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Like racism, sexism most commonly refers to instances of sexual prejudice that are supported or validated by institutional power structures. Sexism is, in fact, perhaps the clearest demonstration of the importance of such covert power structures in enforcing prejudice, since sexism against women remains common in societies in which women comprise a majority.

A person is sexist who believes, for example, that women cannot be competent doctors or that men cannot be competent nursery school teachers. Institutions, as well as individuals, can be sexist. Sexism can be revealed in stereotypes (beliefs about people based on gender), prejudice (negatively prejudging a person solely on the basis of gender), or discrimination (acting in accordance with prejudice).

Sexism influences perceptions and behavior from birth. In one classic study, fathers described their first babies almost immediately after they were born; mothers described their babies during their first twenty-four hours. Despite objective hospital records that showed that these baby boys and girls were almost identical in color, muscle tone, reflex re-

sponses, weight, and length, parents described them differently. Baby girls were perceived as relatively softer, finer-featured, smaller, and less attentive. Fathers in particular were susceptible to this type of selective perception. Children and adults learn from these types of messages what society expects of women and men.

Sexism can be blatant, as it is when a female premedical student is told that women belong at home rather than at work or a male home economics student is told that men belong at work rather than at home. Sexism can also be subtle, as it is when people interpret the same behavior in different ways depending on whether it is exhibited by women or men. People may see a man as assertive but a woman as pushy, a man as flexible but a woman as fickle, a woman as sensitive but a man as a sissy, or a woman as polite but a man as passive. For example, in one research project, college students rated the quality of professional articles in several fields. When an article was attributed to a woman, it received lower ratings than it did when it was attributed to a man. Furthermore, women raters were as guilty as men at assuming male superiority. Therefore, sexism influences both women and men in a variety of blatant and subtle ways.

Although sexism is typically most damaging to women, men can also be victims. Even in the current era, for example, people are more willing to hire a man for a “man’s job” and to hire a woman for a “woman’s job.”

Sexism extends to the way in which people use language. Benjamin Whorf advocated the concept of linguistic relativity, the theory that the properties of language shape perceptions of the world. His classic example compared English and Eskimo views of snow. English has only one word for snow, whereas Eskimo has many words that distinguish falling snow, slushy snow, and so forth. In recent years, the idea that language influences people’s perceptions of the world has extended to the way in which sexist terms are used. Although the masculine forms are supposed to refer to both men and women, most people think of men when they are used. For this reason, some scholars substitute gender-neutral terms such as “firefighter” for gender-laden terms such as “fireman” and avoid using the terms “lady” and “girl” on the ground that they perpetuate the view of women as frivolous and childish. The American Psychological Association’s *Publication Manual* contains guide-

lines for avoiding sexist language that include using the plural whenever appropriate, using “his and her” rather than “his,” and using parallel construction (for example, “husband and wife” rather than “man and wife”).

Sexist language harms people in two different ways. First, women may reach adulthood feeling inferior because of the more frequent references in language to males. For example, in an analysis of children’s books published after 1972, most of the fictional characters were male, whether the stories were about children, adults, or even animals. Furthermore, boys were characterized as curious, clever, and adventurous, whereas girls were characterized as fearful and incompetent. Such bias takes a heavy toll on female self-esteem. Second, the use of certain terms may lead women and men to believe that certain occupations are beyond their capabilities. The harm done by this type of language can be avoided if writers and speakers are aware of the problem and motivated to change the gender-laden terms they are accustomed to using.

Sexual abuse and harassment

DEFINITION: Inappropriate sexual behavior or speech directed toward a professional colleague or subordinate, or otherwise engaged in under color of social or institutional authority

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Sexual abuse and harassment involve such moral issues as the moral worth of a person, gender inequality, and the social distribution of power, authority, and opportunities.

Both the perpetrator of sexual harassment and the victim of sexual harassment may be either male or female as well as being either heterosexual or homosexual. In the vast majority of incidents of sexual harassment, however, the victim is female and the perpetrator is a male heterosexual. This is true primarily because gender inequality is endemic in virtually every culture on earth. That is, the history of the social roles of men as compared with women is such that men, owing only to an accident of birth, are granted significantly more power and authority in society and enjoy the full complement of opportunities that a particular society makes available. (Clearly, there are other factors, many of which are also accidents of birth, that might preclude some segments of a society’s male population from this privileged status, such as skin color, religious affiliation, and so forth.)

Women, by contrast, are granted significantly less power and authority in society (in some cases, histor-

ically, none) and suffer severe restrictions with respect to the availability of opportunities offered by the society. The result of such an institutionalized imbalance of power and opportunities between the genders is an insidious development of social expectations according to which women literally come to be viewed (even by one another) as second-class citizens.

To the extent that these traditional distinctions between the social roles of men and women come to be seen as “the norm” and to the extent that the members of society (male and female), even if only implicitly, recognize that such distinctions are attributable only to the difference in gender, a social climate is created in which any abuse of an individual who happens to be female—simply because she is female—is taken less seriously than it would be were the same type of abuse to be directed at a male person. The rationale for this difference in response is based on the abused individual’s status as a member of the privileged or the nonprivileged gender.

THE IMPORTANCE OF SOCIAL SETTINGS

It should come as no surprise, then, that social settings in which the imbalance of power and opportunities between the genders is most prevalent are ripe for sexual abuse or harassment; two such examples are the work and educational environments.

In the typical work environment, positions of power and authority are held, for the most part, by men, while women usually hold positions of less power and authority. This tradition has been maintained, in large part, because of an institutionalized lack of opportunity for women even to be considered eligible for positions of greater power and authority. Given this fact, it is not at all uncommon for women in the workplace to be the victims of sexual harassment. Such harassment typically involves a male perpetrator of sexual harassment who holds a position of authority over the female victim of sexual harassment. In the work environment, sexual harassment can also take other forms; for example, the perpetrator might be the male client of a female employee who is the victim.

The most obvious imbalance of power and authority in the educational environment is the fact that the instructor determines the grades of the students. Given this fact, there is always the potential for an instructor to abuse the educational system by sexually

harassing a student. Although, in theory, the possibility is greater here for both the perpetrator and the victim to be of either gender and of either sexual orientation, in practice, more often than not, the victim is female and the perpetrator is male (heterosexual). The fact that, more often than not, the perpetrator in this environment is male and heterosexual is explained fundamentally (but not completely) by the fact that although female instructors, within the student-instructor relationship, possess the power to assign student grades, in the society at large, they are still members of the nonprivileged gender, which fact has great influence on their social behavior. Furthermore, in the society at large, there are far more heterosexual males than there are homosexual males.

Additional environments in which sexual harassment occurs are the therapeutic environment and the religious environment. Incidents of sexual harassment in the therapeutic environment are usually similar to those that take place in the educational environment, while incidents of sexual harassment in the religious environment are usually similar to those that take place in the work environment.

Having recognized some examples of specific social environments that allow for above-average potential for sexual harassment because of their very one-sided imbalance of power and opportunities between perpetrator and victim, it is important to acknowledge that any social setting is a potential stage for sexual harassment. Moreover, sexual harassment is not restricted to relationships that involve only one perpetrator and only one victim, and it is not restricted to a private setting. For example, two or more perpetrators of sexual harassment might together verbally abuse several other persons at the same time and might do so in a public forum.

TYPES OF HARASSMENT

Some specific types of sexual harassment are sexist comments (remarks or jokes that stereotype or disparage a single gender), unwelcome attention (uninvited flirtations), body language (fixed eye contact on specific body parts of another), physical sexual advances (pinching, fondling, and so forth), verbal sexual advances (such as nonspecific verbal expressions of sexual interest), explicit sexual propositions (unambiguous invitations for sexual encounters), and sexual coercion or bribery (unambiguous invitations for sexual encounters with the implicit or ex-

PLICIT promise of rewards for acceding or the threat of punishment for refusing).

What makes sexual harassment morally repugnant is that the victim is devalued as a person, in that the victim's dignity as a person is abused, and that such harassment inhibits the victim's ability to pursue whatever activities he or she was engaged in prior to the occurrence of the incident. Any defense that has ever been offered by a perpetrator of sexual harassment, after the fact, has involved the idea that the fact of harassment, or the offense that it engenders, depends upon the person; that is, what offends one person might not offend another, even another of the same gender in the same circumstances. Although it can be granted that sexual harassment is, in a sense, "in the eye of the beholder," this in no way morally excuses it. In the final analysis, the determining factor for what constitutes sexual harassment must be the interpretation of the victim as reasonably construed from the victim's perspective.

Sexual revolution

THE EVENT: Social movement involving the relaxation of sexual mores and inhibitions, especially regarding premarital and nonmonogamous sexual relations, and a more open embrace of sexuality generally

DATE: 1960's

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: The sexual revolution has been variously described as liberating people from im-

Image not available

The sexual revolution of the 1960's was closely identified with the free-spirited "hippie" movement, which reached its apotheosis at the Woodstock music festival, near Bethel, New York, in August, 1969. (AP/Wide World Photos)

proper or artificial ethical restrictions, or as an immoral movement that degraded human beings and human relations. One of the central issues raised by debates over the meaning of the movement is the proper source of sexual morality. Is it a matter of personal ethical intuition and values guiding intimate behavior, or is it a matter of general moral rules regulating such behavior?

During the 1940's and 1950's, the United States and most other Western countries were sexually restrictive. Prepubertal sexuality was ignored or denied, marital sex was considered the only legitimate sexual outlet, and other forms of sexual expression were condemned or prohibited by law.

During the 1960's, with the development of reliable contraceptive methods, sexual activities became less restricted. Premarital intercourse became more acceptable and more frequent, the latter particularly so among women. Young people became more sexually active at younger ages, and society tolerated a wider variety of sexual behavior than had been tolerated in the past. This change, the sexual revolution, was most prominent among women.

During the 1990's, however, despite any so-called revolution, adolescent boys still reported more sexual activity than adolescent girls, with about 80 percent of boys and 70 percent of girls reporting sexual intercourse before the end of adolescence. Also, a double standard for sexual behavior existed: Males were subtly encouraged to engage in sexual behavior but females were subtly discouraged from engaging in sexual activity. Additionally, the life-threatening disease acquired immunodeficiency syndrome (AIDS) made people aware that sexual activity could result in death. Finally, society in general became more conservative. The sexual revolution changed, with sexual activity and attitudes becoming more conservative, and some differences between men and women remained present.

Sexual stereotypes

DEFINITION: Preconceptions about the capacities, values, characteristics, or desires of persons based on their sex or gender

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Sexual stereotypes can prevent men and women from seeing themselves and each other clearly, interfering with moral imperatives to know oneself, to recognize others, and to treat others as dignified subjects or ends in themselves rather than as objects or means to one's ends.

Sexual stereotypes are based on the idea that all females are alike in personality, interests, and abilities, and that males also constitute a homogeneous group. The masculine stereotype includes the characteristics of aggressiveness, achievement orientation, dominance, rationality, independence, high sexual interest, and physical strength. The feminine stereotype emphasizes passivity, submissiveness, emotionality, nurturance, modesty, low sexual interest, and physical weakness. Although stereotypes are an easy way of categorizing people, they are extreme generalizations. They destroy individuality and lead to discriminatory behavior and the victimization of women in the forms of domestic abuse, rape, and pornography.

HISTORY

Male and female sexual stereotypes have existed in European civilization since ancient Greece and probably even earlier. Aristotle, Paul of Tarsus and other leaders of the Christian church, and civil authorities have endorsed the idea that women share typical characteristics. The concept of women as evil was an important rationale for the witch-hunts of the sixteenth and seventeenth centuries. European males typically considered women the "weaker sex," not only physically but also intellectually and morally.

Criticism of sexual stereotypes grew out of John Locke's political philosophy of natural rights. Mary Wollstonecraft's treatise *On the Subjection of Women* (1792) was an early statement about the effects of sexual stereotypes on the liberty and personal growth of women. Elizabeth Cady Stanton and other leaders of the mid-nineteenth century women's movement in the United States worked chiefly for civil liberties and intellectual parity. The negative effects of sexual

stereotypes were restated by Simone de Beauvoir in *The Second Sex* in 1949. They were an important concern in the women's liberation movement and in social science research during the second half of the twentieth century.

ETHICAL PRINCIPLES

Sexual stereotypes are attitudes about a group of individuals. These attitudes are ethically significant because they often lead to discrimination. Women were denied political liberty because they were regarded as incapable of rational thinking. Thus, strongly held stereotypes typically imply an infringement on the liberty of individuals.

Furthermore, stereotypes lead to various problems in social equity, including educational and job discrimination and the denial of economic power. The stereotyped differences between men and women are assumed to be innate rather than cultural or socially acquired. Historically, women have been denied access to educational opportunities at the precollege, college, and graduate level. Lessened opportunities are reflected in lower salaries, less prestige and influence, and fewer opportunities to advance. Job discrimination in hiring and promotions results from stereotypes about what work is appropriate for women. Accordingly, stereotypes can be used to justify denying civil and economic rights to women and granting preferential treatment to men.

Stereotypes of women as passive—even masochistic—and of men as aggressive and sexually driven contribute to the victimization of women by means of domestic abuse, rape, and pornography. These stereotypes are reflected in the psychoanalytic theories of Sigmund Freud and other psychodynamic theorists. “Natural” male aggression can be used as justification for violence; this argument removes ethical responsibility for actions from the aggressor. Stereotypes can even be used to suggest that the victim should be blamed for inappropriate conduct that led to the offense; for example, it may be suggested that a woman who enters a bar alone is inviting rape.

ETHICAL ISSUES

The controversy regarding whether to emphasize equality between the sexes, or to recognize true gender differences remains an issue. Whether women should seek equality with men by attempting to reduce stereotypes to a minimum or should challenge

male domination with a different, feminine ideology is unclear. For example, Carol Gilligan has proposed that there are clear ethical differences in the kinds of reasoning that men and women use to analyze ethical dilemmas. Males usually describe their reasoning as being based on principles that are applicable to every situation. Females frequently make ethical decisions that are strongly weighted by a consideration of the particular situation and, especially, by social relationships and responsibilities. Although it is important to reduce stereotypes, it may also be important to maintain a diversity of gender perspectives.

Annette Baier proposes that a particularly feminine ethical stance is that of trust. Trust underlies cooperation and thus is significant for ethical interpersonal relations. Trust is significant in family relations, between husband and wife as well as between parent and child. Because trust is part of the feminine stereotype, however, it has been largely ignored by philosophy.

OTHER FORMS OF STEREOTYPING

Sexual stereotypes; racial, ethnic, and religious stereotypes; and age stereotypes are similar. People who rigidly hold one kind of stereotype frequently espouse other stereotypes. Because such attitudes lead to discriminatory behavior, all such stereotypes tend to deny equality and opportunity to members of a stigmatized group. In Western society, older minority women experience a triple oppression because of stereotypes and discrimination.

Prejudice against homosexual males and lesbian women is also related to sexual stereotyping. Some prejudicial attitudes result from a perception that homosexual males and lesbians do not act in accord with commonly held stereotypes. Social stigmatization and other forms of harassment frequently result from such views.

Sexuality and sexual ethics

DEFINITION: Sexuality: aspects of people's desires, perceptions, actions, interactions, and identities that influence or constitute their sexual behavior; sexual ethics: formal and informal codes of conduct governing the moral permissibility of specific acts and expressions of sexuality

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Sexuality is one of the most fundamental aspects of human identity and motivation. Even that statement is potentially controversial, however, because the proper relationship of one's sexual identity and experience to one's identity as a whole is a matter of ethical debate. Sexual ethics thus includes not merely the ethics of sexual activity and intimate relationships, but the ethically proper way to incorporate sexuality into one's life.

Men and women have most things in common. In that sense, the biblical view that one sex comes from the middle of the other is very appropriate. The biological view that the male is a modified female also indicates this strong commonality. Concepts of sexuality, however, focus on the differences associated with gender. Sexual assignment and the many behaviors associated with it are basic to personality. The most fundamental difference between male and female is that males produce sperm and females produce eggs, but to be classified as male or female does not involve merely the obvious differences in anatomy; sexuality has profound effects on how a person feels, thinks, communicates, and acts.

Attraction between the sexes and the pleasure inherent in the sex act constitute an efficient biological design that tends to continue the species, but sex is more than reproduction, and most human sex does not involve producing babies. Sex involves the desire for a meaningful, close relationship with another, and it involves the most pleasurable short-term act of which the body is capable. The intimacy of the sex act calls for trust and commitment. The philosopher Richard Solomon has stated, "To think that one can indulge in the traditionally most powerful symbolic activity in almost every culture without its meaning anything is an extravagant self-deception."

HUMAN ASPECTS OF SEXUALITY

Several biological factors are unique to human sex. First, humans are apparently the only creatures that consciously understand that sex is linked to reproduction. Other animals do not know that intercourse may cause pregnancy. Second, human females may be sexually receptive at any time. In contrast, many mammals mate only seasonally, when the hormonal levels, especially of estrogens, cause females to signal their receptivity to males. At that time females are said to be in "heat." Some mammals have more frequent periods of heat. The sexual interest and activity of human females, however, is different. It is influenced, but not limited to, specific hormone-dependent times. Circumstances, judgments, cultural norms, mood, and emotions play larger roles than do hormones when it comes to the timing of the sex act by humans. A third factor is that humans often have sex face-to-face, which seems to be significant in that it promotes bonding and commitment for the protection of possible offspring.

Childhood experiences affect the choice of a mate. Certain characteristics come to be valued. If a person meets and gets to know another person and this person meets many of the desired characteristics, attraction occurs. At that point, the brain is affected by chemicals (especially phenylethylamine) that are similar to amphetamines. The person experiences a chemical high that can last several years, causing the feelings of being in love. The continued presence of a partner causes endorphins to be released internally, causing feelings of calmness and security. This promotes long-term attachment. Finally, another chemical, oxytocin, is released. This chemical is thought to cause cuddling and to enhance pleasure in sex.

There is much that is not known, but sexual behavior is definitely more than simply genes and chemical reactions. Human sexuality is formed by a complicated interplay and overlap of genetics, culture, experiences, and free will. The roles of these elements are difficult to define. One can always argue about the extent to which females are biologically bound to be passive, coy, and monogamous. Likewise, one can question the extent to which males are dealing with genes that compel them to be aggressive, dominating, risk-taking, and promiscuous. How much weight should people give to genetics? How free are human actions?

GENETIC DETERMINATION

Genes, mainly but not exclusively, determine the production of hormones that cause the development of the sex organs and the various secondary physical differences such as body size, percentages of fat, tilt of the pelvis, muscle thickness, voice pitch, and thickness of body hair. Even the development of the brain and patterns of behavior are affected by the sex genes. Normally, two X chromosomes will basically program a woman, while having both an X and a Y chromosome will produce male characteristics.

In 1987, geneticist David C. Page and his colleagues found that there is a particular gene on the Y chromosome that is required to produce a male offspring. In a study of abnormal cases, Page found that a twelve-year-old girl was XY but that the Y chromosome was not complete, apparently lacking the male gene. About one in twenty thousand men is XX but also has inherited a small piece of the Y chromosome that includes the sex gene, causing him to develop as a male. Such XX males and XY females are usually

infertile. The location of the sex gene on the Y chromosome (and the additional discovery of a similar sex gene on the X chromosome) indicates that genetic factors in sex determination are not completely understood. While further study is needed, questions about whether homosexuality is a matter of choice or inheritance are being raised. Preliminary investigation indicates that a gene for homosexuality may also exist. Other studies also indicate a physical difference in the structure of the brain when homosexuals and heterosexuals are compared.

CULTURAL INFLUENCE

Length of hair, type of dress, vocational choices, and many sexual behaviors seem to be mainly cultural values. Because every society has legitimate interests in sexual conduct, certain standards and norms of behavior are maintained. These may vary from culture to culture, but both religion and government tend to be involved, often reinforcing each other, as in the case of requiring marriage to be formalized as a way of providing family structure for the nurturing of children. Within a family, male and female children are usually raised quite differently. At times, these standards within a culture may change.

Many behaviors have more than one cause. For example, self-assertiveness, the ability to communicate openly and honestly in a functional way, appears to be related to gender. Hormones can certainly be given some credit for male aggressiveness in many activities, but women seem to be encouraged by society to be quiet, polite, and considerate of others' feelings, while men are encouraged to take charge. Change in this area can certainly be made by means of teaching and practicing communication techniques that allow both sexes to communicate openly and freely about their feelings, needs, and desires.

Only in the late twentieth century did significant numbers of girls and women begin participating in competitive sports. The positive results have shown that cultures may have mistaken ideas about fixed or natural sexual limits and roles.

FREE WILL

One can argue that all behavior and even culture is programmed by genetics, but biological determinism is a gloomy mechanistic view of life. Are people free to choose or do they merely respond in programmed ways to various signals? Free will allows people to

accept, augment, or reject both nature and nurture. Individuals may choose to modify sexual characteristics, whether they are biological or cultural. One can shave hair or allow it to grow. One can wear high-heeled shoes that accent side movement in walking. A person may consciously choose to dress and act in ways that a society may generally see as part of the role of the opposite sex. Yet perhaps what is perceived as freedom is an illusion. Perhaps such modifications are also programmed. Are humans trapped by their biology? Biology is certainly not irrelevant to social behavior; however, as biologist Richard Lewontin has argued, there is simply not enough DNA to code for all the situations that humans face. Patterns of behavior can only be very generally coded. Humans do have choices.

AREAS OF CONCERN

Sexual ethics is concerned with questions about how sexuality might influence one's behavior, how basic biology might require careful thought and control, and how the common good might be preserved. Sexuality can have many goals, but even if sex and reproduction could be completely divorced, sex and morality cannot. Sex almost always involves another person. Sex, or the choice not to have sex, involves valuing others as ends in themselves, not merely as the means to selfish pleasure. This is not a new principle, even with Immanuel Kant, but goes back to the ancient Jewish and Christian command to love one's neighbor: to be concerned for the emotional and physical welfare of others. Beyond being a means of procreation, sex is a form of communication.

Sex involves much of ethics: trust, truth telling, commitment, friendship, and fairness. There really is no special variety of sexual ethics, but ethics in the sexual realm is very special. This is because sexual behaviors reflect the core of one's personality and can allow the most intimate knowledge of one's being. At the same time, the way in which sexuality is treated profoundly affects all interactions in a society. If the most personal relationships are unethical, then all relationships are at risk.

Societies have a justifiable interest in the area of sexuality. Children need good parents to care for them. The spread of sexually transmitted diseases (STDs) should be prevented; casual sex can carry mortal risk. The education of teenagers should not be interrupted by extramarital pregnancy. Respect for

persons requires that sex should never be forced on another person.

ADULTERY

If two people consent to have sexual intercourse outside marriage, is this immoral? If it is a private matter between consenting adults, what is the harm? Richard Wasserstrom argues that this activity involves the breaking of an important promise. First, the breaking of this promise involves deep hurt and pain to the innocent spouse. Second, such activity almost always involves deception about where a person was and about what was occurring. Third, sexual intimacy should reflect a person's real feelings for another. Western culture teaches that sexual intercourse involves the strongest feelings that one person can have for another. Therefore, the restriction of sexual intercourse to a marriage is logical.

To engage in extramarital sex involves the deepest deception about true feelings, toward either the innocent spouse or the extramarital partner. Society has yet to answer various questions. Can one separate sexual activity from its deep meanings of commitment to a single person? What is sexual love? How could it be different? What price would people pay if sexual relations came to mean something else? Would the institution of marriage be lost and the nurture and protection of children suffer?

NATURAL OR UNNATURAL

Sometimes in arguments about sexual matters, a judgment will be made regarding whether an activity or behavior is natural. The implication is that perhaps "the laws of nature" can be violated, but the laws of nature are only descriptive and by their nature cannot be violated. They are not prescriptive for behavior, and life would be gloomy if it were so. As Sarah Blaffer Hrdy has said, people need to rise above nature in sexual ethics. Arguments that will convince the general population must be based on ethical traditions that consider the consequences of an action (teleological theories) or traditions that maintain that people have duties (deontological theories).

SEXISM

False assumptions about the intrinsic worth of either females or males often cause trouble in society. Children of the "wrong sex" may be devalued and even aborted. Programs or instruction in schools

should not favor one sex. Equal work and responsibility calls for equal pay and equal opportunities for promotion. To use biological differences such as sex or race, over which a person has no control, as a systematic basis for denying anyone their rights violates individual human dignity and autonomy.

A most serious danger is to describe one sex as setting the standards for the species. When this is done, the other sex is viewed as not fully developed, abnormal, and therefore is devalued. For example, during the nineteenth century, Paul Broca claimed that female brains were smaller than normal (“normal” was a European white man’s brain) and therefore not capable of higher learning. Educational policies and women’s aspirations were affected until this view was overcome, when people realized that general body size and many other factors must be considered. Female brains are normal for females. Female intelligence is not limited by sexuality.

GAY RIGHTS

Although the issue of respect for privacy discourages and complicates the enforcement of laws that regulate sexual behavior, the courts are not silent regarding such matters. In 1993, a Virginia County Circuit Court found that a woman’s lesbian relationship made her “an unfit parent.” The judge noted that the woman admitted to engaging in oral sex, which is a felony in Virginia, concluded that her conduct was immoral, and left the woman’s child in the custody of the grandmother. The grandmother testified that the child might grow up confused about sexuality. The judge cited a 1985 Virginia Supreme Court ruling that said that a parent’s homosexuality is a legitimate reason for losing parental rights. Since 1985, however, more than one hundred gay people have gained parental rights through the Virginia courts by means of what is called coparent, second-parent, or same-gender adoption. The issue is far from settled.

SEX SELLS

Advertising plays an important role in society. The device of associating a product with a beautiful or handsome model raises the issue of honesty. The ethics of using sexuality to sell products and to promote messages is questionable and is demeaning to the persons so used. Interesting cases have developed involving the hiring of women as newscasters. What

is really going on when management tells a female newscaster to wear her hair differently?

Billions of dollars are spent annually on cosmetics, especially by women, to enhance beauty and sexuality. (The testing of cosmetic products on animals is an ethical issue in itself.) The clothing fashion industry is also keyed to promoting attractiveness. Models are selected to promote particular images of female body shape and beauty. These images may be unrealistic for most females and may lead to the development of low self-esteem or even serious illness (anorexia, bulimia). Furthermore, Cornel West has pointed out that the ideology of white female beauty even tends to permeate black thinking. “The ideal of female beauty in this country puts a premium on lightness and softness mythically associated with white women and downplays the rich stylistic manners associated with black women.” Damaged self-image and lack of self-confidence can cause fundamental harm to a whole race.

How sexuality is treated in society and how individual humans act sexually involves all of ethics. Making responsible decisions in this area may be more difficult than in others because of the effects of biology and culture. Nevertheless, the effort must be made to affirm sexuality, to recognize it as fundamental to human existence. In all its uses, however, sexuality also needs to be disciplined to communicate truth. William Starr has pointed out that one can have purely casual sex. There is pleasure in it or the act would not be performed. “But what sort of pleasure is it?” Starr continues. “It is short term, transitory, lacks lasting value, lacks continuity with the rest of one’s life . . . and adds nothing to the quality of one’s life.” Sexual relations with a person who is loved, however, represent “a part of the ongoing process of the enhancement of one’s existence.”

Sexually transmitted diseases

DEFINITION: Venereal and other diseases that are often, but not exclusively, spread by sexual contact

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: The existence of sexually transmitted diseases (STDs) complicates sexual ethics in general, because it further raises the stakes of an already ethically charged relationship. In addition to this broad theoretical complication, definite knowledge that one or one’s partner has an STD may have specific, practical ethical consequences.

Sexually transmitted diseases, whose incidence is rapidly increasing, are caused mainly by specific bacteria and viruses. Gonorrhea, chlamydia, and syphilis are bacterial and can be treated with antibiotics. Untreated cases of these diseases can result in sterility, infections of newborn children, and other serious problems. Among the viral infections are herpes 2, genital warts, and acquired immunodeficiency syndrome (AIDS). Herpes 2 and AIDS have no cures. Herpes 2 causes painful sores on the sex organs that heal but reappear. A mother can infect her child with herpes 2 at birth. Genital warts may lead to cancer of the cervix and other tumors.

Although all STDs are serious, AIDS is devastating. The human immunodeficiency virus (HIV) damages the immune system by taking over and killing CD4 white blood cells. A person is said to have AIDS when his or her CD4 count falls below 200 per microliter (normal is 800-1,200 per microliter). At that point, the victim is likely to die from various opportunistic infections.

The risk of getting any STD varies with behavior. Practicing abstinence until marriage is the best safeguard against STDs. Risk increases with the number

of sexual partners. Latex condoms offer some protection but are not perfect.

About 64 percent of AIDS cases in the United States involve homosexual men and correlate with high-risk anal intercourse. Another 28 percent of AIDS cases are caused by the sharing of contaminated needles during drug abuse. About 3 percent are the result of receiving transfusions of infected blood. HIV can also cross the placenta or be in a mother's milk and infect a baby. HIV transmission by heterosexual intercourse is increasing. The risk of HIV infection increases ten to one hundred times if sores from another STD are present.

ETHICAL PRINCIPLES

In *Grounding for the Metaphysics of Morals* (1785), Immanuel Kant wrote that people must not treat others only as a means to some end. All people must be valued as ends in themselves. Respect for persons, fairness, truth telling, and promise keeping are vital to meaningful sexual behavior. Margaret Farley of Yale University concluded that sexual desire without interpersonal love leads to disappointment and loss of meaning. Justice must discipline sexuality so that no one is harmed and the common good is considered. Farley added that sexuality should be freed and nurtured while also being channeled and controlled. One cannot allow that "anything goes" even between consenting adults. Society has legitimate interests regarding the care of offspring, the limiting of extramarital pregnancies, and the control of disease.

ETHICAL ISSUES

To transmit disease carelessly by sexual means violates standards of love, commitment, respect, fairness, and honesty. Consider, for example, that a man might, through extramarital affairs, give his wife HIV. What are the responsibilities of any sexual partner?

In 1991, Kimberly Bergalis died at age twenty-three from a nonsexual HIV infection transmitted to her from her dentist. Other patients were also infected. Before her death, Bergalis asked that health workers be tested and their conditions be made public. Should health workers be tested? Are health workers in greater danger from their patients? Are these private matters? Often, privacy must be balanced with other concerns. Should an infected person reveal or tell all previous sexual partners? Should

even the fact that a person has been tested be kept private?

In many cases, fear of AIDS has fed apathy and discrimination. The parents of the late Ryan White, who contracted HIV from a blood transfusion, had to file a discrimination suit against his school to allow him to attend. Many STD clinics fail to act sympathetically toward patients. Homosexuals are thought by some to deserve AIDS as punishment. How should people act when others carry an infectious disease? Should research monies be allocated for prevention or cure? Preventive and therapeutic HIV vaccines will need to be tested on animals and humans. What concerns will have to be met?

LEGAL ISSUES

Individuals can sue former partners for damages caused by STDs. Such civil actions are based on tort law. A tort is a wrongful act or injury that is committed either intentionally or negligently. Furthermore, many states have passed laws against STD transmission that set fines and prison terms.

In a 1979 landmark case, Margaret Housen of Washington, D.C., was awarded \$1.3 million in compensatory and punitive damages for a gonorrhea infection. Also, when movie star Rock Hudson died of AIDS in 1985, his homosexual lover, Marc Christian, sued Hudson's estate. Christian was found to be HIV negative but was awarded \$21.75 million for "grave emotional distress."

In sum, individuals must inform a sexual partner of possible infection. Noninfected partners are under no obligation to ask. Consenting to have sex does not imply consenting to being exposed to an STD. In a landmark legal case in 1993, it was decided that a Texas woman who was raped at knife point was not consenting to have sex merely because she asked the assailant to wear a condom. In another case, a prisoner with AIDS was convicted of attempted murder because he bit the hand of a prison guard.

ETHICAL DECISION MAKING

The "sexual revolution" of the 1960's, which involved improved contraception, sexual behavioral studies, the women's movement, and trends toward openness, challenged the traditional structures of monogamous relationship: marriage and the family. Mixed messages in the popular culture often neglect birth control and concern for the partner.

Meanwhile, the Centers for Disease Control (1992) reported that 73 percent of U.S. high school seniors have experienced sex and that 4 percent of secondary students have STDs. The World Health Organization (WHO) reported in 1992 that 350,000 cases of STDs were being transmitted each day worldwide. The only current disease that is more infectious is the common cold.

A pandemic makes ethical considerations seem like a luxury. Nevertheless, some experts place hope not in medical breakthroughs but in changes in sexual behavior. As Robert Ashmore of Marquette University has stated, "we must not lose sight of the idea that the purpose of moral inquiry is practical." Can people who are "in love" be rational? Making responsible decisions in an area involving biological desires, peer pressure, society's concerns, moral standards, and individual autonomy may be a formidable task, but it is a necessary one.

Shaftesbury, third earl of

IDENTIFICATION: English philosopher

BORN: Anthony Ashley Cooper; February 26, 1671, London, England

DIED: February 15, 1713, Naples, Italy

TYPE OF ETHICS: Renaissance and Restoration history

SIGNIFICANCE: In *Characteristics of Men, Manners, Opinions, Times* (1711), Shaftesbury argued that the source of human morality was an innate "moral sense" that was allied with, and promoted, the good of society.

The third earl of Shaftesbury's education was placed in the hands of the philosopher John Locke by the boy's grandfather, the first earl of Shaftesbury. He was fluent in classical Latin and Greek in his early youth, as well as in modern French; in his later youth, he spent three years on the European Continent and became thoroughly familiar there with art and music. His later writings, in fact, are of equal importance in both aesthetic and moral philosophy. In Shaftesbury's time, English moral philosophy was heavily influenced by Thomas Hobbes, who maintained that human nature is essentially selfish and that unless they are coerced by society, people will not cooperate to act decently.

In direct contradiction of Hobbes, Shaftesbury maintained that the very existence of society demonstrates a predisposition for moral cooperation—the "moral sense" that he was the first to name. Because it was bound up with society, the moral sense found its greatest virtue in pursuing the public interest. Shaftesbury also believed that morality and religion were separable, which enhanced the status of the moral sense as an innate human attribute. Shaftesbury's views directly influenced the British philosophers Francis Hutcheson and David Hume.

The Price of Adultery in Northern Nigeria

In 2002, the conservative Islamic legal traditions still in force in northern Nigeria made headlines around the world as word got out that two young women were sentenced to be stoned to death for committing adultery. Northern Nigeria's twelve predominantly Muslim states all practiced Sharīʿa law, which calls for death by stoning of Muslims convicted of adultery or rape. Plans to execute the young women might have gone unnoticed by the outside world, had not Nigeria been about to host the Miss World beauty pageant, which brought large numbers of foreign journalists into the country. Under growing pressure from other world governments, Nigeria's secular national government ordered the Islamic executions stopped. Meanwhile, continuing strains between conservative Muslims of the north and non-Muslims, including Christians, of the south were leading to violent clashes in which thousands of Nigerians were dying.

Sharīʿa

DEFINITION: Any of the several traditions of Islamic law

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: All of Islamic ethics—including personal ethics—is connected to *sharīʿa*, since Islam does not separate the private, political, and religious realms of behavior.

Within Islam, no clear distinctions can be made between law and ethics. They are seen, instead, as facets of the single effort to build a community that is guided by the will of God. The Qurʾān (the primary source of Islamic law), for example, provides religious law (“Set not up with Allah any other God”), moral rules (“come not near unto adultery”), social regulations (on fiduciary management of the property of orphans), and guidance for the development of good character—all intermingled in *sūra* 17:22-39.

In issues not addressed by the Qurʾān and its exegesis, the next recourse is usually to the traditions in *Ḥadīth* of the life of Muḥammad. There is a broad diversity of views about possible additional sources of law, which could include *ʿijmā* (consensus among the learned, which is important in Sunnī traditions) or the *imām* (the leader of the faithful, who is important in Shīʿa traditions). There can be no “wall of separation” (Thomas Jefferson’s phrase) between church and state in Islam, since all sovereignty resides with God and human authorities administer only through his will.

SEE ALSO: *Ḥadīth*; Islamic ethics; Law; Muḥammad.

Shīʿa

DEFINITION: One of the two main sects of Islam
DATE: Founded around 661-680
TYPE OF ETHICS: Religious ethics
SIGNIFICANCE: Shīʿa Islam provides a different interpretation of Islam and its tenets from that supplied by the Sunnī majority.

Islamic religion is divided into two main sects: Sunnīs and Shīʿites. Shīʿites are followers of ʿAlī ibn Abī Ṭālib, a cousin and son-in-law of the Prophet Muḥammad, and ʿAlī's sons, Ḥasan and Ḥusayn. Shīʿites contend that ʿAlī should have succeeded Muḥammad at his death. They view the other three caliphs, Abū Bakr, ʿUthmān, and ʿUmar, as usurpers. ʿAlī was chosen caliph after the third caliph, ʿUthmān, was assassinated.

After ʿAlī's death, Muʿawiyya assumed the caliphate despite opposition from many followers of ʿAlī, who considered ʿAlī's sons, Ḥasan and Ḥusayn, the rightful successors. After Muʿawiyya's death, his son Yazid succeeded him. ʿAlī's second son, Ḥusayn, tried to claim the caliphate but was defeated and killed by Yazid's forces. The anniversary of Ḥusayn's death is commemorated by Shīʿites as a major religious event.

There are two main branches of Shīʿites: the Twelvers, or Imāmīs, and the Seveners, or Ismāʿīlites. The Twelvers believe that there were twelve Imāms, or leaders, after ʿAlī, each chosen by his predecessor. The twelfth Imām disappeared when he was a small child. Shīʿites believe that he will appear at an appropriate time as Mahdī, or savior, to rescue the world and restore the glory of Islam. The Ismāʿīlites believe that Ismāʿīl should have succeeded Imām Jafar, the sixth Imām. Ismāʿīl was Jafar's son. The Twelvers are the predominant branch of Shiism. Currently approximately 10 percent of the world's Muslim population is Shīʿite.

Shinran

IDENTIFICATION: Japanese Buddhist monk
BORN: Matsuwaka-Maru; 1173, near Kyōto, Japan
DIED: November 28, 1262, Kyōto, Japan
TYPE OF ETHICS: Religious ethics
SIGNIFICANCE: Shinran founded the True Pure Land Sect (Jōdo Shinshū) of Japanese Mahāyānist Buddhism. His teaching differentiated between real truth (faith), the gift of salvation in the next world; and common truth (morality), one's duty to society in this world.

A monk at Mount Hiei from age nine to age twenty-nine, Shinran had a vision in which Kannon (Avalokiteśvara, the bodhisattva of compassion) directed him to follow the teachings of Hōnen. Both men taught that salvation could be achieved through reciting the nembutsu, the phrase "Hail [or 'I place . . . my faith in'], Amida Buddha." Amida was understood as a Buddha who lived in the Western Paradise and would bring there all persons who came to him in faith. While Hōnen thought that the nembutsu should be repeated over and over, Shinran thought that it was sufficient to pray sincerely to Amida once, since reciting the nembutsu was an act of gratitude for the gift of salvation, not a work by which one earned salvation. In the salvation experience, the believer experiences undoubting faith in Amida and simultaneously utters the nembutsu. Upon death, the devotee is reborn in the Western Paradise, which Shinran identified with nirvana. There the devotee would become a Buddha and return to the earth to enable others to achieve salvation. Shinran broke with his master over the celibacy of monks, married, and fathered six children.

Shintō ethics

DEFINITION: Moral values central to the dominant religious system of Japan
TYPE OF ETHICS: Religious ethics
SIGNIFICANCE: Shintō ethics played a major role in the development of the national state of Japan and of Japanese nationalist ideology. It emphasizes

that there is no timeless and universal formula guiding moral action. Rather, the context of each action must be thoroughly considered before a decision is made.

Shintō, the “Way of the Gods,” is the indigenous religion of Japan. After several centuries of development of traditions, rituals, and observances, it evolved into an organized religion between the third and sixth centuries. Shintō is best described as a religion of daily life. Love and respect for spirits and ancestors are far more important than is appeasement of deities or immortality.

HISTORY

From the beginning, Shintō was influenced by or through China. Confucianism infiltrated Japan from northern China in the third century and was followed in the sixth century by Buddhism. Buddhism, when united with Shintō, gave Japanese religion renewed vitality, universal ideals, and transcendental speculation. Confucianism, which is basically an ethical system, provided the ethical foundation for the social and political development of Japan.

In spite of the infusion of Confucianism, Western scholars have had difficulty in discovering concrete ethical principles in Shintō. Although earlier Shintō reveals very little ethical thought, Confucian contributions brought a major increase in ethical thinking.

This growing ethical consciousness experienced great change and adaptation in later centuries. One of the most serious changes was the Meiji (“enlightened government”) Restoration in 1868. This event officially established Shintō as the state religion of Japan and set the nation on a path of imperialism and conquest. The ethical consequences of this path are abundant. Shintō ethics, as used by the state, helped to formulate the conduct and blind obedience of Japanese military personnel during World War II. Negative examples of such behavior include the brutal treatment of prisoners by the Japanese on the Bataan Death March and the work of the Kamikaze suicide pilots near the end of the war. State Shintō was disestablished after the national humiliation of military defeat in 1945, but it was not eliminated as a national faith.

ETHICAL PRINCIPLES

A careful study of Shintō ethics reveals at least eight principles that are dominant influences on the

daily lives of the Japanese people. The foundational principle of Shintō ethics is embodied in the Three Sacred Treasures of Shintō. These treasures, to which are attached moral and ethical values, are displayed in all significant Shintō shrines. The mirror stands for wisdom, integrity, purity, and righteousness. The sword reflects valor and justice. The last treasure, the stone necklace, symbolizes benevolence, affection, and obedience.

The second principle is tribal ethics, or the authority of the community. In this ethic, the individual melts into unreasoning submission to communal authority. At key points in Japanese history, this has been the power that solidified the people, but it also has been used to justify aggressive national conduct. Tribal ethics fosters a tendency to refer ethical decisions to government offices. It emphasizes a contextual approach and glorifies the ethics of intention.

A strong social ethic is built on the position of the emperor as a direct descendant of the sun goddess and also as the head of a giant family. The roof over the family has often been extended to include the entire world. This ethic has established an almost unbreakable relationship between the emperor and the people, with very few attempts at revolutionary change.

Consistent with the situational nature of Shintō ethics is the concept of *makoto*, or “truth.” Truth is relative, thus in Shintō there is no ultimate truth. *Makoto* involves an inner heart-searching while confronting any ethical issue.

Related to *makoto* is the principle that all evil is external. When a person is untrue to himself or herself or to others, it is only a result of a lack of awareness caused by external influences.

The Shintō ethic of guilt is better understood as shame. A person who fails to fulfill his or her proper role, as determined by the communal authority, is often consumed by an overwhelming shame, even to the point of suicide.

A unique principle of Shintō ethics is *naka-ima*, or the “middle present.” *Naka-ima*, which first appeared in the imperial edicts of the eighth century, means that the present moment is the most important moment of all times. Shintōists are thus exhorted to make each moment as true and as worthy as possible.

The last ethic of Shintō is a strong concept of racial superiority. This concept became extremely important after the inauguration of State Shintō in the

nineteenth century. It produced a jealous contempt for all non-Japanese culture and a major attempt to keep such influences out of Japanese life. Officially, this principle was abolished by imperial decree on January 1, 1946.

CONCLUSION

Japan's military defeat in 1945 unleashed long-suppressed forces of change. The embodiment of moral and ethical truth in the community headed by the emperor was forever broken. Replacing that sentiment was a feeling of individual cooperation by morally responsible citizens of the community. Although many traditional Japanese values have been retained, there is now more freedom to accept the ethical principles of other cultures.

Problems related to State Shintō did not all disappear in 1945. The ethics involved in shrine worship—particularly the Yasukuni Shrine, which honors as deities more than two million war dead—remained as a continual dilemma for many Japanese people. The basic ethical nature of State Shintō has, however, been replaced by the ethic of world peace and an attempt to contribute to the well-being and advancement of all world cultures.

Sidgwick, Henry

IDENTIFICATION: English philosopher
 BORN: May 31, 1838, Skipton, Yorkshire, England
 DIED: August 28, 1900, Cambridge, Cambridgeshire, England

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Sidgwick attempted, in *Methods of Ethics* (1874), to discover a rational means of making ethical decisions and further developed the utilitarian ideas of John Stuart Mill by applying to them Immanuel Kant's notion of the categorical imperative. His work is considered by some scholars to be the most important English-language work on ethics of the nineteenth century.

In *Methods of Ethics*, his greatest book, Henry Sidgwick argues that there are no grounds for rational action in judging an act either on the basis of the happiness it brings to the actor (egoism) or on the basis of criteria other than the promotion of happiness (intuitionism). Instead, he proposes a system of "universal hedonism" in which one seeks to reconcile the conflict between one's own pleasures and those of others. His argument is similar to that of Kant and is parallel to the latter's "categorical imperative."

Sidgwick's interests went beyond formal systems of ethics; he also engaged in psychic research and studied political economy. Among his works are *Principles of Political Economy* (1883), *Elements of Politics* (1891), and *The Development of European Polity* (1903), which was published after his death.

Sierra Club

IDENTIFICATION: Oldest and largest environmental organization in the United States

DATE: Founded in 1892

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: Since the organization's foundation, the mission of the Sierra Club has been to protect the natural environment.

The Sierra Club was founded on May 28, 1892, with an initial membership of 182 persons. Naturalist John Muir was selected as the club's first president. Many of the organization's early activities were concerned with the preservation of natural resources and the establishment of national parks in the United States. Its initial campaign in 1892 focused on defeating a proposed reduction of the boundaries of Yosemite National Park in California.

From this beginning, the Sierra Club grew to an international organization claiming a membership of approximately 700,000 people at the beginning of the twenty-first century. It retained as its primary mission today the protection and enhancement of Earth's natural environment by sustaining natural life-support systems, facilitating the survival of species, establishing and protecting natural reserves, controlling population growth and pollution, developing responsible technology managing resources and educating the public about environmental protection.

Critics of the Sierra Club have charged that the organization's policies to preserve and protect the environment may sometimes infringe on individual rights and restrict public access to property. Some critics also assert that the Sierra Club is composed of an economic, social, and political elite interested in preserving the wilderness for a select few who are not sincerely concerned with environmental justice at the grass-roots level. For example, in 1972 the club opposed the attempt by Walt Disney Enterprises to build a highway through Sequoia National Park in California to a proposed ski resort that was expected to attract fourteen thousand visitors a day. The club argued that the valley should be kept in its natural state for its own sake. The club has also advocated breaching the Glen Canyon Dam on the Colorado River and draining Lake Powell in order to return the region to its natural state. The dam provides flood control and electricity for four million people, and Lake Powell is one of the most popular camping sites in the United States. Controversies such as these illustrate an ethical dilemma repeatedly faced by the Sierra Club: how to balance individual rights and the protection of the environment for all people.

Sikh ethics

DEFINITION: Monotheistic ethical system centered in Punjab, India, that espouses the equality of all people

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Sikhism presents a challenge to the Hindu conceptions of polytheism and caste hierarchy that predominate in India. It offers the model of the "saint-soldier" for whom spiritual insight and physical courage are complementary virtues.

The Sikhs are a religious group that constitute approximately 2 percent of the total population of India. The majority of the Sikhs live in the state of Punjab in the northwest, but followers of the Sikh faith are also in diaspora across north India and in the United States, the United Kingdom, and Canada. By the turn of the twenty-first century, there were about sixteen million Sikhs living throughout the world.

Sikhism, which began in the fifteenth century, draws from elements of both Hinduism and Islam, the predominant religions of the Indian subcontinent. Persecuted by both Hindu and Muslim rulers at various points in their history, the Sikhs have developed a firm sense of themselves as a separate community and have recently begun agitating for separate nationhood. Issues concerning the use of violence in maintaining Sikh autonomy are at the forefront of ethical debates within the Sikh community.

DEVELOPMENT OF SIKHISM

Sikhism as a system of faith was initiated by Nānak, the first of a series of ten Sikh gurus, or teachers. Guru Nānak, drawing on meditative traditions within Hinduism but rejecting its elaborate ritualism, gathered a group of disciples (*sikhs*) around him to form a community called the *Panth*. Within the *Panth*, caste differences were eradicated, as were inequalities between men and women. In addition, the multiple deities of Hinduism were replaced by devotion to a single god something like that of Islam.

Sikhism quickly acquired converts from the lower-caste levels of the Hindu system. In this, it fol-

lowed the pattern of several other heterodox religious movements of India, notably Buddhism and Jainism. For many, however, Sikhism remained heavily intertwined with Hinduism, with many villages and even many families incorporating both Sikhs and Hindus in relative harmony.

Guru Nānak himself is venerated not only as the religion's founding figure but also as a kind of mediator between the human and the divine. He was followed by a succession of nine other gurus who took up the leadership of the Panth. Two of these in particular left a lasting stamp on the nature of the Sikh faith. Hargobind, the sixth guru, donned the double-edged sword that has become symbolic of the Sikhs, representing the recognition that Sikhism must wield both spiritual and temporal power to be successful. This theme was carried further by the tenth and last guru, Guru Gobind Singh, who, after years of persecution, came to the conclusion that the Sikhs had to

become militant to defend their religious beliefs and social order.

Guru Gobind Singh created a brotherhood of militant Sikhs called the Khalsa, or "pure," who were ready to die in defense of their faith. They all took on the surname of Singh ("lion") and adopted the five symbols of Sikh identity: uncut hair, comb, breeches, sword, and steel bangle. One effect of these five signs was to make Khalsa Sikhs highly visible, with the characteristic turbans into which their uncut hair was bound their outstanding feature. Probably this innovation was related to an awareness of the fate of other rebellious religious movements in Indian history, which tended to become merged into the overarching Hindu framework. Guru Gobind Singh believed, however, that physical violence on the part of the Khalsa was to be used only in *defense* of the Sikh faith, and only after all other means had failed.

Sikh communities in India and abroad cluster

The Five Signs of the Sikh (Five “K’s” in Punjabi)

- | | |
|------------------|--------------|
| 1. <i>kesh</i> | uncut hair |
| 2. <i>kangi</i> | comb |
| 3. <i>kachch</i> | breeches |
| 4. <i>kirpan</i> | sword |
| 5. <i>kara</i> | steel bangle |

around their *gurdwaras*, or temples (literally, “gateways to the Guru”). The communal kitchen is a key feature of the Sikh community, symbolic of the Sikhs’ rejection of caste rules forbidding interdining. (The kettle and the sword are said to be representative of Sikh beliefs—the kettle for feeding the hungry and the sword for defending the weak.) Worship services at Sikh *gurdwaras* may involve readings from their scripture, the Guru Granth Sahib, as well as the singing of hymns, recitation of poetry, or other kinds of contributions from community members including, recently, political statements.

The holy city of the Sikhs and center of the Sikh faith is Amritsar in Punjab, India. (*Amrit* is the nectar stirred by the sword and drunk to consecrate a commitment; Amritsar is the “pool of nectar.”) The so-called “Golden Temple” is the main Sikh shrine at Amritsar, and it has been the focal point of the dispute between the Sikhs and the government of India. In 1984, the Golden Temple complex was the scene of intense fighting between the Indian army and Sikh insurgents agitating for an independent state of Khalistan (“Land of the Pure”). The perceived desecration of this shrine by Indian troops and the Hindu-Sikh rioting that followed pushed many Sikhs to take a more militant political posture. Upheaval has continued in Punjab, and it is one of the major security concerns of the Indian government. Human rights issues surrounding India’s handling of the Punjab problem have become a focus of several international investigations.

ETHICAL ISSUES OF CONTEMPORARY SIKHISM

Sikhism is at its heart an ethical system as well as a theology and a design for living. The foundation of Sikh ethics is the principle of equality, which is better understood as an ideal than as an accomplishment.

(Aspects of caste still persist in Sikh communities, and relationships between women and men remain inequitable in many ways.) Other ethical precepts followed by Sikhs include admonitions against theft, lying, and adultery, and a ban on smoking. Many Sikhs regard charity and courage as among the noblest virtues; the “saint-soldier” is the model emulated by many.

The most problematic issue for modern Sikhs, given the political violence endemic in the Punjab, is that of legitimate defense of the faith. Sikhism has never advocated a policy of “turning the other cheek,” but it does seek to restrain the aggressive, as opposed to the defensive, use of force. Whether actions in which noncombatants are killed fall within the realm of defensive violence, and whether the Sikh community is actually under a threat substantial enough to evoke the use of force, are deeply disturbing questions for many Sikhs. For outsiders, conditions in the Punjab are very difficult to evaluate because of extreme limitations on press coverage and travel in the region. It is clear, however, that many thousands of Sikhs were killed during the 1980’s and 1990’s and that there is a strong feeling of being a community under siege on the part of both Indian and overseas Sikhs.

Silent Spring

IDENTIFICATION: Book by Rachel Carson (1907-1964)

DATE: Published in 1962

TYPE OF ETHICS: Environmental ethics

SIGNIFICANCE: *Silent Spring* increased popular awareness of chemical pollution by illustrating the demise and death of organisms that had once been a part of a rural spring.

During the late 1950's, a proliferation of the manufacturing and use of chemical agents as insecticides and herbicides seemed to stimulate the agricultural industry. Initially, these chemicals provided relief to farmers who could now control and obliterate insect pests and weeds from cropland. Insufficient testing and monitoring of the use of these chemicals, however, led to widespread contamination of water and land, resulting in the destruction of a great variety of animals and plants.

The popular book *Silent Spring* aroused public awareness of a sinister development in which streams and springs became silent as birds, frogs, fish, and other organisms died from the toxic chemicals used in adjacent fields. Ethically, the realization that humans can quickly and easily pollute and blight large regions through the careless use of chemicals illustrated the necessity for good stewardship of natural resources. As an alternative to control insect pests, Rachel Carson suggested the use of nonchemical methods that were more environmentally wholesome. Carson's landmark book led to the formation of numerous environmental groups that have committed themselves to protecting natural resources.

Sin

DEFINITION: Violation of religious moral law

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Although sometimes used in a secular context, sin carries strong connotations of transgression against the ethical system of a monotheistic religion. The term therefore implies that one's actions are objectively wrong and that they constitute a rejection or failure of one's duty to God. Sin also evokes the Christian concept of Original Sin, the notion that all people are inherently guilty from the moment of their birth.

The concept of sin has its origin in the prehistoric past in the magical attempt to deal with the forces of nature. Some of these forces are taboo—that is, dangerous to handle. The breaking of taboos is not essentially sinful, since the behavior is typically unavoidable. In ancient Mesopotamia, a moral dimension entered the picture. The creation myth, the *Enuma elish*, explained that humans were created to serve the gods. The *Gilgamesh Epic* took that thinking further. It tells of the creation of Enkidu, a savage of whom the other beasts knew no fear. Enticed to participate in civilization by a prostitute, he lost his innocence, joined with the hero Gilgamesh, put on clothing, and learned to eat and drink in proper proportions. In short, he became human and ultimately met the fate of all humans: death. The Greeks further developed the idea of moral guilt. Plato saw moral failure as a matter of error; no one who knew what is best would choose to do otherwise. It was, however, the Judeo-Christian tradition that more fully developed the notion of sin.

SIN IN THE HEBREW BIBLE

The story of the origin of sin occupies the third chapter of the Bible, and its scope, effects, and forgiveness occupy much of the remainder. Sin is introduced in Genesis 3 as a deliberate act of disobedience by Adam and Eve. Sin was experienced both as the rupture of their relationship with God and as a power that grasped them. It spread to all other humans like a contagious disease, disrupting both the natural and the social order as well as the standing of each sinner before God. Forgiveness for sin in the Hebrew Bible could involve animal sacrifice coupled with human contrition or intercession by a prophet or priest.

The biblical Hebrew language employed about twenty different words for sin, but four in particular stand out. The first root (the basic form of a word from which various parts of speech can be derived) was used 457 times and originally meant to “miss” a target or “fail” to follow the proper order. Hence, sin was understood as the failure to comply with moral standards or obligations. This failure might include obligations to another person (parent, superior, spouse) or to God. Still other sins constituted a failure toward both: for example, murder, robbery, adultery, giving false testimony, and perverting justice.

The second root, which appears 136 times, originally meant “breach” and is used of sin in the sense of a breach of a covenant or “rebellion.” Hence, sin carried with it the idea of persons revolting and dissolving the relationship between themselves and God. A sinner not only commits wrong acts but also lives in a state of rebellion against God.

The third and fourth roots can be dealt with more quickly. The third, used more than 254 times, originally meant “bend” and emphasized the condition of guilt as a consequence of bending the rules. The fourth, used 19 times, meant to “err” and emphasized that the sinner had gone astray and become lost.

The later idea of moral (or cardinal) sins derived from passages in the Hebrew Bible that associated death with the commission of certain sins (for example, premeditated murder, striking one’s father, kidnapping, bestiality, and sorcery). Some passages associated a more general state of sinfulness with death (for example, Ezek. 18:20: “The soul that sins shall die”).

Atonement for sins in the Hebrew Bible was conceived as a covering for sin. It was achieved primarily through sacrifice. The “sin offering” was made for unintentional offenses that broke a person’s relationship with God and endangered the welfare of the community. The “guilt offering” atoned for offenses that required restitution along with a sacrifice. Less bloody means were also used. On the Day of Atonement, the high priest would symbolically lay the sins of the people upon the scapegoat and drive it out of the community, carrying their sins with it. Exodus 30:16 suggests that money could be given for the same purpose. Finally, the Hebrew Bible also speaks of prophets and priests interceding for sinners. For genuinely minor sins, penitents might pray for themselves.

SIN IN RABBINIC JUDAISM

The rabbis, who led Judaism to think through its theology after the destruction of Jerusalem by the Romans in 70 C.E., used a term meaning “pass over” for sin. They spoke of two inclinations within humans. Literally, the names of these inclinations can be translated the “good inclination” and the “bad inclination,” but these translations are misleading. The so-called “good” inclination consisted of characteristics humans were thought to share with the angels: They walk upright, have eyes on the fronts of their faces, reason, and speak. By contrast, the “evil” inclination consisted of characteristics humans share with animals: eating and drinking, voiding, mating, and dying. Clearly, none of these latter characteristics is “evil” in a moral sense, though several may lead to sin if not held in check. Just as clearly, Rabbinic Judaism did not derive from Genesis 3 a doctrine of Original Sin as Christianity did.

The rabbis also thought in terms of sins as transgressions of the individual commandments of the law. Thus, all sins constituted rebellion against God. Even so, the rabbis distinguished between light and severe sins. The most serious were murder, idolatry, adultery, and incest. They also distinguished sins of omission (in which one failed to follow a commandment) from sins of commission (in which one committed a prohibited act). Sins of commission generally were thought to be worse.

SIN IN THE NEW TESTAMENT

The New Testament employed two words for sin. The first originally indicated missing a target and was a near equivalent of the first word discussed above in connection with the Hebrew Bible. The second word designated lawlessness and usually indicated a state of hostility toward God.

The books of Matthew, Mark, Luke, and Acts did not speak of the nature of sin but of specific wrong deeds. The angel informed Joseph that Jesus would save his people from their sins (Matt. 1:21), and Jesus said that he came to call sinners to repentance (Matt. 9:13). A person who recognized Jesus’ mission through the Holy Spirit but refused to confess Jesus and the salvation he brought committed a sin that both Matthew and Mark declared unpardonable. The Gospel of John conceptualized the mission of Jesus in terms of the sacrificial victim of the Hebrew

Bible: The sinless lamb of God took sin upon itself and carried it away.

The apostle Paul extended further the New Testament conceptualization of sin by raising the issue of the power of sin over human nature and the world. Paul argued that sin entered the world through Adam's act of opposition of God in the Garden of Eden. This opposition arose from Adam's freedom. Sin brought death into the world with it. Indeed, Paul portrayed death as the wages paid by sin, the workmaster. For Paul, then, sin consisted of more than individual misdeeds; it was a state of self-assertive rebellion against God in which all humans lived. An act was sinful insofar as it was a rejection of God or his law. He argued (in Rom. 1-3) that Gentiles had refused to accept God as the origin of good, and Jews (who had the law and should have known better) had rejected the law. The result was that all human beings were enslaved to sin.

With such a view of sin and humankind's entanglement in it, the New Testament considered its proclamation of forgiveness for sin "good news." Furthermore, it employed a number of analogies to explain the role of Jesus in that forgiveness. Three examples follow. The first analogy has been mentioned already: sacrifice. Jesus' death was understood as atoning for sins in the same way that sacrifices did in the Hebrew Bible. The book of Hebrews carried that thought further by conceiving of Jesus as both the perfect High Priest (because he was sinless) and the perfect victim (because he was offered once only and for all sins). Another analogy was that of ransom; Jesus' death was understood as the ransom price paid to set sinners free. Third, Paul employed legal language in speaking of atonement as justification; the death of Jesus delivers the sinner from sin, finitude, and death.

SIN IN MUSLIM THOUGHT

Sin is also an important concept in Islam, which derives its ideas on the subject more from the Hebrew Bible and Rabbinic Judaism than from the New Testament and Christianity. Human beings are not considered inherently evil, as in Christianity. Rather, in thinking akin to the rabbinic notion of the two inclinations, Muslim doctrine holds that humans have both a lower nature to which evil spirits appeal and a higher nature to which angelic creatures appeal. People sin by disobeying God's commands and thus committing individual misdeeds.

SIN IN EARLY AND MEDIEVAL CHRISTIANITY

The first Christian to write a systematic account of his theology was Saint Augustine. In his book *The Enchiridion on Faith, Hope and Love* (421 C.E.), he defined sin as a word, deed, or desire in opposition to the eternal law of God. Sin began with Adam's turning away from God, who was unchangeably good. The fall left Adam ignorant of his duty and lustful for what was harmful. Through Adam's fall, all humans were corrupted and were born under the penalty of death. Augustine's thinking on Original Sin was echoed by the Roman Catholic Church at the Council of Trent (1545-1563): The transmission of sin comes by propagation, not by the imitation of others.

Augustine is well known for his ideas about concupiscence. Concupiscence is a characteristic considered unique to human beings, who—unlike either angels or animals—are a mixture of flesh and spirit. Concupiscence grows out of that mixture. It is the fruit of past sin, part of the punishment for that sin, and the seed of future sin. Concupiscence in the first two senses is the result of Original Sin and the sins of one's parents as well as of one's own past sins. Concupiscence in the third sense is a nondeliberate desire pitted against a person's freedom to choose. Hence, it is the seed of future sins, without itself being a sin. It is not, however, exclusively an impulse to act immorally. Even less can it simply be equated with the sexual drive, though it was that aspect of concupiscence that concerned Augustine most.

Augustine recognized that not all sins were of equal severity, but he thought that distinguishing trivial from heinous sins should be left to God. Later churchmen did not share his caution. They distinguished between mortal (or cardinal) sins, which disrupt one's relationship with God, and venial sins, which only introduce disorder into one's relationship with God. Mortal sins merit eternal punishment, while venial sins merit only temporal punishment. Mortal sins must be confessed; venial sins need not be. Cardinal sins are not the same as the mortal sins of the Hebrew Bible or Rabbinic Judaism, but are characteristics that render the sinner liable for Hell and are forgivable only through penance. Enumerated as seven as early as 604 C.E., they have typically included pride, covetousness, lust, anger, gluttony, envy, and sloth.

Redemption from sin was the work of God through the death of the mediator Jesus. Furthermore, Augus-

tine thought that God's grace was ultimately irresistible; if God chose a person to receive it, sooner or later that person would do so. Pardon for sin is offered through the church, specifically through three sacraments. Baptism was held to remove Original Sin and personal sins in cases other than those of infants. Confession removes sins one commits along the way. Extreme unction (now often called the sacrament for the sick) offered the opportunity for final confession or (for unconscious persons) complete final absolution.

SIN IN REFORMATION THOUGHT

The reformers reacted against much in Roman Catholic thinking; for example, limiting the sacraments to two (or three) and denying that baptism cleanses one from Original Sin. They differed little, however, on the doctrine of sin per se. Indeed, John Calvin, one of the leaders of the Swiss Reform movement, developed the thinking of Augustine to its logical conclusion. In his *Christianae religionis Institutio* (1536; *Institutes of the Christian Religion*), he too accepted the idea of Original Sin and the imputation of guilt to all of Adam's descendants. In speaking of total depravity, he said that everything in humanity (specifically including understanding, will, soul, and body) is polluted and engrossed by concupiscence. In short, human beings are corrupt through and through. Calvin drew from this analysis the further conclusion that everything the sinner does is accounted by God as sin.

Calvin also pushed Augustine's thinking on irresistible grace. Both men applied the idea of omnipotence to the idea of grace, concluding that God would not be omnipotent if his grace could be rejected. Calvin carried the thinking one step further: If humans are thoroughly corrupt and incapable of turning from sin, and if God chooses those who will receive grace, by implication, he also chooses those who will not receive grace.

Not all Protestants agreed with Calvin. In the Dutch Reform movement, Jacobus Arminius (d. 1609) opposed Calvin's view of predestination as too harsh in favor of what he called "conditional election," which he thought placed greater emphasis on the mercy of God. Arminius argued that God elects to eternal life those he knows will freely respond in faith to his offer of grace. His thinking was more influential in England than in Holland. Anglicans, General

Baptists, and Methodists followed him instead of Calvin. American Protestantism, even within the Reform or Presbyterian tradition, generally speaking stands closer to Arminius than to Calvin, though one can still find staunch defenders of Calvin's view of Original Sin and the imputation of Adam's sin to his descendants.

SIN IN MODERN THOUGHT

The concept of sin has continued to occupy some of the best thinkers, particularly theologians, of the modern period. One theologian deserving mention is Paul Tillich, who reinterpreted Christianity in terms of existentialist philosophy. For Tillich, humans find themselves in a state of estrangement from God, from others, and from themselves. Tillich retains the word "sin" to characterize this estrangement precisely because it includes the personal act of turning away from God. Hence, human estrangement is sin. The New Testament scholar Rudolf Bultmann also speaks of sin in existentialist terms by saying that being divided against oneself is the essence of human existence under sin.

Modern philosophers have been interested in the concept of sin because of its importance to ethics. Two examples must suffice. The first is the nineteenth century Danish philosopher of religion Søren Kierkegaard. As one of the founders of existentialism, he exercised great influence over Tillich, Bultmann, and many others. He argued that despair (in the sense of not willing to be oneself) is as much a form of sin as murder, theft, unchastity, and the like. It is sin because it constitutes a lack of faith in God not to be all that one could be. Likewise, he denied that sinfulness is inherited through biological generation; he did, however, find its presupposition in the anxiety common to all people. This anxiety is caused by the awareness of one's finitude and the threat of nonbeing. In their condition of anxiety, humans commit sinful deeds.

The second philosopher is Richard Swinburne, who defines sin as failure in one's duty toward God, the creator. He is more concerned, however, with the idea of Original Sin. Swinburne argues that one may not be held accountable for that over which one has no control. Original Sin properly may be said to have begun with the first hominid (who might even be called Adam), but it arose out of characteristics inherited in the process of human evolution. Adam's responsibil-

ity lay solely in initiating a historical and social process. Furthermore, sin arises within every hominid, whether descended from Adam or not; it is not a consequence of choices by one's forebears. It is also not the case that all humans who come after Adam are held accountable (guilty) for Adam's choices.

Kierkegaard and Swinburne have reinterpreted the concept of sin in the light of modern life and thought. Other thinkers, however, see less value in the concept of sin. Reacting against them, the psychologist Karl Menninger has complained about what he sees as the result of ignoring the concept of sin: a society that more and more has difficulty in finding grounds to condemn any behavior.

Singer, Peter

IDENTIFICATION: Australian philosopher and ethicist

BORN: July 6, 1946, Melbourne, Australia

TYPE OF ETHICS: Animal rights

SIGNIFICANCE: A prolific author, Singer is a leading spokesperson for the modern animal rights movement and is also the leading utilitarian bioethicist of his generation.

Peter Singer is best known for his work in two areas of ethics, the first of which is animal rights. His book *Animal Liberation* (1975) builds a case for an animal rights movement similar to the civil and women's rights movements of mid-twentieth century America. His arguments rest upon his belief in equality as a foundational principle of ethics. This is evidenced by the many parallels Singer draws between speciesism—the treatment of nonhuman species in ways that would be considered unethical or immoral to treat human beings—and human racism and sexism. Singer asserts that all forms of animal subjugation are immoral, including domestication, experimentation, and raising animals for food.

A second area of moral thought in which Singer has worked is bioethics. His book *Practical Ethics* (1970) reveals that he holds to pure consequentialist

utilitarian ethics, regarding acts as moral if they produce more happiness, or equality, for all affected parties than do alternative courses of action. In the field of bioethics, Singer has generated much controversy as his ethics have resulted in his endorsement of many beginning-of-life issues such as in vitro fertilization, cloning, and sex selection, as well as many end-of-life practices such as abortion, euthanasia, and infanticide for disabled children.

Singer's views regarding end-of-life issues, such as euthanasia and infanticide, have engendered the greatest amount of discussion. Regarding such issues, it is important to note that Singer does not advocate taking a person's life against the persons' expressed will—or that of the person's guardians. Moreover, in line with his consequentialist utilitarian ethics, the rationale behind Singer's endorsement of end-of-life issues rests upon the notion that end-of-life practices can sometimes result in happiness for the greatest number of people—oftentimes including the individual who is put to death instead of being forced to endure a substandard life.

Situational ethics

DEFINITION: Process of making moral decisions based upon particular contexts and individual circumstances rather than universal moral laws

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Situational ethics differs from applied ethics, as the latter involves taking pre-constituted values, universal laws, or inflexible rules and applying them to a given situation. Situational ethics, on the other hand, derives both ethical principles and fundamental values from a given moral context, and so involves no ground beyond the situation itself. In colloquial speech, “situational ethics” has become a euphemism for lack of ethics, for doing whatever one wants without regard to right and wrong.

Situational (or contextual) ethics is largely a reaction against legalism, the so-called “old morality” of reliance on laws and rules as dependable guides to conduct. Situational ethics emphasizes love rather than law; it begins with the unique elements of a specific ethical situation rather than with any set of laws or rules that are to be applied in every situation. Situational ethics thus takes an inductive rather than a deductive approach to ethical decision making.

JOSEPH FLETCHER

Situational ethics was popularized in 1966 by the publication of Joseph Fletcher's *Situation Ethics: The New Morality*. In this best-selling book, Fletcher states his belief that there are only three basic approaches to ethical decision making; legalism, antinomianism (the rejection of all laws and principles, sometimes called subjectivism), and situational ethics. He depicted situational ethics as being “in between” the other two extremes. The primary purpose of *Situation Ethics* was to oppose legalism, because Fletcher believed that almost all people in Western culture, especially Christians, are and have been legalistic.

Fletcher, along with other proponents of situational ethics, insisted that both Jesus and Paul taught this approach to ethical decision making. Other persons, however, find the roots of situational ethics in the philosophical approaches of existentialism and utilitarianism. Existentialist ethics has often emphasized the free choice of persons as the only avenue leading to authentic existence; such free choice is denied by any reliance on principles and rules in ethical decision making. Although Fletcher tended to categorize existentialist ethics as “antinomian,” he readily incorporated into his approach the utilitarian principle of “the greatest good for the greatest number.” He thus translated the principle of love into the principle of utility; the moral quality of actions derives directly from their consequences. The most loving thing to do in any ethical decision-making situation is determined by a kind of utilitarian calculus: What course of action will bring about the most good for the most people?

Among the many Christian theologians who influenced Fletcher and others who subscribe to situational ethics, Rudolf Bultmann and Paul Tillich stand out. Bultmann held that a Christian can, in love, perceive a neighbor’s greatest need through a kind of moral intuition. Similarly, Tillich believed that moral judgments are based on an intuitive grasp of the potentialities of being. Fletcher quoted with approval Tillich’s statement that “The law of love is the ultimate law because it is the negation of law. . . . The absolutism of love is its power to go into the concrete situation, to discover what is demanded by the predicament of the concrete to which it turns” (Tillich, *Systematic Theology*, 1951-1963).

FLETCHER’S SIX PROPOSITIONS

The heart of situational ethics, according to Fletcher, is found in six propositions that demonstrate how the principle of love works itself out in concrete situations involving ethical decision making. These propositions are:

(1) “Only one thing is intrinsically good; namely, love: nothing else at all.” No law, principle, or value is good in and of itself—not even life, truth, chastity, property, or marriage. (2) “The ruling norm of Christian decision is love: nothing else.” Fletcher, using several admittedly extreme examples, attempted to demonstrate how the most loving thing to do might involve violating each of the Ten Commandments.

(3) “Love and justice are the same, for justice is love distributed, nothing else.” Justice is love working itself out in particular situations; it is Christian love “using its head.” (4) “Love wills the neighbor’s good whether we like him or not.” Loving and liking are not the same thing; according to Fletcher, there is nothing sentimental about love. Love is attitudinal rather than emotional; therefore, it can be commanded. (5) “Only the end justifies the means; nothing else.” Fletcher contested the classical Christian dictum that the end does not justify the means. In a world of relativities and uncertainties, one may do what would normally be considered evil if good results come from it. (6) “Love’s decisions are made situationally, not prescriptively.” The rightness or wrongness of an action does not reside in the act itself, but in the whole complex of all the factors in the situation.

Situational ethics has been, and remains, extremely controversial. In 1952, Pope Pius XII condemned “situation ethics” as an individualistic and subjective appeal to the concrete circumstances of actions in order to justify decisions that are in opposition to natural law or God’s revealed will. Fletcher and others, however, represent a serious attempt to develop a Christian ethic that is based on the principle of love yet is free from the restrictions of a moral code.

In response to his critics, Fletcher said that he would “personally would adopt nearly all the norms or action-principles ordinarily held in Christian ethics.” Yet he added, “I refuse, on the other hand, to treat their norms as idols—as divinely finalized. I can take ’em or leave ’em, depending on the situation. Norms are advisers without veto power.”

Skepticism

DEFINITION: Method of philosophical inquiry involving rigorous or systematic doubt of apparent truths

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Philosophical skepticism always represents a self-conscious investigation of the foundations of knowledge, but it can lead to very different results for different philosophers. Some skeptics seek to doubt self-evident beliefs temporarily, in order ultimately to prove that they are indeed objectively valid. Others seek to demonstrate that knowledge has no foundation and that all values and beliefs are therefore necessarily subjective.

A society and the individuals who constitute it confront many situations that have moral significance, such as those involving abortion, euthanasia, racism, and war. Morally these situations involve decisions concerning the goodness of actions and the value of life that is reflected in those decisions. A practical perspective is to view ethics as a summation of the decisions made by individuals and groups in those situations. A theoretical perspective is to derive ethics from a set of first principles, such as “All pleasure is good” or “The only unconditionally good thing is

a good will.” Skepticism is not primarily concerned with the practical perspective. Ethical skepticism mainly involves theories about the nature of goodness, and especially the status that is accorded first principles (that they be absolutely certain or necessarily true).

CLASSICAL SKEPTICISM

The origins of Western philosophy are typically traced to Greece and Socrates in the fifth century B.C.E. Greek society at that time was undergoing many pervasive and rapid changes, in large part because of successes in commerce and trade that had been made possible by the defeat of the Persians and the advent of writing. These changes represented a challenge to accepted beliefs and values. A group of professional teachers known as Sophists made a living by offering Greek citizens a variety of theories concerning the ultimate nature of reality and the good life.

In Sextus Empiricus’s *Outlines of Pyrrhonism* (c. 200), skeptical responses to exaggerated claims about hidden realities are elaborated. For Sextus, something is considered questionable and worthy of inquiry if it is not an immediate sensory presentation. Inquirers do not generally question appearances. Inquirers are interested in observing something that has not been observed or in reasoning beyond appearances to determine underlying and unobservable phenomena in order to explain something that has been observed. Skeptical inquirers are reluctant to exceed the evidence of the senses, and when they do, they hold those views with some degree of doubt. For example, a skeptic might claim that suspending judgment with regard to imperceptible realities leads to peace of mind but might admit that this may not always hold true.

Sextus imagines three possible outcomes of an inquiry: The object of the search is found; the object being sought is declared inapprehensible; or the search continues. When the thing being sought is beyond the limits of human perception, Sextus calls the first position *dogmatic*, the second *academic*, and the third *skeptical*. Ironically, only the skeptic’s position leaves room for more inquiry, yet skeptics are often accused of shutting the doors to speculation.

NONEVIDENT REALITIES

A nonevident reality is one that does not make itself immediately manifest to the inquirer. There are

several ways in which things might be nonevident. Referenced items might be temporarily hidden from view, as in this claim: "There is a pen locked in this desk drawer." Another way of being nonevident involves the need for special instruments of observation, such as an electron microscope or a radio telescope. Because the things being observed are extremely small or distant, there is still some uncertainty about what has been observed. Such uncertainty is evident in conclusions such as this: "There was something there, but what it was and where it is now are difficult to determine." Subatomic particles and distant quasars are less manifest and obvious than is the pen in the desk drawer.

Philosophical skeptics are not generally concerned with realities that could be made manifest to an inquirer. Instead, they are concerned with claims made about things that are permanently hidden from an inquirer's view. For example, no person can observe all things. Consequently, claims made about all things remain somewhat doubtful (unless these claims are meant only as definitions). It follows that claiming to know that "all pleasures are good" or that "only a good will is unconditionally good" is a form of exaggeration.

SKEPTICISM IN ETHICS

Skepticism is properly elaborated in response to a particular dogmatic position. It is possible, however, to identify patterns of skeptical argumentation. One positivist challenge to absolute ethics is that ethical claims are without definite meaning. Ethical claims lack meaning because, unlike ordinary factual claims, they are neither verifiable nor refutable. At the most general level, ethics is about the value or the sense of the world, of everything. That value or sense, if it exists, is something transcendental, beyond this world. Therefore, ethics may be thought of as being about something higher, but something that remains beyond words.

The emotivist challenge to the language of an absolute ethics is that ethical claims such as "All abortions are evil" can be interpreted as an expression of the speaker's likes and dislikes. Ethical claims are not true or false; they merely communicate the speaker's attitudes.

The subjectivist attack is based on the argument that the ultimate criterion of an ethical truth is the individual. Differences in ethical beliefs have existed since recorded history and seem likely to continue far into the future. People choose, and thus create, their own individual ethics.

These patterns of skeptical argumentation are responses to a dogmatically held absolute ethics. Any of these views can be transformed from a skeptical response into a dogma. For example, the statement "the individual is the criterion of ethical truth" can become exaggerated and changed into the statement "there is no higher or transcendental reality."

Slavery

DEFINITION: System in which human beings are owned as property by other human beings and forced to perform labor for their masters

TYPE OF ETHICS: Human rights

SIGNIFICANCE: Slavery has historically constituted a significant denial of human rights and has a particularly significance in the human rights history of the United States.

One of the oldest institutions of human society, slavery was present in the earliest human civilizations, those of ancient Mesopotamia and Egypt, and it has continued to exist in several parts of the world into the twenty-first century. Despite the near universality of slavery, however, there is no consensus regarding what distinctive practices constitute slavery. In Western societies, slaves typically were persons who were owned as property by other people and forced to perform labor for their owners. This definition, however, breaks down when applied to non-Western forms of slavery. In some African societies, for example, slaves were not owned as property by individual persons but were thought of as belonging to kinship groups. Such slaves could be sold, but so too could nonslave members of the kinship group. In some African societies, slaves were exempted from labor and were used solely to bring honor to their masters by demonstrating the masters' absolute power over other human beings.

Sociologist Orlando Patterson suggested that slavery is best understood as an institution designed to increase the power of masters or ruling groups. Slaves can perform that function by laboring to make their masters rich; however, they can also do that simply by bringing honor to their masters. One of the defining, universal characteristics of slavery is that individual slaves cannot exist as socially meaningful persons. Slaves relate to their surrounding societies only through their masters. Slavery includes many mechanisms to remove slaves from membership in any groups, such as families, through which slaves might derive independent senses of identity. By placing masters in a dominant position over other human beings, slavery is believed to increase the honor and power of the master. The status of slaves is usually permanent and is typically passed down to the slaves' children.

HISTORY OF THE INSTITUTION

The use of slavery was widespread in the ancient Western world, especially in Greece and Italy. During the classical ages of Greek and Roman society, slaves constituted about one-third of the population. Following the collapse of the Roman Empire in Western Europe during the fifth and sixth centuries, declining economic conditions destroyed the profitability of slavery and provided employers with large numbers of impoverished peasants who could be employed more cheaply than slaves. Over the next seven hundred years, slavery slowly gave way to serfdom. Although serfs, like slaves, were unfree laborers, serfs generally had more legal rights and a higher social standing than slaves.

Familiarity with the institution of slavery did not, however, disappear in Western Europe. A trickle of slaves from Eastern Europe and even from Africa continued to flow into England, France, and Germany. Western Europeans retained their familiarity with large-scale slave systems through contacts with southern Italy, Spain, and Portugal, and with the Byzantine Empire and the Muslim world, in which slavery flourished. Western Europeans also inherited from their Roman forebears the body of Roman law, with its elaborate slave code. During the later Middle Ages, Europeans who were familiar with Muslim sugar plantations in the Near East sought to begin sugar production with slave labor on the islands of the Mediterranean.

As Western Europe entered the age of exploration and colonization, Europeans had an intimate knowledge of slavery and a ready-made code of laws to govern slaves. During the sixteenth century, as European nations sought to establish silver mines and sugar plantations in their new colonies in the Western Hemisphere, heavy labor demands led to efforts to enslave Native Americans. This supply of laborers was inadequate because of the rapid decline of the Indian population following the introduction of European diseases into the Western Hemisphere. The Spanish and Portuguese then turned to Africa, the next most readily available source of slave laborers. Between 1500 and 1900, European slave traders imported perhaps nine million African laborers into the Western Hemisphere. Every European colony eventually used slave labor, which became the principal form of labor in the Western Hemisphere. Because the wealth of several modern nations was created by

slave labor, some modern African Americans have claimed the right to receive reparations payments from nations such as the United States, which continue to enjoy the wealth accumulated originally by slave laborers.

SLAVERY AND RACE

The large-scale use of African slaves by European masters raised new moral issues regarding race. There is no necessary connection between slavery and race. A massive survey by Orlando Patterson of slave societies throughout history found that within three-quarters of societies with slavery, both the masters and their slaves were of the same race. Slavery in the Western Hemisphere was unusual in human history because European slaves were drawn almost exclusively from Africa.

In most colonies of the Western Hemisphere, the use of African slaves was accompanied by the rise of racism, which some scholars claim was a new, unprecedented phenomenon caused by slavery. Scholars seeking to understand modern race relations in the United States have been intrigued by the rise of prejudice in new slave societies. Did Europeans enslave Africans merely because they needed slaves and Africa was the most accessible source of slaves? If so, then prejudice probably originated as a learned association between race and subservience. Modern racial prejudice in the United States might be broken down through integration and affirmative action programs aimed at helping whites to witness the success of African Americans in positions of authority. Did Europeans enslave Africans because they saw the Africans as inferior persons ideally suited for slavery? If so, then modern racism may be a deeply rooted cultural phenomenon that is not likely to disappear for generations to come. African Americans will receive justice only if the government establishes permanent compensatory programs aimed at equalizing power between the races.

Historical research has not resolved these issues. Sixteenth century Europeans apparently did view Africans as inferior beings, even before the colonization of the Western Hemisphere. Their racial antipathies were minor, however, in comparison to modern rac-

ism. Emancipated slaves in early settled colonies experienced little racial discrimination. The experience of slavery apparently increased the European settlers' sense of racial superiority over Africans.

After the slave systems of the Western Hemisphere became fully developed, racial arguments became the foundation of the proslavery argument. Supporters of slavery claimed that persons of African descent were so degraded and inferior to whites that it would be dangerous for society to release the slaves from the control of a master. In the United States, some proslavery theorists pushed the racial argument to extreme levels. In explaining the contradiction between slavery and the American ideal that all persons should be free, writers such as Josiah Nott and Samuel Cartwright claimed that black African were not

This Louisiana man named Peter had been severely whipped by a plantation overseer while he was a slave. Peter's owner discharged the overseer—probably not for wanton cruelty, but for damaging his valuable property. (National Archives)

fully human and, therefore, did not deserve all the rights belonging to humanity.

A minority of proslavery writers rejected the racial argument and the effort to reconcile slavery and American egalitarian ideals. Writers such as George Fitzhugh claimed that all societies were organized hierarchically by classes and that slavery was the most benevolent system for organizing an unequal class structure. Slavery bound together masters and slaves through a system of mutual rights and obligations. Unlike the “wage slaves” of industrial society, chattel slaves had certain access to food, clothing, shelter, and medical care, all because the master’s ownership of the slaves’ bodies made him diligent in caring for his property. Slavery was depicted by some proslavery theorists as the ideal condition for the white working class.

THE ANTISLAVERY MOVEMENT

From the dawning of recorded human history until the middle of the eighteenth century, few persons appear to have questioned the morality of slavery as an institution. Although some persons had earlier raised moral objections to certain features of slavery, almost no one appears to have questioned the overall morality of slavery as a system before the middle of the eighteenth century. Around 1750, however, an antislavery movement began to appear in Britain, France, and America.

The sudden rise of antislavery opinion appears to be related to the rise of a humanitarian ethos during the Enlightenment that encouraged people to consider the welfare of humans beyond their kin groups. The rise of the antislavery movement was also related to the growing popularity of new forms of evangelical and pietistic religious sects such as the Baptists, Methodists, and Quakers, which tended to view slave-holding as sinful materialism and slaves as persons worthy of God’s love. The rise of antislavery was encouraged by the American and French Revolutions, whose democratic political philosophies promoted a belief in the equality of individuals. The rise of antislavery also coincided in time with the rise of industrial capitalism. The West Indian historian and statesman Eric Williams argued in *Capitalism and Slavery* (1944) that the economic and class interests of industrial capitalists rather than the moral scruples of humanitarians gave rise to the antislavery movement.

Antislavery activism initially focused on the abolition of the Atlantic slave trade. Reformers succeeded in prompting Britain and the United States to abolish the slave trade in 1807. Other nations followed this lead over the next half century until the Atlantic slave trade was virtually eliminated.

The campaign to abolish the slave trade achieved early success because it joined together moral concerns and self-interest. Many persons in the late eighteenth and early nineteenth centuries were prepared to accept the end of the slave trade while opposing the end of slavery itself. Even slaveholders were angered by the living conditions endured by slaves on crowded, disease-infested slave ships. Some masters, in fact, attempted to justify their ownership of slaves by claiming that the conditions on their plantations were more humane than the conditions on slave-trading ships or in allegedly primitive Africa. Some slaveholders supported the abolition of the slave trade because they realized that limiting the supply of new slaves from Africa would increase the value of the existing slave population. Finally, many persons believed that it was wrong for slave traders to deny liberty to freeborn Africans, but that it was not wrong for slave masters to exercise control over persons who were born into slavery. Indeed, supporters of slavery argued that the well-being of society required masters to exercise control over persons who had no preparation for freedom and might be a threat to society if emancipated.

The campaign to eradicate slavery itself was more difficult and was accompanied by significant political upheavals and, in the case of Haiti and the United States, revolution and warfare. British reformers such as William Wilberforce, Thomas Clarkson, and Granville Sharp made perhaps the most significant contributions to the organization of a worldwide antislavery movement. In 1823, British activists formed the London Antislavery Committee, soon to be renamed the British and Foreign Antislavery Society. The Antislavery Society spearheaded a successful campaign to abolish slavery in the British Empire and, eventually, worldwide. The society remained in existence into the 1990’s. Known by the name Antislavery International, the society had the distinction of being the world’s oldest human rights organization. Antislavery reformers were also active in the United States. From the 1830’s through the 1860’s, abolitionists such as William

Source: Adapted from Eric Foner and John A. Garraty, eds., *The Reader's Companion to American History*. Boston: Houghton Mifflin, 1991.

Lloyd Garrison, Wendell Phillips, and Frederick Douglass sought to arouse the moral anger of Americans against slavery. More effective, however, were politicians such as Abraham Lincoln, Charles Sumner, and Salmon P. Chase, whose antislavery messages were a mixture of idealism, self-interest, and expedience.

EMANCIPATION

Beginning in the late eighteenth century and accelerating through the nineteenth century, slavery was abolished throughout the Western Hemisphere. This was followed in the late nineteenth and twentieth centuries by the legal abolition of slavery in Africa and Asia.

In evaluating the success of abolition in any society, it is necessary to distinguish between legal and de facto emancipation. Changing the legal status of a slave to that of a free person is not the same thing as freeing the slave from the control of a master. Legal emancipation often has little impact on persons held as slaves if the governments of their societies fail to enforce abolition. For example, Great Britain outlawed slavery throughout its colonial empire during the nineteenth century. However, fearing a disruption of economic production in some of its colonies, its colonial administrations simply abstained from enforcing the country's own abolition laws until pressure from reformers put an end to slavery.

A similar situation existed in Mauritania, where slavery was prohibited by law three separate times:

1905, 1960, and 1980. However, neither the colonial nor the independent governments of Mauritania enacted penalties against masters who kept slaves in violation of the emancipation law, and the governments waged no campaigns to inform slaves of their emancipation. As a result, journalists and investigators for the International Labour Organisation found *de facto* slavery still flourishing in Mauritania during the 1990's.

Even within societies that vigorously enforced their acts of abolition, legal emancipation was usually followed by periods of transition in which former slaves were held in a state resembling that of slavery. The Abolition of Slavery Act of 1833, which outlawed slavery in most colonies of the British Empire, provided that slaves would serve as apprentices to their former masters for periods of four to six years. In the American South after the Civil War, former slaves were subject for a time to "black codes" that greatly reduced their freedom of movement and required them to work on the plantations of former slave masters. After the Civil Rights Act of 1866 and the Fourteenth Amendment outlawed such practices, southerners created the sharecropping and crop-lien systems that allowed planters to control the labor of many African Americans through a form of debt bondage.

Efforts of former masters to control the labor of former slaves in all former slaveholding countries were a part of a larger effort by post-emancipation societies to determine what rights freemen should exercise. In the United States, for example, legal emancipation raised many questions regarding the general rights of citizens, the answers to which often remained elusive more than a century after the abolition of slavery. Should freemen be considered citizens with basic rights equal to other citizens? How far should equality of citizenship rights extend? Should equality of rights be kept at a minimum level, perhaps limited to freedom of movement, the right to own property, and the right to make contracts and enforce them in a court of law? Should citizenship rights be extended to the political realm, with guarantees of the right to vote, serve on juries, and hold political office? Should citizenship rights be extended to the social realm, with the protection for the right to live wherever one wanted, to use public spaces without discrimination, and to marry persons of another race?

ANTISLAVERY AND IMPERIALISM

Ironically, the international effort to abolish slavery raised troubling new moral issues. During the last quarter of the nineteenth century, in the name of suppressing the African slave trade at its source, Great Britain and other European nations demanded of African rulers certain police powers within sovereign African domains. The Europeans also organized new African industries to encourage the shift from the slave trade to the "legitimate trade" in other commodities. In this manner, the humanitarian impulse of antislavery combined with less humane motives to produce the New Imperialism of the 1880's through the 1910's. During this thirty-year period, nearly all of Africa fell under European domination. Time and again, the campaign to suppress the slave trade became a cloak for the imperialist ambitions of the European powers. It is worth remembering that the two international conferences in which the European powers agreed to carve up Africa among themselves, the Berlin Conference of 1884-1885 and the Brussels Conference of 1889-1890, both devised significant agreements for ending the African slave trade.

SLAVERY IN THE MODERN WORLD

During the twentieth century, most Westerners believed slavery to be nothing more than a memory of the past. Major international treaties such as the Slavery Convention of the League of Nations (1926), the Universal Declaration on Human Rights (1948), and the United Nations (U.N.) Supplementary Convention on the Abolition of Slavery (1956) seemed to indicate the emergence of an international consensus that slavery in all its forms should be eradicated. In reality, throughout the twentieth century, new forms of slavery continued to appear. The U.N. Supplementary Convention defined debt bondage, serfdom, bridewealth (bride-price), and child labor as modern forms of slavery. Many persons considered the use of compulsory labor by authoritarian regimes such as those of Nazi Germany and the Soviet Union to be forms of slavery.

International cooperation toward ending slavery in the twentieth century sometimes faltered because of Cold War rivalries. Communist states were often hostile to the antislavery work of the United Nations because Westerners sought to define the compulsory labor systems in several communist states as a form of slavery. The Soviets, likewise, charged that the

wage system of capitalist countries constituted a type of slavery, since the wage system compelled people to work in jobs they did not like out of fear of starvation.

At the end of the twentieth century, investigations by international human rights organizations and journalists found that millions of people still served as slaves in Haiti, the Dominican Republic, Brazil, Peru, Sudan, South Africa, Mauritania, Kuwait, Pakistan, India, Bangladesh, Thailand, and China. Even in countries such as the United States, where slavery had long been actively suppressed by the government, isolated cases of the enslavement of workers occasionally came to light with regard to migrant farmworkers and illegal aliens.

SLAVERY IN THE TWENTY-FIRST CENTURY

In the early twenty-first century, human rights organizations continued to report a few examples of traditional forms of slavery from various impoverished, traditional Southeast Asian and African countries, such as Sudan. Sometimes the governments of the countries in which the abuses occurred opposed slavery but lacked the resources to bring such practices to an end. A variety of international groups targeted these practices, with or without the help of the governments in question.

Meanwhile, it was becoming increasingly clear that it was no longer helpful to think of slavery as the public recognition of the private ownership of property in the form of other human beings. Almost nowhere on the globe did a government exist that officially allowed slavery. However, that did not mean that conditions close to slavery did not continue to exist in a number of countries. The world had a growing awareness of these conditions and the fact that they occurred in some of the most advanced nations on the globe.

The first of these conditions is what was once known in the United States by the name of “white slavery”—the domination, if not ownership of a person, for sexual purposes. This was not, strictly speaking, the same as prostitution, a trade that a person could enter voluntarily and retain the freedom later to quit. As a modern form of slavery, there was a recognition that many sexual workers had no such freedom. People forced into sexual employment generally have so little choice in the matter that they may be considered slaves in an ethical, if not a legal sense.

The very term “white slavery” betrayed its racial past. During the slave era in the United States, when only the ownership of African Americans was allowed, the term “white slavery” applied indiscriminately to all female sexual workers (of whatever race), while ignoring the prostitution of young males, especially children. The stigma attached to such work often reinforced the power the controller of the prostitute had over the sexual worker.

In the United States and some advanced countries in Western Europe, the prospect of improved economic conditions to people from poorer countries was so great that the entering those countries illegally was a risk worth taking. However, undocumented aliens were especially susceptible to extortion and sometimes found themselves virtually enslaved in their new homes. Moreover, if they attempted to flee their situations, they were themselves subject to prosecution for violating immigration law. Thus, facing either deportation or imprisonment, they endured their slavery silently. Even children tend to remain silent, although legal authorities are likely to offer them protection rather than prosecution. Sexual workers were not alone in this. Frequent reports of slavery, or near slavery, occurred in the domestic and household care industries and in industrial settings, such as the sweatshops that produce clothing. Illegal immigrants were often controlled as completely by their employers as they would be if they were owned legally. There have also been reports of such workers being bought and sold in the United States and advanced European nations.

Such conditions so closely approximated traditional slavery that the early twenty-first century opened the door to a new phase in the ethical debate over slavery. There was a curious similarity in the arguments of pre-Civil War American slavery apologists and the political masters in communist nations before the end of the Cold War. Both sought to divert attention from their own failings by pointing out the domination they saw as inherent for wage-earners in free enterprise economies. To the extent that wage earners are not free because of conditions resembling extortion, they may be considered “slaves” in a new sense, and the ethical debate shifts to ways in which improper domination can be exposed and eliminated.

“Slippery-slope” arguments

DEFINITION: Arguments objecting to actions on the grounds that once such actions are taken, they may lead to other actions that proceed down a “slippery slope” until some undesirable consequence results

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Slippery-slope arguments arise frequently in applied ethics debates, particularly, in debates concerning bioethics issues such as euthanasia and embryo experimentation.

Slippery-slope arguments attempt to prove that objectionable initial actions will inevitably lead to worse actions and that the latter will lead to other and even worse actions, all the way down a “slippery slope” to terrible calamities at the bottom. In slippery-slope arguments, whatever would justify the first step would also justify all the others, but since the last step is not justified, the first one is not either. The final dangerous step, as the last link in the chain, is presented as a reason for rejecting the first step.

Baseball, Spider-Man, and the Slippery Slope

In May, 2004, millions of American baseball fans were dismayed to learn that Major League Baseball had made a deal to sell advertising space on its playing fields to promote the release of the new film *Spider-Man 2* in June. Having commercial advertisements inside ballparks was nothing new. What shocked fans was the plan to put Spider-Man web logos on the bases and on-deck circles. Although the logos were to appear for only a single weekend, many commentators decried the plan, charging that it was merely the first step on the “slippery slope” to unrestricted advertising that would culminate in the players wearing uniforms with as much advertising on them as NASCAR drivers wore. In response to a massive public backlash, Major League Baseball commissioner Bud Selig quickly announced that Spider-Man logos would not be placed on bases after all.

STRUCTURE OF THE ARGUMENTS

Slippery-slope arguments are constructed in either logical or causal chains, or both together. The logical form shows that accepting *A* rationally commits one to accepting *B*, *C*, and finally *N*. The causal variant predicts that adopting *A* causes *B*, which in turn causes *C* and ultimately *N*. However, actions of type *N* are always undesirable, either for intrinsic reasons, or because of their bad consequences, or both.

There are four basic types of slippery-slope arguments. Precedent arguments involve the warning that if some new step is permitted, it will function as a precedent that will set another precedent, and so on until a disastrous outcome results.

Causal arguments involve the claim that once a certain action is performed, it will cause a second event, that will in turn precipitate a causal sequence of increasingly worse consequences.

Sorites arguments involve the observation that an argument contains a critical concept that is vague and difficult to define precisely, thus leading to paradoxical consequences.

Combined arguments combine all the previous types to suggest that taking the first step will trigger a

contagious series of steps, eventually ending in a “parade of horrors”—a horror such as a police state or ecological annihilation.

ASSESSMENT OF THE ARGUMENT

The tendency to treat slippery-slope arguments as fallacious is not fully warranted. Slippery-slope arguments can, in fact, be used correctly as a reasonable type of argumentation to shift a burden of proof in a critical discussion. For example, when school-based health clinics were first introduced to American schools, some parents complained that they represented a first step toward the distribution of birth-control devices through the schools. That argument proved to be valid, as many school-based health clinics eventually did begin offering birth control and reproductive counselling.

A slippery-slope argument might be misused because of logical or causal gaps in the sequence; however, the argument should be judged fallacious only if it is advanced to prevent posing appropriate critical questions in the course of dialogue. Slippery-slope arguments are commonly strong or weak in particular respects, but they are seldom so bad to be fallacious. Generally, they are as strong as the weakest links in their chains.

Smith, Adam

IDENTIFICATION: Scottish economist

BORN: June 5, 1723, Kirkcaldy, Fifeshire, Scotland

DIED: July 17, 1790, Edinburgh, Scotland

TYPE OF ETHICS: Enlightenment history

SIGNIFICANCE: The author of *The Theory of Moral Sentiments* (1759), and *An Inquiry into the Nature*

and Causes of the Wealth of Nations (1776), Smith was one of the inventors of the field of political economy and a major advocate of laissez-faire economics and the division of labor.

Born in Calvinist Scotland, bereft by the early death of his father, and extremely precocious, Adam Smith spent his life trying to reconcile Providence with the needs of the individual and the greater society. He became professor of moral philosophy at the University of Glasgow in 1752, and it was there that he completed his first important work.

THE THEORY OF MORAL SENTIMENTS

During Smith's time, moral philosophy embraced a series of disciplines in what today would be considered the humanities and the social sciences. At that time, philosophers of the Enlightenment were developing the discrete social sciences, especially psychology and economics.

Although basically a skeptic, Smith never became completely skeptical, as did his close friend David Hume. Smith took Providence into account when formulating his theories of personal and social ethics, especially in the field of economics, in which he became most famous.

Smith sought to reconcile humankind's selfish nature and self-love with its dependence on the greater society. There is in human nature, believed Smith, some principle that makes the fortune of others and their happiness agreeable, even necessary. The individual has a capacity for sympathy and the ability to put himself or herself into another's place and to observe that other as an "impartial observer." Hence individuals, while not compromising their own selfish needs, are able to approve of and to support that which makes others happy and to disapprove of measures that have a negative effect. Self-interest, however, remains dominant. For Smith, self-interest accounted for the habits of economy, industry, discretion, attention, and application of thought.

Smith's theories were well received, but had he written only *The Theory of Moral Sentiments*, he would have become no more than a footnote in the history of philosophy. A trip to France between 1764 and 1766, however, was to change both his outlook and his life. There he met many of the Physiocrats, early economists who began to challenge the prevail-

ing theory that economic wealth was a static commodity and that one nation could grow rich only by impoverishing others. The Physiocrats were free traders who sought to end governmental control of the economy. Smith also had cause to observe the effect of a controlled economy on England's American colonies. What disturbed Smith was the emphasis the Physiocrats placed on land as the major source of wealth. Were this true, then Scotland, with its thin rocky soil, would be forever condemned to poverty. Smith also had occasion to observe the work of the skilled French artisans and to see that the export of their wares provided a major source of revenue for the French state. Smith became convinced that it is labor rather than land or commodities such as bullion that is the true source of wealth.

THE WEALTH OF NATIONS

Smith's monumental and seminal work, *An Inquiry into the Nature and Causes of the Wealth of Nations*, appeared in 1776, the year of the Declaration of Independence by Britain's American colonies. In it, Smith posited three important points: that wealth is created by labor and is thus organic or growing, that the division of labor can enormously increase productivity, and that free trade among states or nations can vastly improve the welfare of humankind. By "wealth," Smith did not mean accumulated treasure, but rather the minimal amount of money needed to keep human beings decently fed, clothed, and housed.

Smith's great problem was the reconciliation of his theory of ethics with theories of economics. He reconciled these theories by emphasizing the selfish nature of humankind, the impulse of self-interest, the greed for material gain. He stated his position succinctly when he wrote that it was not the benevolence or sympathy of the butcher, the brewer, and the baker that put the dinner on one's table, but rather their self-interest. One speaks to them not of one's necessities, but of their advantage.

Smith would remove all bureaucratic impediments and permit individuals and nations alike to pursue what they do best economically. The result, and here Smith waxed lyrical, again falling back on Providence, would be that a wonderful universal machine would be created and a "hidden hand" would distribute equitably the ever-increasing bounty of the earth and with it the greatest possible happiness.

Smith's name is inextricably linked to what came to be called *laissez-faire* economics, or free trade.

IMPLICATIONS FOR ETHICAL CONDUCT

It would seem that Smith condoned any individual action as long as it benefited the economy. Indeed, Smith's theories were often used to justify the most extreme kind of "rugged individualism" and the unconscionable exploitation of labor; economics was well on the way to becoming the "dismal science." Smith recognized the danger and exhorted that the laws of justice not be violated, appealing to instinctive human feelings of sympathy for others. He realized that his division of labor by concentrating on a single mindless operation could result in the brutalization of labor, and he called upon governments, through education, to ameliorate the lot of workers.

Social contract theory

DEFINITION: Philosophical system positing that legitimate governments are formed when individuals freely and rationally agree to cede their political sovereignty to the state or that all members of civil society are implicit parties to such an agreement

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Social contract theory, in all its forms, strongly asserts that it is the individual will, subject to reason, that is the ultimate source of morality.

Social contract theory is a framework for understanding the origin and organization of human society. It begins with the basic assumption that people are autonomous rational moral agents who agree to give up some of their individual power to do as they please in order to live in cooperation with others who also agree to give up some of their individual power. This theory is discussed in the works of many philosophers but is probably given its clearest and most powerful voice in the works of Thomas Hobbes, John Locke, and Jean-Jacques Rousseau. It is a theory that underlies many aspects of modern political life; for example, the U.S. Constitution and Bill of Rights, the United Nations, trade agreements, and military treaties.

THOMAS HOBBS

According to Thomas Hobbes, perhaps the clearest enunciator of social contract theory, people are naturally inclined to be in the society of others. In society, however, it is necessary that there exist a sovereign to protect each person against every other person. Without such protection, people are in what Hobbes identifies as the state of nature. In the state of nature, people have two basic rights: the right to self-preservation and the right to take anything they have the power to take. In the state of nature, there is a war of all against all as people seek to exercise these rights. Each person experiences the constant threat of violence against his or her self and property. In fact, to secure their rights, people will begin to act in anticipation of their being abrogated. They will kill those who are perceived as potential threats.

This insecurity is ever-present and makes society something to be avoided rather than enjoyed. Life in

this state of nature is “solitary, poor, nasty, brutish, and short.” Reason leads people to find this situation intolerable. Therefore, as rational autonomous individuals, people agree to form a contract, giving up some of their power to a sovereign in return for that sovereign’s protection. They are then bound, absolutely, by that sovereign’s laws. This contract is formed out of logical self-interest.

JOHN LOCKE

John Locke offers a kinder picture of the state of nature but reaches much the same conclusion as Hobbes. For Locke, the state of nature is a state of plenty in which each person is able to fulfill his or her needs. Each has a right to as much of anything as he or she can use, if enough is left for others. The only real limitation on how much a person should take is the fact that most goods will spoil if they are not used promptly. With the introduction of money, a nonperishable unit of exchange, the limits on consumption are removed and hoarding and competition begin.

This state of an unbounded right to property would be chaotic except that each person possesses reason. The state of nature is not necessarily synonymous with the state of war (as it is for Hobbes) because of the use of reason. Reason dictates a state in which people seek peace, a state in which the natural rights of life, liberty, and property are honored. This state requires that judgments be made concerning what threatens the life, liberty, and property of an individual. There is the danger here that if one person misjudges what is necessary for his or her own safety or the safety of others and becomes preoccupied with achieving security, he or she may act in anticipation of harm and threaten the security of others.

For Locke, it is the absence of a common judge that distinguishes the state of nature and causes uncertainty and potential disharmony. To protect against misjudgment, people form a contract. This contract is to form a government that will hold the power of the people in trust. It will act as a judge, and it must act to preserve its citizens. The purpose of civil society is to provide each person with security.

JEAN-JACQUES ROUSSEAU

Jean-Jacques Rousseau offers an approach that differs significantly from those of Hobbes and

Alienation and Social Contract Theory

Jean-Jacques Rousseau grappled with the problem of how human beings can form a society in which sovereignty would be legitimate, yet one in which the governed would not lose their autonomy or alienate their freedom. He believed that he found the solution in the social contract. In order to form a social contract, each person would alienate his or her rights to the entire community, to the general will. Such alienation would not entail the loss of autonomy or liberty, however, because each member, as a part of the general will, would be governed by laws to which each person consented. Legitimate authority and individual freedom would be guaranteed by the accord between private wills and the general will.

Locke. Rousseau idealizes the state of nature. People are pure and innocent in the state of nature, whose typical inhabitant is the noble savage. It is civil society itself that has corrupted people and led to strife. In the state of nature, people’s wants and needs are simple and easily satisfied. Furthermore, Rousseau’s goal is not so much to show the legitimate power of the individual (though he does intend to do this as well) to achieve the collective good—the general will.

Rousseau begins with the assumption that nature is good and that those things that have gone wrong are the result of the wrong actions of human society. He seeks not to explain the origins of civil society, but to create a state in which people can retain their original freedom. One should not be dependent on the opinion or will of others; one should also not be dependent on possessing power over and above one’s needs or at another’s expense. The general will requires that each person be free from these particular dependencies. One should not come to believe, however, that this freedom entails being independent in the sense of being free from influence or obligation.

Rousseau’s individual has a duty to be aware of the general well-being, act in accord with it, and make sure that others do so as well. There is no greater sense of social obligation. Each individual feels an obligation to society through the realization of individual interdependence and equality. Rousseau thinks that as a result of showing individuals that

ultimately there is no difference in vulnerability among people—that they are equal—rationality and feeling will then direct such people to form a community that is in the interest of all. Provided that they have been instilled with the correct sentiments, reason will lead to the formation of a general will in which each is bound only by his or her own will and therefore is not enslaved.

CRITIQUE

The social contract tradition has its critics. Some challenge the notion that it is possible for free, autonomous, rational people to form a contract at all. Such challengers argue that no one is free from pressure and coercion; therefore, it is not possible to tell if the contract is valid or for whom it is valid.

One particular example of this problem is the place of women in the contract. In the writings of the main proponents of the social contract theory, it is made clear that it is free, autonomous, rational men who form the primary contract, though women, children, and slaves are somehow to be bound by it as well. Carole Pateman offers an interesting reading of this issue in her book *The Sexual Contract* (1988).

Social Darwinism

DEFINITION: Application of Charles Darwin’s theory of biological evolution by means of natural selection to the development of society and human social behavior

DATE: Concept coined during the late nineteenth century

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Social Darwinism, used in the nineteenth and twentieth centuries to justify the mistreatment of colonial and working-class peoples and various forms of racism, is described by some sociologists as a misapplication of Darwin’s theory based on an extremely dubious analogy between biological species on the one hand and social or economic groups on the other.

Western colonialism and imperialism and the Industrial Revolution of the late nineteenth century did little to benefit all people equally. Disparity in access to resources, wealth, and social status was nothing new, but as non-Western peoples and their natural resources were exploited by those in the West, a justification for such behavior was sought. Western governments were motivated to expand their political and economic power and influence, while industrialists sought to fulfill their desires for wealth and fame. The Western clergy, in turn, saw colonial expansion as an opportunity to consummate their mission of spreading the Gospel.

HERBERT SPENCER

In 1857, Herbert Spencer, a British social philosopher, published “Progress: Its Laws and Causes,” in

which he expressed his early ideas on social evolution. Later, after Charles Darwin had published *On the Origin of Species* (1859), Spencer sought to apply the ideas outlined by Darwin to human society. Spencer's ideas then were used to perpetuate the conservative status quo of the unequal distribution of wealth associated with the changing capitalist environment. Indeed, it was Spencer and not Darwin who coined the metaphors "struggle for existence" and "survival of the fittest," which Darwin later incorporated into his fifth edition of *On the Origin of Species* (1869).

Darwin's ideas on natural selection were employed to account for biological evolution. Specifically, Darwin demonstrated to the world that evolution took place and that its requirements were variation, inheritance, natural selection, and time. Since Darwin's ideas preceded those of the pioneering geneticist Gregor Mendel by six years, Darwin believed that the environment was critical to explaining variation and that biological success was measured by the frequency with which one reproduced. Successful reproduction in turn was influenced by various environmental forces. For Darwin, the term "struggle" was illustrated by the subtleties of environmental influence. Simply stated, although animals and plants attempted to survive heat, cold, wind, rain, and competition with other species, they were not involved in within-species warfare and bloodshed, as was implied by those who later promoted Social Darwinism as a natural and expected precondition of human social evolution.

When Spencer introduced the groundwork for what became known as Social Darwinism, he failed to recognize the importance of Darwin's subtleties. Spencer included various value and moral judgments in his suggestion that the struggle for existence within society or between societies was a natural condition for cultural evolution. He believed that societies were comparable to biological organisms, slowly evolving from simple to complex by means of competition for resources, and that such competition was natural and to be expected within and between societies. Social Darwinists believed that those individuals, institutions, and societies that attained the greatest political and economic power were by definition more fit, while those that did not were by their nature less fit.

WILLIAM GRAHAM SUMNER

William Graham Sumner, an American sociologist and economist, became a strong advocate of Spencer's ideas. He was a supporter of laissez-faire economic policy, arguing that people were not born equal and that millionaires were a product of natural selection. Typical of the industrialists who accepted Social Darwinism was John D. Rockefeller, Sr., the rugged individualist and successful capitalist who founded the Standard Oil Corporation. Rockefeller is quoted in Hofstadter (1959) as having said, "The growth of a large business is merely a survival of the fittest. . . . It is merely the working-out of a law of nature and a law of God." His statements express the attitude of many Social Darwinists. Indeed, Spencer and Sumner opposed social and economic planning and any attempts to offer social assistance to the poor because of their belief that such practices interfered with the natural process of social evolution.

Sumner argued in his book *Folkways* (1906) that customs and morals were instinctive responses to drives such as fear, sex, and hunger. Thus, Social Darwinists sought scientific justification from nature to promote individual competition and the exploitation of the poor by the rich classes. Because the concept and its followers supposed that social progress demanded that competitive struggle occur between nations, states, and races, Social Darwinism was used to justify Western ethnocentrism, racism, and eugenics. Such ideas were carried to a horrifying extreme by Nazis in Germany during World War II. Under Adolf Hitler, the Nazi belief in a master race and the inferiority of Gypsies and Jews led to the genocide of millions of people who were believed to be inferior. It was partly because of the world's revulsion toward the acts of the Nazis that the popularity of Social Darwinism and racism began its decline.

Social justice and responsibility

DEFINITION: Moral obligations to participate in or ensure the fair and equitable distribution of wealth and resources throughout a society or across all existing human societies

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: The values of social justice and responsibility represent ethical responses to liberal individualism and to rights-centered theories of morality.

Rights-centered theories of morality assert individual and collective obligations to allocate resources as fairly as possible, both within and between nations, and they presuppose that the economic realm is a central and appropriate venue for considerations of justice. Most individualist and rights-centered ethics would respond to these assertions by saying that, while distribution of resources to those who lack them may be a morally admirable act, it is certainly not one that is in any sense required, as such a requirement would infringe upon such values as merit, individual sovereignty, and a conception of fairness that concentrates on opportunity rather than outcome.

Questions about justice and responsibility arise because different needs, conflicting interests, and scarce resources exist in human society. There are conflicting demands upon society's scarce resources and there is uncertainty about who has the responsibility to meet those needs. How is it possible to adjudicate among competing claims to determine the just distribution of resources? Is it right to tax the rich to provide for the poor? Does society have an obligation to take care of the needy? These questions deal mainly with a form of justice called distributive justice.

Responsibility, too, can be interpreted in different ways. First, responsibility can refer to the character of a person. To say that a person is responsible in this sense means that the person has uprightness of character, can be trusted, and has a sense of duty. Second, responsibility means the same thing as the ability and capacity to perform some task. Third, responsibility also refers to the issues of praise and blame. Fourth, responsibility refers to position or office in accordance with which a person is entrusted with the performance of a particular task. The latter is closely tied to the question of social justice, because the concept of justice implies that someone is responsible for being just.

Distributive justice deals with the fair allotment of society's goods and services and presupposes the complementary issues of responsibility, equality, and the good society. A theory of distributive justice should determine what needs should be met and what goods individuals should give up for the common good. These issues can also be encompassed in the questions of entitlement, desert or merit, and equality.

PHILOSOPHICAL VIEWS

Plato, who was not an egalitarian, developed a vision of a just society along lines of unequal status. In the *Republic*, Plato attempted to define the *dikaios*, the "just person," and the *kallipolis*, the "good city." The just person is one who possesses the virtues of wisdom, moderation, and courage. The just city is divided into three classes: the working class, the warriors, and the philosopher-rulers. The city is just if it is based on an aristocratic constitution and the three social classes embody their respective virtues. The aristocratic class is wisdom-loving, the warriors are courageous lovers of honor, and the artisans exercise

moderation in their pleasure seeking. Each individual and each class, by responsibly fulfilling its duty, contributes to the existence of a just society.

Another approach to social justice and responsibility has been offered by social contract theory, which holds that justice and society are produced by a general agreement—a social contract. People are obligated to obey rules and the government because they have agreed to do so. They have made a contract to live by certain rules because it suits their self-interest. The general will of the people creates rules, laws, and government. Individuals give up certain rights and privileges for the protections and mutual advantages of the state.

Jean-Jacques Rousseau wrote an essay called “On the Social Contract,” whose purpose was to explain the nature of authority. It was based on an optimistic view of human nature but a negative view about society. For Rousseau, human beings are born good, but they are corrupted by society. Social contract theory argues that human beings give up or alienate their rights by transferring them to society. The state becomes the sole possessor of political authority. The state is a legitimate power and guarantees the freedom and autonomy of its citizens through a social contract—a voluntary, unanimous agreement of all people of a society to form a united political community. Popular sovereignty is called general will.

Immanuel Kant formulated, in *Foundations of the Metaphysics of Morals* (1785), the categorical imperative, which holds that one should act only on that maxim that one can will to become a universal law. Kant presupposes that persons are rational creatures, that they have an infinite worth of dignity (that is, that they are ends in themselves), and that they are authors of moral law, or are autonomous. In short, human beings are ends in themselves. Therefore, Kant envisions society as a kingdom of ends.

Utilitarianism adheres to the rule that one should always try to make as many people happy as possible. This “greatest happiness principle” states that one ought to act so as to maximize pleasure and minimize pain. The principle of utility, which is derived from the happiness principle, is a rule that determines moral norms and actions according their ability to maximize or minimize happiness. Rule utilitarianism means that governments are to use this rule in establishing general laws and are to treat individuals

according to existing rules. In his essay *On Liberty* (1859), John Stuart Mill stated that society could progress to a higher state of civilization on the basis of what he called the basic principle—that individuals, groups of individuals, and the mass of people must refrain from interfering with the thoughts, expressions, and actions of any individual. The second principle, which is known as the “harm to others principle,” holds that government may not interfere in private life except to prevent harm to others. These principles function as regulative criteria for developing public policy that preserves individual rights, limits government intervention, and fosters general well-being.

Socialism

DEFINITION: Political and economic system characterized by collective ownership of the means of production and equitable distribution of goods and resources

DATE: Developed during the late nineteenth century

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: Socialism represents an alternative vision for social ethics in which justice is realized through material equality and the eradication of exploitation, leaving all members of society free to associate in common productive efforts aimed at satisfying social needs.

Socialism is based in a positive conception of freedom, defined as a way of life that allows all humans to realize and express their inherent potential through their labor. This definition is generally in conflict with definitions of freedom based on individual rights and choice and with capitalist notions of labor as productive of increased wealth rather than expressive of humanity.

Socialism is a politico-economic system in which the struggle to eradicate social inequality is the highest ethical pursuit. Socialist morality generally extols the collective pursuits of the larger community and asserts that the vast potential latent in the human species can be fully realized only through freely associated, nonexploitative social relations. Throughout history, socialism has developed from its origins in the romantic visions of intellectuals and philosophers to an alternative social system that has been struggled for by exploited classes in virtually all corners of the globe. The legacy of socialism persists in the modern world, both as an ethical critique of capitalist values and as an alternative prescription for social justice.

UTOPIAN SOCIALISM

Although some of the key ethical elements within socialism can be traced back to ancient times, their consolidation into a unified vision occurred at the beginning of the nineteenth century in what has since become referred to as utopian socialism. Claude Henri Saint-Simon, Charles Fourier, and Robert Owen, among others, created a comprehensive critique of early capitalist society as it entered its industrial phase. Although the socialist visions of each thinker

differed, all the utopian socialists shared a preoccupation with the morally bankrupt character of early industrial capitalism and saw the need for a more communal and egalitarian society in which an ethic of cooperation would prevail over individual greed.

Equally representative of utopian socialism was the notion that a socialist world could somehow be achieved through enlightened choice. Later socialists, such as Karl Marx and Friedrich Engels, argued that this idea amounted to a lack of a revolutionary strategy for realizing the utopian vision. Utopian socialists generally saw political violence as the historical baggage of presocialist society and believed that it would be unnecessary in a world that was being gradually civilized by means of emerging socialist values. In short, their moral critique of bourgeois society was not accompanied by an analysis of the way in which capitalist domination could be decisively broken.

Emile Durkheim, one of the founders of modern sociology, argued in his posthumously published work *Socialism* (1928) that Saint-Simon conceptually linked the ethical failures of the social era born of the Enlightenment with the urgent call for a consciously managed society—one in which production is cooperatively organized and the interests of the exploited classes are advanced through the socialization of industry. Saint-Simon's call for a "New Christianity" that would emphasize public concerns rather than the pursuit of individual self-interest made his utopian vision a complete one from Durkheim's perspective.

Robert Owen likewise espoused the notion that once socialist principles became enacted and shared, socialism's intrinsic desirability would automatically lead to its promulgation. Owen's contributions to socialism were vast, because of his agitation for reforms on behalf of the English proletariat as well as his sponsoring of experimental socialist communes that were based on socialist morality and cooperative business ventures. Charles Fourier added to the utopian socialist vision with his critique of the family and his agitation for sexual liberation. He became famous for his expression that the best measure of social freedom is the existing degree of women's freedom. Fourier argued that industrial bourgeois society repressed the human passion for love. Liberation could be gained only through smashing the prohibitions against human sexual expression, according to

Fourier, and the larger community needed to guarantee all of its members the support necessary for “basic” sexual and well as economic satisfaction.

REVOLUTIONARY SOCIALISM

Utopian visions of socialism ultimately became overshadowed by the emergence of the revolutionary socialism pioneered by Karl Marx and Friedrich Engels. Marx, a German thinker, transformed socialism into a practical program for struggle out of which organized social classes within industrial capitalist societies could create a socialist society through revolution. Marx and Engels’s point of departure is their social class analysis, which argues that only the exploited working class is capable of successfully carrying out a socialist revolution. The ethical basis of what later became known as Marxian socialism is to be found in revolutionary “praxis,” or practical activity, designed to overthrow bourgeois domination. The moral basis for revolutionary activity, including armed struggle, was to be found in the larger historical mission of the working class, which was the ending of class exploitation.

An important distinction of Marxian socialism is its dialectical conception of ethics, which views all systems of morality as historically situated and dynamic insofar as morality changes in accordance with the ongoing struggle of social classes. The “contradictory” nature of morality thus rests in the notion that what is ethical at one stage of history becomes outmoded as human social relations continue to change and develop. The ethical basis of revolutionary armed struggle, for example, becomes transformed once new social circumstances become achieved and the need for violence has been surpassed. As Engels argued in *Anti-Duhring* (1878), a fully humanized morality can be achieved only after a socialist revolution has overcome social class inequalities and after the former system of morality has vanished from the collective memory.

MODERN SOCIALISM

The twentieth century could be largely characterized by the struggle between the competing systems

of capitalism and socialism. Even the fall of the socialist bloc countries during the late 1980’s and early 1990’s can be related to an ethical crisis of particular political regimes and their relative inability to realize socialist goals. In the twenty-first century, most modern nations continue to experience political tensions between the status quo and powerful critics who argue for socialistic reforms or the need for a socialist revolution. The socialist critique of race, gender-based, and social class exploitation remains relevant in the modern era, and its advocates remain influential in world affairs.

Society for the Prevention of Cruelty to Animals

IDENTIFICATION: Organization created by humanitarians to oppose the mistreatment of animals

DATE: Founded in 1824

TYPE OF ETHICS: Animal rights

SIGNIFICANCE: As the first animal welfare organization in England or Continental Europe, the Society for the Prevention of Cruelty to Animals (SPCA) influenced all future western humane organizations.

According to the seventeenth century philosopher René Descartes, animals were soulless, God-created automatons lacking consciousness and the ability to feel pain. Any human use of animals was therefore justifiable. By the late eighteenth century, other philosophers challenged humanity's right to absolute dominion over animals, thus heralding the birth of the anticruelty movement. These new convictions were best summarized by the utilitarian philosopher Jeremy Bentham, who wrote in 1789, "The question is not, can they *Reason*? Nor can they *Talk*? But can they *Suffer*?"

Reflecting increasing concern over animal welfare, M. P. Richard "Humanity Dick" Martin in 1822 submitted and successfully promoted the passage of a bill protecting domestic farm animals from cruelty. Meanwhile, encouraged by the Martin Act, humane activists formed the SPCA, which began policing slaughterhouses, markets, and private citizens for animal abuse. With the bestowal of royal patronage in 1835, the organization became the Royal Society for the Prevention of Cruelty to Animals (RSPCA). During the late twentieth century, the United Kingdom remains a principal center of advocacy of animal rights.

Sociobiology

DEFINITION: Study of the evolutionary basis of human social behavior

DATE: Originated around 1975

TYPE OF ETHICS: Scientific ethics

SIGNIFICANCE: Sociobiological studies of humans are based on the premise that human behavior is the result of evolution. Thus, sociobiologists argue that morality has evolutionary value, and indeed that it results from processes of natural selection. This argument has been attacked, however, as a form of biological determinism.

In 1975, E. O. Wilson, a Harvard professor and world-renowned expert on ants, published a massive book in which he tied together decades of empirical research by animal behaviorists with decades of theoretical work by geneticists and evolutionary biologists. In so doing, he defined a new academic discipline, "sociobiology," the name of which is taken from the title of his book, *Sociobiology: The New Synthesis*.

The thesis of Wilson's book was that behavior, like any other attribute of an animal, has some of its basis in genetics, and therefore scientists should study behavior in the same way they do anatomy, physiology, or any other observable feature of an animal; that is, they should not only describe it but also try to figure out its function and the reasons why it evolved. Most biologists found no fault with this logic, and the discipline grew very rapidly, spawning hundreds of books and thousands of articles. Many predictions generated from this new perspective were corroborated, and many previously unexplained behaviors started to make sense.

The majority of biologists were rapidly convinced that this new approach was both useful and valid. Other scientists, however, as well as many sociopolitical organizations and representatives, immediately took a stand against it. In his book, Wilson had included a closing chapter on the sociobiology of human behavior, and his critics believed that the principles and methods used to study nonhuman animals simply could not be applied to humans. Academic critics tended to be psychologists, sociologists, anthropologists, and political scientists who believed that learning and culture, not evolution and genetics, determine most human behavior. Nonacademic crit-

ics tended to be either philosophers and theologians who believed that the human spirit makes people qualitatively different from other animals or left-leaning political organizations who believed that violent, discriminatory, and oppressive human behaviors might somehow be justified by calling attention to the existence of similar behaviors in other animals.

THE ALTRUISM DEBATE

The first, and perhaps most significant, debate over sociobiology as it applied to humans involved explanations for altruism. Altruism, by definition, is behavior that helps another individual or group at some cost to the altruist. Since altruistic behavior would appear to help nonaltruistic recipients of altruism to survive and pass on their genes but not help altruists themselves, any genetic tendency toward altruism should rapidly die out; which would imply that altruistic behavior must be nonevolved; that is, either culturally learned or spiritually motivated, as the critics claimed.

Biologists, however, had documented altruistic behavior in a wide variety of nonhuman animals, suggesting either that other animals must also have cultural or spiritual motives (suggestions not accepted by most of the critics) or that altruism really must, somehow, increase the altruist's ability to survive and pass on genes, not merely help the nonaltruistic recipient. Two theoreticians provided explanations for how this might have occurred.

W. D. Hamilton proposed an evolutionary model based on the concept of "kin selection"; according to this model, altruistic behavior does not have to increase the altruist's chances of survival and reproduction, as long as it increases the survival and reproduction of the altruist's relatives. Since relatives share genes, even though an altruist may decrease his or her own chances of survival and reproduction, the genetic tendency for altruism can be passed on to subsequent generations because the altruist has increased the total number of his or her genes in the next generation by increasing the number of collateral, or nondirect, descendants.

Later, Robert Trivers proposed a model based on the concept of "reciprocal altruism"; according to this model, altruists do increase their own chances of survival and reproduction, because the recipients of their altruism remember them and help them out when the tables are turned. (This is often referred to

colloquially as the "You scratch my back and I'll scratch yours" model.)

Largely on the basis of these two models of altruism, sociobiologists argued that even the most complex and seemingly spiritually motivated behaviors of humans could be explained solely by evolutionary biology. This notion was widely publicized in Richard Dawkins's book *The Selfish Gene* (1976), E. O. Wilson's subsequent book *On Human Nature* (1978), and Richard Alexander's *The Biology of Moral Systems* (1987).

Although many anthropologists and psychologists have converted to the evolutionary perspective and found it fruitful, many remain antagonistic to it, and sociologists, philosophers, and theologians, in particular, remain highly critical. Their argument continues to be that human behavior is qualitatively different from that of other animals because of the complexity of human culture and spirituality. They argue that a reductionist approach to human behavior will inevitably miss the most important features of human nature and social interactions.

In addition, many individuals and political groups remain hostile to sociobiology because of the widespread belief that if something is genetic, it is inevitable and justifiable. Although these conclusions are not logically valid, there is legitimate concern that some people might use sociobiological arguments to try to undermine moral teaching or to promote or rationalize nepotism, aggression, racism, or sexism. To the extent that sociobiology is perceived as an ideological tool rather than a scientific enterprise, it has been argued that sociobiological research should not be funded or otherwise promoted by public institutions (such as universities). The debate has thus become one of politics and social goals as well as one of scientific philosophy and method.

Socrates

IDENTIFICATION: Ancient Greek philosopher

BORN: c. 470 B.C.E., Athens, Greece

DIED: 399 B.C.E., Athens, Greece

TYPE OF ETHICS: Classical history

SIGNIFICANCE: Socrates objected to written language because he believed that it was inherently removed from truth, and he therefore never produced any written works. Thus, he is known primarily as a character in the dramatic philosophical dialogues of Plato, his greatest student. Socrates is believed to have shifted the focus of Greek philosophy from the natural world to the human psyche and ethics and to have argued that moral goodness is based on objective knowledge.

Socrates' views on ethics must be understood against the background of his main opponents, the Sophists. They were moral relativists who believed that ethical beliefs could never be more than a matter of convention and subjective human opinions. In contrast, Socrates thought that ethical truths were universal and objective and concerned the way in which humans

should best live. He said that the goal in human life was not simply living but "living well." To make an excellent ship, one must understand the purpose of ships and what constitutes the standard of excellence for a ship. Similarly, to live life well, one must understand what constitutes human excellence. For this reason, Socrates said that "the unexamined life is not worth living."

For Socrates, the goal of ethics was not obedience to some set of abstract duties. The whole purpose of ethics was to flourish as a human being, to fulfill one's true function, to achieve happiness. Hence, "Why should I be moral?" was a foolish question, for it was like asking, "Why should I live a happy, fulfilled life?" The problem is, Socrates said, that people tend to identify themselves with their bodies, and this gives them a false picture of what is the true goal in life. The body is, however, merely the outward shell, or instrument, of the soul. The immortal, non-physical soul within one is the real person. The proper goal in life, therefore, is to "care for one's soul," to make it as good as possible, and this is achieved by striving to achieve wisdom.

Socrates' position is sometimes called "ethical-intellectualism," because he believed that ethics is a matter of the intellect and that the moral person is one who has correct moral knowledge. Socrates' ethical conclusions are often called the "Socratic paradoxes" because they seem to contradict normal moral intuitions. Two of the key Socratic teachings are that virtue is knowledge and that no one knowingly does what is wrong.

VIRTUE IS KNOWLEDGE

In the Greek language, the word for "virtue" has a much broader meaning than does its English counterpart. For anything to have "virtue" meant that it was excellent at its task or fulfilled its function well. Hence, the virtue of a shipbuilder is the skill of making high-quality ships. Human beings engage in many different and specific tasks (making music, playing sports, practicing medicine), and each activity has its appropriate goal and requires a certain sort of knowledge. Socrates believed, however, that people are all engaged in the more general task of living human life, and this is something that can be done poorly or well, depending on how well one understands this task. Hence, being a moral person requires having knowledge of what is genuinely valuable.

For Socrates, there is a difference between genuine knowledge and correct belief. Someone can be told the correct answer to a mathematics problem without really knowing why it is the correct answer. Similarly, simply having the correct moral beliefs is not enough. To truly have moral knowledge of the right way to live requires that one understand why that way is best. Socrates claimed that the end of human life is the achieving of wisdom; only wisdom will make one a morally excellent person.

NO ONE KNOWINGLY DOES WHAT IS WRONG

Since moral goodness is knowledge of how to live well and flourish, it was inconceivable to Socrates that anyone could have this knowledge and not follow it. Since doing what is wrong will harm the soul, however, those who do evil do so through error, thinking that they are pursuing what is good for them. For example, a thief steals because he or she believes that money is the ultimate value. By starting out with this false assumption about what is important in life, the thief logically concludes that it is good to obtain money in any way possible. What is wrong with the thief, Socrates would say, is that he or she lacks a correct understanding of what is genuinely valuable. Still, it may seem that sometimes people knowingly do what is wrong. Socrates would say, however, that when one performs an action that is morally wrong and harmful to one's soul, one does so because one's mind is blinded by desire. In that moment, one actually believes that the pleasure of the moment is a better goal to pursue than one's long-range satisfaction. For the person who has wisdom and the true vision of life, reason will guide the emotions in the right direction in the same way that a chariot driver guides his horses.

IMPLICATIONS FOR ETHICAL CONDUCT

For Socrates, being a moral person was more than simply doing the right thing. It also did not mean simply following a list of rules or duties. Instead, morality was a matter of making one's inner self as excellent as possible. This required an understanding of what is of enduring value in life as opposed to what is merely transitory and peripheral. One can gain this understanding by means of a process of self-examination in which one critiques the values by which one lives, abandoning those values that prove to be worthless, and getting a clear understanding of those

values that lead to human excellence. Once one's soul has a vision of what is truly good, one will have no reason to do anything else but to steer one's life in that direction.

Solzhenitsyn, Aleksandr

IDENTIFICATION: Russian novelist and historian

BORN: December 11, 1918, Kislovodsk, U.S.S.R.

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Recipient of the 1970 Nobel Prize in Literature, Solzhenitsyn produced both literary works, including *One Day in the Life of Ivan Denisovich* (*Odin den' Ivana Denisovicha*, 1962), *The First Circle* (*V krughe pervom*, 1968), and *Cancer Ward* (*Rakovy korpus*, 1968), and historical works such as *The Gulag Archipelago, 1918-*

1956: *An Experiment in Literary Investigation* (Arkhipelag GULag, 1918-1956: *Opyt khudozhestvennogo issledovaniya*, 1973-1975). In all his work, he advanced the idea of the mutuality of communal and individual ethics within the context of the Russian Christian tradition.

While confronted with mounting censorship from Soviet authorities during the 1960's and his eventual arrest and forced exile in 1974, Aleksandr Solzhenitsyn maintained an ethical identity with his homeland and his image of its historical traditions. Solzhenitsyn's ethical base was predicated on a renewal of traditional Russian Christian values; he was not attracted to the individualism or democratic institutions of the West.

Solzhenitsyn condemned the oppression of the Soviet (and especially the Stalinist) phase in Russian history and described the ethical and moral bankruptcy of the Soviet regime and its institutions. In particular, he condemned the depersonalization of Russian life under the Soviets. He advanced the cause of the individual living within a free but ethically based and directed society. Solzhenitsyn's exile came to an end in 1994, when he returned home to live in Russia. Although all the Solzhenitsyn canon is worthy of study, his most significant works from the standpoint of ethics are *One Day in the Life of Ivan Denisovich* and *The Gulag Archipelago*.

Song lyrics

DEFINITION: Expressions of a wide range of subjects by means of words set to music

TYPE OF ETHICS: Arts and censorship

SIGNIFICANCE: The lyrics of contemporary popular music challenge the boundaries of taste and public notions of propriety and are central to the debate over limits to free expression.

Bawdy and subversive lyrics are as old as music, and the impulse to suppress them is as old as social hier-

archy. There is an ancient underground tradition of songs that defy the prevailing order, satirize the ruling class, and challenge commonly accepted precepts. Anthems such as France's "Marseillaise" and the communist "Internationale" began as often-banned incitements to revolution. In nineteenth century Italy, the politics of the reunification movement, the Risorgimento, circumscribed the texts of Giuseppe Verdi operas. Richard Strauss's opera *Salome* was shut down after one performance in New York in 1908, in part because of its allegedly indecent German libretto, which was based on a play by Oscar Wilde.

MODERN POPULAR CULTURE

With the invention of sound recording and the advent of broadcast media, arguments favoring limits to the content of commercially distributed songs gained currency in the United States. Before the 1950's, most censorship incidents involved the proscription or laundering of Harlem Renaissance blues lyrics or Broadway show tunes such as Cole Porter's "Let's Do It." On occasion, records such as the Andrews Sisters' "Rum and Coca-Cola," whose unexpurgated lyrics refer to a mother-and-daughter team of Trinidadian prostitutes "working for the Yankee dollar," would be banned from the radio. During the Joseph McCarthy era, the socially conscious lyrics of leftist folksingers such as Woody Guthrie were widely suppressed as "communist" propaganda.

With the rise of rock and roll during the 1950's, the verbal content of popular music began to ignite moral panic. Rock, which evolved from African American rhythm and blues in the early 1950's, was considered "jungle music," a destructive combination of primitive rhythms and lewd lyrics. Early antirock music campaigns were sometimes unapologetically racist and always maintained that the music spread violence and promiscuity. The lyrics of some songs, such as the Kingsmen's "Louie Louie," did not even have to be decipherable to be deemed obscene by the Federal Bureau of Investigation and the Federal Communications Commission.

Although the sexual frankness that crept into pop lyrics as the 1960's progressed became increasingly overt, rock songs of that decade were most commonly censored or banned because of real or imagined references to drugs. The Beatles' "Lucy in the Sky with Diamonds" (1967), for example, was re-

viled in some quarters because it was assumed to describe the effects of LSD. More overt allusions to drug use, such as the Jefferson Airplane's "White Rabbit" (1967), with its exhortations to "feed your head," often caused the song to be denied radio play. Drug-culture jargon and four-letter words at times provided authorities with convenient excuses to keep antiwar and social protest songs off the air.

Within the United States, organized efforts to clean up rock music lyrics have come from across the political spectrum. Leaders of such campaigns have ranged from right-wing ideologue David Noebel to civil rights activist Jesse Jackson. In the late 1970's, the messages of punk bands such as the Sex Pistols, along with the continuing popularity of "heavy metal" music among young teenagers, created concern that "morbid" and "occult" lyrics were causing a rise in teenage suicide. In the late 1980's, artists were threatened with legal action by bereaved parents and in some cases sued. Evangelists and radio personalities such as Bob Larson popularized the idea that satanic messages were encoded in rock lyrics or subliminally injected into certain albums through sound engineering.

Upset by masturbation references in Prince's song "Darling Nikki" in 1985, Tipper Gore, the wife of future vice president Albert Gore, cofounded the Parents Music Resource Center (PMRC), an organization aimed at curbing the excesses of popular music. Congressional hearings held at PMRC's request resulted immediately in censorship activity at the state level. By 1990, the Recording Industry of America (RIAA) was pressured into instituting a voluntary warning-label system whereby some records would carry stickers with the label "Parental Advisory/Explicit Lyrics." The labeling scheme created a climate of censorship within the music industry and provided a foundation for efforts to restrict sales and criminalize certain lyrics in Louisiana, Washington state, and elsewhere.

THE DEMONIZATION OF RAP

In the late 1980's, Florida attorney Jack Thompson began enlisting allies in a campaign against rap, an African American art form that he considered an affront to "traditional values." Thompson helped to inspire the arrest and obscenity conviction of a record-store owner who was guilty of selling the Miami rap group 2 Live Crew's album *Nasty as They*

Wanna Be (1990); the band itself was arrested in Fort Lauderdale following a live performance of such songs as "Me So Horny." Although 2 Live Crew was acquitted, Thompson continued to hound them and other outspoken rap musicians—especially NWA (Niggas With Attitude)—across the country and as far as the United Kingdom, where 22,000 copies of an NWA album were impounded.

Hysteria over "gangsta" rap reached fever pitch in 1992 with the release of Ice-T's *Body Count* album (technically a heavy metal record), an outpouring of rage over forms of racism. Its climactic song, "Cop Killer," was condemned for its venom:

I got my twelve gauge sawed off.
I got my headlights turned off.
I'm 'bout to bust some shots off.
I'm 'bout to dust some cops off.
COP KILLER, it's better you than me.
COP KILLER, f—— police brutality!

Iran-Contra figure Oliver North retained Jack Thompson as counsel in July, 1992, for the express purpose of mobilizing his lobbying operation, Freedom Alliance, against musicians. North's strategy included encouraging police organizations to use various means to eliminate the sale, broadcast, or commercial release of "seditious" music. Ice-T and his distributor, Time Warner, were finally driven to excise "Cop Killer" from future pressings of the *Body Count* album. Other artists who were legally threatened or economically pressured included Ice Cube, Tupac Shakur, Almighty RSO, and Paris, whose "Bush Killa" vented rage at the White House.

CENSORSHIP DURING THE 1990'S

In 1994, mounting a fresh campaign to force the recording industry to clean up rap and heavy metal lyrics, the PMRC created the unlikely team of liberal Democrat C. Delores Tucker, chairman of the National Political Congress of Black Women, and conservative Republican William J. Bennett, secretary of education under President Ronald Reagan. In joint press releases, op-ed columns, and public appearances, Tucker and Bennett decried "lyrics from the gutter" while paying little attention to actual content. In 1995, Tucker and Bennett successfully pressured Time Warner to drop its controlling interest in

Interscope Records, which carried such controversial artists as Snoop Doggy Dogg.

U.S. senators Joseph Lieberman of Connecticut and Sam Nunn of Georgia joined Tucker and Bennett in public condemnation of “obscene music,” citing such songs as Dove Shack’s “Slap a Ho.” In 1997, Senator Sam Brownback of Kansas held hearings designed to showcase complaints about objectionable lyrics and other elements of what Senator Lieberman, in testimony, called our “broken culture.” In Brownback’s media-tailored forum, the voices of artists, serious analysts of American culture, and free-speech advocates were almost absent; witnesses who deplored the moral turpitude of popular music were welcomed warmly. As Congress continued its attack, the Recording Industry Association of America, once fiercely opposed to censorship, began wavering in its support for freedom of expression.

By the mid-1990’s, the \$12 billion U.S. recording industry began backing away from nonmainstream music. The climate of censorship was aggravated by pressure from retailers and distributors. Wal-Mart, the largest record retailer in the nation, refused to sell albums with “parental-advisory” warning stickers and went so far as to demand censored versions of certain record albums, with problematic songs edited for content or dropped altogether.

After students gunned down fellow classmates at Littleton, Colorado’s Columbine High School in 1999, and similar incidents occurred elsewhere, the campaigners against rock and rap were eager to blame the incidents on the troubled teenagers’ taste in music. When it was erroneously reported that the Columbine shooters were fans of “goth-rock” singer Marilyn Manson, Senator Brownback and nine of his colleagues demanded that Seagram’s, which owned

Manson's record label, put an end to the performer's career. They also called for an investigation into popular culture by the U.S. surgeon general.

In an era during which commercial music veered away from political content, the popular art being demonized was often material daring to critique contemporary American life. The so-called gangsta rap genre vented the outrage of an underclass whose real grievances received scant attention in congressional hearings. Critic Lawrence Stanley describes gangsta rap an "unmistakably black art form" that emerged at a time when white institutions were indifferent, if not hostile, to the concerns of African Americans.

For young people of all races who felt numbed by American middle-class life, Marilyn Manson offered an invigorating challenge to traditional gender roles, religious fundamentalism, and pressure to conform. White rapper Marshall Mathers III, who performs under the name Eminem, was vociferously condemned by everyone from Joan Garry of the Gay and Lesbian Alliance Against Discrimination (GLAAD) to Republican activist Lynne Cheney, wife of future vice president Dick Cheney, when his *Marshall Mathers LP* (2000) gained popularity, praise, and award nominations. Accused of nihilistic, misogynist ranting, Eminem was in fact an articulate chronicler of the ills of working-class Detroit. Describing the blighted industrial city in his song "Amityville," Eminem sings:

we don't call it Detroit, we call it Amityville ('Ville).
You can get capped just having a cavity filled
(filled). Ahahahaha, that's why we're crowned the
murder capital still (still). This ain't Detroit, this is
m——n' Hamburger Hill (Hill!). We don't do
drivebys, we park in front of houses and shoot. and
when the police come we f——n' shoot it out with
them too! That's the mentality here (here), that's the
reality here (here). . . .

Through the 1990's, song-lyric censorship in the United States was opposed by the National Campaign for Freedom of Expression, the National Coalition Against Censorship, and grassroots advocacy groups such as Rock Out Censorship and the Massachusetts Music Industry Coalition. The American Civil Liberties Union (ACLU) Arts Censorship Project worked to provide legal aid to embattled musi-

cians, producers, and retailers, helping to overturn an "erotic music" law in Washington state and to defend record stores across the country. Citing federal court rulings on speech, ACLU attorneys maintained that song lyrics, even if they extolled armed rebellion, did not constitute a direct and imminent threat—and that First Amendment protections did indeed apply to such works as "Cop Killer." The irreconcilable disagreements in this controversy illustrated a growing rift between opposing visions of American democracy.

Inspired by a growing worldwide concern about content restrictions on music, activists and musicians held the first World Conference on Music and Censorship in Copenhagen, Denmark, in November, 1998. In the twenty-first century, the debate over song lyrics and other popular expressive media pitted human aspirations toward freedom against a perceived need, real or imagined, for increased authoritarian social control in response to a growing terrorist menace.

Sophists

DEFINITION: Group of professional teachers active in ancient Greece and generally based in Athens

DATE: Fifth and fourth centuries B.C.E.

TYPE OF ETHICS: Classical history

SIGNIFICANCE: Known largely through their caricature in the work of Plato, the Sophists trained their students in rhetoric and oratory, among other subjects, and used formal logic to criticize traditional Greek values. For this reason, they are often represented as having believed that truth is irrelevant, morality is an empty construct, and the point of philosophical and legal argument is simply to win no matter what side one is on. Whether this is a fair assessment of some or all of the Sophists is a matter of ongoing debate.

First appearing in Greece during the period of Athenian empire-building (the *Pentekontaetia*), the Sophists established a general intellectual climate rather than a well-defined school of thought. The Sophists furthered the *Pentekontaetia*'s process of dynamic change by declaring that traditions were based on optional arrangements. In an era of sharpened competition, they also claimed that the value of actions varied according to circumstances, that knowledge was necessarily imperfect, and that truth was relative. Their relativistic, individualistic, and skeptical outlook was epitomized by their foremost representative, Protagoras of Abdera, who declared that "man is the measure of all things." The Sophists' ethical relativism was sharply attacked by a new philosophical movement, led by Socrates, reaffirming absolute values. Socrates and his followers, however, adopted the Sophists' critical spirit and concern with ethical issues; by further exploring Sophist topics such as the nature of truth and the justification of values, the Socratics built upon and partially perpetuated their work.

South Africa's Truth and Reconciliation Commission

IDENTIFICATION: Government commission established to investigate human rights abuse that occurred under the former apartheid regime

DATE: Established in July, 1995

TYPE OF ETHICS: Human rights

SIGNIFICANCE: The work of the Truth and Reconciliation Commission established that it is possible to negotiate a peaceful transition from a repressive, authoritarian regime to an open, democratic civil society and that restorative justice is achievable through public truth telling, dialogue, and reparations to victims, while extending amnesty to perpetrators of a previous brutal regime.

After centuries of white-minority rule, South Africa elected its first nonracial government in 1994 and put a final end to the notoriously rigid segregation policy known as apartheid. Under an agreement worked out between the outgoing National Party leaders of the old government and the incoming leaders from the nonracial African National Congress (ANC), the Truth and Reconciliation Commission was created to investigate human rights abuses perpetrated by all factions over the previous forty-four years—the period of time from South Africa's 1960 Sharpeville massacre to the inauguration of Nelson Mandela as president in 1994.

The commission was officially created by the 1995 Promotion of National Unity Act, which defined the commission's goals. Under its chairman, Archbishop Desmond Tutu, a winner of the Nobel Peace Prize and a long-time advocate of human rights in South Africa, the commission conducted its work from April, 1996, through July, 1998. Over that four-year span, it heard testimony from more than 21,000 victims of apartheid and received more than 7,000 petitions for amnesty from prosecution for crimes committed under apartheid. By 1998, the commission had rejected 4,500 of those petitions and granted only 125 amnesties. In October, 1998, it issued a 3,500-page report on its findings.

BACKGROUND

During the early 1990's, shortly before the leaders of the National Party agreed to cede power to the

African National Congress, they demanded a general amnesty for the members of the government military and paramilitary forces responsible for atrocities, tortures, and human rights abuses under the past regime. That request was deemed unacceptable, but the interim parliament instead crafted a unique amnesty provision that found its way into South Africa's interim constitution of 1993. The amnesty provision provided for the establishment of a Truth and Reconciliation Commission by the new government that would deal with issues related to human rights abuses during the apartheid regime. The commission was tasked to serve as an outlet for citizens who were willing publicly to disclose details of gross violations of human rights they had committed during the apartheid regime and in turn were to be granted amnesty.

The Truth and Reconciliation Commission's Mandate

The South African legislation that created the commission charged it with promoting national unity and reconciliation in a spirit that transcended conflicts and divisions of the past. The commission was specifically charged with these goals:

1. Establishing as complete a picture as possible of the causes, nature, and extent of the gross violations of human rights committed under apartheid through investigations and hearings.
2. Facilitating the granting of amnesty to persons who fully disclose all relevant facts relating to acts associated with political objectives and who comply with the requirements of this act.
3. Establishing and making known the fate or whereabouts of victims of past abuses and restoring the human and civil dignity of such victims by granting them opportunities to relate their accounts of the violations of which they were victims, and recommending reparation measures.
4. Compiling a report providing as comprehensive an account as possible of the activities and findings of the commission and offering recommendations of measures to prevent future human rights violations.

The more than seven thousand amnesty petitions filed with the commission revealed details of atrocities committed by agents of the apartheid regime and, to a much lesser extent, by members of the African National Congress. Those applying for amnesty included the perpetrators of some of apartheid's most publicized crimes, such as the murder of Stephen Biko in 1977. They testified before the commission and thereby escaped prosecution for their actions. Some critics decried this process of swapping "truth for justice" as unconscionable and immoral.

The legislation that established the Truth and Reconciliation Commission was the outcome of a confluence of political and social developments negotiated during South Africa's transition to democracy. The key political tensions were between the outgoing government's demands to protect members of the old regime and the liberation movement's insistence to hold the leadership of the apartheid government accountable for past wrongs. As a part of the transitional constitutional arrangements, both sides accepted the creation of a truth commission. Details of the exact balance between punishment and indemnity and accountability and impunity had to be negotiated as well. In the end, the final agreement produced a compromise that obligated the incoming majority-rule government to provide amnesty to human rights abusers in exchange for their "honest" contrition of what happened. The Truth and Reconciliation Commission was thus shaped more by the national political agendas at the time of its creation than by the needs of victims of historical abuses.

SHORTCOMINGS

Despite the laudable aims of the legislation that created the commission, the act was not clear on how the commission was to achieve the lofty goal of promoting "national unity and reconciliation in the spirit of understanding that transcends the conflicts and past divisions." The commission achieved the goal of restoring dignity to victims of apartheid abuses primarily by engaging communities in the process of collecting statements from local victims during community human rights hearings. Community hearings thus became the dominant focus during the first fourteen months of the commis-

sion's work, during which eight community hearings were held. The hearings focused on victims—giving them opportunities to tell their stories. The hearings provided forums for open discussions that helped promote understanding among different political parties and different ethnic groups. The community hearings also provided powerful media images that could be conveyed throughout the country.

The more difficult challenge of the commission was the goal of promoting justice and reconciliation. This facet of the commission's work proved a contentious point, as it was interpreted differently by various political parties and communities through the life of the commission. It could be argued that the commission actually denied justice through its very structure. For example, its amnesty provision robbed victims of their right to seek justice through a criminal and civil process.

Following the commission's final report in 1998, studies of the commission found a wide range of opinions on its work. While some community members, particularly the Inkatha Freedom Fighters opposed the commission in principle, most community members had mixed feelings about the process. Almost every aspect of the commission's work caused some level of controversy.

Sovereignty

DEFINITION: Legitimate and exclusive possession of autonomous political authority over a particular territory or citizenry

TYPE OF ETHICS: International relations

SIGNIFICANCE: National sovereignty, essentially the right to demand that other countries respect a nation's absolute authority within its own borders, raises significant moral issues involving the limits of a government's right to remain unmolested if it mistreats its own people, as well as the ethical limits of a benevolent government's right to harm the people of other nations in order to preserve its own power. Internally, claims of sovereignty raise the moral questions of when and why one ought to obey the sovereign.

Sovereignty is a central concept in domestic and international law as well as in political theory, and its ethical implications are enormous.

To be sovereign in international law, a nation must be completely self-governing—recognizing no exterior legal authority to have the right to control its actions. The form of a national government is not an issue in determining sovereignty; a democracy, an absolute monarchy, a military junta, or a communist dictatorship may be sovereign if it submits to no higher, external legal authority.

In international affairs, one often contrasts *de jure* with *de facto* sovereignty, sovereignty in law versus sovereignty in fact. Some nations have been officially self-governing but have been, in fact, controlled by another. During the 1930's and 1940's, for example, Egypt was officially an independent nation but was, in fact, ruled by the British Empire in an arrangement that some historians have called an "informal empire."

Alternatively, some nations are nominally under foreign control but do, in fact, govern themselves. Such was clearly the case between the Balfour Declaration of 1926, wherein the British government promised not to interfere in the self-government of the dominions, and the Statute of Westminster (1931), which granted the dominions *de jure* independence.

During civil wars and wars of independence, questions of sovereignty are often blurred. The American colonies declared their independence from the British crown on July 4, 1776, but the Crown did not recognize that independence until the Treaty of Paris

(1783). When did sovereignty pass from the king in Parliament to the Continental Congress (or, more exactly, to the several states)?

Legally, such issues of sovereignty in international law are often solved by resort to competing interpretations by domestic law. American law views the date of the Declaration of Independence as the effective date of American sovereignty for all legal purposes, while in British law, the Treaty of Paris marks the end of British sovereignty in the thirteen American colonies.

In international law, land without a sovereignty over it is called *terra nullius* (or *territorium nullius*)—empty land—even though it may have a substantial human population. *Terra nullius* is open for annexation by existing sovereignties under international law on the theory that land without a sovereign is dangerously susceptible of producing lawlessness, such as piracy or terrorism, or armed conflicts between existing nations. Given the new dispensation in international affairs under the United Nations Charter, it is likely that an area of *terra nullius* that contained a large population but had not developed (or had lost) a governmental structure capable of asserting an “international legal personality” would be put in a trusteeship relationship with an established nation until such time as it might be capable of asserting sovereignty. By this means, the aura of direct colonialism might be averted.

SOVEREIGNTY AND POLITICAL PHILOSOPHY

The concept of sovereignty has application in political philosophy as well as in international law. Sovereignty is not only a claim of a right to rule made vis-à-vis other sovereignties but also one made domestically in regard to those subject to a governmental authority.

Political philosophers as divergent as Thomas Hobbes and Jean-Jacques Rousseau have recognized the essential truth that sovereignty is illimitable and indivisible. By the late twentieth century, these observations had fallen into general disuse, perhaps in the aftermath of the rise of the American Republic. In the British system, whatever Parliament passed and the king signed was law, without question and without limitation. Political theorists spoke of the legal omnipotence of the king-in-Parliament.

With the development of the U.S. Constitution, with its division of powers and its system of checks

and balances between the executive, legislative, and judicial branches, it may, perhaps, have seemed that sovereignty could be divided and limited. Writing in the *Federalist Papers*, Alexander Hamilton, James Madison, and John Jay propounded the new sovereignty, which was tamed not only by the relationships of the branches of the national government but also by a federalism that preserved a sphere for the power of states and a system of enumerated rights that protected the citizen from governmental abuse.

In fact, in the U.S. Constitution, as in all political systems, sovereignty remains undivided and without limitation. Within the constitutional order, an ordinary sovereignty operates with divisions and limitations of power, but an extraordinary sovereignty resides also. The process of constitutional amendment could create a monarchy, establish an official church, authorize torture, eliminate elections, abolish the Supreme Court, and so forth. Seeming limitations, such as the prohibition upon depriving a state of its equal suffrage in the Senate, prove to be only procedural variants, because an amendment reducing the senatorial representation of a particular state would need ratification by that state, and an amendment to abolish the Senate would require unanimous ratification by the states.

In all approaches to sovereignty, there are underlying implications of a moral right to rule, in addition to a legal right and a practical power to rule. Even with legal positivism, in which moral questions are not directly injected into the pure theory of law—in which law is seen as merely “the command of the sovereign”—morality reenters through the questions of why, when, and whether the subject ought to obey the sovereign.

Also concerned in the ethical issues surrounding sovereignty has been its origin: Is sovereignty natural, or is it the construct of a social contract arising out of a state of nature? Anarchists, furthermore, including theoretical anarchists, such as Robert Paul Wolff, have viewed sovereignty as a morally dangerous illusion.

Soviet psychiatry

DEFINITION: Use of psychiatric techniques and facilities in the Soviet Union as tools of political oppression

DATE: Approximately 1862 to the 1990's

TYPE OF ETHICS: Psychological ethics

SIGNIFICANCE: The confinement of religious and political dissidents by Soviet psychiatrists was been a vivid reminder of the ways in which a profession can function unethically as an agent of social control.

The persecution of both political and religious dissidents by mental health authorities in the former Soviet Union was long a source of great concern to organizations that monitor human rights violations. Extensive evidence exists that hundreds if not thousands of mentally healthy dissidents were involuntarily committed to Soviet psychiatric hospitals. These individuals were committed in order to remove them from society and thus suppress their dissenting ideas and opinions.

HISTORY

Although psychiatric facilities in the Soviet Union practiced this type of abusive social control for many years, Soviet psychiatry was not always an eth-

ically compromised profession. The field of psychiatry was founded in the Soviet Union by Ivan Belinski, a Russian physician, who formed the first Russian psychiatric society in 1862. Belinski promoted psychiatric training and worked to establish outpatient treatment for the mentally ill. Under his leadership, the profession of psychiatry grew rapidly. In 1887, the first Congress of Russian Psychiatrists met in Moscow and endorsed the humane, scientifically informed treatment of mental patients as well as the notion that, if possible, psychiatric patients should be cared for in their home environments. Such ideas put Russian psychiatrists on an equal plane with their fellow practitioners in the rest of the world.

Positive developments continued to take place in the field of Soviet psychiatry after the Communist Revolution of 1917. At the time of the revolution, a People's Commissariat of Health was formed, with a special division devoted to psychiatry. Under the commissariat's leadership, many types of services were offered free of charge to the mentally ill, such as crisis intervention, sheltered workshops, and home care programs. Many Soviet psychiatrists also began to develop an interest in the young field of psychoanalysis, and the major works of Sigmund Freud were widely distributed.

THE ADVENT OF ABUSE

Problems began to develop during the late 1920's, as Joseph Stalin consolidated his hold on the government of the Soviet Union. Stalin had little concern for the rights of the mentally ill, and he viewed involuntary psychiatric commitments as an effective way to control his ideological opponents. Although psychiatric hospitals continued to treat individuals who suffered from genuine forms of mental illness, they also became a place of involuntary confinement for individuals who openly disagreed with the political or religious doctrine of the government. Labor organizers and artists who advocated creative freedom were favorite targets of the psychiatric establishment. Placing such dissidents in psychiatric facilities served both to remove them from society and to discredit their ideas by allowing the government to label them as insane.

A special diagnostic category, known as "sluggish schizophrenia," was developed. Anatoly Snezhnevsky, a notorious Russian psychiatrist who rose to a position of high authority under the Stalinist regime, defined sluggish schizophrenia as delusions of

reforming the country's social system in the mind of an otherwise normal individual. This type of false diagnosis enabled psychiatrists such as Snezhnevsky to label mentally stable individuals as insane and have them involuntarily committed to psychiatric facilities. Even if such an individual was eventually fortunate enough to be discharged, his or her name was maintained on a national list of mental patients. This registry was distributed to prospective employers and schools, ensuring that the individual would suffer from lifelong discrimination. Doctors who refused to follow the unethical practices of this system were routinely disciplined or even imprisoned. Over time, Soviet psychiatrists became virtual servants of the state, with no professional autonomy and little room for ethical judgment.

THE USE OF TORTURE

Psychiatric treatment in the Soviet Union eventually became so abusive that some dissidents were actually tortured during their hospitalization. A convincing account of such treatment has been provided by Anatoly Koryagin, a Soviet psychiatrist who was himself hospitalized involuntarily because he refused to carry out government policy. Throughout his fifteen-month hospitalization, Koryagin was kept on a virtual starvation diet, so that he was severely emaciated and in a constant state of hunger. He was forced to take various psychiatric medications and also reports having had a probe smeared with acid placed in his stomach in order to induce excruciating pain. This type of torture was apparently designed to force Koryagin and other dissidents to renounce their ideological beliefs. Because of such extreme violations of human rights, the World Psychiatric Association (WPA) condemned Soviet psychiatry in 1977. Six years later, the All-Union Society of Soviet Psychiatrists resigned from the WPA rather than face certain expulsion.

Such international condemnation, however, did little to change the field of psychiatry in the Soviet Union. Peter Reddaway, a political scientist who has written extensively about Soviet psychiatric abuse, has noted that only *glasnost* and the reorganization of Soviet society has brought about genuine reform. In what was once the Soviet Union, the reorganized profession of psychiatry appears to be returning to its humanitarian roots.

Sperm banks

DEFINITION: Places in which human sperm cells are frozen and stored for later use in artificial insemination and in vitro fertilization techniques

DATE: First established during the late twentieth century

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Although most often used to ensure that couples will be able to reproduce in the future, sperm banks can also be used as sources of anonymous genetic material for infertile couples, lesbian couples, or women who want to become single mothers. This application raises ethical issues involving genetic manipulation, as well as the rights and responsibilities of the genetic father of a child produced with donated sperm.

The freezing of tissue, or cryopreservation, is a procedure that is used to delay the normal degenerative

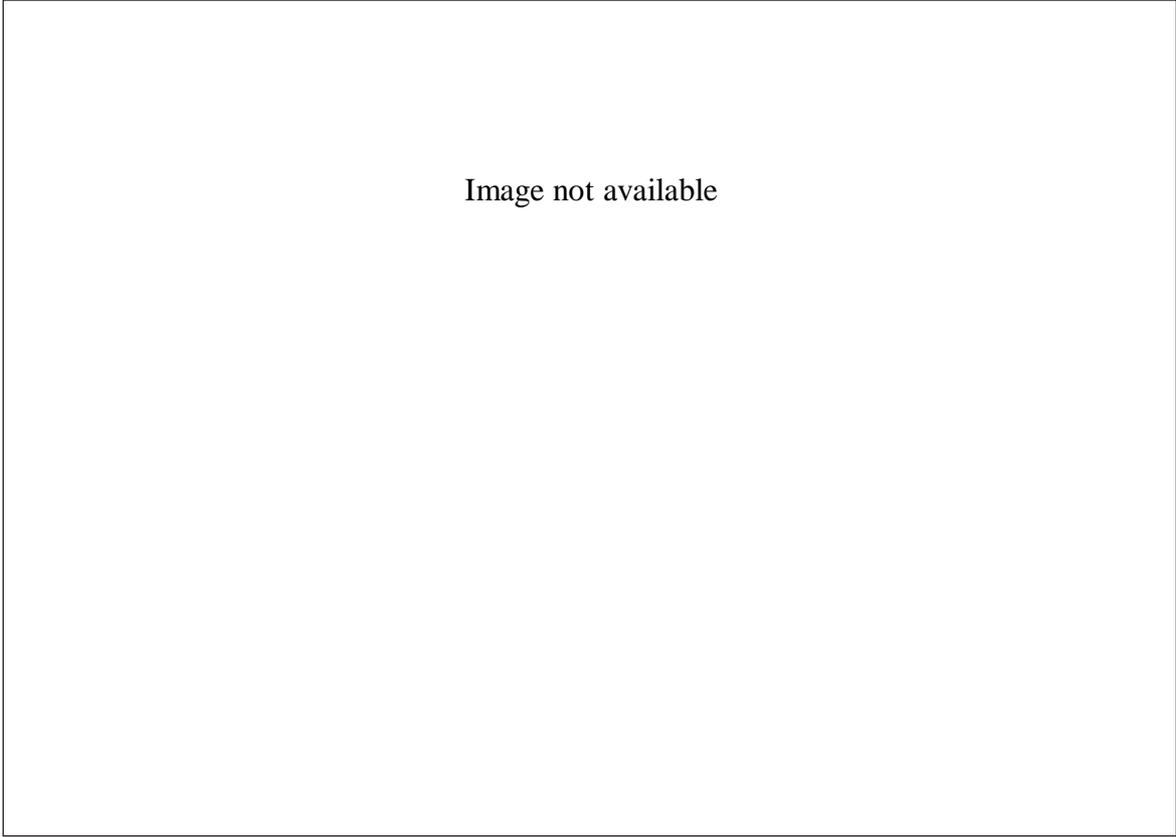

Image not available

In 1983, the Sperm Bank of California became the first such facility in the United States to ask donors if they would be willing to be contacted by the offspring of their donated sperm after the latter reached legal adulthood. In early 2002, a young woman named Claire, seen here (at left) with her mother, made plans to become the first person to take advantage of the sperm bank's policy by contacting her anonymous father to learn about her genetic history. (AP/Wide World Photos)

processes that occur when a tissue is removed from the body. Sperm banks acquire sperm from male donors and then deep freeze the sperm in liquid nitrogen, where they can be preserved for more than a decade. When needed, the sperm can be thawed out and used in processes such as artificial insemination and in vitro fertilization. Some sperm donors are husbands who cannot have children with their wives by ordinary means. Others are men who face sterilization through vasectomies or as the result of chemotherapy drugs for cancer. Still others are healthy men who donate their sperm for the money.

Those interested in obtaining donor sperm can often choose the sperm based on the physical characteristics, hobbies, and/or intellectual capacities of the

donor. This technology tends to tempt persons to manipulate the gene pool so as to create a superior class of persons, avoid individuals with undesirable traits, and attempt to create the "perfect child." One problem involves determining the true father of the child—the biological donor or the parent who raises the child but did not donate the sperm. Additionally, some people believe that the commercialism inherent in the business of sperm banking tends to lessen the value of procreation.

Spinoza, Baruch

IDENTIFICATION: Dutch philosopher
BORN: November 24, 1632, Amsterdam, United Provinces (now the Netherlands)
DIED: February 21, 1677, The Hague, United Provinces (now the Netherlands)
TYPE OF ETHICS: Renaissance and Restoration history
SIGNIFICANCE: In such works as *A Theologico-Political Treatise* (*Tractatus theologico-politicus*, 1670) and *Ethics* (*Ethica*, 1677), Spinoza constructed a monistic philosophy of God and nature in which ethical behavior would follow naturally from understanding reality as a unified whole.

In the seventeenth century, academic Scholasticism, with its syllogistic reasoning and its Aristotelian epistemology, was withering away after a millennium of dominance. The empirical scientific methods of Nicholas Copernicus, Johann Kepler, and Galileo showed a new direction of philosophical understanding, and a rising interest in mathematics suggested new types of philosophical proof based on the methods of Euclidian geometry. Baruch Spinoza played a part in the movement that resulted, together with such notable thinkers as Francis Bacon, Thomas Hobbes, René Descartes, and Gottfried Leibniz.

LIFE

Spinoza was born into a family of prosperous Jewish merchants in Amsterdam, an area with a tolerance for religious practice and dissent in advance of its time. His education was in the Hebraic tradition of his community, with studies of the Old Testament and the Talmud, as well as of Scholastic philosophy and theology. Preparing to become a rabbi, he continued his studies after finishing school, becoming acquainted with the Kabbala and the thinking of medieval Jewish philosophers. His own views, fueled by a determination to think everything through *ab initio*, diverged from orthodoxy to the point that he was expelled from the Jewish community (by civil, not religious, authority) in 1656. He renounced his Hebrew name, Baruch, and was thenceforward known as Benedict (de) Spinoza. He continued in Amsterdam for a time, studying Latin, Greek, physics, geometry, and the philosophy of Descartes, and associating with members of a number of free-thinking Christian

sects such as the Mennonites, the Collegiants, and the Remonstrants.

In 1660, Spinoza left Amsterdam to live successively in Rijnsburg, Voorburg, and finally The Hague (all on an axis of approximately thirty miles between Amsterdam and The Hague). In these places, he supported himself as an expert lens grinder and met for discussion with groups of philosophically minded friends. This activity led to his early writings, in which he set forth his views on God, humanity, and the universe, and produced an account of Descartes's philosophy. These were original and powerful enough that his reputation quickly spread beyond his immediate circle, and within a few years he was in correspondence with major philosophers in Europe and England, including Leibniz and the physicist Christiaan Huygens on the Continent, and in England Henry Oldenburg, secretary of the Royal Society of London, and the scientist Robert Boyle. *A Theologico-Political Treatise* was published anonymously in 1670 and was widely condemned for its religious skepticism. All of Spinoza's other works, including his major production, the *Ethics*, were published posthumously by his friends.

In 1672, the French general Condé (Prince Louis II of Bourbon) invited Spinoza to visit, possibly with a position in mind, but no position was forthcoming. In the following year, he was offered a position at Heidelberg University, but he declined it. Spinoza's last years were spent virtually as an invalid, and at the age of forty-four he died of consumption, probably aggravated by the silica dust from his lens-grinding activities.

EARLY THOUGHT AND WORK

The *Short Treatise* of 1660 and the exposition of Descartes's philosophy were written when Spinoza's thinking was developing into the mature expression of the *Ethics*. The Descartes work, written for a group of students, was expressly not his own thinking. Nevertheless, he derived valuable ideas from it through reaction, notably his rejection of the dualism of mind and body (or spirit and matter) and his affirmation that the individual must form his own judgments in political and religious matters, free from the pressures of church and state alike. It was this conviction, as expressed in *A Theologico-Political Treatise*, that first aroused opposition that later became virulent. Spinoza's notion of freedom of thought and action is

absolute, a position that does not sit well with religious or political authority.

ETHICS

The reason for this absolute freedom becomes evident in the *Ethics*. Laid out in Euclidian fashion with definitions and axioms, and propositions deduced from them, the *Ethics* first deals with God and nature, which are one. God/nature is its own cause, requiring no prior cause and encompassing all that is, including humankind. Properly understood, this eternally existing unity admits of no internal contradictions. It also admits of no free will and is absolutely impersonal about the fate of humankind. These last conclusions led to Spinoza's condemnation as a dangerous atheist, although his God informs his entire system of morality and ethics. In his deterministic universe, the ethical imperative is unending rational inquiry to learn the true nature of things. The free individual perceives what he or she must do and acts accordingly. Those with confused ideas about their universe are in some degree not free, and they act not through understanding but because they cannot help themselves.

SIGNIFICANCE AND INFLUENCE

Morality and ethics are individual matters for Spinoza, and they lead to political and religious consensus only when enough people, made free by rational and empirical inquiry, act on the understanding they have gained. Spinoza's philosophical system is remarkably complete and self-contained, which has led to much misunderstanding by later thinkers who tried to extract and develop portions of it. This misunderstanding, together with the charge of atheism, produced an almost total lack of influence of Spinoza's work for more than a century. Only in the nineteenth century, in the time of rejection of monarchy and despotism, were his ideas taken up by the German and English romantics and idealists. No school of thought has grown from his writings, and his influence on philosophy has been more catalytic than structural.

Stalin, Joseph

IDENTIFICATION: Soviet political leader

BORN: Joseph Vissarionovich Dzhugashvili;

December 21, 1879, Gori, Georgia, Russian Empire

DIED: March 5, 1953, Kuntsevo, U.S.S.R.

TYPE OF ETHICS: Modern history

SIGNIFICANCE: Stalin was the leader of the Communist Party of the Soviet Union from 1928 to 1953, during which time he directed the transformation of the Soviet Union into a repressive totalitarian state and led the country in the Great Patriotic War against Nazi Germany.

Joseph Stalin was one of the most powerful leaders of the twentieth century. His rule would have a permanent impact upon not only the Soviet Union but also the entire international system. Stalin governed his political behavior according to the Marxist-Leninist tenet that the ends—the transformation of society along the lines anticipated by Karl Marx and Vlad-

imir Ilich Lenin toward socialism, under the undisputed leadership of the Communist Party of the Soviet Union (CPSU)—justified whatever means were deemed to be appropriate by the party leadership.

In addition, Stalin accelerated and eventually fully implemented many of the policies and trends initiated during the period of Lenin's active rule in the Soviet Union (1917-1922). These included the complete consolidation of CPSU totalitarian intrusion into all social, economic, cultural, political, and even personal aspects of life in the Soviet Union, as well as the acceleration and eventually the institutionalization of the centralizing, bureaucratic, authoritarian trends within the party itself. Finally, Stalin directed the industrialization of the Soviet Union, led the Soviet Union's tenacious defense during World War II, and significantly buttressed Soviet security in the war's aftermath. In doing so, however, Stalin applied a degree of mass coercion and terror rarely equaled in human history.

STALIN AND TOTALITARIAN RULE

Following the 1917 Revolution, Stalin rose rapidly to power largely as a result of his early institutional control over the CPSU Apparatus via his position as general secretary of the party's Central Committee, as well as his membership in the party's top decision-making organs. As a result of these institutional positions, particularly that of general secretary, Stalin was able to assign personal allies and protégés to strategic leadership positions not only within the CPSU organization itself but also throughout the Soviet state bureaucracy. Since that development was framed against the rapid expansion of CPSU and Soviet state totalitarian control over all aspects of Soviet public and even private life, by 1928, Stalin had successfully placed his lieutenants in virtually all key positions of power throughout the Soviet Union. Simultaneously, by the end of the 1920's, he had isolated and effectively eliminated or rendered politically powerless all of his political rivals from the early post-Revolutionary period.

Between 1928 and his death in 1953, Stalin was unquestionably the most powerful person within the Soviet leadership. As power increasingly concentrated at the highest level of the party hierarchy, Stalin continuously, but with extreme skill and perception, coalesced a sufficiently powerful, though ever-changing, body of allies and supporters to enable him

to remain the dominant Soviet leader, despite periodic challenges to his ruling position from within the party elite.

Conversely, within this dynamic but largely shrouded framework of coalitions and counter-coalitions that characterized Soviet politics at the political center, Stalin aggressively purged real or imagined policy dissidents and individuals who appeared to threaten his personal leadership from positions of power and authority. Although Stalin's practice of purging the ranks of the party can be traced to the precedent of Lenin's theory and practices regarding the enforcement of party discipline, the massive scope and degree of Stalin's use of terror, imprisonment, and physical liquidation within the CPSU were both qualitatively and quantitatively unprecedented in party annals prior to the 1930's.

Although the precise or even approximate number of party members and affiliated individuals purged during the Stalin period will never be known, it has been estimated that during the period of the 1930's alone, approximately one million party members perished. Furthermore, in addition to the physical decimation of the party's ranks caused by the purges of the Stalin era, the terror engendered within the party created a tone of fear, denunciation, and paralysis of individual initiative and willingness to assume personal responsibility that permanently influenced the character of the CPSU and the attitudes of its members.

Stalin's use of arbitrary arrest, imprisonment, torture, execution, and terror were not confined to the ranks of the party, but were extended on a much larger scale throughout the entirety of Soviet society. Indeed, as the tentacles of party control and the domain of its self-assigned responsibilities extended throughout the whole of the Soviet public and private sectors, and, further, as the Stalin-led Party leadership moved to reshape the entire character of the Soviet Union, those who individually or collectively offered actual or perceived resistance to the party's policies or who could be utilized by the party as scapegoats for the CPSU's failures to fulfill promises in return for societal sacrifices felt the harsh, cold, bureaucratic, deadly wrath of the authorities. Hence, tens of millions of Soviet citizens were killed or imprisoned, or simply disappeared during the two and a half decades of Stalin's rule. Between ten and fifteen million perished during the 1930's alone, not includ-

ing the victims of the famine associated with the collectivization of agriculture.

TRANSFORMATION OF THE SOVIET UNION

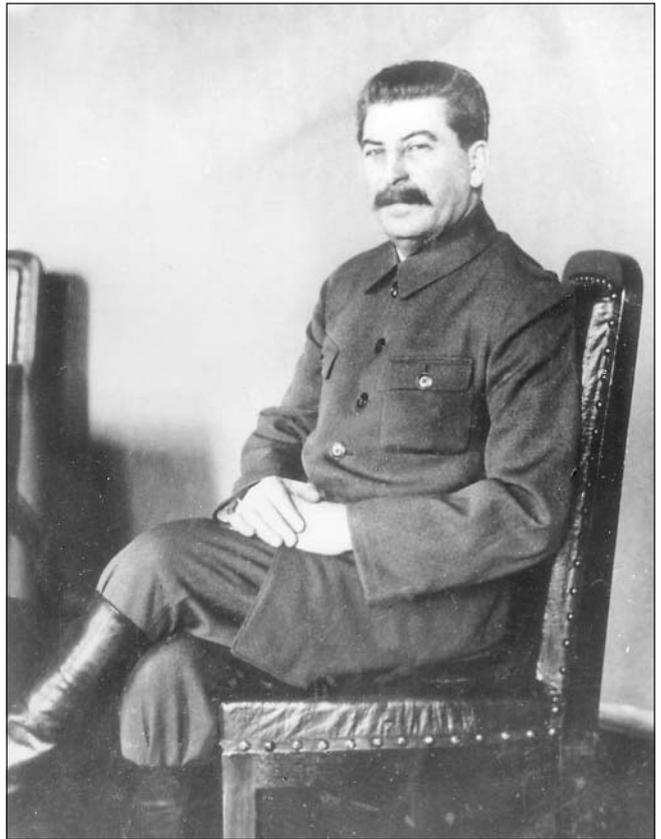

As the CPSU increasingly established totalitarian control over the entire Soviet Union, the tone, direction, and specific policies adopted in every sector of Soviet life were increasingly determined by Stalin and the party leadership. One of the aspects of Soviet life most transformed during the Stalin era was the Soviet economy. Stalin inaugurated and directed the collectivization of Soviet agriculture, which, though enormously costly in both human life and material resources, was designed to break permanently the politico-economic power of the Russian peasantry and to secure the agricultural resources necessary to sustain the accompanying industrialization effort.

The industrialization of the Soviet Union under the rubric of a series of centrally formulated and administered Five Year Plans, which were inaugurated during the late 1920's, rapidly expanded the Soviet Union's heavy industrial and defense output. As with the agrarian sector, the dramatic expansion of Soviet capital output was accomplished at a very high human, material, and environmental cost. Overall, the Stalinist economy left a legacy of over-centralization of economic direction; imbalances between sectors of the economy, with most resources dedicated to the priority heavy industrial and defense components of the economy at the expense of consumer industries and agriculture; and a resultant lack of material incentives for Soviet workers. Notwithstanding these human, material, and long-term systemic and environmental costs, however, in 1928 Stalin inherited an economy during the early stages of industrialization and transformed it into a major heavy industrial and defense production power by the time of his death in 1953.

In addition to directing the transformation of the Soviet economy and virtually every other aspect of Soviet domestic life, Stalin also orchestrated the successful defense of the Soviet Union during the 1941-1945 war against Nazi Germany—"The Great Patriotic War." Notwithstanding the initial

successes enjoyed by the Germans following their massive surprise attack upon the Soviet Union on June 22, 1941, a combination of German politico-strategic-operational errors, combined with the tenacious resistance of the Soviets themselves, enabled the Red Army to halt and drive the Germans back at the gates of Moscow in December, 1941, and on the banks of the Volga River, at Stalingrad, in late 1942 and early 1943.

Following the Soviet victory at the Battle of Kursk in July, 1943, the offensive capability of the German Army on the Eastern Front was permanently broken and the Soviet forces surged relentlessly westward. By mid-1944, when the Western allies successfully landed their armies on the beaches of Normandy, the Soviets had successfully liberated most of the pre-1939 Soviet territory. Finally, throughout the remainder of 1944 and into 1945, the Red Army fiercely fought across Poland and into the eastern portion of Germany, as well as up the Danube River Valley into

Joseph Stalin. (Library of Congress)

Austria and Czechoslovakia. The war, the largest land conflict in human history, left a tremendous wake of devastation throughout most of the western portion of the Soviet Union. Within the Soviet Union alone, between twenty-five and forty million Soviet citizens had died, tens of millions more were wounded in body or spirit, and massive urban, industrial, and agrarian destruction extended throughout the European half of the country.

THE POSTWAR WORLD

By the conclusion of hostilities in Europe, the Red Army dominated eastern and much of central Europe. Capitalizing upon this unprecedented level of military power, combined with the inability of the United States and Great Britain to counter effectively Soviet postwar designs on the areas it dominated, Stalin not only successfully secured *de facto* Western acknowledgment of the Soviet annexation of Estonia, Latvia, and Lithuania, as well as portions of Finland, Poland, Czechoslovakia, and Romania, but also imposed Soviet satellite regimes in Poland, Czechoslovakia, Hungary, Albania, Rumania, and Bulgaria. These measures, combined with the establishment of a Soviet zone of occupation within prewar German territory, significantly enhanced Soviet security against the threat of future overland invasion from the West and extended Soviet influence over a large portion of Europe.

Similarly, in the Far East, in return for the Soviet Union's entry into the war against Japan in August, 1945, Stalin obtained direct Soviet control over the Kurile Islands and the southern half of Sakhalin Island. In addition, he oversaw the erection of satellite regimes in North Korea and, in 1949, over the entirety of mainland China. Finally, Stalin encouraged the prompt development and acquisition of atomic and thermonuclear weapons. In short, by the time of his death in 1953, Stalin had not only greatly enhanced the geo-strategic security of the Soviet Union but also had expanded Soviet influence to engulf a significant portion of the Eurasian landmass. Indeed, the entire character of the post-World War II international system was shaped, in large measure, by the policies of Stalin.

On March 5, 1953, Stalin died in circumstances that remain shrouded in mystery. True to the ethics of Marxism-Leninism, Stalin used any and all means necessary to reshape the Soviet Union in accord with

his plan for the advancement of the historical process toward his vision of socialism. Ultimately, however, after two and a half decades of Stalinist rule, the means had clearly consumed the ends, thereby permanently marring the achievements of the Stalin era.

Stanton, Elizabeth Cady

IDENTIFICATION: Pioneering American suffragist leader

BORN: November 12, 1815, Johnstown, New York

DIED: October 26, 1902, New York, New York

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Stanton advocated woman's suffrage as necessary to achieve full moral and social equality between men and women.

Elizabeth Cady Stanton was one of the first Americans to call vociferously for full equality between women and men. After marrying abolitionist Henry

Stanton in 1840, she traveled with him to the World Antislavery Convention. As a woman, she was denied a voice or voting privileges at the convention, an experience that convinced her that women's rights must be promoted. She helped organize the first Woman's Rights Convention in Seneca Falls, New York, in 1848. She also contributed to the convention's principal document, the Declaration of Sentiments, which decried the oppression that made women irresponsible moral beings by denying them freedom to choose and act. More progressive than some of her contemporary suffragists, Stanton believed women and men were moral and social equals and called for woman's suffrage to achieve full equality.

As Stanton grew increasingly convinced of religion's role in oppressing women, she led a committee of women that prepared *The Woman's Bible*, a two-volume commentary on biblical passages dealing with women. The first volume, published in 1895, was criticized soundly by clergy and many other suffragist leaders. Despite opposition from the National-American Woman Suffrage Association, for which Stanton had previously served as president, Stanton and the committee published the second volume in 1898.

Following her death, Stanton was remembered as a great leader of the suffrage movement, a pioneer in feminist theology, and a woman committed to the ethical principle of the fundamental equality of women and men in all aspects of their moral lives and social relationships.

State of nature

DEFINITION: Theoretical formulation of the conditions of existence of individual persons prior to the advent of any social order

DATE: Concepted developed during the seventeenth and eighteenth centuries

TYPE OF ETHICS: Politico-economic ethics

SIGNIFICANCE: The concept of a pre-social state of nature was used by political philosophers to provide a foundation for social contract theory. It was meant to illustrate the motives behind and the alternative to the social contract.

The state of nature describes those conditions in which individuals find themselves prior to the existence of any society or government. To envision the state of nature, try to imagine what conditions would be like if there were no law, no society, and no government. The resulting image captures what is meant by the state of nature.

Thomas Hobbes, John Locke, and Jean-Jacques Rousseau make extensive use of the concept in their political writings to explain the origin of society and government. The resulting theory is known as the social contract theory. One goal of the social contract theory is to explain how and why individuals moved from the state of nature to form society and government. Their explanations, though they have the common thread of the social contract, vary as a result of their differing conceptions of the state of nature.

THOMAS HOBBS

In *Leviathan* (1651), Thomas Hobbes spells out his account of the state of nature. Since there is no society, there is no right or wrong. There are no constraints, whatsoever, except for physical limitations, on human actions. Human beings, then, are completely free. In addition, human beings are essentially equal. There is an equality of need. All humans need more or less the same things; for example, food, clothing, and shelter. There is, however, a scarcity of the things that are needed. Resources are limited. All human beings have an equality of power. Although one individual may be physically stronger than another, no one person is so strong that he or she cannot be conquered, through cunning, intelligence, conspiracy, or other means, by another. Finally, there is limited altruism. In this state of nature, people will think and act for themselves first and rarely act for others.

According to this view, the state of nature is bleak and intolerable. Nothing productive could be done for fear that what one produced would be taken. Commerce and trading could not take place because there would be no guarantees that people would be fair in their dealings with one another. In short, peo-

ple would live in constant fear. Hobbes labels these conditions a state of war, and life in such a state would be unbearable.

It is no wonder, then, that individuals want out of the state of nature. Hobbes shows that the way to escape the state of nature is for individuals to cooperate with one another. The way to ensure cooperation is to have a strong government that will guarantee that individuals will coexist peaceably in society.

JOHN LOCKE

In his *Second Treatise on Civil Government* (1690), John Locke also makes use of the state of nature to explain the origin of society and government, but his account is far different from that of Hobbes. In fact, one could make the case that the *Second Treatise on Civil Government* was written in response to and as a criticism of Hobbes's account. Locke disputes Hobbes's claim that the state of nature is identified with the state of war. Locke believes the state of nature to be peaceful, because he thinks that human beings by nature are rational and that there is a natural moral law that reason can discover. In Hobbes's account, there are absolutely no laws that bind individuals in the state of nature, while Locke contends that there are natural laws that individuals as rational agents will discover and follow. Such laws hold that one should not infringe on another's life, liberty, or property. The state of war comes about only when individuals fail to heed the dictates of the natural moral laws.

There is, then, for Locke, less of a motivation to escape the state of nature and form society. For Hobbes, conditions were quite intolerable. Locke can imagine, however, that conditions would be quite comfortable if everyone followed the natural laws. Unfortunately, what individuals ought to do and what they actually do are two different things. The individuals in Locke's state of nature get together to form society to ensure that those individuals who do not obey the natural law because it is a rational thing to do so will obey it because they will be punished if they do not.

JEAN-JACQUES ROUSSEAU

In *A Discourse upon the Origin and Foundation of the Inequality Among Men* (1758), Jean-Jacques Rousseau spells out his version of the state of nature. It has elements in common with the thought of both

Hobbes and Locke but also is different in significant ways. Like Hobbes, Rousseau claims that individuals in the state of nature are motivated by self-interest and are not bound by laws of any kind. Unlike Hobbes, however, Rousseau does not believe that this will lead to intolerable conditions. Rousseau believes that humans are naturally good and will feel compassion for, not animosity toward, their fellow humans. This compassion is a by-product of an individual's self-interest. Unlike Hobbes, Rousseau acknowledges that natural inequalities of physical strength and talent exist, but he does not think that this will lead to problems because of the existence of compassion. Hence, the state of nature is not tantamount to the state of war but is an idyllic state that is to be sought and envied.

Like Locke, Rousseau believes that individuals possess a special quality that makes them noble and their situation tolerable. For Locke, that quality is rationality. For him, the individual is a noble thinker. For Rousseau, that quality is the sense of freedom. For him, the individual is a noble savage. Rousseau thinks that individuals in the state of nature live off the land, coming and going as they please, enjoying their freedom and self-indulgence while having natural compassion for all other individuals.

Why, then, would individuals give up this life and choose to live in society? For Hobbes and Locke, the formation of society was a positive step. For Rousseau, it entailed mixed blessings at best. Individuals in the state of nature noticed that their freedoms were secured and sometimes enhanced by engaging in social behavior. They entered naively into the social contract to form society without seeing the dangers to freedom that would result. In particular, they failed to recognize that the political, economic, and moral inequalities that forming a society generate would ultimately curtail rather than expand their freedom. Rousseau thought that the state of war that both Hobbes and Locke claimed arose in the state of nature could exist only after the formation of society.

Stem cell research

DEFINITION: Scientific studies of undifferentiated cells derived from fertilized human embryos less than one week old that have the ability to develop into virtually any other human cell

DATE: First discoveries announced in November, 1998

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Stem cells are uniquely valuable to medical research because they can be directed to become specific types of cells or tissues useful to treat such diseases as juvenile diabetes and heart disease. They can also yield new methods for screening and testing new drugs and provide insights into the earliest stages of human development. However, they are at the center of a major ethical debate over definitions of the beginning of human life.

In 1998, biologist John Gearhart of John Hopkins University and researcher James Thomson of the University of Wisconsin announced that they had isolated embryonic stem cells and induced them to

Nancy Reagan's Endorsement of Stem Cell Research

During a May, 2004, fund-raising event for juvenile diabetes research in Beverly Hills, California, former first lady Nancy Reagan spoke out publicly for the first time in favor of human embryonic research. Alluding to her Alzheimer-stricken husband, former president Ronald Reagan (who died the following month), she said, "Ronnie's long journey has finally taken him to a distant place where I can no longer reach him. Because of this I'm determined to do whatever I can to save other families from this pain. I just don't see how we can turn our backs on this."

At the same event, actors Harrison Ford and Calista Flockhart read letters from former presidents Gerald Ford, Jimmy Carter, and Bill Clinton that endorsed her support of embryonic stem cell research.

begin copying themselves without turning into anything else. They had apparently discovered how to manufacture cells that could become human tissue.

Both Gearhart and Thomson called on the U.S. Congress to enact clear legal guidelines for future stem cell research. Instead, Congress placed a moratorium on federal funding for experimentation on most fetal tissue. However, no law governed what scientists could do using private funding. A situation then arose in which most stem cell research was in the hands of corporate-backed researchers. This proved to be a mixed blessing. While the situation permitted stem cell research to continue, albeit more slowly, the research was being done by privately funded scientists and was therefore not subjected to the multiple levels of peer review and disclosure normally required of publicly funded researchers. Producing even greater anxiety was the fact that stem cell research can make human cloning possible.

Because stem cell research uses cells from human embryos, controversy developed over the ethical question of when human life begins. Roman Catholic, evangelical, and Islamic religious theorists say that life begins at the moment sperm meets egg. By this view, a single cell can have sacred rights. Scientists counter, however, that technically that process is not what happens. DNA (deoxyribonucleic acid) sets from egg and sperm do not in fact immediately merge, as the egg divides once before the onset of genetic recombination.

Obstetricians sometimes mark the time when life begins at about two weeks after conception—when the fertilized egg implants itself in the mother's womb. *Roe v. Wade*, the 1973 Supreme Court decision permitting women to choose to terminate their pregnancies through abortion, held that viability (the moment when the fetus is capable of existing outside the mother) was significant. Other authorities argue that life begins at the moment when fetal brain activity commences, around the twenty-fifth

George W. Bush on Stem Cell Research

Extracts from his August 9, 2001, speech in Crawford, Texas:

Research on embryonic stem cells raises profound ethical questions, because extracting the stem cell destroys the embryo, and thus destroys its potential for life. Like a snowflake, each of these embryos is unique, with the unique genetic potential of an individual human being.

As I thought through this issue I kept returning to two fundamental questions. First, are these frozen embryos human life and therefore something precious to be protected? And second, if they're going to be destroyed anyway, shouldn't they be used for a greater good, for research that has the potential to save and improve other lives?

I've asked those questions and others of scientists, scholars, bio-ethicists, religious leaders, doctors, researchers, members of Congress, my Cabinet and my friends. I have read heartfelt letters from many Americans. I have given this issue a great deal of thought, prayer, and considerable reflection, and I have found widespread disagreement.

On the first issue, are these embryos human life? Well, one researcher told me he believes this five-day-old cluster of cells is not an embryo, not yet an individual but a pre-embryo. He argued that it has the potential for life, but it is not a life because it cannot develop on its own.

An ethicist dismissed that as a callous attempt at rationalization. "Make no mistake," he told me, "that cluster of cells is the same way you and I, and all the rest of us, started our lives. One goes with a heavy heart if we use these," he said, "because we are dealing with the seeds of the next generation."

And to the other crucial question—If these are going to be destroyed anyway, why not use them for good purpose?—I also found different answers. Many of these embryos are by-products of a process that helps create life and we should allow couples to donate them to science so they can be used for good purpose instead of wasting their potential. . . .

As the discoveries of modern science create tremendous hope, they also lay vast ethical mine fields. My position on these issues is shaped by deeply held beliefs. I'm a strong supporter of science and technology, and believe they have the potential for incredible good—to improve lives, to save life, to conquer disease. . . .

I have concluded that we should allow federal funds to be used for research on these existing stem cell lines, where the life-and-death decision has already been made. . . .

week of gestation, indicating that the fetus has become human.

THE CLINTON ADMINISTRATION

In September, 1999, the National Bioethics Advisory Commission appointed by President Bill Clinton released its final report recommending federal funding for research on the derivation and use of human embryonic stem cells. The commission recommended that voluntary consent to the research should be sought only from individuals or couples who have already decided to discard their embryos instead of storing them or donating them to other couples. It further recommended that the sale of embryos remain illegal, and that professional standards should be developed to discourage fertility clinics from increasing the numbers of embryos remaining after infertility treatments that might subsequently become eligible for research.

Ethical and moral problems are associated with manufacturing embryos in the laboratory to be used in research. Most members of American society do not want to see embryos treated as products or as mere objects, fearing that such a development will diminish the importance of parenting, risk commercialization of procreation, and trivialize procreation. Society, it is argued, has granted embryos a special standing in American law and culture because of their potential to become human beings. Manufacturing embryos for stem cell research would violate that status.

During the early years of the twenty-first century, several clinical trials were utilizing mature stem cells taken from adult human beings. There were, however, severe limitations to this line of research because adult cells are already functionally specialized and their potential to regenerate damaged tissue is thus limited. Adults do not have stem cells in many vital organs, so when those tissues become damaged, scar tissue develops. Only embryonic stem cells, which have the capacity to transform into any kind of human tissue, have the potential to repair vital organs. Moreover, embryonic stem cells have the ability to reproduce indefinitely in laboratories, while adult stem cells are difficult to grow, and their potential to reproduce diminishes with age. In 2003, a

study indicated that deciduous (baby) teeth were a source of stem cells. Research is ongoing.

BUSH ADMINISTRATION AND STEM CELL RESEARCH

In a speech delivered on August 9, 2001, President George W. Bush announced that he would allow research on only existing human embryonic stem cell lines, provided that the stem cells came from embryos that no longer had the possibility of developing into human beings. He specifically referred to organs and tissues “harvested” from executed Chinese prisoners and stated that he was limiting federal subsidies to the more than sixty genetically diverse stem cell lines that already existed. (At the time of Bush’s speech, the National Institutes of Health identified thirty diverse stem cell lines). Some commentators applauded Bush’s decision because it could be used to justify policies such as organ harvesting. Others denounced it because they felt it justified the taking of human life.

Sterilization of women

DEFINITION: Medical procedure—including hysterectomies and surgical and chemical blocking of the Fallopian tubes—that render women incapable of bearing children

TYPE OF ETHICS: Sex and gender issues; Bioethics

SIGNIFICANCE: Whether sterilization is involuntary or voluntary, the procedure raises ethical questions about respect for the autonomy of individuals in making decisions about their own bodies.

Involuntary sterilization may be performed against the express wishes—or even without the knowledge—of the women who are sterilized. Sterilization may be more subtle, though still involuntary, when social conditions prevent subjects from making autonomous decisions. Justifications for involuntary sterilization include the desire to protect society from the financial burdens imposed by so-called degenerate or inferior types of people, to achieve ideals of “racial purity,” or to curb population growth, often of poor or racial minorities. Additional justifications for subtle coercion include economic constraints and birth control. Sterilization may also be a voluntary choice, and both involuntary and voluntary sterilization raise the issue of informed consent.

The earliest American laws permitting involuntary sterilization were inspired by the nineteenth century eugenics movement, a combination of scientific and social beliefs that aimed to improve society. The main assumptions of the eugenics movement were that all human defects, including feeble-mindedness, insanity, criminality, drug and alcohol addiction, and even epilepsy were determined by genetics and that people so afflicted constituted a threat to society and the very viability of humanity. The threat was often conceived in terms of cost, though arguments that sterilization improved the victim’s own life also appeared as if to soften the criticism that those sterilized were injured. As institutionalization proved too costly and limited, eugenicists turned to sterilization to achieve their goals.

EUGENIC STERILIZATION IN THE UNITED STATES

The earliest eugenic measures targeted men because medical technology at the turn of the twentieth century could not sterilize women safely and inexpensively. Twelve state laws passed between 1907

and 1917 authorized sterilization, generally by vasectomies, for institutionalized men—criminal, rapists, and those regarded as imbeciles and idiots. However, seven of those state laws were challenged and found to be unconstitutional. For example, the New Jersey supreme court found that the sterilization approved in 1912 for Alice Smith, an epileptic and resident of a state facility, to violate the constitutional principle of equal protection. Meanwhile, by contrast, California’s sterilization laws remained unchallenged from 1909 through 1921, during which time more than 2,500 people were sterilized—a figure constituting nearly 80 percent of the total for the entire United States.

During the 1920’s, renewed efforts for sterilization laws succeeded in thirty states. A leading eugenicist, Harry Hamilton Laughlin found a way to avoid the unconstitutional aspects of the earlier laws that were imposed mainly on institutionalized people. He formulated a plan for appointing a state eugenicist who would examine the entire population to identify citizens who were unsuitable for reproduction. Hearings and jury trials would be held to recommend sterilizations, followed by the possibility of legal appeals. In a famous 1924 appeal case of Carrie Buck, the seventeen-year-old mother of a child conceived after she was raped, the U.S. Supreme Court upheld the law.

Most sterilizations in the United States were performed during the 1930’s. After a slowing down during World War II, sterilizations increased moderately. By the 1940’s, it also became apparent the hereditarian assumptions concerning the sources of mental weakness were false. However, in the 1950’s, involuntary sterilization took a racist turn, with the “Mississippi appendectomy”—sterilization of many southern African American women and girls without their knowledge. Only during the 1970’s did coercive sterilization become a central concern of the movement for reproductive rights after abuses of Native American, Mexican, African American, and Puerto Rican women became publicly known. Activists pushed for the enactment of rigorous measures requiring informed consent.

STERILIZATION IN OTHER NATIONS

The successes of eugenics advocates in the United States inspired other nations, including Canada, Denmark, Germany, Sweden, Norway, Finland,

Mexico, Japan, and France to pass involuntary sterilization laws during the 1920's and 1930's. Only in Great Britain were such laws soundly rejected. In 1933, the German government enacted a comprehensive sterilization law. By some estimates, Germany sterilized 3.5 million people between then and 1945.

In many nations outside Western Europe and North America, sterilization was illegal until the late twentieth century. In developing countries, such as Peru, sterilization became legal and was used by governments as a means of coerced population control of the poor and minorities, especially indigenous peoples. China's official population control policies involve the employment of coercive means, including forced abortions and sterilization.

SUBTLE ABUSES AND INFORMED CONSENT

Many pressures on women to choose sterilization have existed. Where access to abortion or birth control is limited, women may have only the option of sterilization for family planning. Sometimes subtle forms of coercion are economic. For example, in 1978, the American Cyanamid Company in the economically depressed area of Willow Island, West Virginia, required women employees working in its lead-pigment department to be surgically sterilized; five women underwent the procedure. The ostensible purpose of the company's policy was to prevent fetuses from exposure to lead poisoning.

Other subtle reasons for sterilization include inadequate medical care. Undesired sterility can be caused by sexually transmitted diseases and by pelvic inflammatory disease caused by the use of intrauterine devices. The burden of these problems falls most heavily on the less advantaged.

Medical ethicists and legal scholars have argued that sterilization, whether surgical or chemical, may be performed only if the person has given informed consent, a criterion extended to repeat sex offenders. The standards of informed consent include two major principles. First, patients must make medical decisions voluntarily, as free from coercion as possible. The American College of Obstetrics and Gynecology advises physicians to refrain from making recommendations to patients that reflect their own values, social goals, or racial, ethnic or socioeconomic factors.

Informed consent also requires that patients must be fully advised concerning the risks and benefits of sterilization procedures. They must understand that

sterilization is irreversible. While informed consent may rest on a utilitarian principle that patients benefit from participation in decision-making processes, it is more often justified by appeals to respect for individuals' autonomy. Special difficulties arise with certain persons, such as those with chronic mental illnesses or mental disabilities—both of which are variable conditions. The permissibility of sterilization or its denial may be determined through extensive interviews with trained psychologists, according to definitions of legal competence, possibly in conjunction with court decisions.

Stewart, Martha

IDENTIFICATION: Entrepreneur and television personality

BORN: August 3, 1941, Jersey City, New Jersey

TYPE OF ETHICS: Business and labor ethics

SIGNIFICANCE: Stewart parlayed her homemaking and fashion skills into a multimillion dollar business empire and became a national icon of style and domesticity, but her ethical reputation took a severe blow when she was charged with insider trading and other offenses and was convicted on all counts in 2004.

A large rectangular box with a thin black border, centered in the upper half of the page. Inside the box, the text "Image not available" is centered in a black serif font.

Martha Stewart, immediately after learning that she has been convicted on all charges in March, 2004. (AP/Wide World Photos)

Beginning with a modest catering service in 1976, Martha Stewart gradually built a homemaking and style empire of books, articles, syndicated television shows, magazines, and a line of products sold through her own mail-order business and at Kmart department stores all over the United States. Her total worth after she consolidated her enterprises as Martha Stewart Living Omnimedia and went public in 1999 put her for two years running on *Forbes Magazine's* list of the four hundred wealthiest citizens of the United States.

In December, 2001, the day before the stock of the ImClone company fell sharply because the Federal Drug Administration had refused to approve ImClone's anticancer drug, Erbitux, Stewart sold her ImClone shares. Her timely move gave the appearance of having been improperly influenced by inside information. Federal investigators were led to Stewart because of the arrest of Samuel Waksal, the chief

executive officer of ImClone and a personal friend of Stewart's, on insider trading charges in the summer of 2002. Now suspected of insider trading herself, Stewart told investigators that she had ordered her broker to sell her ImClone stock if the price per share went down to sixty dollars. The broker corroborated her statement, but his assistant, who had handled the sale, later said that he knew of no "stop-loss" order in this case. Stewart protested her innocence of any wrongdoing.

On June 4, 2003, Stewart was indicted, not for insider trading, but for conspiracy, making false statements, obstruction of justice, and securities fraud. The last charge was based on the allegation that she defrauded investors in Martha Stewart Living Omnimedia by making false statements about her company's worth. Stewart again maintained her innocence of all charges but immediately resigned

from the directorship of Omnimedia, though she remained on its board as “creative director.”

Stewart’s indictment occasioned much speculation about the reason for federal interest in a case involving a stock transaction worth less than forty-six thousand dollars—a tiny fraction of Stewart’s total assets—when nothing was being done about more serious cases, such as the multimillion dollar misdeeds of Kenneth Lay, the former chief executive officer of Enron. Many claimed that Stewart was singled out for attention not because she had committed a major transgression, but because she was a self-made and eminently successful businesswoman and a celebrity or because prosecutors believed that they would win an easy conviction.

Other speculation centered around the reasons why the original basis of the investigation of Stewart for insider trading was abandoned for the lesser, and perhaps farfetched, charge of misleading her investors. That charge was based on Stewart’s public claim in June, 2002, that she had done no wrong. It was also suggested that charges of insider trading are notoriously difficult to prove and more easily left to the jurisdiction of the Securities and Exchange Commission.

Before the scandal over ImClone broke, Stewart had been regarded as a paragon of competence, style and good taste. However, the apparent inconsistencies in the three accounts of the sale of her ImClone stock tarnished her reputation for honesty and forthright dealing, and her financial worth began to decline. CBS-TV cancelled her regular appearances on its weekday *Early Show* and relegated her popular daily homemaking show, *Martha Stewart Living*, to a 2 A.M. time slot.

Although Stewart retained the enthusiastic support of tens of thousands of her admirers and experienced no immediate decline in her line of products sold at Kmart stores, the popularity of her formerly best-selling magazine, *Living*, fell precipitously. Most damaging, however, was the nearly 50 percent fall between June of 2002 and June of 2003 in the value of Omnimedia stock, of which Stewart herself was the major shareholder. This was especially damaging because Stewart’s image and that of her company were virtually identical. Recovery of a lost reputation under such a circumstance is extremely difficult, if not impossible.

On March 5, 2004, Stewart and her stockbroker were convicted on all charges of obstructing justice

and lying to the government about her stock sale. In July, she was fined thirty thousand dollars and sentenced to five months in a federal prison. She began serving her term in a West Virginia minimum-security facility on October 8, 2004.

Stoic ethics

DEFINITION: School of ancient Greek philosophy that defined happiness as the result of making wise moral choices

DATE: Fourth century B.C.E. to third century C.E.

TYPE OF ETHICS: Classical history

SIGNIFICANCE: Stoic ethics are typical of and influential upon traditional Western philosophy, in that they begin from the premise that emotion is deceptive or untrustworthy and that reason is the only legitimate basis for moral choice. While this premise was generally accepted for many years, the critique of reason and “logocentrism” launched by feminism and poststructuralism in the second half of the twentieth century left it open to debate.

Stoicism was one of the most significant philosophical movements of the Hellenistic Age. The founder of Stoicism was the fourth century B.C.E. Greek philosopher Zeno, who lived and taught in Athens. He taught his disciples in the *stoa poikili*, the painted colonnade of the market place, from which the name of this movement was derived. Stoicism, like most philosophies in the ancient world, was concerned not only with abstract concepts but also with how an individual behaved in society. Therefore, the teachings and writings of Zeno and his later followers had a major ethical component.

The basic goal that undergirds Stoic ethics is humanity’s search for happiness. Happiness is not defined in the sense of emotional well-being, but is a description of living with what is good and moral. In

the Stoic system, this goal of happiness is ultimately achieved by making wise choices that are based upon nature. For the Stoics, the ultimate virtue was to live harmoniously with nature, which would result in a lifestyle that would guarantee happiness.

BASIC BELIEFS

The Stoics believed that a person was constantly engaged by his or her passions. These passions were generated by outside images that would entice a person's internal impulses to choose that which was undesirable. The goal for the wise person in Stoicism was to allow the *logos* (the reason or intellect within a person) to rule. When the *logos* ruled, then one could choose what was best and be free of the passions. This freedom does not mean that one is unfeeling or is unpassionate, but that a person does not let these areas interfere with making the right and logical judgments in the ethical realms of life.

This decision-making process can be taught to a certain extent. There are those things in the world that can be classified as good, evil, and indifferent. The indifferent would be those areas such as death, life, fame, scandal, hardship, lust, wealth, poverty, sickness, and health. If one considers these areas as indifferent to one's life, these areas have no bearing upon the experience of happiness. Because of their indifference to such areas of life, the Stoics were often incorrectly labeled as passionless and perhaps unfeeling individuals. This perception has carried over into the modern usage of the word "stoic," when it is applied to a person who, in the face of what appears to be a traumatic and emotional event, does not express feelings.

The process of choosing between good and evil is more difficult and more intuitive in the Stoic system. This intuitive decision making of right judgments is assisted, however, when the wise person uses nature as a guide or criterion. The good is that which is in harmony with nature; the bad or evil is that which is against or in tension with nature. For the Stoics, nature becomes the all-encompassing norm that enables one to evaluate situations and make decisions. In observing nature, a Stoic could make some rational deduction regarding what is natural in relationship to plants, animals, and humanity. For example, it is not inherent in nature for a person to starve; it is unnatural. Therefore, the Stoics would render the logical action of feeding starving people. When one at-

tempts to live according to nature, one practices a strong social ethic. Therefore, a Stoic individual honors the kinship networks and his or her native land.

When events or situations occur within nature that do appear as natural, these only help to reinforce what is the norm. For example, the birth of a six-legged cat is an anomaly that helps illustrate that in nature, cats have four legs. The Stoic system illustrates that one considers the whole on the basis of its parts. When nature is considered as a whole, it becomes clear that it is perfect. It is humanity's task to strive for that perfection and to live in harmony with nature.

The founder of Stoicism, Zeno, used a metaphor to illustrate the choice that humanity could make regarding living in this harmonious relationship with nature. He compared the situation of humanity to that of a dog tied behind a cart. The dog has the choice to run freely with the cart or to be dragged along. The choice is the dog's to make. To freely follow along behind is to live in harmony with nature and to ensure one's happiness. To be dragged is to live contrary to nature and to ensure one's misery.

To live in harmony with nature was the ultimate goal for a Stoic because it culminated in happiness. Yet followers of the Stoic tradition lived with the realization that they could never truly attain this goal. The ideal toward which to strive was to become a sage who, when faced with a choice, would invariably choose the good. In the Stoic system, one always attempted to reach the level of sage, but it was a rare feat. One of the later Stoic teachers, Seneca, remarked that a good man (a sage) appeared only once every five hundred years.

CONCLUSION

Although Stoicism as a movement no longer exists, its influence is evident in many areas of ethics and human behavior. The Stoics placed a great deal of emphasis upon those things that are indifferent, and one natural outcome of this emphasis is a form of asceticism. Groups that practice forms of abstinence or austerities often employ some of the ideological framework of Stoicism. Also, one can see traces of Stoicism in Immanuel Kant's categorical imperative: "Always act in such a manner that your actions can be taken as a universal maxim." Kant's emphasis is upon reason, which Stoics valued in all decision making.

Stonewall Inn riots

THE EVENT: Uprising by gay men and lesbians in Greenwich Village sparked by police harassment

DATE: Began on June 28, 1969

PLACE: Greenwich Village, New York City, New York

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Named for the New York bar at which they began, the Stonewall Inn riots signaled the beginning of what would eventually become the modern gay rights movement. It was the first response by the queer community as a group to the harassment and oppression of its members.

There are moments in history when conditions come together to create the impetus for great social change. Although the roots of the social movement for gay, lesbian, and bisexual equality date back to mid-nine-

Image not available

The fact that New York's Stonewall Inn riots left a worldwide legacy is evident in the thirtieth-anniversary celebrations held around the world in 1999. Among the celebrations was a Lesbian and Gay Pride Parade held in Paris on June 26, 1999. An estimated 100,000 people participated in the event. (Notre-Dame Cathedral is visible in the background.) (AP/Wide World Photos)

teenth century Germany, many historians and activists place the beginning of the modern movement at the Stonewall Inn, a small bar in New York City's Greenwich Village that was frequented by drag queens, gay and lesbian street people, students, and others.

At approximately 1:20 A.M. on June 28, 1969, Deputy Inspector Seymour Pine, along with seven other officers from the Public Morals Section of the First Division of the New York City Police Department, conducted a routine raid on the bar on the basis of the trumped-up charge that the owners had been selling alcohol without a license.

Police raids on gay and lesbian bars were a frequent occurrence in New York City; for example, laws were enacted for the express purpose of closing establishments that catered to a gay and lesbian clientele. Statutes forbade more than “three homosexuals at a bar at any given time,” behavior that was considered “campy,” and same-sex dancing, touching, and kissing. It was also required that bar patrons wear at least three “gender-appropriate” garments.

Although small pockets of resistance to police raids on gay and lesbian bars had occurred before June 28, 1969, bar patrons usually accommodated officials. This time, however, was different. Believing that they had been harassed for far too long, bar patrons and others challenged police officers with varying degrees of intensity for the next five days, flinging bottles, rocks, bricks, and trash cans, and using parking meters as battering rams.

The Stonewall Inn riots occurred in a larger social and political context of enormous upheaval and change. It is also probably no coincidence that the riot began only a few hours after the funeral of Judy Garland, a longtime cultural icon to gay and lesbian people.

The events that occurred at the Stonewall Inn would lead to the development of a number of both militant and mainstream groups that jointly would constitute a new, highly visible movement. In commemoration of the riots, June is designated each year as “Gay, Lesbian, and Bisexual Pride (or History) Month,” and marches and various celebrations are held during that month.

Subjectivism

DEFINITION: View that knowledge of the external world of objects is dependent upon the perspective and disposition of the knowing subject

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: Subjectivism maintains that perspective is constitutive of knowledge, so that “objective knowledge” is a contradiction in terms. Thus, ethical judgments and moral norms are a function

of the standpoint and disposition of the person making the judgment.

Epistemological subjectivism is the belief that the objects of knowledge are constituted by consciousness. In this doctrine, reality, truth, knowledge, meaning, and understanding are limited to the subjective states of the subject of knowledge. Metaphysical subjectivism leads directly to solipsism, the idea that the world exists only for the self, or to subjective idealism, which reduces the world to the realm of ideas found in an individual consciousness.

In epistemology, the “subject” is the agent or apprehender of the knowing process. The “subject” may be understood as a conscious ego, a transcendental ego, mind, the cognitive state, the self, and so forth. “Object” refers to that which is being apprehended, known, or being attended to by an act of perception, cognition, or understanding. Simply put, the subject is the perceiver and the object is what is perceived. “Objective” means possessing the character of a real object existing independently of the knowing mind.

ETHICAL SUBJECTIVISM

Ethical subjectivism holds that ethical judgments refer directly to certain feelings, attitudes, and beliefs of individuals or groups; namely, feelings of approval or disapproval with regard to some person or action or quality. Ethical judgments are regarded either as meaningless or as relative to the individual who holds them. Bertrand Russell maintained that differences about values are really differences about tastes. Ethical judgments really express feelings of approval or disapproval. This is the doctrine called emotivism. Ethical judgments are neither true nor false, but are simply expressions of feelings of approval or disapproval.

The Sophists believed that the senses were the only source of knowledge about the world and that reality was in a constant process of change. Everything that exists is only a matter of appearance. Therefore, the Sophists believed in the relativity of knowledge and were skeptical regarding truth. They questioned the validity of ethical principles and claimed that morality was a matter of social convention. Protagoras of Abdera said, “Man is the measure of all things, of things that are, that they are, of things that are not, that they are not.” This philosophy relativizes truth

and morality. Interestingly, it ends up justifying democracy and equal rights, because it holds that each individual must decide for himself or herself.

Epicurus held that pleasure is the sole good. This doctrine is known as hedonism. The view that people value pleasure above all else is known as psychological hedonism. Ethical hedonism goes a step further and holds that people not only seek pleasure but ought to seek pleasure. Since pleasure is relative to an individual's experience, feelings, and tastes, however, hedonism amounts to ethical subjectivism.

Bishop George Berkeley believed in the doctrine called immaterialism, which denied the existence of the immaterial world. Whatever exists, exists in the mind—*esse est percipi* (“to be is to be perceived”). This doctrine amounts to solipsism, the idea that nothing exists but one's mind and its ideas.

Immanuel Kant held to a motivistic theory of ethics. According to this doctrine, the rightness or wrongness of an act depends upon the motives and intentions of the moral agent, not upon the intrinsic character of the act or the consequences of an act.

Johann Gottlieb Fichte believed that the ego, which is pure creative activity, makes possible not only the awareness of self but also that of the nonego (whatever is not regarded as self). According to Fichte, the conscious mind creates the objects of the world because they exist only in the mind's knowledge of those objects. Therefore, both subject and object are generated by a creative ego. It is the ego that makes the world intelligible.

EXISTENTIALISM AND PHENOMENOLOGY

Søren Kierkegaard adhered to the doctrine that truth is subjectivity. Truth involves passion. There is no objective absolute truth. Truth is that on which the individual acts, a way of existence. Truth does not consist in what is said but in how it is said. Because there is no absolute truth, uncertainty accompanies subjectivity, calling for a leap of faith.

Jean-Paul Sartre claimed that humanity is condemned to freedom. People are absolutely free and morality is relative. One creates one's own values.

Edmund Husserl employed a philosophical method called phenomenological reduction that considered only the pure phenomena of consciousness—that is, self-evident, certain, and intuitive thoughts and ideas of consciousness. Phenomenological reduction revealed three elements of knowledge: the pheno-

menological ego, which is identical to the stream of consciousness; thinking activities; and the objects of thought. Husserl's doctrine of intentionality claimed that every act of consciousness was a consciousness of something and that that something was a mental entity. Therefore, knowledge of the world is purely subjective.

ETHICAL PROBLEMS

If moral standards are merely subjective, there seems to be no objective way of settling ethical disputes and disagreements regarding moral behavior. Mistakes about values are impossible to make. What becomes of the sense of duty in this scenario? Sometimes, the sense of acting out of duty to others means acting against one's own inclinations. Finally, subjectivism seems to contradict ordinary language and common sense, in which it is assumed that “good,” “bad,” “right,” and “wrong” have the same meanings for everyone.

Suffrage

DEFINITION: Right to vote in government elections

TYPE OF ETHICS: Sex and gender issues

SIGNIFICANCE: Suffrage is the central right and responsibility of each full citizen in a democratic government. Lack of suffrage marks one as less than a full member of such a society. In the nineteenth century, “suffrage” became a common shorthand for woman suffrage specifically and for the movement to gain full citizenship for women.

Woman suffrage is the basis of political power for women. From the nineteenth and early twentieth century campaigns for woman suffrage in the United States and Great Britain, the issue of suffrage spread worldwide. By the late twentieth century, women could vote in most countries.

HISTORY

Participation in the political process through voting was either nonexistent or limited to a small elite until the nineteenth and twentieth centuries (the United States removed all property qualifications for voting during the 1830's). Suffrage in the colonial United States was limited to white, male property owners, and women did not vote or, if married, even exist legally.

Because of the eighteenth century revolutionary movements that were active in America and parts of Europe, the question arose whether the rights of man should not also apply to women. In England, Mary Wollstonecraft, in *A Vindication of the Rights of Woman* (1792), asserted that women could be good citizens of the state if men would let them participate. The state constitutions in the new United States of America, however, prohibited women from voting except in New Jersey, which allowed all property owners to vote. Spinsters and widows who owned property voted until 1807 when New Jersey restricted suffrage to white male property owners. By

the 1830's, however, there was universal adult white male suffrage throughout the United States, while women and racial minorities remained disfranchised.

During the early nineteenth century, many women in the northern states embraced reform movements, including the antislavery movement. The antislavery movement split during the 1830's over the proper role for women within its organizations and within society as a whole. In 1840, American women delegates to the World Anti-Slavery Convention in London, England, were excluded from the convention and relegated to a curtained gallery to observe deliberations. As a result, Elizabeth Cady Stanton and Lucretia Mott decided that women needed to work for their own rights.

They organized a women's rights convention on July 19 and 20, 1848, in Seneca Falls, New York. Stanton wrote the document that was adopted by the convention, the most controversial resolution of which was a demand for woman suffrage. Other women's rights conventions followed. Susan B. Anthony and Lucy Stone joined the cause in 1851, with Anthony doing most of the work before the Civil War.

The women's rights movement interrupted its activities during the Civil War, but its members felt betrayed when their antislavery male allies proved to be more interested in securing rights for freedmen than for women. When the Fourteenth Amendment (1869) introduced the term “male inhabitants” into the Constitution, suffragists were alarmed, and the proposed Fifteenth Amendment, extending suffrage to black men but not to women, divided the woman suffrage movement. In 1869, Stanton and Anthony formed the National Woman Suffrage Association, which advocated a wide range of women's rights and advocated a federal amendment to achieve woman suffrage. The American Woman Suffrage Association, headed by Stone, focused on suffrage and worked on campaigns at the state and local level.

Suffragists campaigned for woman suffrage between 1867 (Kansas referendum) and the 1920 ratification of the Nineteenth Amendment. They participated in state referenda campaigns (mostly unsuccessfully) and petitioned and lobbied legislatures and state constitutional conventions, while continuing to advocate a federal amendment. In the western United States, some women were voting,

beginning in the Wyoming (1870-1890) and Utah (1870-1887) territories. By 1900, women had the vote in four Rocky Mountain states: Wyoming (statehood, 1890), Colorado (referendum, 1893), Utah (statehood, 1896) and Idaho (state constitutional amendment, 1896). In some areas, women had limited suffrage (school board or municipal or presidential elections). In 1890, the rival suffrage organizations merged, becoming the National American Woman Suffrage Association (NAWSA).

TWENTIETH CENTURY MOVEMENTS

In 1903, Emmeline Pankhurst organized the Women's Social and Political Union to demand woman suffrage in England. The group quickly adopted militant tactics, resulting in arrests of the Suffragettes. In January, 1918, Parliament passed a law granting suffrage to women thirty years of age or older who met specified property qualifications (in 1928 suffrage was extended to all women older than twenty-one). By 1918, women also had the right to vote in New Zealand (1893), Australia (1902), Finland (1906), Mexico (1917), and Russia (1917), and suffrage was extended in 1918 to Austria, Canada, Czechoslovakia, Germany, Hungary, Ireland, Poland, Scotland, and Wales.

Carrie Chapman Catt, president of NAWSA (1900-1904 and 1916-1920), designed the "Winning Plan." This plan involved state campaigns that would continue until women were able to vote in thirty-six states (the number needed to ratify a federal amendment), after which there would be a campaign to pass the "Anthony Amendment" for woman suffrage. Suffragists became more visible, adopting some of the tactics of the English Suffragettes. Catt believed that, although it was important that women support the involvement of the United States in World War I (1917-1918), they should continue working for suffrage during the war.

The radical National Woman's Party, headed by Alice Paul and Lucy Burns, opposed the war, and its members picketed the White House for suffrage, with some of them being arrested. Catt secured the support of President Woodrow Wilson for the "Anthony Amendment" in 1918. Congress passed the Nineteenth Amendment in June, 1919. On August 24, 1920, Tennessee became the thirty-sixth state to ratify the Nineteenth Amendment, thereby enfranchising women in the United States.

During the twentieth century, woman suffrage extended throughout the world. In 1954, the United Nations Convention on Equal Political Rights affirmed women's right to suffrage and political activity. By 1985, only in Saudi Arabia and the Gulf States were women still completely disfranchised.

Sufism

DEFINITION: Mystical practices and traditions associated with Islam

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: Sufism encompasses many important paths of spiritual and ethical discipline and has been important in the global dissemination of Islam.

Sufism embraces so many mystical traditions that many scholars debate whether there is one referent to “Sufism” and whether some Sufi traditions are Islamic. Sufi mystics emphasize the importance of extreme, ascetic adherence to *sharīʿa* (Islamic law), or ecstatic union with God (sometimes associated with antinomianism), or a middle ground between those extremes. Some Sufis believe legalistic and antinomian traditions to be mutually exclusive. Others view them as aspects of a single, larger truth, as did Sanāʿī in his famous claim that “the veils are many, but the Bride is One.”

Most often, Sufis abjure worldly goods and follow a “path” (*ṭarīqa*) of exercises for spiritual discipline and purification. Along the path, the Sufi attains “stations” (*maqāmat*) or plateaus of spiritual development, to each of which there is a proper “state” (*ḥāl*). The ultimate state to which Sufis aspire is variously indicated as “love” (*mahabbat*), “gnosis” (*maʿrifat*), “annihilation” (*fanāʾ*), or “union” (*ittiḥād* or *tauḥīd*). These goals sometimes have attracted the condemnation of Islamic legists who have argued that these states imply pantheism or, at least, a denial of the absolute transcendence of God.

In its early history, Sufism was the private spiritual effort of individual Sufis. In the eighth century, groups of students or disciples began to assemble informally around prominent Sufis. In the eleventh century, these informal associations began to formalize as clearly defined Sufi orders, with distinctive sets of spiritual practices, and these orders often were housed in a compound at the tomb of an important Sufi whose spiritual power (*barakat*) remains at the tomb.

Sufism provides popular ethical guidance in several ways. The keepers of Sufi tombs, to which many turn (for practical needs) in order to avail themselves of *barakat*, are a source of popular religious and ethical guidance. Reverence for individual Sufis such as Rābīʿah serves as a frequent reminder of the importance of detachment from worldly goods and of love of God. Sufi poetry and hagiography have been extremely popular and have been important in transmitting Islam and Sufi spiritualism in vernacular languages. Sufism’s devotionism and instrumental religion associated with *barakat* often have been more accessible than the sometimes-austere Islamic legalism, and often have served to gradually assimilate popular culture to Islam.

Philosophical treatises are not prevalent in Sufism, but some Sufis (notably al-Ghazālī and Ibn ʿArabī) have made significant contributions to ethical theory, especially through analyses of moral psychology and the epistemic status of direct apprehension of God.

Suicide

DEFINITION: Self-initiated, intentional act directed toward, and resulting in, the ending of one’s own life

TYPE OF ETHICS: Personal and social ethics

SIGNIFICANCE: Most religions condemn suicide as immoral; however, humanitarian organizations argue that persons have a right to choose death rather than suffer by remaining alive. Some ethicists have raised questions, though, as to whether a person in physical or mental anguish is competent to make the decision to commit suicide or whether their suffering constitutes a form of duress.

French writer and philosopher Albert Camus, in *The Myth of Sisyphus* (1955), asserted that the core philosophical question is whether to choose suicide. Existential suicide is founded on the idea that as a person comes to the insight that life is an empty absurdity, he or she must confront suicide as an option.

Deaths by suicide are notoriously underreported, even in countries that do not strongly condemn the act. In countries where there are adverse sanctions related to suicide, powerful pressures exist to cover up suicidal deaths. Therefore, caution must be used in interpreting officially recorded suicide statistics.

In 1985, conservative estimates held that, worldwide, more than 400,000 persons committed suicide. Although suicide is a major problem in the United States, which had more than 30,000 documented suicides in 1988, the suicide rate in the United States is notably lower than are those of many developed countries. According to the World Health Organization, many countries have suicide rates that are dou-

ble that of the United States (Hungary, Denmark, Finland, and others), and many others have rates, which, although not double, are substantially higher (Japan, Czechoslovakia, China, Sweden, Switzerland, and others). Of particular concern in the United States was the near tripling of the suicide rates of adolescents and young adults between the 1950's and the 1980's. As of 1990, suicide was the second leading cause of death of adolescents and the third leading cause of death among adults aged twenty to twenty-four in the United States.

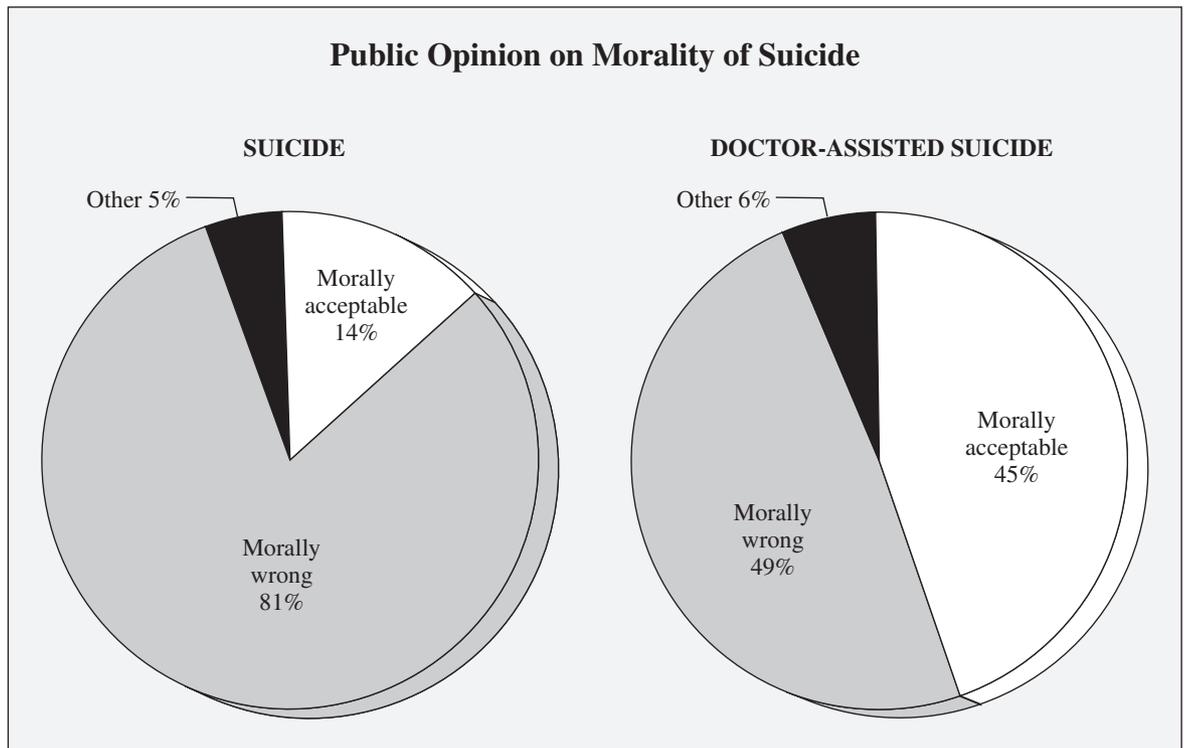

Western opinions concerning the morality of suicide have been heavily influenced by the teachings of Judaism and Christianity. Although the Old Testament of the Bible provides no condemnation as it records the suicides of several important persons (Abimelech, Saul, Samson, and others), rabbis and theologians have rebuked suicide as a violation of the sixth commandment: Thou shalt not kill. According to the fifth century Christian theologian Saint Augustine, no degree of torment, no physical injury or disease, no threat to personal safety, and no amount of personal suffering can justify suicide.

Although many of the world's other major religions condemn suicide, some do not. Islam damns the person who commits suicide, although exceptions are made for suicides that are part of a holy war or for a woman to protect her virginity. For the Baha'i, suicide is forbidden, and anyone who commits suicide will suffer spiritually in the afterlife. Buddhism rejects suicide on the principle that all life is sacred. Still, there have been cases in which Buddhist priests have used self-immolation as a method to draw attention to morally intolerable situations.

While Hindus and Sikhs reject most suicides because they interfere with reincarnations, both religions concede special circumstances in which suicide is either allowed or encouraged. For example, in the Hindu rite of suttee, a widow is encouraged to die in her husband's funeral pyre. Although honoring a person who commits suttee is illegal in India, instances of the practice continue to be reported.

EUTHANASIA

Any discussion of suicide becomes confused when the practice of euthanasia is brought into the

Source: Gallup Poll, May 5-7, 2003. Figures summarize responses of 1,005 adults throughout the United States.

deliberation. Euthanasia has been variously defined as the good death, death with dignity, mercy killing, and the deliberate putting to death of a person suffering intolerable life circumstances. The two most commonly discussed forms of euthanasia are passive euthanasia and active euthanasia.

Initially, passive euthanasia was defined as including the refusal of life-sustaining medications, requests that resuscitation not be provided, and other solicitations related to not being subjected to unwanted medical procedures. Later, the concept of passive euthanasia was broadened to include a variety of alterations or abatements of medical treatments that might hasten death. Therefore, disconnecting a patient from a respirator, provision of adequate dosages of pain-relieving narcotics, and the termination of forced feeding were included as examples of passive euthanasia. Most religions accept all but the last practice (termination of feeding) as acceptable choices. These practices are not viewed as murder or suicide because a natural course of events is being allowed to unfold.

Active euthanasia, however, the administration of a lethal agent or the initiation of a process that will prove fatal, is condemned by most religions. Furthermore, if a second person aids in the commission of active euthanasia, the second person may be charged with homicide or held responsible under a statute that makes aiding suicide illegal.

During the 1980's, many U.S. states broadened patients' rights in regard to living wills and the right to refuse unwanted treatments. Despite the fact that most states either allow or are mute regarding the right of a competent person to terminate his or her life, they all permit the involuntary commitment and forced treatment of suicidal persons deemed to be suffering mental diseases. According to the American psychiatrist Thomas Szasz, "in treating desires as disease, we only end up treating man as a slave." Although he does not oppose treating the person who voluntarily seeks psychiatric assistance, Szasz concludes, "if the prevention of death by any means necessary is the physician's therapeutic mandate, then the proper remedy for suicide is indeed liberticide."

Suicide assistance

DEFINITION: Active provision of help to a person committing suicide

TYPE OF ETHICS: Bioethics

SIGNIFICANCE: Decisions to assist other human beings end their own lives pose difficult moral dilemmas, and suicide assistance is illegal in most U.S. states.

Terminally ill patients often openly express the wish to hasten their deaths. Such requests may pose dilemmas for persons in the position to assist with the suicides. Historically, the self-induction of death among persons who are severely ill and suffering has been justified by a number of philosophers including Plato, Seneca, and David Hume. The concept of having a physician assist with a patient's suicide was not widely discussed until after the twentieth century discovery of analgesics and anesthetics. When administered in sufficient quantities, these substances permit the inducement of painless deaths.

Assistance to commit suicide became an increas-

Arguments for and Against Physician-Assisted Suicide

Arguments for

Decisions about time and circumstances of death are personal; competent persons should have the autonomous right to choose death.

Like cases should be treated alike. If competent, terminally ill patients may hasten death by refusing treatment, those for whom treatment refusal will not hasten death should be allowed the option of assisted death.

Suffering may go beyond physical pain; there are other physical and psychological burdens for which physician-assisted suicide may be a compassionate response to suffering.

Although society has a strong interest in preserving life, that interest lessens when a person becomes terminally ill and has a strong desire to end life. A complete prohibition on assisted death excessively limits personal liberty.

Assisted deaths already occur secretly, as when the administration of morphine may be a covert form of euthanasia. Legalization of physician-assisted suicide would promote open discussion of the subject.

Arguments against

Assisted suicide is morally wrong because it contradicts strong religious and secular traditions supporting the sanctity of life.

There is an important difference between passively letting someone die and actively killing a person. The two options are not equivalent.

There is a potential for abuse; persons lacking access to care and support may be pushed into assisted death; moreover, assisted death may become a cost-containment strategy.

Physicians have a long ethical tradition against taking life. Their Hippocratic oath pledges them not to “administer poison to anyone where asked” and to “be of benefit, or at least do no harm.”

Physicians occasionally make mistakes, and there may be uncertainties in diagnoses, and the state has an obligation to protect lives from such mistakes.

Source: Ethics in Medicine, University of Washington School of Medicine (<http://eduserv.hscer.washington.edu/bioethics/topics/pas.html>).

ingly important issue as Americans began to grow significantly older and advances in health care extended life spans among terminally ill patients. Over the second half of the twentieth century, a shift from dying in the home to dying in clinical-care settings and hospitals developed. By the early twenty-first century, approximately 80 percent of American deaths were occurring in medical-care settings. Consequently an increasing number of persons have begun seeking ways to die with dignity and in physical comfort. There has been a growing demand for modern medicine to provide comfortable, pain-free deaths and merciful ends of lives. Studies have shown that approximately 70 percent of the American public favors legalization of physician-assisted suicides or aids in dying. Health-care proxies and advance direc-

tives routinely include provisions to ensure that individual patients retain autonomy and control over their dying.

Although committing suicide is not in itself a crime, assisting or failing to take steps to prevent a person's suicide can result in ethical and legal actions. The double effect of providing medications that relieve suffering while at the same time inadvertently shortening a patient's life is an ethically accepted part of medical practice. The withdrawal of life-sustaining but burdensome treatments that leads to death is also an accepted part of medical care, even when such actions hasten death. However, in 2004, *voluntary* active euthanasia was illegal in the United States, and assisted suicide was against the law in the majority of states.

In June, 1977, the U.S. Supreme Court ruled that persons have no right to assistance in committing suicide. However, the Court did not rule out the possibility that state law could legalize physician-assisted suicide. The ruling addressed a narrow federal constitutional question that affects the mentally competent, terminally ill patient who seeks the assistance from a physician to prescribe medication for the purpose of committing suicide. However, states were permitted the right to publicly debate the issue and pass laws that either prohibit or allow physician-assisted suicide. At the federal level, this Supreme Court decision clarified the role of the physician in handling requests from a patient to hasten death. The Supreme Court did not address the role of other health care professionals such as social workers and psychologists. Following the Court's decision, a law to legally sanction physician-assisted suicide in the state of Oregon was passed.

DATE: *Summa theologiae*, wr. c. 1265-1273 (English translation, 1911-1921)

TYPE OF ETHICS: Medieval history

SIGNIFICANCE: The *Summa Theologica* encompassed, modified, and extended the ethics of Aristotle within a Christian framework. It advanced the view that Christian morality was rationally defensible.

Thomas Aquinas intended the *Summa Theologica* to provide instruction to students in Roman Catholic theological schools who not only studied the Old and New Testaments of the Bible but also participated in oral disputations concerning controversial theological questions. The *Summa Theologica* is a written, if condensed, version of these theological debates.

The work was also intended to reform the teaching of sacred doctrine, which for Thomas Aquinas involved not only the exposition of those religious tenets known through revelation—such as the nature of salvation—but also the aspects of the Christian faith that are accessible to reason—such as the question of God's existence. Reducing the confusing number of topics, arguments, and distinctions that were often arbitrarily arranged in the standard theological texts, the *Summa Theologica* argues its way point by point through questions concerning first the nature of God, then “the rational creature's movement towards God,” and finally Jesus Christ (a person's way to God).

Thomas Aquinas died before finishing the third part; a supplement, drawn from his earlier writings, completes the plan of the work. Part 1 is divided into three parts (the divine essence, the persons of the Trinity, and creation), and part 2 into two parts (part 2-1, the general treatment of virtues of vices, and part 2-2, their specific treatment). Part 3 deals with Jesus Christ, the sacraments of the Church, and with resurrection and eternity.

THE NATURE OF TRUE HAPPINESS

For Thomas Aquinas, and for Aristotle (whom the *Summa Theologica* calls “the Philosopher”), everything in the universe has a purpose, an “end,” a teleology. The purpose of a saw is to cut; the purpose of the acorn is to grow into a tree. Since human beings can reason and act, they are able to choose what they think will fulfill their desire for the perfect good; human moral choices, by their nature, are oriented toward this “last end.” Happiness is the fulfillment of human desire for the perfect good, but as both Thomas Aquinas and Aristotle point out, happiness is not equivalent to wealth, honor, power, or pleasure. Instead, since human beings share a common human nature, happiness involves a life full of all the things that all human beings really need, in the right order and the right proportion. For Thomas Aquinas, the perfect happiness is in the life to come and consists of

the contemplation of God's essence. In this life, however, happiness involves not only (imperfect) contemplation but also the development of practical reason to direct human actions and feelings into a life of choosing what is truly—not apparently—good, and learning to enjoy those choices.

In Thomas Aquinas's Aristotelian view, morality touches all of life; everyday choices tend to develop in the individual either virtue (human excellence) or vice. "Right reasons" must direct human activity to acquire that which is objectively good for human beings (such as knowledge). These goods are intrinsically to be desired, but their acquisition is also a means of building the kind of stable character with which God is pleased. Without courage, for example, a person would be unable to act in accordance with right reason.

Thomas Aquinas took Aristotle's view to be complementary to his own, not competitive. Unaided by supernatural grace, Thomas Aquinas said, reason could discern the kind of character that a human being ought to have, but a complete picture of an individual required God's grace, which would provide the theological direction that human beings could not discover through philosophic reflection alone. Already in this life, God was suffusing human beings with faith, hope, and charity (love), the three theological virtues, which were given not by human action but by the Holy Spirit. They prepared a believer for the vision of God in the life to come.

Central to the *Summa Theologica's* discussion of true happiness and the final end is the concept of law. A law is made by reason for the common good by those in charge of a community, and persons cannot become truly virtuous independent of society. God's eternal law—his divine plan—governs the universe; the natural moral law, which is made up of those precepts that human beings discern through the use of right reason, reflects the eternal law. Actions that oppose the natural moral law are forbidden not because God arbitrarily says they are wrong, but because they are contrary to the development of full human potential. In addition, there is positive divine law, in which God wills that individuals receive grace through the sacraments, and those are positive human laws, in which communities or states restrain actions that are detrimental to society and promote obedience to the natural moral law; unjust laws do not have to be obeyed. Governments exist not only to provide peace

and protection but also to nurture the common good. In times of need, the resources of a community become "common property," and thus it is not sinful for someone to take bread to feed a starving child. People may resist tyrannies and overthrow them, unless there is good reason to believe rebellion would make matters worse.

The *Summa Theologica* presents a synthesis of faith and reason that was declared to be of permanent value to the Roman Catholic Church by Pope Leo XIII in 1879.

DIVISIONS OF THE WORK

The three parts of the *Summa Theologica* (as well as the supplement to the third part) are divided into questions dealing with the main subtopics of each part; in turn, every question is divided into several articles. Each of the 3,112 articles in the work is a stylized disputation beginning with an assertion of the position contrary to the one that Thomas Aquinas will take and a presentation of several objections to Thomas Aquinas's position. Thomas Aquinas answers by supplying a relevant quotation from the Bible or a Church father (such as Saint Augustine), followed by his own argument. The point here is to show that reason (that is, Thomas Aquinas's reply) is in harmony with sacred Scripture and the theologians of the Church. Finally, there are specific replies to each objection.

Sunnīs

DEFINITION: One of the two main sects of Islam

TYPE OF ETHICS: Religious ethics

SIGNIFICANCE: The majority of the world's Muslims belong to the Sunnī sect of Islam.

Image not available

Islamic religion is divided into two main sects: Sunnīs and Shī'ites. Sunnī Islam developed over many centuries. An important distinction between the two sects is that the Shī'ites relied on Imāms to provide spiritual guidance, while the Sunnīs emphasize the Qur'ān; the Sunna, or examples, from Muḥammad's life and his practice of Islam; and interpretations of these sources by eminent religious scholars. The interpretation of Islamic concepts by these scholars led to the emergence of several schools of thought. Four of the most important of these schools were led by Imām Abū-Hanīfa, Mālik ibn-Anas, al-Shafī'ī, and Ahmad ibn-Hanbal.

With the passage of time and expansion of the newly emerging Muslim empire, numerous issues relating to the meaning of the various religious concepts emerged. One such issue that ultimately helped to define the Sunnīs was the definition of a Muslim. A group of people known as Khārijites believed that only those who strictly adhered to the teachings of the Qur'ān and Sunna could be called Muslims, and those who did not should be declared non-Muslims and expelled from the community of Muslims. Others thought that even sinners should be considered Muslims and that the punishment for their sins should be left to God. People belonging to the latter school were ultimately defined as Sunnīs.

Supererogation

DEFINITION: Doing what is morally praiseworthy beyond what is required by duty or what is required to be free of moral blame

TYPE OF ETHICS: Theory of ethics

SIGNIFICANCE: If supererogation is possible, then moral goodness is not exhaustively describable as the fulfillment of moral duty; it is possible to go above and beyond the call of duty.

The term "supererogation" derives from the Latin verb *supererogare*, which means "to overspend" or "to spend in addition." The first known

appearance of this verb is in the Latin Vulgate biblical account of the Good Samaritan (the tenth chapter of the Book of Luke). The modern notion of supererogation is based upon the idea of making an expenditure of one's goods or energy over and above what is required of one by moral duty. More precisely, the modern notion requires that an act satisfy three conditions to qualify as an act of supererogation. First, the performance of the act must be morally praiseworthy. Second, the performance of the act must not fulfill moral duty. Third, the omission of the act must not be morally blameworthy.

Although the idea of rising above and beyond the call of duty is familiar to most people, there has for centuries been great opposition to this idea. The major figures of the Protestant Reformation associated the idea of supererogation with the detested practice in the Roman Catholic Church of selling indulgences, which was based upon the idea that the good actions of the saints create a treasury of merit. The Protestants Martin Luther, John Calvin, and Philipp Melancthon taught, on the contrary, that God requires all people to do what is good or praiseworthy; hence, it is impossible to do good over and above the requirements of duty. No matter how saintly or heroic one's behavior is, even to the point of sacrificing one's life, one is simply doing what God requires as a matter of duty.

The Protestant Reformers were also bitterly opposed to the Scholastic distinction between the commandments of God and the counsels of God. According to Thomas Aquinas and other Scholastics, the commandments of God are obligatory to obey, but the counsels of God are optional recommendations. Although Christians are not required to obey the counsels of God, such as renouncing riches and carnal pleasures, following them is recommended to those who wish to lead more perfect lives. Clearly, this distinction opens the door to the possibility of supererogation, and the Reformers refused to acknowledge that there are any counsels of God apart from what God demands as obligatory. If it is good to renounce wealth or carnal pleasure, that is exactly what one is required to do.

Opposition to the idea that supererogation is possible has more recently come from two of the major modern traditions in ethics: Kantian ethics and act utilitarianism. According to Kantian ethics, an act can be a moral act only if it is performed in obedience

to moral duty. Thus, if an act is performed that goes beyond the requirements of duty, Kantians dismiss it as an act that falls outside the sphere of ethics or morality. One cannot, according to their view, act morally in a way that transcends duty.

ACT UTILITARIANISM

Act utilitarianism is based roughly upon the idea that persons ought at a given time to perform whatever act produces the greatest benefits for the greatest number of persons. In this view, duty requires one to choose the alternative that maximizes benefits. If a person chooses this alternative and acts accordingly, the person has fulfilled his or her duty. If the person chooses another alternative and acts accordingly, the person has violated his or her duty. In both cases, however there is no possibility of doing what is praiseworthy without fulfilling duty. Either one's act fulfills duty or it does not, but if it does not fulfill duty, it is the violation of duty and hence cannot be praiseworthy.

In spite of all the opposition to the idea that acts of supererogation are possible in human life, there is also much support for the idea. An article by J. O. Urmson entitled "Saints and Heroes," published in 1958, has been particularly significant in restoring popularity to the notion of supererogation. Urmson, a philosophical ethicist, presents several persuasive arguments to show that saintly and heroic behavior cannot plausibly be regarded as the fulfillment of duty. In one example, Urmson describes a soldier who throws himself upon a live grenade to save the lives of his comrades. Surely it would be wrong to judge that the soldier has a duty to perform this act, and surely it would be wrong to blame him for deciding not to perform it. Yet it is clearly a morally praiseworthy act, and hence it qualifies as an act of supererogation.

Urmson admits that saints and heroes often regard their own behavior as the fulfillment of duty. People frequently reply that they were only doing their duty when congratulated for performing acts of saintliness or heroism, and this is a phenomenon that has led many people to conclude that there really are no acts of supererogation in human life. Urmson argues, however, that people who react to their own saintly or heroic acts in this manner are simply mistaken. They have subjected themselves to a standard of duty that is unrealistically rigorous, and they have in reality gone beyond the call of duty.

David Heyd has argued that, in addition to heroism and saintliness, there are five other categories of acts that are capable of qualifying as supererogatory. First, there are acts of beneficence, such as acts of charity, generosity, and gift giving; second, doing favors for others; third, volunteering or promising something; fourth, forbearing to do what is within one's rights; and fifth, forgiving, pardoning, and showing mercy. In each of these categories there is room for performing acts of supererogation.

Although acts of supererogation are almost always portrayed in dramatic fashion, it is important to realize that small acts of generosity, courtesy, or kindness can satisfy the three conditions required of being supererogatory. Thus, it can be supererogatory to buy lunch for a coworker who has arrived at work without any money, to put in a good word about someone else to a person in authority, or to offer to cover the office phone while everyone else is downstairs at the office Christmas party.

Supreme Court, U.S.

DEFINITION: The highest court in the United States
DATE: Established in 1789
TYPE OF ETHICS: Legal and judicial ethics
SIGNIFICANCE: The U.S. Supreme Court has the authority to make final decisions in all judicial cases relating to the U.S. Constitution and federal legislation.

The U.S. Constitution mandated the creation of the Supreme Court and outlined its basic powers and duties. The first Congress then established the Court's organizational structure and determined the number of its justices. The Court itself decides most of its own procedures, such as allowing both dissenting and concurring justices to publish signed opinions of the cases on which the Court rules. The major function of the Court is to review the decisions of state courts and lower federal courts. Each year, out of approximately four thousand appeals, the Court chooses to give detailed examination and render judgments in about 150 cases.

The Supreme Court's central role in the American system of government is primarily a result of its longstanding practice of judicial review, which includes the power to make judgments about the constitutionality of congressional legislation and executive actions. The Court's precedents are binding on lower courts, and those relating to constitutional interpretations are recognized as constitutional law.

ETHICAL ISSUES

The Supreme Court frequently decides controversial cases dealing with such values as equality, individual freedom, and fairness. When making its decisions, the Court must interpret many ambiguous terms in the Constitution, including "cruel and unusual punishment," "establishment of religion," and "unreasonable search and seizure." Because such terms are value-laden, liberal and conservative justices tend to disagree about their meanings in particular situations.

In the realm of individual liberty, the Court's most important judgments are usually based on the First Amendment, which prohibits government from abridging freedom of expression, religion, and assembly. The Court has never held that these freedoms are absolute, but during the second half of the twentieth

eth century, the Court greatly expanded constitutional protections for matters such as pornography, subversive speech, and unpopular religious practices. In looking at these and other issues, the Court's jurisprudence includes subtle "line-drawing." After 1962, for instance, the Court consistently held that prayer ceremonies in the public schools are unconstitutional, even though the Court allows such ceremonies in sessions of Congress and state legislatures.

In the area of equality, the Court has made a large number of important decisions relating to the Fourteenth Amendment's requirement that government must provide persons with an "equal protection of the law." In the 1896 case of *Plessy v. Ferguson*, for example, the Court decided that the Constitution's equal protection clause allowed states to mandate racial segregation, based on the doctrine of separate but equal. One-half century later, however, in *Brown v. Board of Education* (1954), the Court reversed *Plessy v. Ferguson* and held that racially segregated

public schools were inherently unequal and therefore unconstitutional. In later years, cases dealing with affirmative action and reverse discrimination engendered heated controversy.

The Court has frequently examined ethical issues of law enforcement. For instance, the Fifth Amendment mandates that defendants may not be forced to testify against themselves in criminal trials. The Court has broadly interpreted this provision as applying to suspects from the moment that police officers begin their interrogations. In the famous case, *Miranda v. Arizona* (1966), the Court found that the only way to ensure a confession was voluntary was to require the police to notify suspects of their basic constitutional rights. Many conservatives have denounced the decision as legislative rather than interpretative, while liberals insist that it is entirely consistent with the Fifth Amendment's purpose of preventing police coercion.

Some of the Court's most notable value-laden

The U.S. Supreme Court under Chief Justice William H. Taft (center front), former president of the United States, in 1921. (Library of Congress)

cases have dealt with the right to privacy, which is based on an expansive interpretation of the reference to “liberty” in the Fifth and Fourteenth Amendments. Using this interpretation, the Court held in *Roe v. Wade* (1973) that women have a constitutional right to abortions during the early stages of a pregnancy. Likewise, in 2003 the Court ruled that states may not punish homosexual acts between consenting adults in private homes. Critics have charged that the decisions went beyond the text of the Constitution and ignored moral traditions.

APPROACHES TO DECISION MAKING

Supreme Court justices frequently disagree with one another about the theoretical approaches that they should apply to interpreting the Constitution and the laws. Most justices claim to make decisions without reference to their personal preferences for public policy but do not deny that their theories about jurisprudence have a profound impact on their decisions.
